Guide to the FX13 Hottentot File

[The Hottentots are divided into four primary divisions: East Hottentot, Cape Hottentots, Korana and Nama. Most of the information in this file is on the Nama, whose indigenous social organization has not yet been completely obliterated by European influence. 1: Schultze (translated from the German) and 2: Schapera are the two major sources. L. Schultze was a noted German zoologist. His book is a scientific investigation of the natural resources and inhabitants of the Namaland. He was also an assiduous collector of folklore. I.Schapera, a noted authority on South African tribes, is on the faculty of the University of Cape Town and a member of the International African Institute. His book is an excellent compilation of existing knowledge on the Hottentot people and their society. Ethnographic descriptions of the early Cape Hottentots are represented by 8: Dapper, 9: Ten Rhyne] and 10: Grevenbroek, based on seventeenth century eye-witness accounts. Sources 11, 12, and 13 give information on the little known Korana Hottentot. The remaining sources are articles on specific topics which provide information on particular aspects of Hottentot culture not covered adequately in the major works. --]

Processed in 1957-58

Chapter XII

The Hottentots

[170] The seventeenth century Dutch gave the aborigines of the Cape of Good Hope region the name "Hottentots" because of their peculiarly clicking language. According to contemporary authors "Hottentot" was an insulting term for a stutterer. This nickname has stuck to the people. 101

As far back as their history extends, the Hottentots have never united in one nation. Even the oldest Dutch [171] settlers at the Cape report of tribal wars. In addition to this, beginning with the seventeenth century, the Hottentot tribes were pressed back by the white race from the south and in the nineteenth century by Bantu invasions from the north. As the Hottentots were thus compressed into an ever narrowing area, increasingly bitter battles for pasture grounds and water holes resulted and the processes which for ages have commingled the yellow-skinned nomadic tribes of South Africa were accelerated: migrations over an extensive area; the scattering of related elements; and the union of unrelated ones into a new tribal community under a new leader. We will not enumerate the tribes which succumbed during these struggles; the sources of their oldest history are obscure. The best accounts of the past century are missionary reports. (65) 175 619

65. Berichte der Rheinischen Missionsgesellschaft zu Barmen.

We can pass over the few remnants of the Hottentots that are left in the present Cape colony; they are vanishing, physically debased and spiritually estranged from their people in customs and language. They are the Korana and the Griqua and a few families scattered among the Boer farms that work as day-laborers. Only north of the Orange River a number of Hottentot tribes remained strong and relatively pure, linked with the tribes or hordes who had fled across the great river to escape pressures of civilization. Both, the aborigines and the refugees, were undisputed masters of Great Namaland up to the beginning of the eighties. Now fate has also caught up with them. The tribes, still important political factors before their last attempt at revolt, will be distinguished by name for only a short period. As history has taught, the differentiation of the tribes disappears with the captaincies (that greatest danger to peace which has now, we hope, finally been removed). Of the Hottentot tribes north of the Orange, with whom we first became more closely acquainted about the middle of 131 619

[196] I would like to direct the attention of future travelers to the following plants, the leaves and blossoms of which are greatly desired, if he would like to become acquainted with the wild field fruits of the old inhabitants of the country:

a) *omam!gaub is a plant with succulent leaves; the carrot-like underground part has a strong purgative effect. The name of the plant expresses this drastically: "one lets it fall (!gau) at the door (ams) of the hut (oms)", or, more optimistically translated, "one just makes it to the courtyard." [Picture. omam!gaub. 1/2 natural size. The "Ostrich foot". 2/3 natural size.]

) *!ga./marib· (3. st. cf. p. 352.) or ǂna·bab has a smooth, carrot-like, underground part and thin, narrow leaves, 3 centimeters long and crinkled at the edges.

)*/kʉu·bus forms juicy root formations as big as a child's head.

Pelargonium incrassatum Curt., called */a·miǂai·b, the "Ostrich foot", (so called because of the shape of the budding leaves) is the last of the plants which should be mentioned here because of their edible underground parts.

b) The chief fruits are gourds and cucumbers because of the abundant water in their flesh and the food content of their seeds.

The Topnaars in the region of Waluis Bay received their name !na·ranin from the gourd fruit !na·rab, the Acanthosicyos horrida Welw., on which they live for a large part of the year (cf. Analysis in the appendix). The nara matures in the first four months of the year: the chief harvest time is in February and March.

Then the kraals become desolate. The poorer families depart for the dunes with all their belongings, either taking their mat house with them or building a scanty shelter of brushwood, which can scarcely be called a hut, and only return to their old dwellings to get water when it is unavailable in the nara field. Wealthier Hottentots stay at home and have the nara brought to them by slaves and only go out for the day on a visit or for inspection. [Picture. Half-ripe nara fruit. 2/3 natural size]

The individual families have inherited rights to definite nara bushes (cf. Plate IX above and illustrations, page 146, 147). That is the only case known to me of private ownership of immoveable property outside of the hut area among the Hottentots. The Hottentot defends his nara bushes from attacks by fellow tribesmen by bringing a legal complaint before the captain. No quarter is given the Berg-damaras and Bushmen. I know of several cases in which the thieves

3. Power

622
623

Power within the tribal community at the time of my stay in Namaland, was, as it had been for generations, in the hands of a chief, gao-aob or ǂgao-b, a "captain," and of a council of older men, with whom the captain discussed all important matters, sometimes leading in an arrogant way, sometimes led by the others, according to his personality. The right to sit in the council is not tied to specific conditions. Ability, experience and age qualify one. But in many particulars this ancient Hottentot form of government is today strongly influenced by the Cape Dutch models and Christian elements (cf. the followers of Hendrik Witbooi) (73).

73. H. v. François, Nama und Damara, Deutsch-Südwestafrika, Magdeburg (ohne Jahrangabe).

If the Hottentot kraals which are under one captain are far apart, the captain places a relative as a kind of governor in charge of the distant one. In this way the ruling family branches out into clans that are widely separated and distinguished by special names (frequently borrowed from their ancestors). The Topnaars differentiate the relations of their capitain in this way: /hai begu, mũ//(e)ĩn and !norabagu.

The decision about war and peace, about migrations and trade relationships, the settlement of legal quarrels and the setting of punishments was, until recently, the authorized power of the captain and of his council. The last attempt at rebellion by the Hottentots against white rule will have completely eradicated the native form of government. With Hendrik Witbooi, in his own way a respectable person, its last representative has departed.

C. The Relationship of the Hottentots to the Foreign Races in their Home and Neighborhood

101
619

This relationship will only concern us briefly and only in its personal aspect, to the extent that it adds to the picture of native character.

It is assumed without argument that the Hottentots have given expression to their own pride in the phrase by which they call themselves, [322] elevating themselves above all other people: Kʌoǂ-kʌoǁn, "people of peoples," in the same glorifying sense that we use when speaking of the "Book of Books." This concept must be modified. If one asks a Hottentot: "mã ǂhaos kʌoētsa?", i.e. literally "A man of what tribe are you?", he answers

either "na-ǂmata," "I am a Nama," or he assumes this knowledge and understands the question as a doubt of the purity of his humanity and then he answers: "kχoë-kχoëta," "I am a true person." The doubling has the same meaning here as in the answer of a Hottentot in reply to a skeptical question: "tarebe hāba?", "What kind of a horse is that?" the answer: "hā-hāba g(u)mo," "oh, but a horse-horse," i.e. a true horse. With the doubling of the designation "person" the Hottentot is saying that he is a person without anything foreign in him, that he is no half-way creature such as a Bushman Bastard or a despised Bergdamara, who they consider related to the baboon (cf. folk tale XV). In the same sense the Hottentot would understand the answer "kχoë-kχoëta" from the mouth of a white. Thus if the designation kχoĭ-kχoin was a collective name for all the Hottentot tribes (it does not seem to be so any more among the people) then it did not have the meaning of "elite people" but was only the designation to show that the Hottentot, while living surrounded by other people, was conscious of his "genuineness," i.e. of the racial purity of the origin of his humanity. That does not exclude the idea that he also acknowledged the same in other peoples. Individually, however, his estimate of foreign races was determined by his experience.

1. Personal Relations With the Other Natives of South Africa

a) The Bushman occupies the lowest place. The Bushmen, of all the South African human tribes, probably have the oldest ties with the Hottentot. But when and how they became his slaves we do not know. They are despised and treated with the greatest severity. Stealing cattle, for which they cannot compensate as they have no property, is punished by death. The nomadic hunting life of the miserable remnant of the Bushmen in Namaland does not permit any intermarriage with the families of their masters and makes their position of dependence seem slacker than is usually associated with the status of slave. [Plate XIV. Bushman from the Sandfeld, of the tribe of the Gobanin.] [323] It is based less on force that on the willing subordination of the weaker people, in the expectation of small handouts of the necessities of life although also with the knowledge in the back of their minds that they are completely without rights.

More closely tied to the Hottentot families are the Bergdamara or "mountain Kaffir". We will not discuss the mysterious origin and the ethnological characteristics of these very dark, thickset, middle-sized people any more than we discussed the Bushmen. We are only interested in the Hottentots' opinion of them.

Chapter I

THE COUNTRY OF THE KHOISAN

By the year 1652, when the establishment of the pioneer Dutch settlement at Table Bay laid the foundations for the present political dominance of the white man in the country, Africa south of the Zambesi River was already inhabited by a considerable number of different native peoples. On the basis of racial, linguistic and cultural distinctions, these native inhabitants are customarily classified into four separate groups, known respectively as the Bushmen, the Hottentots, the Bergdama, and the Bantu.

The Bushmen, at one time spread over almost the whole of South Africa, are to-day confined principally to the Central and Northern Kalahari Desert and adjacent districts. They are a short, brownish-yellow people, with certain peculiar and distinctive racial characteristics; they all speak languages of a uniform and easily recognizable type, phonetically remarkable especially for the great prevalence of "click" consonants; and they live in small nomadic bands which lead a purely hunting and collecting existence, practising neither agriculture nor pastoralism.

The Hottentots formerly occupied most of the western half of the region, but are now found chiefly in the southern parts of South-West Africa. They are closely allied to the Bushmen in race, and their languages are of a somewhat similar type, although in both respects certain differences are also observable. They are, however, a predominantly pastoral people, keeping cattle and sheep, and live in larger communities with a more complex system of social organization.

The Bergdama, also inhabiting South-West Africa, are racially a true negro people, different in appearance from both the Bushmen and the Hottentots. They all, however, speak the language of the Nama division of Hottentots, to whom they have long been in subjection. Like the Bushmen they live in very small nomadic groups and derive their subsistence primarily from hunting and collecting, although some of them also keep goats.

The Bantu, finally, although historically the most recent native people settling in South Africa, are now spread over the whole country

2: Schapera E-4, 5 (no date) 1930
FX13 Hottentot FX13
Bushmen FX10

superior to those of the other native peoples that they have been able to preserve much of their original cohesion and culture, and in many cases to offer a strong resistance to the disintegrating effects of contact with European civilization.

The present work deals with those two groups of natives who have suffered most at the hands of the European settlers: the Bushmen and the Hottentots. In spite of the far-reaching differences between them, they have in common several features, not only of race and language, but also of culture, especially religion, which justify their being treated together. These common features by no means render invalid the distinctions upon which is based the customary classification of these peoples into two separate groups. They are significant enough, however, to permit of both groups being regarded as constituting to some extent a larger ethnic unit, which, it is important to note, is clearly differentiated from the Bergdama on the one hand and the Bantu on the other. The term *Khoisan*, recently coined by Schultze to denote the racial stock to which the Bushmen and the Hottentots belong,[1] has therefore been accepted here as a convenient generic name for these two peoples. The necessity for such a generic name will perhaps be seen more clearly when the racial history of each people has been considered.

Topography: General Features

The Khoisan peoples at the present time live almost entirely in the western and central portions of South Africa. The main political areas within whose borders they are found are the Territory of South-West Africa, formerly a German colony, but now administered under mandate by the Union of South Africa; Bechuanaland Protectorate, administered directly by Great Britain through the High Commissioner for South Africa; and the central and western districts of the Union, principally in the Cape of Good Hope. The Bushmen formerly extended further east into Southern Rhodesia and over the rest of the Union, but have virtually disappeared from those parts.

The territory over which the two peoples are now scattered presents a solid land mass, covering an area of approximately 915,000 square

[1] L. Schultze, *Zur Kenntnis des Körpers der Hottentotten und Buschmänner*, 1928, p. 211. The term is compounded of the names *Khoi-Khoin*, by which the Hottentots call themselves, and *San*, applied by the Hottentots to the Bushmen. The latter have no collective name of their own.

2: Schapera E-4, 5 (no date) 1930
FX13 Hottentot FX13

whole of the western half of the country. At the present time they are found chiefly in South-West Africa, the north-west districts of the Cape, and parts of Orange Free State. Their former distribution further south and south-east is, however, not only abundantly testified by actual historical record, but is also reflected in the numerous half-breeds who have sprung up all over the Cape as a result of Hottentot intermixture with European settlers and imported slaves. Moreover place-names of Hottentot origin occur widely spread over many districts where the Hottentots themselves are now hardly ever seen. This is the case especially in the eastern parts of the Cape, now largely occupied by Bantu peoples, where many of the rivers, mountains, and other natural features of the country have Hottentot names[1]; while the fact that the South-East (Zulu-Xosa) Bantu languages have incorporated several of the clicks as well as many Hottentot roots indicates that intimate intercourse between the two peoples must have lasted for some time before the Hottentots finally disappeared from these parts.

Tribal Divisions

The Hottentots were originally divided into numerous separate groups, each with its own distinctive name. They all, however, apparently owned to the common name *Khoi-khoin* (men of men, i.e. men *per excellence*, people of pure race), by which they distinguished themselves from other peoples. The origin of the name *Hottentots*, by which they are now universally known and often term themselves, has given rise to much speculation, and there is no single accepted view. It is generally assumed, however, that the word is derived from the term *Hŭttentŭt* ("stammerer" or "stutterer"), applied to this people by the early Dutch settlers on account of the peculiar "clicks" which gave their speech its distinctive character.[2]

Both in culture and in physical features these different groups of Hottentots present a good deal of homogeneity, save where there has been much recent influence from other peoples. It is difficult

[1] Cf. Kingon, "A Survey of Aboriginal Place-names," *S. Afr. J. Sci.*, xv (1918), 712–79; Pettman, "Hottentot Place-names," *S. Afr. J. Sci.*, xvii (1920), 334–52.

[2] The various interpretations advanced are discussed briefly by J. du Plessis, "Origin and Meaning of the Name 'Hottentot'," *S. Afr. J. Sci.*, xiv (1917), 189–93. His own opinion is that the name is derived from the words *Hetta hie* (? *Haitsi Eibib*), uttered by the people themselves "in connection with their ceremonial religious dances", and also "employed by them in friendly greetings".

CERTAIN RITES OF TRANSITION AND THE CONCEPTION OF !NAU AMONG THE HOTTENTOTS[1]

A. W. Hoernlé

114
101
The following notes have been put together from the materials which I collected during the years 1912 and 1913 on two expeditions made among three different tribes of Hottentots. In 1912 I visited the remnants of certain tribes of the Little Namaqua, among whom some fugitives from the tribe of !Gamí-ǂnūn or Bondelzwaarts of German South West Africa were living. It was a very scattered community on the southern bank of the Orange River, about fifty miles inland from its mouth, and in British territory.

The following year I spent among the ǂĂunin or Topnaars of Walfish Bay and among the /Hei /Khauan, who live now in the territory round Berseba in German South West Africa. This latter tribe crossed the Orange River in the beginning of the 19th century, after its members had absorbed a great deal from the Dutch among whom they had lived, and with whom there had been a considerable amount of intermixture. As a result of
177
the mixed blood and the adoption of many Dutch ways, the pure Hottentot customs and beliefs had been considerably modified among them. They are an offshoot from the Cauquas, who in the time of Simon Van der Stel (17th century) lived in the present Worcester district of the Cape Colony in the valleys of the Breede River,[2] and belong therefore to the so-called Colonial Hottentots, not to any branch of the Namaqua people with
796
whom the other tribes I visited must be classed. It is, therefore, extremely interesting to find that all four of the transition rites (*rites de passage*) which I am about to describe in this paper are practised by them with but slight variations. Whether they brought these customs with them, or whether they adopted them from the tribes with which they came in contact when they crossed the Orange River in their progress northwards, it is impossible to say. The ǂĂunin, though but a miserable remnant of what was never,

104
[1] In this paper I have used, as far as possible, the notation employed by J. G. Krönlein, Wortschatz der Khoi-Khoin, Berlin, 1889. /, indicates the dental click; ǂ the palatal; ! the cerebral; // the lateral. χ indicates a guttural *ch*; the mark ¯ over a vowel indicates that it is long; ˜ indicates that it is nasalised. A short vowel has no special sign; ` represents the low tone of the vowel; ´ the middle tone; ˆ the high one. The sign ̣ under a vowel indicates that it is very short; while ¨ indicates that the vowel is to be separately pronounced.

Nama

perhaps, one of the largest tribes, is probably the one most satisfactory to study, for these people have been marooned for two or three centuries among the sand dunes which form their present home, attracted thither by the famous !nâras melon which provides them with food for many months in the year. I travelled in the country five years after the end of the German-Hottentot wars, during which great numbers of the older people perished, and the whole tribal system of the Hottentots received its death blow.

The Hottentots are now a passing people, who have practically given up the struggle of keeping alive their own traditions. What vitality is left is spent in the absorption of the ways of the incoming Europeans. One has, therefore, to be content with what remnants of their former customs and beliefs one can still gather from them. It was only by reviving long forgotten memories among the oldest of the men and women that I could gather up many of the customs of the past. One of my best informers, a woman, reproached me bitterly for encouraging her to think of things she had spent half her life in trying to forget: "You have made me live the old life once more; soon you will be going, and what shall I do then?"

The four transition rites which I shall describe are, however, practised even now among the people I visited, though sometimes in a simplified form owing to the great poverty which prevails. Though I have obtained details from many informants, the main contribution is that of four persons, two men and two women. It is to one of the women that I am most indebted. Hannah[1] !Amatis was, before she married among the ǂÂunin, a member of the //Khau-ǂGôan tribe, where she learnt all she knew from her grandfather. The latter was headman of his tribe, and as she was his favorite, and a very clever girl, he told her all the old lore of his tribe. She became my closest friend among the Hottentots, and to her I owe the framework of my information. She is now a woman well over 60 years of age. Louisa !Kabes is a somewhat younger woman, less intelligent, but very inquisitive. As a girl she used to hide where old and important people were talking, thinking that such as she were far away. She married into the family of the old Captain Piet //Eibib of Walfish Bay, who was long subsidized by the Cape Government, and who was a most intelligent old man. He died some eight years before I came among the people, well over eighty years of age. Gottlief //Àmib was the oldest of my informers, and both he and his brothers had been throughout their lives, not only because of their family connections, but because of their intelligence, the headmen of the captain of the Topnaars. Gottlief was a splendid informer and an admirable character, but he was becoming frail, and his memory was no longer at its best. He often said he was no use, and wished I might have clearer information on what were for him exceedingly weighty

[1] Most Hottentots have now a "Christian" name as well as a native one.

NEW SERIES

VOL. 27 JANUARY-MARCH, 1925 No. 1

THE SOCIAL ORGANIZATION OF THE NAMA HOTTENTOTS OF SOUTHWEST AFRICA[1]

BY A. WINIFRED HOERNLÉ

101 THE people with whom this paper deals live in the territory known to-day as the Protectorate of Southwest Africa. They form one branch of the people known generally as the Hottentots, but from the very earliest days of the Dutch settlement at the Cape this branch of the Hottentot peoples has been called the Namaqua, and Nama is the name by which they call themselves to-day. The meaning of the word is unknown, but it is, according to tradition, the name of a remote ancestor of all the tribes calling themselves by the name. The old form, Namaqua, is probably derived from the dual form, *Namakha*, *Namab* being the masculine singular, *Namas* the feminine singular, and *Naman* the common plural.

101 131 To the early Dutch settlers two groups of the Nama were known, viz., the Little Namaqua, inhabiting what is known to-day as Little Namaqualand, and the Great Namaqua who inhabited what is to-day known as Great Namaqualand. Both of these groups of people at times visited the settlement at Table Bay,

104 [1] In transcribing the Hottentot words, I have used the system of K⁺3nlein's *Wortschatz der Khoi Khoin*, Berlin, 1889, as this is the system used by the Nama themselves nowadays in their writing. It is not strictly accurate always from a phonetic point of view, especially for the Swartbooi pronunciation, but it is the conventional script of the Nama, and in this paper which is not concerned with phonetics it seemed best to follow it.

There are three tones in Nama each of which may give an entirely different meaning to an otherwise identical word. ` indicates a low tone, ' a medium tone, " a high tone. In order not to complicate the manuscript, I have indicated these tones only where it is essential in order to avoid confusion in the reading.

~ is the sign of nasalising; - indicates a long vowel; X indicates a harsh guttural *ch* something like the Dutch *ch*.

/ indicates the dental click, ≠ the palatal, ! the cerebral, // the lateral.

●101 131 and their area of migration seems to have been a very wide one in the early days. But the Great Namaqua were always the most northerly group of the Hottentot peoples, and early in historical times they settled definitely in the country to the north of the Orange river.

HOTTENTOT TRIBES
IN THE SOUTHWEST AFRICAN PROTECTORATE

131 The whole area of the Southwest African Protectorate is approximately 322,450 square miles, and Great Namaqualand

4: Hoernlé E-5 (1912-1913)1925
FX13 Hottentot FX13
Nama

175 some cases, a slightly different intonation. These incoming groups were remnants of different tribes, mostly of Little Namaqua stock, who had, however, before their migration received a considerable [191] infiltration of white blood. A great many of the men also spoke Dutch and the general culture had in many ways been influenced 175 by contact with the Dutch and other colonists. These groups are called collectively Orlams by the indigenous people, a name the 101 origin of which is doubtful. They penetrated into the territory of their kinsmen, at first peacefully by paying a small tribute for the use of the water of certain fountains, but later there was a great deal of fighting between the different sections, and the Orlams in the second half of the 19th century certainly had the upper hand in every way owing chiefly to their prior possession of firearms. The chief of these incoming groups are the Africaners (*//Aixa //ain*), the Witbooi (*/Hobesen*), the Bethany Hottentots (*!Aman*), the Berseba Hottentots (*/Hei /Khauan*), the Amraal Hottentots (*Gei /Khauan*). It will be seen that the Dutch names for these groups are taken partly from the names of their chief settlements, e.g., Bethany, Berseba, partly from their chief leaders, Africaner, Amraal, Witbooi. The Hottentot names are [173] taken mostly from the name of the supposed first ancestor of the people, e.g., */Khauan* from the personal name, */Khauab*, which is not now thought of as having any special meaning. There were two branches of these people, the older branch or the big (*gei*) branch, and the light-coloured branch (*/hei*). On the other hand, the Witboois have a Hottentot nickname, */Hobesen*, from */hobe* or */howe*, lazy, which they do not like at all. For most of the names of these groups, or "tribes," as I shall call them later, it is not now possible to find any clear meaning, nor are the names thought of as having any meaning by the people themselves; they are proper names and no more.

173 The indigenous people were in historical times divided into seven main groups, with one or two subsidiary ones which are 101 known to have been late offshoots from these main groups. According to the traditions of these people they are all descendants of one line of ancestors. One form of this legend was told to me by Abraham Kafir, a headman of the Bondelswarts, in 1913. There

4: Hoernlé E-5 (1912-1913)1925
FX13 Hottentot FX13
Nama

were once, so he said, five brothers, each one of whom was the founder of a tribe of the Nama. The eldest was the ancestor of the *Gei //Khauan*, or Rooi Natie, the tribe acknowledged by all the others to be the senior tribe among them. The other brothers are said to have founded the *!Gami ≠nun* or Bondelswarts, the *//Haboben* or Veldschoendragers, the *!Kbara Gei Khoin* or the Simon Kopper Hottentots, and the *//Khau /goan* or the Swartboois, who are said to be the descendants of the youngest brother. According to another legend, the *//Haboben* are a branch of the *!Gami ≠nun*, and this agrees with the information given to us by the traveller Sir James Alexander, who reports that when he visited the *!Gami ≠nun* in 1836 the *//Haboben* were still part of the people owing obedience to the *!Gami ≠nun* chief.[2] The other two major groups of these Nama people, the *//O gein* or Groot Doode, and the *≠Aunin* or Topnaars or *!Gumin*, are not linked up with the others in the legend of the five brothers, but they themselves claim to be offshoots from the Rooi Natie, and the Rooi Natie on their side support this claim.

The names of these tribes are in many instances exactly translated by the Dutch names by which they are now chiefly known. Thus the *//O Gein* are the great dead, or Groot Doode as the Dutch has it; the *!Gami ≠Nun* are the people of the black bundle or Swart Bondel. Their own legend concerning their name is that they once formed one group with the Rooi Natie; that on the death of an old chief his sons quarreled among themselves, the elder going off with his supporters, while the younger brother stayed behind with his little group of people huddled together so that they looked like a little black bundle. The *//Haboben* are called after a kind of sandal worn by the people (Dutch, *Veldschoen*, Nama, *//Habob* or *//Hawob*). The Rooi Natie and the Swartboois are closely related. As late as 1855 the chief of the Rooi Natie expected the Swartboois to obey his orders concerning migrations, etc., but they did not always do so.[3] The Nama names by which these two groups are called still record this close

4: Hoernlé E-5 (1912-1913)1925
FX13 Hottentot FX13
Nama

101 connection. They mean the big group of *//Khauan*, and the young group, or, literally, the children, of the *//Khauan*. The derivation of the name *//Khauan* I do not know. The Topnaars, or the *≠Aunin*, are the people of the point, referring to their inhabiting the sea coast, the extreme point of occupation of the Nama. An alternative name is the *!Gumin* of which I do not know the meaning.

621 All these groups which I have enumerated I propose to speak of as "tribes," for, in spite of their claim to a common ancestry, 423 these groups have been for a long time independent of one another. Each group has its acknowledged chief and its acknowledged fountains, though before the coming of the white man and of the Orlams the boundaries between the different groups were not marked in any clear manner. In an old document, translated in the Rhenish Missionary Record for 1854,[4] the chief of the Rooi Natie complains that the Berseba Hottentots have taken possession of one of his fountains. He gives them permission to stay, but states specifically that this does not mean that he gives over the fountain to them; "the water is my water," he says again and again. We shall also see a little later that the different water holes, or fountains, in the country were always thought of as belonging to certain specific groups. This did not mean that other people could not use this water, but that one group had a prior claim to it established by habit, and had the right to expect that any other group intending to camp there for long would ask permission to do so.

175 A certain light is thrown on the antiquity of these different divisions of the Nama people by the record of the travels of the 621 Frenchman, Le Vaillant. Travelling north of the Orange river in 1783, he came to an encampment of Hottentots who called themselves Gami nu Khois.[5] The place to which he went, and the name, both point to the fact that he found himself among the *!Gami ≠Nun*, or *!Gami ≠Nu Khoin* (*Khoin* meaning "people"), so that at least as early as 1783 the *!Gami ≠Nun* formed a distinct group.

NAMA

THE NAMA.

1. Physical and Mental Characteristics.

101 1. The Nama nation lives in South West Africa. Its principal seats are in the territory between the Orange and the Swakop rivers. Ethnographically it forms a portion of the Hottentots, once a nomad people consisting of many tribes which wandered over the broad plains of Southern Africa before the arrival and expansion of the Europeans.

141 2. The Nama are mostly of medium height. Some of them attain a height of 1.70 m., which is the reason for the observation made in old reports that the Nama are a tall race compared with the Hottentots of the Cape. Their general height, however, varies from 1·50-1·65 m. Members of both sexes are frequently met with, however, who are less than 1·50 m. in height.

142 3. The colour of their skin is remarkably light. A light-skinned people among the dark races of Africa is in itself an enigma and leads one to the assumption that the Nama migrated with other Hottentot tribes from Northern Africa in prehistoric times. This view gains in probability in the light of linguistic research and is supported by old legends.

The colour of the skin, which on the palms of the hands and the soles of the feet, is hardly different from that of European races, may be described as pale yellow, tinged, particularly in the case of the old tribe of the Red Nation, with a red undertone. Over the spine there is a darker patch. The membranes of the lips are a pale dull red.

141 142 4. The skull is of peculiar shape. The narrow forehead, which is usually slightly arched, has no bumps. The back of the head is more or less arched and never flat. The cheek-bones are prominent. The receding chin is pointed. The prominent cheekbones and pointed chin give the face an almost triangular appearance, especially in the case of elderly people, whose rounded cheeks have been superseded by numerous wrinkles. The root of the nose hardly protrudes, the bridge has the appearance of having been pressed back and ends in a flat, broad snub nose, the openings of which are clearly visible.

142 5. The prominent cheekbones and the flattened bridge of the nose cause the eye-lids to seem slanted. The glaring sun of the country and the frequent lack of vegetation force the ocular muscles to contract, causing the eyes to blink and this accentuates the impression of slant-eyes. The iris is always

5: Vedder M-5 (ca. 1910) 1928
FX13 Hottentot FX13
NAMA

181 their mode of thought. Only then may we hope to obtain a clear impression of their psychic condition. Anyone who for any length of time has travelled in the company of Hottentots and has suffered starvation and thirst with them, has shared their joys and sorrows, will doubtless discern under that rough exterior a good heart, will learn to appreciate them and inevitably admit that their good points outweigh their bad."

II. Divisions and Distribution.

101 1. The origin of the tribal name "Hottentot" has not yet been cleared up. The old reports spell the name in different ways: Ottentoo, Hottnot, Hodmodod, Hottentott. It is assumed that the meaning attached to the word by the old settlers was "a stammerer" and that the name had reference to the peculiar clicks of the language, which give its speech a distinctive character. At any rate the name is not of Hottentot origin, nor had the Hottentots a distinct name to include all their tribes. Old reports state that they also called themselves "Quaiqua" or "Khoi-khoin"; but these names differ merely in spelling, not in meaning. He who knows the language sees at once that the word Quaiqua is an effort to fix the word Khoigua in writing. But Khoigua merely means men, while Khoin is the word for "people," and Khoi-khoin means people of pure race, *i.e.*, excellent people.

174 2. In all probability the Hottentot tribes migrated from the region of the Central African lakes in prehistoric times and moving westwards, crossed the Kunene, and then entered present-day South West Africa, passing between the Kaokoveld and Ovamboland. It is impossible now to say with any degree of certainty what the cause of the migration may have been, but it may be assumed that the numerous Bantu tribes pressed them southwards. In the case of a nomadic people, other causes, however, are also possible. At the time of the Hottentot immigration, South West Africa must have been well-nigh uninhabited, for the Herero had not yet occupied the land. In all probability the Bergdama laboured as herdsmen or servants for the nomadic Hottentots, whose language they had adopted, and first came to South West with their masters.

The traces and paintings of the Bushmen on rocks betray that in all probability they were the first inhabitants of the vast territory, which was to become the grazing and hunting ground of the most varied African tribes.

3. While the great majority of the Hottentots moved South with their herds, until they reached the utmost point, the very //Hui-!keib, *i.e.*, place of the snakes, where Cape Town now lies, some tribes settled in South West and led a nomadic life between the Orange and Swakop Rivers.

FX13 Hottentot FX13
Cape Hottentot

KAFFRARIA OR LAND OF THE KAFIRS, OTHERWISE NAMED HOTTENTOTS.

The country or land of Kaffraria (or, according to Marmol,[1] Quefrerie) is so named after the Kafirs, its native inhabitants. They are commonly known to our countrymen as Hottentoos or Hottentots, because their language is so clumsy and difficult;[2] and they live without any laws of religion.

* * *

The land of Kaffraria, although not divided into any special kingdoms of which we know, is nevertheless inhabited by different indigenous peoples. Some of them are governed by kings and some by chiefs, while others live in the wilds without any leader at all. I shall describe several of these peoples, together with their customs, government, religion and other characteristics, as far as these have come to our knowledge from some reports recently sent over by men who have dwelt in those parts for some time.[3]

The principal peoples, then, whom our countrymen have up till now discovered in this southernmost portion of Africa, are the following:[4] the Gorachouquas, Goringhai-

---

[1] *Descripticn general de Affrica*, by Luis del Marmol Caravajal. 3 vols. Granada and Malaga, 1573-99. (French trans., Paris, 1667.)

[2] See below, p. 71.

[3] On Dapper's sources of information, see above, p. 2.

[4] In the Cape records of this period the names of the Hottentot tribes and clans are spelt in a variety of different ways. All, however, are obviously so inaccurate that the correct versions according to Hottentot pronunciation are no longer obtainable, now that the tribes concerned have ceased to exist. The names as given above are all written without the clicks, and most of them have the suffix for the third masc. plur. (*-qua*, *-kwa*, or *-gwa*) or, sometimes, for the common plur. (*-sa*). The forms given by Dapper are for the most part identical with those used by van Riebeeck in the "Instructions" he left for his successor (Leibbrandt, *Precis of the Cape Archives: Letters Despatched*, 1652-1662, vol. iii, 239-43), except that *k* has been uniformly substituted for *c*. Van Riebeeck in his list (*loc. cit.*) describes briefly the following tribes: Goringhaiconas, Goringhaiquas, Gorachouquas, Cochoquas, Little (and Great) Chariguriquas, Namaquas, Chainouquas, Heussaquas, and Hancumquas; and mentions also the Chamaquas, Cenaquas, Atiquas, Houtunquas, and Chasiquas. "After these is said to begin . . . another race of men, called . . . Choboqua or Chobona." Wagenaar, in a similar memorandum written four years later (1666), mentions only the first nine of these (Moodie, *The Record*, Part I, 291).

KOBONAS.

000 De *Kobonas*, aen wiens lant de *Chainouquas* na by gelegen zijn, is een heel zwart volk, met zulk lang hair, dat hen over de ruch speelt, en tot op d'aerde neerhangt.

Deze zijn rechte mensch-eters: want zoo zy eenen *Hottentot* of ander mensch kunnen bekomen, dien braden zy levendigh en eten hem op. Zy hebben ook vee, dan niet zoo veel als andere volken, en planten kalbassen, daer zy zich mede erneren.

Zy hebben, na het verhael der Hottentots van de Kaep, rare maekselen, die zy uit het geberghte weten te vinden, en meer andere rariteyten. Noit heeft eenigh Neerlander van de Kaep by deze volkeren geweest, ter oorzake van de verre te lande in.

Voor zeven of acht jaren, te weten des jaers zestien hondert negen-en-vijftigh, was een van des *Chainouquas* volk, genaemt *Chaihantimo*, ontrent de *Kabonas*-lant geweest, en had van daer, met hulp van zijn by-hebbende volk, een hunner vrouwen, uitgestreken met allerlei fraie dingen, wegh gestolen en geschaekt, en na zyne negerye gevoert, om voor zyne eigen vrouwe aen te nemen.

d'Onzen met begeerte ontsteken, om dit vreemt slagh van menschen te zien, (want zy had, volgens het zeggen van den gemelden schaker *Chaihantimo*, die zich toen aen de kaep bevont, hair op 't hooft, dat haer, los-gemaekt of ontvlochten, op de aerde nasleepte,) verzochten op *Chaihantimo*, deze vrouwe aen het Fort van goeder hope te willen ontbieden, waer in hy, op belofe van genot, hen te wille was, en schikte derwaerts eenigen van zyn volk af, om dezelve, met al wat zy had, te halen, en te zeggen dat haer jonghst getroude man haer ontboden hadde by een volk, genaemt Duitsman, dat vol kiederen gingh behangen, en by deze vrouwe, noch noit by gene van de hare gezien was.

● 101, [34]) Mentioned in van Riebeeck's list (*Letters desp.*, iii, 342) under the name of "Choboquas or Cobonas." In reality they were not Hottentots, but the name by which the Hottentots spoke of the Bantu (AmaXhosa). Van Riebeeck, on hearsay, speaks of them as "another race of men, who live in permanent dwellings made of wood, clay and other material, and also subsist on cattle and wear clothes" (*loc. cit.*). They are first mentioned by him in Oct. 1657, when he heard from the girl Eva a marvellous tale of "an emperor or king, who ruled over all the Cape natives, and called them Chobona. He lives far inland, and is rich in gold, which is taken out of sand. They also know how to coin and stamp the coins, which they make as big as, or even bigger than, the palms of the hands. They have large

[231
241]

The Kobonas,[24]) near whose land the Chainouquas dwell, are a very dark people, with hair so long that it flows over the back and hangs on to the ground. They are real cannibals, for if they can get hold of a Hottentot or any other person they roast him alive and eat him. They also have cattle, although not so many as other tribes, and plant gourds upon which they live. According to the reports of the Cape Hottentots, they have curious objects which they know how to get from the mountains, and still other rarities. No Hollander at the Cape has ever been to this tribe, owing to its remoteness.

H
583

About seven or eight years ago, in 1659, one of the Chainouquas, named Chaihantimo, was near to the land of the Kobonas, from which, assisted by his companions, he stole and carried off one of their women, decorated with all sorts of beautiful objects, and took her to his village to be his own wife.

000

Our countrymen, stirred with curiosity to see such strange people (who, according to the tale of this abductor Chaihantimo, then present at the Cape, had hair on the head which, when loose or unbound, dragged behind them on the ground), requested him to summon his wife to the Fort. To this he agreed, on promise of some reward, and accordingly sent several of his people to fetch her with all that she possessed. They were to tell her that her newly-married husband had summoned her to a people named Dutchmen, who went about fully covered with clothes, and whom neither she nor any of her people had ever seen.

---

101 ●

houses of stone and beams, sowing with rice and planting all kinds of vegetables. They also wear clothes and speak another language than those nearer the Cape" (D., Oct. 21, 1657). But Harry, a fortnight later, when van Riebeeck insisted that the Chobonas were the supreme rulers of the Hottentots, retorted angrily that his informants were "mad" (D., Nov. 15, 1657); he had seen some of them among the Chainouquas, although he had never been in their country, and describes them accurately as "black Caffres, like the Guinea and Angola slaves, dressed in calf and sheep skins, of which they have many" (D., Dec. 16, 1660). Van Riebeeck, however, haunted by the thought of their great wealth (in 1650 he speaks of them as "dwelling in towns and castles, and rich in gold and ivory"), sent out several expeditions to the north-east in search of them, "who found no Chobona and no gold, but plenty of Nama and abundance of copper" (Maingard, *op. cit.*, 490, where the official records are summarised). It was not until 1702 that the settlers first came into contact with them overland, when a party of freebooters "made a drive into the country of the Chabuquas, called the Great Caffres" (Maingard, *op. cit.*, 494).

8: Dapper Q-4 (no date) 1933
FX13 Hottentot FX13
Cape Hottentot

342 are so big that ten or twenty men, with women and children, can live in them comfortably. But on the average they are much smaller, and some are so small that they
354 can simply be picked up and carried away. The fire-hearth is in the middle of the hut, but as they make no chimneys to draw up the smoke their dwellings are always full of
372 it. They make fire with remarkable dexterity, by placing under the foot a bit of wood in which there is a small hollow, and then firmly and continuously twisting another piece of wood into this hollow until the sparks come out.

LANGUAGE.

197 All these Hottentots, especially those along the shore, speak one and the same language. This is at once a hindrance, for owing to the difficulty of pronunciation it cannot be learned by our countrymen, to the great detriment of further exploration of the country and of dealing with these
194 people. Their speech is full of clucks like those of the turkey-cocks; they clap or clack each word in the mouth, as if a man were snapping his thumb, so that their mouth goes almost like a rattle, continuously clapping aloud with the tongue, each word with a different clap. Some words they can only utter with considerable difficulty, seeming to fetch them up from the back of the throat, like a turkey-cock, or like the people on the German Alps do, who through drinking ice-water get swellings at the neck.
● 101 Because of this our countrymen, observing this impediment and extraordinary stuttering in speech, have given them the name of Hottentots, in the same sense as that word is commonly used here at home as a taunt against anybody who stutters and stammers in uttering his words.[81]) They
192 now also call themselves by the name Hottentot, and in the presence of our countrymen dance and sing: *Hottentot brokwa, Hottentot brokwa*, by which they mean to say,

---

[81]) Dapper's theory about the origin of the name "Hottentot" has been adopted by most later writers. It is discussed in detail by Prof. du Plessis (*S. Afr. J. Sci.*, xiv, 189-93; xxix, 660-67), who comes to the conclusion, after a careful review of the relevant literature, that this name was *not* bestowed upon the Cape natives by early travellers, as suggested by Dapper, but rather was derived from their use of some such word as *hautitou* (whence *Hottentoo*) in their dancing songs, and so found its way into Dutch and other European languages. The problem is still a matter of controversy, but the authorities quoted by du Plessis seem to bear out his contention. It may be added that the Hottentots, although they now acknowledge this name as well, originally called themselves *kxoikxoin* ("*Khoi-Khoin*"), or "real people", a name which they still retain for themselves in their own language.

Korana

STUDIES IN KORANA HISTORY, CUSTOMS AND LANGUAGE

By Professor L. F. MAINGARD, M.A., D.LIT.

I. THE PROBLEMS—A GLIMPSE INTO THE PRESENT-DAY LIFE OF THE KORANA

[101] 114 The Korana are a branch of the Hottentot race. They are a very interesting people from many points of view and they present a field of study still fresh and as yet imperfectly explored. To the historian, the mystery of their origin is still a fascinating problem, for they may still perpetuate the original Hottentot tribes who lived at the Cape when it was discovered by the Portuguese. To the physical anthropologist there is much yet to learn respecting their relationship with the rest of their Hottentot brethren, and indeed, with the other races of South Africa. The social anthropologist and the ethnographer are arrested by the remnants of the ancient customs of a tribe which was for a long time, even with its European contacts, a genuinely pastoral one, and by the gradual transformation and even the disappearance of those ancient customs and their changed mode of life. The strange clicks, the tones and the peculiar structure of their language, are another aspect of this people, and one that, because of its unique position in the midst of the Bantu and Bush languages, has still many unsolved problems.

[161] The Korana live, in the present century, in small groups scattered widely over the central portions of the Union. They are a vanishing race. In the middle of last century their numbers were estimated by competent authorities at 20,000, and, in spite of the absence of accurate statistical data for the present day, it does not appear that more than 1000 exist now. If any attempt is to be made to solve the problems that confront the student to-day, it is imperative to go into the field and collect as much of the fast-disappearing fragments of their customs and traditions and language as may be garnered before it is too late.

121 Many people—authors, and reliable authors,—have asserted that "the Korana is extinct." I made it my business to verify their statements. My historical inquisitiveness and my researches into the Africana

TSŨI-||GOAB.

CHAPTER I.

The facts of language, however small, are historical facts.—
MAX MÜLLER.

INTRODUCTORY REMARKS ON THE ETHNICAL CONDITION OF THE KHOIKHOI IN PREHISTORIC TIMES, BASED ON THE EVIDENCE OF LANGUAGE.

●101 THE Khoikhoi form a branch of the most peculiar and, doubtless, of the most interesting race of all the representatives of mankind on our continent. These Khoikhoi generally go by the name of *Hottentots*, a term to which I must object, as up to this moment it has been the cause of gross misunderstanding and heartburning, especially to ethnologists, when they had in view the classification of the South African races and nations.

In order to introduce to the reader the worshippers of ǃTsũi-||goab and to lay a secure basis for the study of the Science of Religion as regards the ǂKhoikhoi branch, I shall endeavour in a short sketch to delineate their prehistoric ethnical condition.

When the first European navigators, especially the Dutch, became acquainted with the Cape of Good Hope, they found a yellowish race of men, who possessed large herds of ǂcattle, sheep and goats, and were on the whole, even after they had received a very provoking treatment at the hands of the Europeans, peaceably and ǂhospitably

14:Hahn L-5 (ca. 1870-1880) 1881 FX13 Hottentot FX13

101 inclined towards strangers. On account of their curious language abounding in harsh faucal sounds and clicks, the Dutch called them Hottentots. Hottentot or 'Hüttentüt means in Frisian or Low German a quack, and therefore the old Dutchmen, who were so much puzzled and did not know what to make of such an unheard-of language, more akin to the chat of a parrot than to human speech, called it Hottentot—*i.e.*, a mere gibberish. They very little knew that they had before themselves a highly-developed language, so highly, indeed, that the ingenious Martin Haug supposes that its higher and more refined constituents must have been acquired by contact with a civilized people.

The old Dutch also did not know that their so-called Hottentots formed only one branch of a wide-spread race, of which the other branch divided into ever so many tribes, differing from each other totally in language, and having only a phonetic relationship, as regards certain peculiar sounds, of which the clicks formed the essential part. This other branch differed also entirely in language from those the Dutch had met first. While the so-called Hottentots called themselves Khoikhoi (men of men, *i.e.*, men *par excellence*), they called those other tribes Sā, the Sonqua of the Cape Records.

This yellow race, consisting of these two branches, inhabited in ancient times the greater part of South Africa, at least the territory south of the rivers 'Kunéne and Zambesi.

The appellation Hottentot is now *en vogue*, and as Goethe has it:—

> "Wo die Begriffe fehlen,
> Da stellt ein Wort zur rechten Zeit sich ein."
> (For there precisely, where ideas fail,
> A word comes in most opportunely.)

It is useless therefore to extirpate it, for the custom of more than two centuries has sanctioned its use; and all we can do is to define it more accurately. We should apply the

14:Hahn L-5 (ca. 1870-1880) 1881 FX13 Hottentot FX13

term *Hottentot* to the whole race, and call the two families, 101
each by the native name, that is the one, the *Khoikhoi*, the so-called *Hottentot proper*; the other the *Sān (Sā) or Bushmen*.

In the Nama language, one of the Khoikhoi idioms, 196
the Bushmen are called Sā-n (com. plur). The meaning of this term is not quite intelligible, and I frankly confess that, after nine years, of which I have spent nearly seven amongst the Khoikhoi, I did not succeed in arriving at a quite satisfactory etymology, and I must still adhere to the interpretation which I first gave in the *Globus*, 1870, where I traced the word Sā-(b) to the root SĀ, to inhabit, to be located, to dwell, to be settled, to be quiet. Sā(n) consequently would mean Aborigines or Settlers proper. These Sa-n or Sa-gu-a, Sonqua or Sounqua, &c. (obj. plur. msc.) as they are styled in the Cape Records, are often called Bushmen—the Bossiesman, Bosjesman, Bosmanneken of the Colonial Annals, a name given to them to indicate their abode and mode of living.

The word Sā(b) has also acquired a low meaning, and is not considered to be very complimentary. The Khoikhoi often speak of *!Uri-Sān* (white Bushmen) and mean the low white vagabonds and runaway sailors who visit their country as traders. One also often hears, "*Khoikhoi tamab, Sab ke*," he is no Khoikhoi, he is a Sā, which means to say, "*he is no gentleman, he is of low extraction, or he is a rascal.*" A Nama will say of a man who is very proud and reserved in his manners, who only mixes in good society, "*Khoikhoisen ra aob ke*," the man *makes-a-Khoikhoi-of-himself*, that is, *he stands very much upon his dignity*, and also, *he keeps himself very much to himself*.

Those who desire to have information on the natural 113
and physical condition of the Khoikhoi and Sā-(n), I refer to Dr. Gustav Fritsch's standard work, "Die Eingeborenen Sūd-Africas," and to three Essays published by me, Die Namas, and Die Buschmänner, in the

14:Hahn L-5 (ca. 1870-1880) 1881 FX13 Hottentot FX13

113 *Globus*, 1868 and 1870, and Beiträge zur Kunde der Hottentoten, in *Jahresbericht des Vereins für Erdkunde*, Dresden, 1868; not to forget the chapter on the Hottentots in Friedr. Müller's excellent work "Allgemeine Ethnographie."

648 It is enough meanwhile to say, that the Bushmen lead the life of a Pariah, and that they are hated and chased by all other nations of South Africa, having to suffer most, however, from the hands of their own nearest kith and kin, the Khoikhoi, whom I have, on more than one occasion, seen manifesting more charity for a dog than for a starving Bushman.

101 The Khoikhoi are generally called, as I have already said, Hottentots, a term to which I would not object, were it not for the confusion it generally brings in its train, as far as ethnological, anthropological or linguistic terminology is concerned. Sometimes they are called the *Hottentots proper* in our Colonial language. But very often, again, our Khoikhoi in the Colony, or more particularly those remnants of the tribes formerly occupying the vicinity of Cape Town, are called *Hottentots, Hottentots proper* or *Cape Hottentots*, while on the other hand the inhabitants of Griqualand West, of the South Kalihari, of Great Namaqualand are called by their tribal names, Griquas, Namaquas, !Koras or Koranas, just as if they were not Hottentots as much as the Khoikhoi tribes of the Cape Colony. It would be as absurd for us to call only the Prussians, Germans, and apply to all the other tribes of Germany their tribal names, Bavarians, Suabians, Hessians, &c., denying to them the attribute German; or for Londoners to claim for themselves the title of Englishmen, while excluding the Northumberland and Sussexmen from it.

This is my reason for protesting emphatically against the indiscriminate and superficial use of the term *Hottentot*, and therefore I have taken the liberty of taxing the patience of my readers by dwelling at some length on this subject.

14:Hahn L-5 (ca. 1870-1880) 1881 FX13 Hottentot FX13

legends, by supposing that the people among whom they are found descended from a common ancestry in primordial times. But such coincidences merely corroborate the old maxim that among different varieties of men, in different regions, and at different times, the same objects have given rise to the same idea.—Peschel, "Races of Man," London, 1876, pp. 461 and 462.

[26] *After the death of the snake.*—I shall hereafter, in the third chapter, come back to this superstition, and only now mention that the words, ǀau-b snake, ǀau-b blood, ǀau-s fountain, ǀau to bleed, ǀau to flow, ǀau to bear ill-feeling, ǀavi (from ǀauï to stream) to rain, ǀava red, are all derived from the root ǀAU to flow, to stream, and we shall see why it is that in every fountain there is a snake.

[27] Alexander is mistaken if he calls ǂNumeep a *Bushman.* The name of this so-called Bushman proves sufficiently that he was a Khoikhoi. The ǂAuni tribe live in the territory here spoken of. The poor Namaquas are also called by the others, Bushmen, especially when they are servants, or if they lead a Bushman's life, and have no cattle and sheep.

[28] *Labouring under an attack of dysentery.*—Sometimes the brackish water works so strongly on the bowels that one who drinks it is immediately taken ill.

[29] ǀ*naras.*—This fruit is a Cucurbitacea, almost as large as a newborn child's head. The flesh of it is eaten raw, and the seeds are kept for the dry season, when there is no fruit. The seeds taste almost like almonds, and are at present to be got from confectioners in Cape Town. The Topnaars or ǂAunis of Walefish Bay and Sandwich Harbour, and all the Bushmen tribes along the coast of Great Namaqualand, live partly on this fruit. It is to be met with from the Orange River mouth as far as latitude twenty-one degrees: but it grows only on the sandy coast.

[30] *Redman,* or ǀAva-khoib, is identical with Khoikhoib,

14:Hahn L-5 (ca. 1870-1880) 1881 FX13 Hottentot FX13

101 while the Europeans are called ǃUri-khoin, white men, and the Bantu ǂNu-khoin, black men. For Toosip, or Tusib, see the third chapter.

000 [31] *The difficult task of translating the Bible.*—I mention this the more, as I had not long ago the opportunity of convincing myself that a missionary, in a farewell circular had assured to his brethren, that "*he was the only man who was destined by the Lord to give the Khoikhoi the Bible in their language.*" What I have seen of the publication of the said missionary does not corroborate this opinion, and I can state that his publications require much polishing in style and grammatical correctness.

[32] *They had left the colony.*—The mission station, Bethany, in Great Namaqualand, was founded by the Rev. Mr. Schmelen in 1814, who left with about three hundred ǃAmas the station Pella in Bushmanland, and trecked north until they came to the beautiful fountain ǃUiǂganis on the banks of the ǁGõaǀgib River. The ǃAmas bought the rights of this place and neighbourhood from the then paramount chief of Great Namaqualand. *Gameb*, for axes, knives, iron spears and tinder-boxes; and Schmelen gave the place the new name, Bethany. Amongst the leaders of the ǃAmas were the Xamǂhã (Lion tail) and ǁHõaǀara (Cat rib) families, or, as they are now styled, the Amraals and Boois. Their language is the one in which Knudsen's St. Luke is translated, and we have in this way an excellent specimen of the old Cape Hottentot idioms. In 1850 they told my father that they were called upon by the Dutch Government in 1805 to fight against the English. The Namaqua, according to the Cape Records, lived in 1665 as far South as the Olifants river. They have always been, and still are, by far the most powerful tribe among all the Khoikhoin.

[33] At first sight this myth shows some resemblance to the words of the Lord to Adam: "Of every tree in the

14:Hahn L-5 (ca. 1870-1880) 1881 FX13 Hottentot FX13

just as the name Dyaus was used among the ancestors of our own race, and has been handed down to us, to our historical times. Certain it is, also, that hand in hand came the decay of the nationality went a retrogression and decay of the religious ideas. I do not speak too boldly if I maintain that the Khoikhoi language, if its makers would only have had the necessary inducement, must have become an inflecting language. And then the intellectual vivacity of the Khoikhoi, combined with their mythopœic power, undoubtedly would have produced as charming and fanciful mythologies as we admire in the myths of Eran, Hellas, and Thule.

NOTES TO THE THIRD CHAPTER.

[1] Confer Pott: Die Sprachen vom Kaffer und Kongostamme, in *Zeitschrift der deutschen morgenländischen Gesellschaft*, ii. 5–26, 129–158. Hans Conon von der Gabelentz on the same subject in the same Proceedings, i. 241.

FX13 Hottentot FX13

whole of the western half of the country. At the present time they are found chiefly in South-West Africa, the north-west districts of the Cape, and parts of Orange Free State. Their former distribution further south and south-east is, however, not only abundantly testified by actual historical record, but is also reflected in the numerous half-breeds who have sprung up all over the Cape as a result of Hottentot intermixture with European settlers and imported slaves. Moreover place-names of Hottentot origin occur widely spread over many districts where the Hottentots themselves are now hardly ever seen. This is the case especially in the eastern parts of the Cape, now largely occupied by Bantu peoples, where many of the rivers, mountains, and other natural features of the country have Hottentot names[1]; while the fact that the South-East (Zulu-Xosa) Bantu languages have incorporated several of the clicks as well as many Hottentot roots indicates that intimate intercourse between the two peoples must have lasted for some time before the Hottentots finally disappeared from these parts.

Tribal Divisions

The Hottentots were originally divided into numerous separate groups, each with its own distinctive name. They all, however, apparently owned to the common name *Khoi-khoin* (men of men, i.e. men *par excellence*, people of pure race), by which they distinguished themselves from other peoples. The origin of the name *Hottentots*, by which they are now universally known and often term themselves, has given rise to much speculation, and there is no single accepted view. It is generally assumed, however, that the word is derived from the term *Hüttentüt* ("stammerer" or "stutterer"), applied to this people by the early Dutch settlers on account of the peculiar "clicks" which gave their speech its distinctive character.[2]

Both in culture and in physical features these different groups of Hottentots present a good deal of homogeneity, save where there has been much recent influence from other peoples. It is difficult

[1] Cf. Kingon, "A Survey of Aboriginal Place-names," *S. Afr. J. Sci.*, xv (1918), 712–79; Pettman, "Hottentot Place-names," *S. Afr. J. Sci.*, xvii (1920), 334–52.

[2] The various interpretations advanced are discussed briefly by J. du Plessis, "Origin and Meaning of the Name 'Hottentot'," *S. Afr. J. Sci.*, xiv (1917), 189–93. His own opinion is that the name is derived from the words *Hotte hie* (? *Heitsi Eibib*), uttered by the people themselves "in connection with their ceremonial religious dances", and also "employed [illegible] in friendly greetings".

2: Schapera E-4, 5 (no date) 1930
FX13 Hottentot FX13

therefore to draw any clear-cut lines of distinction among them based on either of these factors. Their languages, on the other hand, although all very closely related, fall into four separate dialectical groups. It is customary therefore to group the people themselves into four main divisions, corresponding to the linguistic groupings. These four divisions are known respectively as the Cape Hottentots, the Eastern Hottentots, the Korana, and the Naman.

The CAPE HOTTENTOTS were the people found by the first European settlers in the vicinity of Table Bay. They probably extended over the greater part of what is now the Western Province of the Cape, and seem to have been fairly numerous.[1] The old Cape Records and the reports of early travellers have preserved for us the names of several of their tribal groups.[2] In and about the Cape Peninsula were the *Goringhaiqua* or *Goringhaikona* and the *Kora* or *Gorachouqua*; further north along the west coast from the neighbourhood of Table Bay to Saldanha Bay roamed the *Kochoqua*, who at the time when the Dutch settlement was founded were the strongest of the local groups; beyond them and extending to the Olifants River were the *Little Grigriqua* or *Chariguriqua*, while north of that river were the *Great Grigriqua*, bordering on the southernmost group of the Naman. To the east of the *Kochoqua*, again, were found the *Chainoqua*; further east and south, in what is now the district of Caledon, roamed the *Hessequa*, to the north-east of whom, probably in the present district of Worcester, lived the *Hancumqua*, and, adjoining them, a few lesser groups. Then came the *Attaqua*, extending from Mossel Bay to near the present village of George, and beyond them, finally, were the *Outeniqua*, whose name still survives in the Outeniqua Mountains.

It is estimated by Theal, on the basis of the early records, that about the time when the Dutch settled at the Cape these different groups together must have numbered from 45,000 to 50,000 persons.

[1] There is a considerable body of literature on this division. The most useful original sources are: N. N. Graevenbroeck, *Elegans et accurata gentis Africanae circa Promontorium Capitis Bonae Spei vulgo Hottentotten nuncupatae descriptio epistolaris*, MS. (1695), published in a Dutch translation by van Oordt under the title "Uit den Ouden Tijd", in *Het Zuid-Afrikaansche Tijdschrift*, 1886; P. Kolb, *Caput Bonae Spei Hodiernum, das ist vollständige Beschreibung des afrikanischen Vorgebirges der Guten Hoffnung*, Nürnberg, 1719; G. Fritsch, *Die Eingeborenen Süd-Afrika's*, 1872, pp. 265–342.

[2] The names of these tribes are unfortunately spelt so inaccurately in the early records that to-day, the tribes having ceased to exist, the correct version of the name according to the Hottentot pronunciation is no longer obtainable. Almost all the names are written not only without the click, but with the suffix for the third person masc. plur. (*-kwa* or *-qua* in the Cape Hottentot dialects). The versions given above are those most generally employed by the early writers.

14:Hahn L-5 (ca. 1870-1880) 1881 FX13 Hottentot FX13

802 196 instance, to know whether a man is by himself, one would ask, |*Gu*riseb hã ? Is he alone ?

|*Gam, two,* I derive from the root |ka, |kha, |ga, or |ya, which is originally a post-position, meaning *with, " added," " contributed," in connection with.*

|*Nona, three,* comes from |*no-na-s* or |*no-ma-s*, the *root*, the *radix* of a tree. In every plant the central root is the radical and strongest root. The same, the middle finger of every hand being the *root-finger*, it is obvious that this finger should have provided the name for the number *three*, because the natives count with the aid of the fingers; and whether they commence with the thumb or with the little finger, the central or middle finger always will turn out to be the *third* finger, and thus this finger became the symbol of the abstract number *three.*

Haga, four, I cannot venture to explain.

More interesting again is the derivation of *gore, five,* which means nothing else than the palm of the hand. The word *goreb*, for palm of the hand, is antiquated but still in use. I once told a girl to take a dish of food to her mother in return for milk which I had received, and told her to be careful and not to break the dish. She answered, " *Goreb* |na ta ni tani" (I will carry it in the [482] palm of my hand). This is the way in which the Khoikhoi girls always carry their milk-vessels. *Goreb* is also the Euphorbia candelabra, and shows at the distance the profile or appearance of a vertically stretched 802 arm with the open hand. It is certain that both the 196 number *gore* and the *gore*-tree have derived the name 137 from goreb (also koreb), the open hand. It is also ● 103 certain that the number *gore* and the tree *kore* both are of the same age. The bark of this *gore*-tree has served [314] from the earliest times as the chief material for the manufacturing of the quiver. Places have received their names from the abundance of these trees. There is a Koreχas in the North-western Cape Colony; a |Kora told me that he was born at Koreχas in the Free State;

14:Hahn L-5 (ca. 1870-1880) 1881 FX13 Hottentot FX13

another Korexas is in the !Gami-ǂnus territory in Southern Namaqualand, and another Korexas in the North-western Kalihari, between Gobabis and Ghanze. It is well known that the Euphorbia candelabra shows the most beautiful and gigantic forms in the Khalamba Mountains and in Sekukuni's country and the Hoogeveldt (Highlands) of the Eastern Transvaal. From this we may conclude, as the *gore*-tree does not grow in flats, but is, in very few exceptions, almost entirely confined to mountainous territories, that the Khoikhoi before they separated lived in a mountainous country. This circumstance allows us to account for the higher development which they received before their cousins, the Bushmen. It also points out to us the primordial "fatherland" of the Khoikhoi.

We come now to the number *!nani, six*, where I am not able to give a satisfactory explanation.

Hū or *hūgu* (originally *hunigu*) mean the "mixed ones," the "amalgamated ones," from *hūni*, to stir, to amalgamate. For instance, if milk is thrown into coffee, a man says, "Hunire eibe ots ni !gāise ā." "Stir at first" (that is, mix the coffee with the milk), "and you will drink nicely." Whether here the seven colours of the rainbow gradually flowing into one another originated the idea of the number seven I cannot tell, but I think it possible.

!Khaisi or !khaisa, eight, is very clear from the root *!khai*, to turn; thus !khaisi means "turning number"—*i.e.*, four is turning back again.

Khoisi, nine, is not intelligible. All I can say is, that it has with *khoib*, man, the root *khoi* in common.

Disi, ten, from *di*, to do, would give us the meaning "*done*," "*finished*." And the Khoikhoi now continued *eleven*, disi-!gui-!kha; twelve, disi-!gam-!kha—that is, ten-one-with, ten-two-with, &c. &c., or simply with striking off disi, ten, !gam-!kha, two-with, and so forth. Twenty is !gam disi, two tens; thirty is !nona disi, three

14:Hahn L-5 (ca. 1870-1880) 1881 FX13 Hottentot FX13

103 Names of places

and rivers up to this day tell us of battles once fought, such as *ǃKhami* and *ǃKhams*, Battlefield, *ǃKho-||oa-tcs*, "You cannot catch me;" *ǃKhotoas*, the last one caught; ǂ*Kχīχas*, peace; *ǃHuritamas*, "I am not afraid." Other names again bear testimony to the love for dancing and singing, like *ǃGaī||naīs* and *ǃGaī||naiχas*, "Good, pleasant singing," ǂAχaīs, "Reed-dance." And even sentimental feelings seem to be as characteristic of them as of the writers of fashionable novels now-a-days. *||Ā||ōs*, "Dying from love," has probably been the scene of a very tragical love affair.

791 Prophets (gebo-aogu, *i.e.*, seers) could tell to new-born children as well as to heroes their fate, and this important institution was in the hands of the greatest and most respected old men of the clan. We shall see hereafter that Heitsieibib, Tsu-||goab and the Moon, all were endowed with the power of prophecy.

196 I have already shown in the forms derived from *khoi*, that the Khoikhoi are able to form abstract words.

This distinguishes them most favourably from all the Bushmen tribes, and proves how high their mental development must have been before they emigrated from their primitive territory.

I shall give only a few specimens. ǂ*Eī*, to think, from ǂ*ani* to cut to pieces, to slaughter, hence, ǂ*eīs* (ǂ*anis*), the thought; ǂ*eī-*ǂ*eī-sen*, to consider, to think over again; ǂ*eī-*ǂ*eī-sen-s*, the result of one's own consideration, idea, perception.

Ī, to appear, to shine; *īsib*, form, shape, likeness, appearance; *īsa* and *īχa*, full of form, beautiful, pretty, handsome.

Sī, to come, to arrive; *sī* (from sini), to cause to arrive—*i.e.*, to send; *sīsen*, to send oneself—*i.e.*, *to work*; German, *sich anschicken*.

Ā, yes; *ama*, true; amab, truth: amasīb, truthfulness, love of truth.

ǃNams, love, fondness; nam|namsa, fond, dear; ǃnam, to love.

14:Hahn L-5 (ca. 1870-1880) 1881 FX13 Hottentot FX13

we find the River *Zambere*; on the map attached to Dapper's work the *Zambere* is also marked. Valentyn, in his admirable work on the Dutch East Indian Colonies, gives a map, on which also a part of South Africa is sketched, and where the said river is pretty fairly laid down with the two names *Zambesi* and *Empondo*. The Kunene's name is also to be found with the quite correct translation "Groote Rivier."

[7] *Gorcb.*—That the Khoikhoi transferred other names of certain parts of the body, or utensils and furniture, to plants, is quite evident from the following examples:—ǂǁoāb, arm and branch of a tree; ǂgeigu, the ears, and the leaves of the trees and plants; ǁharan, the flowers, or little pockets from ǁhās or ǁhōs pocket, bag. We, for instance, call a certain flower in Germany *Pantoffelblume—i.e.*, the slipper-flower.

[8] *All the daughters are called after the father.*—Mr. G. Theal, our excellent South African historian and custodian of the colonial archives, who spent many years among the frontier Kafirs, N!gika and !Galeka, informs me that they have adopted the same way of name-giving from the Khoikhoi, and that this custom is still in vogue at the present day. Here we have also, as in so many other instances, an evidence that the Khoikhoi exercised an influence on the Kafir.

[9] ǁ*Hu-!gais.*—This is the name by which Cape Town is known wherever the Khoikhoi tongue is spoken. This name consists of two words, ǂhū the root of a verb, meaning "to condense," hence ǁhū-s, an old word for *cloud*, the word is still used; ǁhūs is also a game, and especially the game where !Gurikhoisib, who is also called ǂEiχa|kha‖nabiseb, or *lightning*, loses all his copper beads. This is metaphor; and ǁhūs or the ǁhūs game is the game, battle, or fight in the clouds—the thunderstorm. In the thunderstorm ǂEiχa|kha‖nabiseb loses the lightning, which falls down to the earth; !gai is to bind, to surround, to tie, to envelop. ǁHu-!gais

14:Hahn L-5 (ca. 1870-1880) 1881 FX13 Hottentot FX13

consequently means "veiled in clouds." And, indeed, every inhabitant of Cape Town will admit that this is a very significant name for "Table-mountain." We still say, if the clouds envelop the top of "Table-mountain," he has his "tablecloth" on.

everything that can at least be saved, at least for the ethnologist, should 114
be brought to safety. I tried to carry out to the best of my ability this duty
that belongs to every scientific traveler, insofar as my chief task, research [123]
in my own special field, permitted, I made it a rule to note down only
those things I saw and experienced in direct, personal contact with the
natives. Only in the chapter, "Midwifery" did I find it necessary to depend
upon the experiences of a local white woman. Well aware that the ex-
periences of an [173] individual can only be spotty, I still prefer to paint
the picture of the Hottentots as it appeared to me and not to draw with
another's pen, even when the gaps are large, because in an area that leaves
so much to the interpretation of the individual, I would only trust myself
an interpretation of those things which I myself have observed.

G. Fritsch (68) has made a compilation of the most worthwhile ethno-

68. G. Fritsch, Die Eingeborenen Südafrikas, ethnographisch und anatomisch beschrieben, mit Atlas. Breslau, 1872.

logical material that was available up to 1872. But since the work of
Theophilus Hahn, (66) published in 1867, there have been no coherent

66. Th. Hahn, Die Nama-Hottentotten. Ein Beitrag zur südafrikanischen Ethnographie (Globus, vol. XII, 1867).

original investigations of the folk life of the Hottentots. I will merely men-
tion Ratzel's (70) presentation here. It cannot be my job to discuss the

70. Fr. Ratzel, Völkerkunde, 2nd ed., 1894.

problems of the comparative ethnology of the South African peoples from
the viewpoint of the specialized literature. I shall only report my own
observations, developed independently, often merely stated as facts for
more expert people to evaluate.

In regard to the Hottentot script inserted in the text, refer to what is [104]
said in chapter V, A, about the language.

I was always spurred to further research by seeing that where, on the 177
basis of older reports, it was least expected, the old individuality of the
people in respect to the family and the individual, had often remained

teeth are as uncouth as those of a dog." The excessively large horns of an ox are called !hõ' //nãgu. An oath that is often heard is: "!hõ' ǂkʗaraga ũ" i.e. "You with the big testicle." (Here as in other cases of groups of words that belong together, I have only indicated the tonal level of the vowels where there was a question of a special differentiation.)

A Hottentot, who found one of my people in the described position, struck him on the knees with the words "ne !hõ' //goabats gye nĩ ʃũ", i.e. "you should stop lying with such uncouth knees," because it brings bad luck, as I found out in reply to my question.

Placing the knee high, which is unavoidable when a long-legged person squats, is mocked. Thus a tall slim Herero girl was teased with the words: "/ũitsibeb kʗoma gai //goaga (e)ĩs," i.e. "you with your tall (towering) knees like a fly." (The fly itself is called !hõ' //goab because of its long legs which seem just as uncouth as the knees of the squatting, long-legged person).

A woman who is half resting on the ground seems to be in a squatting position at first glance: The upper part of the thighs go straight up and the knees stand correspondingly high and are severely bent. (If the woman still wears her native costume, she pulls the front apron between her legs and under her seat when she sits down.) But the body does not rest on the knee joints as it does when squatting, but sits upright on the heavy fatty padding of the seat. Men or thin people can sit in this position without back support only when they have relatively long hips; otherwise they sit on a foot-high stool that folds up (ǂnũais), the top of which is covered with straps. If the woman, who is sitting on her fatty buttocks, wishes to do needle work, she spreads her upper thighs a bit and thus gives her arms sufficient freedom of movement.

If the woman is nursing a child, she sits down the way an oriental woman does, with upper thigh spread and flat, crosses her bent lower legs and draws them up in such a way that the leg of the one side rests on the foot on the other. In the trough thus formed by the woman's legs, the nursling lies so safely that the woman has both arms free for work. I also frequently found older men sitting on the ground in the position of nursing women.

[182] The younger men usually sit down in such a way that they rest on the ground without back support on the hindmost part of the

Summary of the Various Positions of the Tongue in the Formation of the Clicks

Name and Sign of the Click	Shape of the Tongue at the Start of the Click	The Starting Position of the Clicking Parts of the Tongue	Position of the Part of the Tongue that is not Clicking During the Start of the Click	Direction of the Withdrawal of the Clicking Part of the Tongue from the Starting Position
Dental /	Flat and broad	The front end of the tongue is placed against the inner surface of the upper incisors and canines	The lateral edges of the tongue, while the front end starts clicking, are so placed against the inner surfaces, and partly against the chewing surfaces of the side teeth, that you cannot see into the oral cavity.	Far down, right behind the incisors.
Lateral //	Rounded like a bullet, so that the oral cavity is visible on both sides of the tongue, even when the tongue is placed to begin the click	Most of the back of the tongue rests against the palate	The tip of the tongue rests against the front palate, also partly against the inner surface of the upper incisors. The side edges of the tongue lie on the inner surface of the upper molars.	Perpendicularly down, but only so far that the back of the tongue remains considerably above the chewing surfaces of the lower molars.

continued

Summary of the Various Positions of the Tongue in the Formation of the Clicks (Cont'd)

Name and Sign of the Click	Shape of the Tongue at the Start of the Click	The Starting Position of the Clicking Parts of the Tongue	Position of the Part of the Tongue that is not Clicking During the Start of the Click	Direction of the Withdrawal of the Clicking Part of the Tongue from the Starting Position
Cerebral !	Hollow like a basin, and broad	The front end of the tongue lies at some distance from the incisors against the front and middle part of the palate.	The lateral edges of the back section of the tongue lie against the inner surfaces of the molars, just touching their chewing surfaces	Downwards and backwards
Palatal ≠	Flat and broad	The tip of the tongue lies closely against the front palate right behind the incisors	The lateral edges of the back section of the tongue lie against the inner surfaces and the chewing surfaces of the molars	Downwards and so far to the rear that the ligament of the tongue is visible between the front edge of the tongue and the incisors

1; Schultze--142 N-5 (1903-1905) 1907 FX13 Hottentot FX13 [343]

to that in Krönlein's [345] "Wortschatz" and that would lead to misunderstandings. The following nine different musical modifications of the Nama sounds divide into three groups.* 194

* The termini technici, which I had created for naming the newly differentiated sound elements of the Nama language, were reviewed by Professor Eduard Sievers in Leipzig and improved when necessary in the interest of a unified nomenclature. (81) I also received

81. E. Sievers, Grundzüge der Phonetik, 5. Aufl., 1901.

decisive assistance in the task of reproducing the phonetic elements in such a way that they did not over-burden the sentence and so that they did not pile up in a muddle when combined. I mention again in this place my heartfelt thanks to Professor Sievers.

a) The initial tone level. By this I mean the level at which the voice regularly starts when pronouncing certain words, compared with the initial level of the voice in other words.

Three kinds of initial tone level must be differentiated; the signs which I have chosen for them are included in parentheses.

α) The middle tone is characterized by the fact that the voice does not begin either lower nor higher than on the average. What is meant by the "average tone niveau" of a person and how it varies according to age, sex and individual peculiarities, do not need to be defined in number of vibrations. One becomes to attuned to the organ of one's Hottentot teacher that one immediately notices a deviation of the voice either up or down. The middle tone does not need a sign. It is assumed wherever there is not a sign (if the signs for the tonal level are otherwise completed). 194 104

β) The high tone (sign: / after the sound) is characterized by the fact that the voice is higher,

γ) the low tone (sign: \ after the sound) by the fact that the voice is lower than normal.

192
194

38. /no↓bo = to grow hair
/nobo· = to scrape
39. !noa· = to become gray
!no↓a· = to run away (shy animals), to awaken
40. !nõ·↓as = slovenliness
!nõ·ʔas = the heel
!nõʔa·s = stumbling
41. ≠noa· = to quarrel
≠no↓a· = to throw
42. õ·a = to seek
õ·↓a = to increase
õa· = to calf, to lamb, to have young
43. o·re = to vomit milk (of a suckling), as a noun (-s) also: the milk in the stomach of a young, wild calf, just killed.
o·ʔre = of the predatory animal: running to fetch the buried booty
(ore· = to make free)

[349] 44. !o↓m = to push
!oʔm = to be without horns (of cattle)
!o↓m = to become hard, to pull out a thorn
45. sao↓s = thy mother
saos = the pursuit
46. sĩʔ = to sneeze
sĩ↓ = to send
47. uru· = to stalk game
ᵒu↓ru· = to jump on an unsaddled horse
48. tsabi· = the habit of rolling the eyes around while watching
tsa↓bi·s = the black ebony tree

194
194

b) Tone extension. By this I understand the difference between the initial tone level and the level of the same vowel or dipthong of a one syllable word, when it has been extended.

Three kinds of tone extension are to be distinguished.

a) The even extension is characterized by the fact that the voice ends at the same level at which it began. This staying the same does not need to be marked by any sign. It is assumed as given if there is no sign.

β) The rising extension (sign ↑ after the sound) is characterized by a rising.

γ) the falling extension (sign ↓ after the sound) by a dropping of the fading voice.

The ear of the white man has to slowly become accustomed to these differences. For the native they are as clear as the rising of the voice for a question is for us or its sinking at the end of a statement. Examples:

1. ā = to weep
   ā↓ = to drink
   ā↑ = yes! (modified easily by emotions when the tone is extended.)
2. /ā = to wring out
   /ā↓ = to be sharp
3. ǀā = to be wet
   ǀā↓ = to pilfer
4. a↓ms = the mouth
   a↑ms = the roast
   a↓m = to the right
5. //ga↑n = to bake a cake in the pan
[350] //ga↓n = to pull in one's head
   (//ga↓↓n = verb - the leaving behind of the lamb at a definite place on the part of the mother.)
6. *!ga↓m = to have gonorrhea
   *!ga↑m = deep
   (!ga↓m = to bow)
   (!ga↑m = to kill)
7. /gē = to collect cattle of the same color
   */gē↓ = not wanting to give away his last bit
   (gē↑ = to have twins)
8. ǂgō↓↓ = to be sharp
   ǂgō↑ = to set up a scarecrow for animals
   (ǂgō↓ = to turn aside)
9. //gū↓s = the dish that is made from the breastbone of the ostrich
   //gū↓b = compulsion
10. !gū↓b = the long reed mat
    !gū↑b = following a track

1/2, st. means . . . a word-tone rising about 1/2 tone. 194
3, st. means . . . a word-tone rising about one major third.
1/2, f. means . . . a word-tone sinking (falling) about 1/2 tone.
3, f. means . . . a word-tone sinking (falling) about one major third.

Examples:

1.	/ga/ri·b	(3, st.)	= name of a riverbank grass.
	/ga/ri·s	(1/2, st.)	= a boil.
2.	/go/a·b	(3, st.)	= name of a succulent edible plant.
	*/go/a·b	(1/2, st.)	= the call of the sitting /hunos owl.
3.	!go/ro·	(3, st.)	= to stay behind.
	!go/ro·	(1/2, st.)	= to roar.
4.	!gu/ru·b	(3, st.)	= poison.
	!gu/ru·b	(1/2, st.)	= thunder.
5.	/ha/na·	(3, st.)	= to be slow.
	/ha/na·	(1/2, st.)	= to smell of urine.
6.	!ha/ra·	(3, st.)	= to look on.
	!ha/ra·	(1/2, st.)	= to snort, to spit hard.
7.	/ha/ra·b	(3, st.)	= the wart.
	/ha/ra·b	(1/2, st.)	= the contents of the first stomach of ruminants.
8.	/haru·s	(3, st.)	= name of Cyperus species.
[353]	*/haru·s	(1/2, st.)	= Mesembrianthemum species.
9.	/ha/u·b	(3, st.)	= goat beard.
	/ha/u·b	(1/2, st.)	= visible breath.
10.	/ho/bo·	(3, st.)	= to paint the face.
	*/ho/bo·	(1/2, st.)	= to arrange a new-born one.
11.	na/ri·	(3, st.)	= to be thickened.
	na/ri·	(1/2, st.)	= this morning.
12.	!na/ba·b	(3, st.)	= the mend.
	!na/ba·b	(1/2, st.)	= rhinoceros.
13.	!no/ra·b	(3, st.)	= tobacco roll.
	!no/ra·s	(1/2, st.)	= the black ball of manure of the little ruminants.

d) The accent (sign: · after the sound) should be placed with the sound modifications as a part of the rhythmic pattern. An amalgamation of the accent sign with the signs of the "tonal level" elements (as Kroenlein tried) is not feasible. I consider a sign exclusively used to indicate the accent indispensible for a thorough analysis of the sounds of the Nama language. 194 [104]

In the pronunciation of individual words, in many cases you can only differentiate between syllables that are more or less accented, not between accented and unaccented syllables. Especially when the falling word-tone amounts to one third, the accent usually lies so evenly on the first and last syllable that a differentiation in the accent is not possible. In such cases the sign can be left out. 194

In general in two syllable words with a rising word-tone the accent lies on the second syllable and with the falling word-tone on the first syllable. How

e) combinations of the four above-mentioned musical elements determine the phonetic character and thereby usually the meaning of the words, the following examples shall show:

«) combination of differences in initial tone level and tone extension. The combination of high initial tone level and falling tone extension is designated by ↓, the combination of low initial tone level and rising tone extension is designated with ↑. 194 104

1.	ǂā↓	= to burst open
	ǂā↓	= to slaughter
2.	/a↑n	= to groan
	/a↓n	= to smoke (of the fire)
3.	//a↑↑m	= to clean oneself with cow dung
[354]	//a↓m	= placing stones in the hole game (see page 314); clapping hands
	//a↓m	= to eliminate
	•//a↓m	= to cover in order to hide
4.	//ā↑n	= to dwell
	//a↓n	= to ripen
	//a↑n	= to hold firmly together
5.	ǂa↓n	= to know
	ǂa↑n	= to give a blow
6.	dã↑	= to jubilate, make merry
	dã↓	= to be someone's enemy
7.	gā↓	= to be lost
	gā↑	= to be clever, to outwit someone
8.	!gā↓	= to burst
	!gāb	= the resurrection, the reappearance of the crescent moon

192 194

37. /o↓m = to breathe
/o↓m = to wipe off

38. s̃ã↓ = to warm oneself
s̃a↓ = to pick one's nose

39. sĩ = to come there
sĩ↓↓ = ? [pforzen]

β) Differences in the initial tone level and the word-tone:

1. /abi· (1/2, st.) = to rain (cf. p. 237 note)
/a↓bi· (3, st.) = to scratch the skin for purposes of healing

2. χore· (1/2, st.) = to release
χo↓re· (3, st.) = to joke

3. /ga↓i·b (3. st.) = name of a lizard, the Mabuia acutilabris Ptrs.
/ga↑i·b (1/2, st.) = dancing

4. gu↓ni· (3, st.) = to stalk game
gu↑ni· (1/2, st.) = to scratch one's closed eye or ear

5. //guru·s (1/2, st.) = quartz stone
*//gu↓ru·b (3, st.) = mountain ridge

6. !ha↓mi· (3, st.) = to hunt
!ha↑mi· (1/2, st.) = to be insulted

7. !huri·b (3, st.) = fear
!hu↑ri·b (1/2, st.) = the backbone

8. //naru· (1/2, st.) = to roast, to chew on a bone (said of cattle)
//na↓ru· (3, st.) = to impale in rows

9. !na↑ru·s (1/2, st.) = the black ebony tree (synonym, see p. 144)
*!na↓ru·s (3, st.) = name of a ray (fish)

10. u·↑ri (1/2, f.) = to gnaw bones
u·rib (3, f.) = louse

[357] γ) Differences in word-tone and accent.

[104] (Where not specially indicated, the word-tone is 1/2 a tone):

1. a·bu = to fold up
abu·s = the empty ostrich egg

δ) Differences in the word-tone, accent and initial tone level (only the third is indicated in the word-tone, otherwise it is assumed to be a 1/2 tone):

1.	/a·rab	(3, f.)	=	the annoyance
	/ara·b		=	rib
	/a·ˀrab		=	the crack
2.	//a·ri		=	yesterday, tomorrow
[359]	//aˀri·		=	to pulverize (in the language of the Namib nomads: !oˀˀn)
3.	!a·ba		=	to climb up
	!aˬba·	(3, st.)	=	to scratch
4.	χoa·		=	to scrape
	χo·ˀa		=	to write
5.	χuru·b		=	powdered coals
	χuˬru·	(3, st.)	=	to pull out
6.	χu·bu		=	to pulverize tobacco
	χuˬbu·	(3, st.)	=	to drink from [sip]
7.	gara·		=	to be cool
	ga·ˬra		=	to have German measles
8.	gaˬro·	(3, st.)	=	bend, bow
	ga·ro		=	to dry out, become thin, to be hard
9.	/ga·bi		=	to sprinkle
	/gaˬbi·s	(3, st.)	=	the cup
	(/gabi·		=	to be high)
10.	//gaˬe		=	to imitate
	//gaë·		=	to chew
11.	//ga·mi		=	water
	//gaˬmi·	(3, st.)	=	to bend the head
12.	//ga·nas		=	the giraffe acacia, (Cape D. kameelboom)
	//gaˀna·s		=	name of a plant that is like a fig tree that grows frequently in the cliffs near Kubub. The inner soft skin of the root is eaten raw.

194
[104]
192
194

[262
824]

3. Orthography

The spelling which I use for Nama words in this report is closely pat- 104
terned after the general linguistic alphabet, which Steinthal (80) uses. I 194

80. H. Steinthal, Linguistik, in G. Neumayer's "Anleitung zu wissenschaftlichen Beobachtungen auf Reisen," 1891.

can therefore restrict myself here to a few remarks to orient the reader and as an explanation for several deviations from Kroenlein's method.

ā indicates the length of a vowel. If the long sign is missing, the vowel is short.

ã̄ indicates nasalization. Individual tendency towards nasalization of vowels, which follow an m (toma, "not," go ma·b, "ox," ma, "to give," etc.) I have observed frequently but I have not considered this in the script.

(a) indicates that the vowel involved is spoken hastily, almost supressed.

y is pronounced as the "j" in the German word Jena.

a/o and analogously all vowels that are separated by a sound sign, are not to be spoken as a dipthong but separately.

aë, aï, and oë etc. are to be spoken with the vowels separated with the accent on the first if no accent sign is given.

ai is to be pronounced as in the German "Kaiser," "Eile," "einerlei," etc. The dipthong ei (as pronounced in the linguistic alphabet) does not exist in the Hottentot language. The linguistic method of writing should definitely be preferred. Where Kroenlein writes ai, in many cases this could be confused with aë.

au is to be pronounced as in the German "Auge," "auch," etc. The linguistic dipthong ou does not exist in the Hottentot language [364] any more than it does in pure German. Where Kroenlein writes au, there is often a confusion with ao which is very close to it.

ao is to be pronounced with the emphasis on the first vowel and with such a quick transition to the second, that it sounds like a dipthong.

b at the beginning of a word is pronounced like our b, in the middle of a word usually softly like our w, and at the end of a word hard but not quite so hard as our p.

χ is pronounced as in the German "lachen," "Bach" etc.

kχ corresponds to Kroenlein's kh, that should be "somewhat harder,

but not much" than k. I have always heard this sound as k with a following χ and therefore write it that way.

r is rolled with the tongue, not made with the uvula.

s is pronounced weakly at the end of a word like the German sch in "Busch," "Bresche," but at the beginning of a word like the s in "salz," "Sonne," etc, often sharply as in the French "salon."

ts is pronounced as is German z in "Zahn," "Zunft" etc.

f and l are missing in the Nama language. When met with occasionally they occur in word stems borrowed from the Dutch: gurla·bigis, butterfly; f(a)la·migob, the flamingo, ff·lsib, the vuilziekte of the Boers (lues).

[364]

B. Knowledge of Nature

8.2

[illegible]at we learned (from our consideration of the sustenance and medicine, handicrafts, animal husbandry and hunting as well as from the portrayal of the land and climate) about the Hottentot's specific knowledge of the three realms of nature was that it derived more or less directly from material exigencies and had always been connected with them. The question now poses itself whether this knowledge also exists independently of the cares of daily life, that is, to what extent it can be regarded as the free expression of intellectual stimuli. It will be shown that despite all the intellectual agility of the Hottentot his knowledge of nature at no time rises to an even rudimentary form of natural science. Only in two fields can we recognize at least the striving for a certain continuation beyond the rudiments or for an organization of the factual data: in the field of biology (which even today is closest to the hunter and cattle owner) and -- almost lost once again to oblivion -- in the field of division of time, whose seasonal changes and deep influence upon animated nature both give the herdsman cause to think.

1. Flora and Fauna

[365] The Hottentot's knowledge of animals and plants will not be discussed here. The zoological and botanical classification of the material I collected must be finished before we can attain a clear picture of the matter. We would gain nothing by simply listing the native names.

CERTAIN RITES OF TRANSITION AND THE CONCEPTION OF !NAU AMONG THE HOTTENTOTS[1]

A. W. Hoernlé

114
101
The following notes have been put together from the materials which I collected during the years 1912 and 1913 on two expeditions made among three different tribes of Hottentots. In 1912 I visited the remnants of certain tribes of the Little Namaqua, among whom some fugitives from the tribe of !Gamí-ǂnūn or Bondelswaarts of German South West Africa were living. It was a very scattered community on the southern bank of the Orange River, about fifty miles inland from its mouth, and in British territory.

The following year I spent among the ǂĀunin or Topnaars of Walfish Bay and among the /Hei /Khauan, who live now in the territory round Berseba in German South West Africa. This latter tribe crossed the Orange River in the beginning of the 19th century, after its members had absorbed a great deal from the Dutch among whom they had lived, and with whom there had been a considerable amount of intermixture. As a result of [177] the mixed blood and the adoption of many Dutch ways, the pure Hottentot customs and beliefs had been considerably modified among them. They are an offshoot from the Cauquas, who in the time of Simon Van der Stel (17th century) lived in the present Worcester district of the Cape Colony in the valleys of the Breede River,[2] and belong therefore to the so-called Colonial Hottentots, not to any branch of the Namaqua people with [796] whom the other tribes I visited must be classed. It is, therefore, extremely interesting to find that all four of the transition rites (*rites de passage*) which I am about to describe in this paper are practised by them with but slight variations. Whether they brought these customs with them, or whether they adopted them from the tribes with which they came in contact when they crossed the Orange River in their progress northwards, it is impossible to say. The ǂĀunin, though but a miserable remnant of what was never,

[104]

[1] In this paper I have used, as far as possible, the notation employed by J. G. Krönlein, Wortschatz der Khoi-Khoin, Berlin, 1889. /, indicates the dental click; ǂ the palatal; ! the cerebral; // the lateral. x indicates a guttural ch; the mark ¯ over a vowel indicates that it is long; ˜ indicates that it is nasalised. A short vowel has no special sign; ` represents the low tone of the vowel; ´ the middle tone; ˆ the high one. The sign ˛ under a vowel indicates that it is very short; while ¨ indicates that the vowel is to be separately pronounced.

VOL. 27 JANUARY-MARCH, 1925 No. 1

THE SOCIAL ORGANIZATION OF THE NAMA HOTTENTOTS OF SOUTHWEST AFRICA[1]

BY A. WINIFRED HOERNLÉ

101 THE people with whom this paper deals live in the territory known to-day as the Protectorate of Southwest Africa. They form one branch of the people known generally as the Hottentots, but from the very earliest days of the Dutch settlement at the Cape this branch of the Hottentot peoples has been called the Namaqua, and Nama is the name by which they call themselves to-day. The meaning of the word is unknown, but it is, according to tradition, the name of a remote ancestor of all the tribes calling themselves by the name. The old form, Namaqua, is probably derived from the dual form, *Namakha*, *Namab* being the masculine singular, *Namas* the feminine singular, and *Naman* the common plural.

101 131 To the early Dutch settlers two groups of the Nama were known, viz., the Little Namaqua, inhabiting what is known to-day as Little Namaqualand, and the Great Namaqua who inhabited what is to-day known as Great Namaqualand. Both of these groups of people at times visited the settlement at Table Bay,

104 [1] In transcribing the Hottentot words, I have used the system of K⁵nlein's *Wortschatz der Khoi Khoin*, Berlin, 1889, as this is the system used by the Nama themselves nowadays in their writing. It is not strictly accurate always from a phonetic point of view, especially for the Swartbooi pronunciation, but it is the conventional script of the Nama, and in this paper which is not concerned with phonetics it seemed best to follow it.

There are three tones in Nama each of which may give an entirely different meaning to an otherwise identical word. ` indicates a low tone, ´ a medium tone, ˇ a high tone. In order not to complicate the manuscript, I have indicated these tones only where it is essential in order to avoid confusion in the reading.

∞ is the sign of nasalising; ¯ indicates a long vowel; X indicates a harsh guttural *ch* something like the Dutch *ch*.

/ indicates the dental click, ≠ the palatal, ! the cerebral, // the lateral.

7: Laidler D-5 (ca. 1925) 1928
FX13 Hottentot FX13

argument, be a good " blood giver." This is an instance of the modern application of ancient sympathetic method.

The further information here gathered together, represents the work of four years' questioning, checking, and corroborating statements made by many herbalists, not a few of whom were also practitioners of witchcraft, that is, practitioners of major qualifications. One took four bottles of water mixed with earth and the ground remains of a certain little red-headed hornet that builds in houses and huts. Before rising each morning he drank a mouthful of the suspension. On the fifth day of this treatment; " there lay the sick people—and there lay the medicines. And now pressed the new power between the shoulders." Here, perhaps, is some small relic of the initiation of a man into the cult of P/gai* aup.

Only occasionally is there a little resemblance between the herbs used by the Native and those of the modern occidental pharmacopoeia. Yet there is a sufficient similarity between them to cause the scoffer to cease his scoffing, and realise that here, after all, lies the root and origin of modern medicine—modern scientific medicine which owes at least one of its drugs to this ancient Hottentot herbal, namely, Buchu. The bitter roots are similar in appearance on cross section, colour of infusion, taste, and action to the Radix Calumbae of modern pharmacy. But, with this one exception, there is no commercial future for any other item. The quantity of most of the herbs and medicinal bushes in the country is but small.

Red substances are used in anaemias and weaknesses, and repeated doses are given during fevers. They are used, several authorities state, because they are red and the blood is red, and therefore they strengthen the blood, and, of course, when grown on red ground, their value as drugs is increased enormously. All such red materials when used and finished with must be disposed of carefully, because good stuff must never be thrown away. Rooi wortle, for weaknesses, Baboon's ear, the Kalkoen bloom. Rooi rainkie, are examples, and in each the reason for use is their colour, and, should they grow in red ground, they must be good. The same principle is expressed in the use of the dark lichen which grows on almost all granite outcrops in Namaqualand, which is used in decoction as a mouth-wash for teething.

Barend makes young people's medicine as the moon grows during the first days of the month, and never prepares any when the moon is on the wane. Yet he always examines cut sections of roots to see if they come from poor ground. He evidently works on a combination of " scientific " and " sympathetic " lines. The same medicine prepared in a different manner may have a different action. Thus, if black root be cut in an upward

*For ease in printing and reading I have denoted the clicks thus :—D/ the dental; P/ the palatal; C/ the cerebral; L/ the lateral and X/ the guttural.

14:Hahn L-5 (ca. 1870-1880) 1881 FX13 Hottentot FX13

bear specially on our country. Then, and then only, the South African Public Library will thrive as a public institution, and soon become the workshop and nursery of South African science. With the spread of education, no doubt the interest in "Our Library" will increase. The name of Dr. Dale, the Superintendent General of Education in this Colony, is a guarantee that education will continue to advance with daily greater strides; and thus we may hope that, ere long, Colonial youths will aspire to distinguish themselves in historical and purely philosophical studies.

For the orthography of the Hottentot and Bantu words, I employed, with slight modifications, the excellent Standard Alphabet of Professor Lepsius, which proves, after all, the most serviceable, as far as South African languages are concerned.

The words and names quoted from travellers are given in their own orthography; in a few instances, however, I considered it necessary to substitute for their spelling that introduced by Professor Lepsius, in order to render the phonetic composition of words more transparent, and, consequently, their etymology more evident. The clicks, which are of vital importance for the etymologist, are very indiscriminately treated by most travellers, with the sole exception of Professor Dr. Gustav Fritsch.

Travellers and missionaries who wish to serve the cause of South African Philology should be well acquainted with the principles of Phonology before they venture to write down texts of illiterate languages. No missionary should be sent to the heathens without having acquired as thorough a knowledge of Phonetics as he has of the Gospel, and he should be taught to respect every vowel, every accent, every consonant; in fact, "*every jot and tittle in any, even the most barbarous, dialect he may hereafter have to analyse.*"* Comparative Philology is entirely based upon phonology, and if the laws of phonology for a group of languages are

* Max Müller, "Lect." ii. p. 42, ed. 1868.

14:Hahn L-5 (ca. 1870-1880) 1881 FX13 Hottentot FX13

once correctly established, the natural offshoot will be a true scientific etymology. This science is *the* telescope with which, where all other records fail, we can draw prehistoric times into our immediate view, and which allows us a look far back into "the very dawn of man's life."

It is an urgent want for us here in South Africa that a Standard Orthography for the Native Languages should be introduced in all official, educational, and public departments. The task is not as difficult as it may appear at first sight, and where there is a will, there is a way.

In the present Standard Orthography we write the clicks as follows:—

The Lateral ‖,	[1] ‖a,	[2] ‖na,	[3] ‖kha,	[4] ‖ga,
The Cerebral ǀ,	[5] ǀā,	[6] ǀnā,	[7] ǀkhā,	[8] ǀgā,
The Palatal ǂ,	[9] ǂā,	[10] ǂnā,	[11] ǂkhā,	[12] ǂga.
The Dental ǀ,	[13] ǀā,	[14] ǀnā,	[15] ǀkhā,	[16] ǀgā.

The importance of the clicks will be best illustrated by giving the meanings of these words here at once, thus, [1] to wash, [2] to drop, [3] to be able, [4] to split, [5] to fall, [6] to light, [7] to bore, to perforate, [8] to serve, [9] to wash, [10] to pour, [11] to refuse, [12] to plant, [13] to be sharp, [14] to filter, [15] with, [16] isolated, separated, thin, &c., dotted.

Those who wish to inform themselves about the nature of these clicks and their bearing on the phonology of the Hottentot language, I refer to Henry Tindall's excellent "Grammar and Vocabulary of the Namaqua-Hottentot Language," and to my "Sprache der Nama."

In Tindall's book, however, and in my own no mention is made of a harsh faucal sound peculiar to the old Cape Hottentot dialects—of which Witsen and Leibniz have supplied some materials—to the ǀKora-Hottentot and to the Bushman languages of the ǀKham, ǀAi, ǀNuni, ǀKoang, Heiǂguis, Matsanakhoi and ǀGabe. I write this consonant, which most resembles a forcibly produced *short croaking sound*—just as if a person is endeavouring to get rid of a bone in the throat—with the Hebrew

Bushmen FX10

Chapter I

THE COUNTRY OF THE KHOISAN

By the year 1652, when the establishment of the pioneer Dutch settlement at Table Bay laid the foundations for the present political dominance of the white man in the country, Africa south of the Zambesi River was already inhabited by a considerable number of different native peoples. On the basis of racial, linguistic and cultural distinctions, these native inhabitants are customarily classified into four separate groups, known respectively as the Bushmen, the Hottentots, the Bergdama, and the Bantu.

The Bushmen, at one time spread over almost the whole of South Africa, are to-day confined principally to the Central and Northern Kalahari Desert and adjacent districts. They are a short, brownish-yellow people, with certain peculiar and distinctive racial characteristics; they all speak languages of a uniform and easily recognizable type, phonetically remarkable especially for the great prevalence of "click" consonants; and they live in small nomadic bands which lead a purely hunting and collecting existence, practising neither agriculture nor pastoralism.

The Hottentots formerly occupied most of the western half of the region, but are now found chiefly in the southern parts of South-West Africa. They are closely allied to the Bushmen in race, and their languages are of a somewhat similar type, although in both respects certain differences are also observable. They are, however, a predominantly pastoral people, keeping cattle and sheep, and live in larger communities with a more complex system of social organization.

The Bergdama, also inhabiting South-West Africa, are racially a true negro people, different in appearance from both the Bushmen and the Hottentots. They all, however, speak the language of the Nama division of Hottentots, to whom they have long been in subjection. Like the Bushmen they live in very small nomadic groups and derive their subsistence primarily from hunting and collecting, although some of them also keep goats.

The Bantu, finally, although historically the most recent native people settling in South Africa, are now spread over the whole country

F1 Africa
Hottentot FX13
Nama

105

Identification

The Nama (Naman, Namaqua) are a major division of the Hottentot nation. They originally numbered about 20,000. They include the following tribes: Gei //khauan, !gami /nun, //haboben, !khara Gei Khoin, //khau /goan, //o Gein, /aunin or !naranin, all of whom constitute the Great Namaqua, and also the Little Namaqua tribes. The Nama numbered 24,000 in 1946.

Basic Economy

Primarily pastoral. No agriculture. Hunting is important, and gathering and fishing fairly so. Cattle, sheep, and some goats are herded, and dogs kept. Milk and game are the staple foods.

Sex Division of Labor

Men hunt. Women milk animals (unlike Bantu) and gather. Herding done mainly by boys and servants.

Property

Main wealth in cattle and sheep. Land is communally owned by the local group. Private property exists in livestock, movables, wells dug, and wild beehives discovered.

Livestock are inherited by ElSo; other property equally by children of both sexes.

Social Stratification

No true slavery. War captives or rescued fugitives were kept as servants, earning their subsistence in return for their labor, but were allowed to leave if they wished. Hired servants were paid by a share of the increase.

Marriage

The groom provides several cattle; some are slaughtered for the wedding feast, some given as presents (apparently not a true bride-price) to his parents-in-law, who give some in return as a dowry for the bride. Postmarital bride-service occurs during the period of initial matrilocal residence.

105

Polygyny is permitted but not common. Monogamy is the norm. In a polygynous family each wife normally has her own hut.

Family

The nuclear family is the norm--occupying one hut (others in case of polygynous wives). No extended family organization, though patrilineally related men tended to camp nearby.

Residence

Matripatrilocal residence is the norm--matrilocal till birth of first child, then usually patrilocal in the camp of HuFa. Occasional matrilocal exceptions.

Kin Groups and Exogamy

Local exogamy is the norm.

Bilateral extension is absent. Marriage with either cross-cousin is permitted, but is forbidden with parallel cousins.

Exogamous patrilineal sibs, divided into lineages. They share a marked fissive tendency.

Kinship Terminology

Fa, FaBr--//gun. Mo, MoSi--//gus. So, BrSo--oab. Da, SiDa--oas. Br--gab, Si, Br--gas. Br and Si often modified by adjectives "big" and "young" to indicate age distinctions. The above three pairs of terms differ internally only by sex gender endings.

MoBr--//naob. FaSi called "big Mo" or by special age-distinguishing terms. Avuncular and nepotic terminology is bifurcate merging in type.

Iroquois cousin terminology. Sibling terms are used for parallel cousins.

Settlement Pattern

Migratory bands.. Camps of mat-covered, dome-shaped huts arranged in a circle.

Community Organization

Patri-sibs (or parts thereof) are localized as patrilocal clan-communities.

105

Local Government

Clan chief or headman, succeeded by ElSo (then Br or BrSo); council of adult males.

State

Twelve sub-tribes, each with a chief, the headman of the senior clan. Other clan chiefs formed a council. Little political cohesion, but often united for war.

Warfare

Intertribal warfare and intra-tribal clan feuds common.

Environment and Culture

H B 105

The possibilities of exploitation this region offers to people lacking the highly-developed technical equipment of modern European civilization vary considerably. The ways in which the Bushmen and Hottentots utilize the natural resources of their surroundings will be discussed in some detail in later chapters. Here a rapid survey may be made of the factors conditioning the distribution and mode of life generally of the natives inhabiting the country.[1]

H B 105 311 312

The most important consideration naturally is water. Animal and plant life are there in sufficient quantity to support human existence, provided a supply of water is near. Man in his primitive condition is dependent entirely on surface water for the satisfaction of his needs, for he has not the means now possessed by civilized man for getting at the water in the depths below. The amount of surface water therefore determines the density of population in any one area, and the water available in a given area, together with the density of the vegetation, determines the number and size of the settlements in that area.

The character of the country, moreover, limits at once the types of culture that can become indigenous there. South Africa even under modern conditions can only carry on agriculture in certain parts, and most of the country could never support a primitive population of pure agriculturists. It is only in the well-watered districts to the north and east and along the south coast that native agriculture has been developed to any extent. On the other hand, there is an abundant fauna and a sufficiency of vegetable life to afford good subsistence to men. The type of culture then that we would *a priori* expect to find here would be one based largely on hunting and collecting. This is exactly what we do find. The abundance of game formerly existing in South Africa makes it readily comprehensible that hunting at one time played a great role in all parts of the country, and therefore that hunting peoples were distributed all over its surface. All the native peoples of South Africa, whatever other means of subsistence they have, rely to some extent at least for food on the products of the chase and on the edible bulbs and roots of the veld.

H B 105 311

A country, however, which can support great numbers of buck

[1] For special discussions of the South African environment in relation to man, cf. Passarge, *op. cit.*, pp. 162–75; *idem*, "Die Grundlinien im ethnographischen Bilde der Kalahari-Region," *Z. Ges. Erdk. Berlin*, 1905, pp. 20–36, 68–88; (Mrs.) A. W. Hoernlé, "South-West Africa as a Primitive Culture Area," *S. Afr. Geog. J.*, vi (1923), pp. 14–28.

311

and other grass and herb-eating animals will also support other species of these animals, provided that conditions such as the absence of the tsetse fly and other pests are favourable. Hence we also find pastoral tribes, who have come in from other regions bringing with them great herds of cattle and immense flocks of sheep and goats. One important point must, however, be noticed. Country which, under modern farming conditions, will only carry a small herd of cattle, sheep, and goats, used formerly to carry large herds of well-fed antelopes and zebras. The explanation is that each wild species is specially adapted to living on certain bushes or plants, and that many natural foodstuffs useless to farm stock were made use of by one species or another of wild game. It must also be remembered that the wild game was not restricted by farm boundaries; it was free to shift its ground according to the seasons and the supplies of food and water. For the same reasons a nomadic life was imposed on the native tribes keeping domestic animals, although nowadays with the extension of the European settlements the areas over which free movement is possible have become greatly restricted.

H
B
105
311
312

Viewed in this light, the natural regions of South Africa which have been described above are seen to differ widely in their value for culture. Certain parts of the country, such as the Namib desert strip and the interior of Bushmanland, are largely uninhabitable. The rainfall in both is exceedingly slight, and there is practically no surface water all the year round. In parts of the Namib, however, the river-courses from the mountains of the South-West African plateau periodically carry water, which is dammed up in a few places by rocky outcrops in the river beds, and above all there is the */naras* melon, whose fruit is sufficiently succulent to provide a substitute for water. Agriculture is completely out of the question. The thin scattered population which the region can support is forced to lead a nomadic hunting life, although in the east, towards the borders of the plateau, the grass which flourishes during the rainy season occasionally permits of pastoralism.

The greater part of the Middle and Southern Kalahari lacks surface water during the dry season only. The water supply at other times is generally sufficient to permit of temporary settlements, although the porous sand covering of the surface absorbs all the rainfall, so that except in the pans and other waterholes the standing water rapidly disappears. The region is sparsely inhabited, and mostly by nomadic peoples. Agriculture is again impossible, save in a few tracts to the

312
3:1

east, where the soil is more favourable, but the rainfall is too uncertain to enable grain to be grown with a reasonable prospect of success. The abundance of grass in many parts, especially during the rainy season, affords good pasture to cattle, but the region is above all an excellent hunting ground, and formerly at least it was extraordinarily rich in game. Hence its inhabitants are in the first place hunting peoples, and their life is conditioned by the movements of the game. At the beginning of the rainy season the animals wander out of the permanently-watered regions encircling the desert into its sandy plains, where water is found only in pans, pools, and waterholes. The hunters follow them. As the dry season sets in and the water in the pans begins to shrink, part of the game returns to the watered regions, part of it, however, continues to live in the plains on the *tsama* melons and other succulent plants—and the hunters do the same.

In the well-watered Northern Kalahari three great streams, the Okavango, Kwando, and Zambesi, overflow on to the flat land, in some parts continuously, in others periodically, and thus give rise to an extensive region of swamps. This marshy region is excellent hunting and fishing ground. Its population, more numerous and densely settled than in the rest of the Kalahari, is therefore primarily concerned with these two pursuits. The natives indeed are actually forced to resort in part to fishing, since for motives of security they live mainly on the small islands between the swamps and the rivers. The periodic rise of the rivers annually floods wide stretches of the country, resulting in displacements and wanderings of the game. Consequently, the natives also must roam, partly because their habitations are flooded out, partly because they must follow the animals. Both agriculture and pastoralism are also carried out in parts of the country. The cattle pasture in the sandveld away from the swamps, while the marshy region can only be used for the cultivation of crops, since for wide stretches it is infested by the tsetse.

The upland regions encircling the Kalahari basin on the south-east, south, and west, have for the most part a scanty rainfall. The permanent settlement of this belt during the dry season is therefore restricted to the scattered waterholes, which occur in river beds, on mountain slopes or in depressions on the hard soil. Waterless stretches from 40 to 100 miles in extent are no rarity, so that the settlements are frequently distributed far apart over the land. Here, as in other regions of South Africa, hunting must depend on the movements of

H
B
105
311
312

the game. In the more arid parts the animals in the dry season concentrate in vast numbers about the rivers and waterholes and pans, to disperse widely as soon as the rains make life possible elsewhere. The same features of alternate concentration and dispersal can be observed in the life of the purely hunting tribes. The pastoral resources are on the whole excellent, there being no lack of grass or edible shrubs even during the dry season, and consequently cattle-keeping peoples are able to lead a favoured existence in these uplands. Agriculture is also practised to some extent, but is confined to the scattered alluvial tracts. As a means of subsistence it is rendered precarious by the frequent droughts which characterize the region. These often exercise a harmful effect on pastoralism as well, partly because of the ensuing lack of water, but mainly because the pasture is completely destroyed in many parts of the country. The plateaus of the Orange Free State, Cape Province, and Southern Bechuanaland are especially exposed to such catastrophes, but they are often enough marked in South-West Africa also, particularly in Great Namaqualand.

Further east and along the south coast the rainfall is high enough to place cultivation on a safe footing, while the country, where it is not covered with bush or forest, is composed of extensive grass flats which can be used as pasture land. Consequently, both agriculture and pastoralism are equally developed, the former being carried out on a far greater scale than in other parts of South Africa. Here, therefore, we find the most thickly settled zones, and the population is mainly sedentary, even although the pastoral tribes must still to some extent lead a nomadic life.

Migration Routes

H
B
131
167

The geographical situation of South Africa has an obvious bearing upon the racial history of the country. Cut off by vast uninterrupted stretches of water from ready access on the west, south, and east, its most direct link with other regions is overland to the north. In the north-west the great forest regions of the Congo impose an effective barrier upon extensive human migrations, so that it is principally from the north-east that invading peoples have been able to enter the country.[1] The East African highlands are connected with the south by a favourable route passing between the escarpments in the east with their sharp descent to the fertile but fever-stricken coastlands,

[1] Cf. Passarge, *Z. Ges. Erdk. Berlin*, 1905, pp. 32–3; *idem*, *Südafrika*, pp. 163–7.

FX13 Hottentot FX13
Bushmen FX10

Hottentots. The nature of the relationship between these two peoples has given rise to much discussion. They are unquestionably allied in race, and, indeed, in appearance and bodily characters resemble each other so closely as to have often been confused. There are certain features, such as stature and the shape of the head, in which the Hottentots are actually found to differ somewhat from the Cape Bushmen, but differences of the same nature exist even between the Northern Bushmen and those of the Cape.

The two peoples also have much in common in language. Their speech has the same phonetic basis, characterized especially by the occurrence of several "click" consonants; many roots in the Hottentot languages are found with the same meanings in various Bushman languages; while in grammatical processes and categories there is also a fundamental correspondence, more particularly between the Hottentot and the Central Bushman languages. At the same time, the Hottentot languages have certain grammatical features, such as sex-gender, sex-denoting particles and a dual number, which do not occur in any of the Bushman languages save that of the Naron.

In culture the differences are more readily apparent. While the Bushmen are hunters and collectors only, the Hottentots in addition are a pastoral people, with herds of long-horned straight-backed cattle and flocks of fat-tailed hairy sheep. They were also able to smelt metal ores for the manufacture of their implements, weapons, and ornaments, while the Bushmen have never learned to do so and still obtain whatever iron they use by barter from their more advanced neighbours. The Hottentots, again, do not appear ever to have possessed the art of painting and engraving on rock, so remarkable a feature in the culture of the Southern Bushmen; but, then, it should be noted, there is no direct evidence either that the Northern Bushmen were acquainted with this art. In social organization, habits, and customs there are likewise many far-reaching differences, but at the same time, as we shall see, the similarities in some respects are by no means insignificant. In religion, on the other hand, the similarities are occasionally very striking, although here again there are also important differences of detail.

All these points, both of resemblance and of difference, will be analysed below and discussed more in detail. It must here be mentioned, however, that the common elements indicated are on the whole significant enough to warrant the conclusion that the Hottentots are basically of the same racial stock as the Bushmen, and

Identification

The Cape Hottentot, with whom are here also grouped the East Hottentot about whom practically nothing is known, speak a language of the Khoisan or Click stock. Since it is extinct, its exact relationship to Nama is not known, but doubtless both belong to the Central Bushman branch. The East Hottentot include the Damaqua, Gonaqua, and Inqua tribes; the Cape Hottentot the Goringhaiqua (Goringhaikona), Kora (Gorachouqua, later the Korana), Kochoqua, Little Grigriqua (Chariguriqua), Great Grigriqua, Chainoqua, Hessequa, Hancumqua, Attaqua, and Outeniqua.

Basic Economy

Primarily pastoral. Herding of long-horned cattle and fat-tailed sheep is followed in importance by gathering, then hunting. Fishing is reported for only one coast-dwelling tribe. Agriculture is lacking. Schapera (1930) reports dogs and goats, as well as cattle and sheep. Milk and meat are the staple foods.

Sex Division of Labor

The men herd and hunt. The women milk. Both sexes gather.

Property

Livestock are the chief wealth. Women as well as men own cattle. Land is communally owned by local groups.

Inheritance is patrilinea--by ElSo, in default thereof by Br or BrSo.

Social Stratification

Slavery is not practiced. There are wealth distinctions.

Marriage

A true bride-price is lacking, but marriage involves a token gift of one or two animals which are slaughtered for the wedding feast.

Polygyny is permitted but is relatively infrequent, being practiced mainly by wealthy men. The first wife is chief wife, and each wife has her own hut.

Family

The residential unit is the nuclear or polygynous families, although

patrilocal extended families are a possibility--rather more likely than among the Nama.

Residence

The patrilocal rule prevails. Initial matrilocal residence as among the Nama, though not reported, possibly exists. Children remain with their parents until marriage.

Kin Groups and Exogamy

One source reports that marriage with any consanguineal relative is forbidden.

Exogamous patri-sibs are highly probable.

Settlement Pattern

The local group is a migratory band. The main camp, where the older people remain and to which the smaller nomadic groups return from time to time, is a great circle of huts surrounded by a thorn fence. The dwellings were presumably hemispherical mat-covered lodges like those of the Nama.

Community Organization

The community is presumably a patri-clan as among the Nama. Age-grades are lacking.

Local Government

Each band has a hereditary headman, who is assisted by a council of elders. Succession is patrilineal--often by ElSo.

State

Though local groups are largely autonomous, they are grouped into tribal aggregations, each with a hereditary chief (succeeded by ElSo) and a council of local headmen. Political cohesion, however, is minimal.

Warfare

There are perpetual feuds or petty wars.

2: Schapera, Isaac. The Khoisan Peoples of South Africa: Bushmen and Hottentots. London: George Routledge & Sons, 1930.

Pp. xi, 1-445; 14 plates; 2 end maps; bibliography; index.

Yale: Nkd84.930s

/This book is a comprehensive survey of the Khoisan peoples compiled mostly from the literature. Pages 73-220 and occasional references to the Bushmen included in the Hottentot sections have been marked for the FX10 Bushmen file. The remainder of the work appears in the Hottentot file. Most of the information on the Hottentots is concerned with the Nama people, but references are also made to the Cape Hottentots. The Bushmen section deals with various groups and frequently notes variations in culture and beliefs found among the different Bushmen tribes. Included in the source are materials on physical environment, tribal divisions, physical traits, social organization, habits and customs, economic life, political structure, religious beliefs and magic, art and folklore. The concluding chapter is a description of the Khoisan languages. The author is an ethnologist who specializes in South African native cultures. --Analyst/

Korana

Do not light your pipe in a fire in the veld.

If you see anything sick in the veld, do not look at its feet. Bring it to the stad. The old men will look at its feet. If you look at its feet in the veld, you have transgressed, you must go back.

Then the fat of sheep is drunk. Then he is called. He answers. Then omuses are struck in his ear. If he is far and he is called, he hears.

A nine year old heifer is picked, he chases it. If he catches its tail, he is a man. If he does not catch it, he is brought back to the " law."

Notes:

The *dowo* ceremony. For an analysis of the accounts concerning the Nama ceremony and the sources, see Schapera, The *Khoi-san Peoples*, pp. 279-285, Olpp has given the most detailed account for the *Naman*. Schapera omits all reference to the Korana ceremonies throughout this part of his work.

For the Korana, see

(i) Wikar, in G. M. II pp. 103-104.

(ii) Campbell, 1820, II p. 346.

(iii) Wurms. Ms. (1858) published in *Bantu Studies*, iii, p. 291-293.

(iv) Burkhardt. p. 118.

(v) Meinhof. p. 17-18 and 66-67.

It is the first time that the full *dowo* ceremony is given in Korana. Meinhof has published a Korana text of the " laws " and has given a short description of the ceremony in German. Campbell merely says : " They have no rite of circumcision like the Bootchuanas and the Morolong nations ; but when a boy enters upon a state of manhood, a feast called Dauro is made according to the circumstances of the father. Sometimes eight or ten oxen are slain upon such an occasion."

By far the fullest account for the Korana is Wurms'. His facts tally with those set out in the two texts above. There are however one or two material points in which Wurms differs :

(a) the fat is rubbed on the boy's body, not drunk,

(b) the " *dowo*, the very act of reception," as his version has it, consists of three parts : (i) " the knocking of the awls," which corresponds to the knocking of the stones in our text ; (2) nine cuts on the belly and nine cuts on the chest of the initiate ; (3) the " laws " given to him.

11: Maingard Q-5 (1931-1932) 1932
FX13 Hottentot FX13
Korana

Korana description did not differ from the game as played by the Naman. It may be useful to point out here that the game gets its name from //ha:, "To make a hole" and //ha:s is thus properly "a hole."

(ii) The *guessing*, "hide-and-seek." It is played by two or more players, one of them hiding some small object in one of his hands behind his back and then presenting both his hands closed, he exclaims: "*kaxe //kamiy //xa ka?*" "In which hand is it?" If the opponent guesses correctly, he says: *//kanga*. "You win."

This game is of interest because it is the famous "Hottentot card-playing," to call it by the name under which it was familiar to the Dutch colonists. It has been lengthily described by Sparrman, among others, in his *Voyage to the Cape of Good Hope*, (I, p. 231-233). He, however, missed the essentials of its significance.

VI. LANGUAGE.

This short survey concerns only the language of the *//aiway //ain* of Bloemhof and it is limited to its most important aspects. It does not appear necessary to go in a detailed manner into the features which our particular dialect may have in common with the rest of the Korana language and which have been adequately dealt with in the following works:

(i) Engelbrecht—J. A. *Studies over Koranataal*, Kaapstad, 1928. It contains a grammatical sketch and a very copious vocabulary.

(ii) Meinhof—C. *Der Koranadialekt der Hottentottischen*, Berlin, 1930. A very thorough exposition of the grammar and the vocabulary.

(iii) Maingard—L. F. *A revised ms. version of the Korana Catechism of C. F. Wurm*, Bantu Studies, v, 112-165. Contains a detailed grammatical analysis of the text and a comparative vocabulary.

PHONOLOGY

Note: The texts already given preserve the individual peculiarities of each speaker.

(a) *Vowels.* Their pronunciation is not always very clear. Engelbrecht has already noted the indistinctness between the pairs *i* and

11: Maingard Q-5 (1931-1932) 1932
FX13 Hottentot FX13
Korana

173 114 *Kopi* and *Jan Taaibosch* the father of *Gert Taaibosch*, the latter being in reality the brother of the former (Cp. B. C. p. 263 " Captain Hantu, whom his brother Gert Taaibosch succeeded.")

Hans Taaibosch is the same person as *Kopi*, for the reigning chief in 1838 was *Hans Kaptein* (Papers relating to the Wesleyan Missions, LXXXIII, September 1838, p. 2, and Report for the year 1840, pp. 61) and we know that the young Farmerfield student died at the end of 1839 or the beginning of 1840 (Shaw's Report in Report for the year 1840, p. 67).

Omissions.

(i) *Jacob Taaibosch*. He is mentioned as Jan Kaptein's brother by Edwards. At the Wingatbosm meeting (1869) and also at Mamusa before Colonel Warren (1879) a *Jacob Taaibosch* appears (*Imperial Blue Book* C. 2454, '79, p 33-34.) Whether the latter is the same as the brother of Jan Kaptein is not clear.

(ii) *Isaac Taaibosch*, mentioned by Petrus Rooy, as having succeeded *Hans*, (B. C. 263).

(iii) *Goliath Ysterbek*, the chief of the Bethany Hottentots. He is given by Missrow Rijt Taaibosch (document in *Admonetie*) as a cousin of Jan Taaibosch. It is not clear whose descendant he is.

GENEALOGY OF THE LINKS CHIEFS

173 113 Sources: Informants at Bloemhof; supplemented by the publications of the Berlin Missionary Society (1846-1854). *Totsé*, *Tabab* and others gave details which are fully supported by these records.

173 114 *gwig !haroip*, " great " or " old Haroip " is the " alte Haroip " of the Berichte (1850, p. 37, etc.) He is given as the father of Gert Links, the captain of Saron (1848-1854) and, when Johann Schmidt arrived, was already a very old man (" ein circa 90 jähriger Greis." B. M. B. 1851, p. 122), so that he must have been born about 1760 and been therefore one of the original Korana of the Orange River. If that is the case, he was already advanced in years in 1823, when Broadbent and Hodgson travelled in the Bloemhof district. It might not then be improbable to identify him with the chief *Chaabep*, " a venerable old man," about whom these missionaries speak so much. Phonetically, the identity can be explained, for, in the unsatisfactory rendering of the time, *ch* would represent a click, *-d-* would stand for the flapped retroflex consonant, which is heard by some as *l* and by others as *d* or *r*; and the *a* would be the obscure vowel, as the tone and stress are on the last

12: Maingard D-S (1931-1932) 1932
FX13 Hottentot FX13
Korana

This sketch is only a stepping-stone which, it is hoped, will lead to further somatometrical research not only upon the Korana but the other living races and tribes of South Africa – a subject the fringe of which has so far only been touched.

D. SUMMARY

1. The work of earlier writers on Korana anthropology is reviewed and criticised. So far there has been considerable theoretical discussion and insufficient investigation of known Koranas.

(2) Historical evidence is adduced to show that the Korana, once described as "pure Hottentots," are now extensively infiltrated with Bush and Bantu elements.

(3) The external appearance of eleven members of the Links tribe of Korana is briefly discussed and is also shown to point to racial impurity.

(4) The available skeletal characteristics of Links Korana are discussed. This group is shown to be mainly of "Bush type" in these respects.

(5) There is no evidence apart from the effects of this extensive admixture with Bush and Bantu, that the Korana differ appreciably from other "Hottentots" in skeletal characteristics.

(6) The matter of nomenclature is discussed. Faulty nomenclature and methods of research have, up to now, led to confusion in this subject. The importance of field work and the necessity for exact identification of the material under examination is emphasised.

14:Hahn L-S (ca. 1870-1880) 1881 FX13 Hottentot FX13

term *Hottentot* to the whole race, and call the two families, 101
each by the native name, that is the one, the *Khoikhoi*, the so-called *Hottentot proper*; the other the *Sān* (*Sā*) *or Bushmen*.

In the Nama language, one of the Khoikhoi idioms, 196
the Bushmen are called Sā-n (com. plur). The meaning of this term is not quite intelligible, and I frankly confess that, after nine years, of which I have spent nearly seven amongst the Khoikhoi, I did not succeed in arriving at a quite satisfactory etymology, and I must still adhere to the interpretation which I first gave in the *Globus*, 1870, where I traced the word Sā-(b) to the root SĀ, to inhabit, to be located, to dwell, to be settled, to be quiet. Sā(n) consequently would mean Aborigines or Settlers proper. These Sa-n or Sa-gu-a, Sonqua or Sounqua, &c. (obj. plur. mec.) as they are styled in the Cape Records, are often called Bushmen—the Bosjesman, Bosjesman, Bosmanneken of the Colonial Annals, a name given to them to indicate their abode and mode of living.

The word Sā(b) has also acquired a low meaning, and is not considered to be very complimentary. The Khoikhoi often speak of *!Uri-Sān* (white Bushmen) and mean the low white vagabonds and runaway sailors who visit their country as traders. One also often hears, "*Khoikhoi tamab, Sab ke*," he is no Khoikhoi, he is a Sā, which means to say, "*he is no gentleman, he is of low extraction, or he is a rascal.*" A Nama will say of a man who is very proud and reserved in his manners, who only mixes in good society, "*Khoikhoiseb ra aob ke*," the man *makes-a-Khoikhoi-of-himself*, that is, *he stands very much upon his dignity*, and also, *he keeps himself very much to himself.*

Those who desire to have information on the natural 113
and physical condition of the Khoikhoi and Sā-(n), I refer to Dr. Gustav Fritsch's standard work, "Die Eingeborenen Süd-Africas," and to three Essays published by me, Die Namas, and Die Buschmänner, in the

14:Hahn L-S (ca. 1870-1880) 1881 FX13 Hottentot FX13

113 *Globus*, 1868 and 1870, and Beiträge zur Kunde der Hottentotten, in *Jahresbericht des Vereins für Erdkunde*, Dresden, 1868; not to forget the chapter on the Hottentots in Friedr. Müller's excellent work "Allgemeine Ethnographie."

648 It is enough meanwhile to say, that the Bushmen lead the life of a Pariah, and that they are hated and chased by all other nations of South Africa, having to suffer most, however, from the hands of their own nearest kith and kin, the Khoikhoi, whom I have, on more than one occasion, seen manifesting more charity for a dog than for a starving Bushman.

101 The Khoikhoi are generally called, as I have already said, Hottentots, a term to which I would not object, were it not for the confusion it generally brings in its train, as far as ethnological, anthropological or linguistic terminology is concerned. Sometimes they are called the *Hottentots proper* in our Colonial language. But very often, again, our Khoikhoi in the Colony, or more particularly those remnants of the tribes formerly occupying the vicinity of Cape Town, are called *Hottentots*, *Hottentots proper* or *Cape Hottentots*, while on the other hand the inhabitants of Griqualand West, of the South Kalihari, of Great Namaqualand are called by their tribal names, Griquas, Namaquas, !Koras or Korannas, just as if they were not Hottentots as much as the Khoikhoi tribes of the Cape Colony. It would be as absurd for us to call only the Prussians, Germans, and apply to all the other tribes of Germany their tribal names, Bavarians, Suabians, Hessians, &c., denying to them the attribute German; or for Londoners to claim for themselves the title of Englishmen, while excluding the Northumberland and Sussex men from it.

This is my reason for protesting emphatically against the indiscriminate and superficial use of the term *Hottentot*, and therefore I have taken the liberty of taxing the patience of my readers by dwelling at some length on this subject.

the nineteenth century. Five had already been destroyed in native wars before our armed intervention in the disorders of Namaland. Their former territory (as of 1852) is indicated on the map by broken lines, for the borders of the remaining tribes (as of 1890) by unbroken lines (cf. map legend). At the moment it is not possible to foretell what the situation will be in regard to their numbers, their captains and their dwelling places, when the country is at peace again. At least the names of the tribes can be listed here: [172] a) Nãũna-o is the name the Hottentot gives to those tribes who have lived for generations in present-day Great Namaland. They are: [5] 68

1. The ǂAo-ǁain or ǃGo-ǁnun, who are sometimes called °ǂNa-tsain by their neighbors because of their great (tarse) fields, the Topnaar of the Boers.

2. The ǃKŭa-tsaĩ-b‖aĩn, shortened to ǃKŭa-ts(a)ĩb‖ĩn, the Franzmann Hottentots or also called the Simon Kopper people after their captain.

3. The ‖Ha-hoba-o or Veldschoendragers,

4. The ǃGa-mi‖ãũ-ǁa or Bondelswarts,

5. The ‖Kŭãũ-ǁgãũ-a or Zwartboois now settled in the southern bushveld outside of Namaland with a few scattered exceptions.

There are also others, who, although today they are scattered, still live in the memories of the natives as ancient tribal communities.

6. The ‖Kŭãũ-hen or the Red Nasie,

7. The ǃKŭa-ng‖ã-an or the Tsaibochen Hottentots of Keetmanshoop,

8. The ǀOgain or Groenlanders.

b) °Gã‖ain is a designation for those Hottentot tribes, who emigrated from the present Cape Colony to Great Namaland at the turn of the nineteenth century. The following, usually called Orlam, belong here:

9. The ǂA-mãĩn or Bethanie Hottentots,

10. The ǀHai-ǁkŭãũ-an or Berseba Hottentots,

11. The ǀKŭã-hain or Witboois,

12. The Gai-ǁkŭãũ-an or Amraal Hottentots of Gobabis.

In addition there is the tribe, extinct since 1889 which, under the leadership of Jonkers and Jan Afrikaner was the most feared of all the Orlam tribes,

13. ‖Aũ-ǂa‖a-an or the Afrikaaner.

These thirteen names will soon be all that is left of the old tribal divisions of the Hottentots. Before the destruction of the language, ideas and customs of this people, inevitable as its political destruction ensues, 14

everything that can at least be saved, at least for the ethnologist, should be brought to safety. I tried to carry out to the best of my ability this duty that belongs to every scientific traveler, insofar as my chief task, research in my own special field, permitted. I made it a rule to note down only those things I saw and experienced in direct, personal contact with the natives. Only in the chapter, "Midwifery" did I find it necessary to depend upon the experiences of a local white woman. Well aware that the experiences of an [178] individual can only be spotty, I still prefer to paint the picture of the Hottentots as it appeared to me and not to draw with another's pen, even when the gaps are large, because in an area that leaves so much to the interpretation of the individual, I would only trust myself an interpretation of those things which I myself have observed.

G. Fritsch (68) has made a compilation of the most worthwhile ethno-

68. G. Fritsch. Die Eingeborenen Südafrikas, ethnographisch und anatomisch beschrieben, mit Atlas. Breslau. 1872.

logical material that was available up to 1872. But since the work of Theophilus Hahn. (66) published in 1867, there have been no coherent

66. Th. Hahn. Die Nama-Hottentotten. Ein Beitrag zur südafrikanischen Ethnographie (Globus, vol. XII. 1867).

original investigations of the folk life of the Hottentots. I will merely mention Ratzel's(70) presentation here. It cannot be my job to discuss the

70. Fr. Ratzel. Völkerkunde. 2nd ed., 1894.

problems of the comparative ethnology of the South African peoples from the viewpoint of the specialized literature. I shall only report my own observations, developed independently, often merely stated as facts for more expert people to evaluate.

In regard to the Hottentot script inserted in the text, refer to what is said in chapter V, A, about the language.

I was always spurred to further research by seeing that where, on the basis of older reports, it was least expected, the old individuality of the people in respect to the family and the individual, had often remained

645

The first contact of the Hottentots with the Bergdamaras goes beyond any time from which we have historical dates. Pieter Brand, the companion of the explorer Willem van Reenen (14), who led an expedition in

14. G. M'Call Theal, History of South Africa, Vol. I - VI, London, 1888-1902.

September 1791 into Great Namaland, found the language of the Hottentots in use among the Bergdamaras. Their own mother tongue seems to have been forgotten at that time as it is today. Although the Bergdamaras have obtained their freedom under the German protectorate and have been freed from the yoke of the Hereros as well as from that of the Hottentots, they have often remained in voluntary dependency as household servants as the Buhmen have.

Although generally known as good-natured and docile and therefore treasured by the whites, the derogatory name given the Bergdamaras by his oppressors has remained. The Hottentot calls the Bergdamaras ǂau-daman, i.e. shit Kaffirs." I also heard them called ǂhau/kxoĩn, i.e. (according to the claim of the Hottentots themselves) "Manure people."* A friendly

*Derived from ǂhau/b = manure. Krönlein (57) [114]

57. J. G. Kroenlein, wortschatz der Khoi-Khoin, Berlin, 1889.

does not know this word and derives the above designation, which, according to him, the Bergdamaras have given to themselves, from the word for "to be right." But to my ear it is not ǂhau/ but sounds like ǂhau-, the two vowels pronounced separately and with a rising (one third) accent. I can only place my opinion beside Kroenlein's as the actual result of my findings without deciding which is better. Schinz (50) mistakenly writes !haukhoin and his

50. H. Schinz, Deutsch-Südwestafrika. Forschungreisen (1884-1887) durch die deutschen Schutzgebiete etc. Oldenburg and Leipzig, 1891.

typesetter muddled the click even more in the index.

shown whether the fragments published by Lichtenstein, Burchell and Wuras of the !Kora dialect, whether the parts of an eastern dialect which Sparrmann, Thunberg and Barrow have heard, and whether the notations of Herbert, Ten Rhine and Witsen of the dialect of the Capeland Hottentots of the seventeenth and the beginning of the eighteenth centuries could be so arranged that they would at least give us a vague picture of the lost languages. The tribes of Great Namaland now form linguistically unified group with the fugitives from the south. Their language is that of the old Namaa or Namaqua as older authors write using the former ending of the masculine plural. 197

The language of the Hottentots was the greatest hindrance during the first six months of my journey in getting closer to the spiritual life of the people. In the second and third year it was the most fertile source of my studies. Where war troubles or the unfavorable time of year stopped my zoological studies, I turned to the study of the language. A small work by Theophilus Hahn (78), a concise presentation of the 114

78. Th. Hahn, Die Sprache der Nama, Leipzig, 1870.

language that contains many errors by A. Seidel (79) and especially

79. A. Seidel, Praktische Grammatiken der Hauptsprachen Deutsch-Südwestafrikas, Wien, Pest, Leipzig, (ohne Jahreszahl).

Kroenleins Wortschatz (57) gave me a first start and later a basis for

57. J. G. Kroenlein, Wortschatz der Khoi-Khoin, Berlin, 1889.

testing my own results against older ones.

The Hottentot words in the text all stem from the natives. If I have avoided all the information of the whites who know the language, it is not because I underestimated the help that I could have received here, but because I wished to drink exclusively from the source. Therefore I have also avoided natives who could read and write, because they looked at their own language through the glasses of the white man who first gave written signs to these sounds, partly in close connection with the Dutch

language. I was interested in the spoken word of the linguistically pure Hottentot. The difficulties of making oneself understood with illiterates had the advantage that they concentrate all their attention on listening and when I was attempting to repeat what I had heard in a phonetically correct manner they demanded a much stricter accounting than would have been required in any agreement on paper on the basis of conventional signs. In this way I first established the native names for the animals [341] and then for the plants which I gathered. From these studies came other linguistic stimulations, in the way that a simple example will illustrate. One Hottentot, whom I asked if he had ever seen the large, South African ant-eater, the aardvark, which animal is very difficult to shoot, promised, to my great amazement to bring me one that same evening. He brought a root, because I had not pronounced the Hottentot term for this animal with the accent on the last syllable and with a rising word-tone (/kxubu·s), but with the accent on the first syllable and with a falling word-tone (/kxu· bus). Such misunderstandings occurred frequently in the course of the first year. They showed me again and again the necessity of never leaving out of consideration the phonetic side of the language and of marking every new word immediately with diacritical signs, since I might have to differentiate it later from a similar sounding one.

The counter check, whether I had used enough signs to differentiate similarly sounding words and had chosen the right ones, was simple. After several days I would pronounce the words I wished to test to a native, reproducing them exactly from the chosen signs and then I saw at once whether he had understood the meaning clearly or not in the sense that the written method wished to convey. I then compared the results of this method with the customary way of writing it and soon came to the conviction that there were not sufficient signs in use to reproduce the sound relationships of the Nama language as was necessary from the phonetic viewpoint and as was desirable in the interest of a clear differentiation of similarly sounding words.

In the stories that follow later I shall give examples of morphology and syntax of the Nama language. I will restrict myself here to giving the results of my investigations of phonology.

1. The Clicks

Clicks are the most noticeable sounds in the Nama language, and learning to differentiate and pronounce them belongs to the first and

Nama

CHAPTER IX

Social Organization

The only Hottentot people whose social organization is at all well known are the Naman of South-West Africa, of whom a special study from this point of view has been made by Mrs. A. W. Hoernlé. The valuable description given by her[1] is supplemented in several respects by the observations of other writers,[2] so that it is possible to arrive at a fairly clear conception of the social structure of this division. The original organization of the other Hottentot peoples has long since been totally obliterated, and the information bearing upon it is too fragmentary to provide much material for discussion. As far as can be gathered, however, they appear to have had essentially the same system of social grouping as the Naman.

In the case of the latter also the old tribal system has been almost wholly destroyed. At the present time some of their tribes are already extinct, i.e. the tribal unity has been completely broken down, although one may still come across individuals claiming to belong to one particular tribe or another. Most of the Naman, in fact, are now scattered all over South-West Africa in the service of Europeans, and have no longer any tribal allegiance, for it was the deliberate policy of the German government to break up the tribes. But even where a small remnant of the people still hold together under the leadership of a man whom they regard as headman or chief, much of the old system of grouping has ceased to exist. The following analysis, therefore, relates very largely to conditions of the past.

The Tribe

The nomadic pastoral life of the Naman and the unsuitable climatic conditions under which they dwell have resulted in their distribution over the country in small scattered communities. Although it appears from the traditions of the people that they all originally belonged to

[1] "The Social Organization of the Nama Hottentots," *Amer. Anthrop.*, xxvii (1925), 1–24. Except where otherwise stated, this is the principal authority for the facts recorded below.

the sacramental meal being the central feature. The other discrepancies between the two versions it is more charitable to ascribe to differences in tribal custom. The point cannot be definitely settled, since no other first-hand observers appear to have recorded the ceremony with sufficient wealth of detail to provide material for comparison.

Even the descriptions given above seem inadequate when considered in the light of Mrs. Hoernlé's general analysis of the Hottentot "transition rites". That these hunting ceremonies fall into this category is evident from the holding of the sacramental meal, the usages relating to the fire and to the meat, the scarification and the smearing of the face recorded by Wikar, as well as the seclusion mentioned by Kolb. Now that hunting of this description has ceased to be possible, owing largely to the extermination of most of the big game, the rites seem completely to have lapsed, and it is hardly likely that further information about them can still be obtained. A casual remark by Mrs. Hoernlé implies that they really constituted the boys' puberty ceremony. "I found it extremely difficult," she says,[1] "to get trustworthy information about the puberty ceremonies of the boys, which seem completely to have lapsed since big game hunting ceased to be possible, and with it the necessary test of manly prowess which it offered." It will be remembered, however, from the descriptions given above of the boys' puberty ceremony that none of the authorities there quoted makes any mention of hunting; Wikar explicitly separates the two ceremonies in his general sketch of the occasions on which the sacramental meal is held, as does Mrs. Hoernlé herself in a similar analysis[2]; and so too Kolb describes them in different contexts, and even, as we have seen, speaks as if the hunting rites were usually undergone by married men only. On the evidence at present available, therefore, there seems no good reason for connecting the two.

Industries and Trade

Industries

Few aspects of Hottentot life have been recorded in less detail than the economic activities directed towards the production of objects of use and trade. The great majority of the writers merely enumerate and describe the various implements and utensils noticed

[1] "The Conception of Sin among the Hottentots," 70.

by them, although the technological processes involved are dealt with to some extent by Kolb and more fully still by Schultze. But the social side of the industries—forms of work, economic motives, division of labour, and so on—has received hardly any attention at all. It is difficult therefore to give an adequate picture of the industrial activities of the Hottentots. This difficulty is increased by the fact that ever since contact with Europeans was established there has been a gradual substitution of European goods for native products, until at the present time the productive work of the Hottentots, where it is still carried on, has to a considerable extent acquired a new character.

The main economic unit in Hottentot life, as far as one can judge, is the family. Each family not only has its own herds and flocks, thus providing for the greater part of its subsistence, but in a large degree also manufactures the objects required for its domestic purposes. The construction of the huts, the making of whose mats is still an important native craft, has already been described. The other forms of industry may be grouped under the main heads of skin-dressing, netting, pottery, wood-carving, stone- and metal-work.

Before the Europeans came into the country, the skins of domestic animals and game provided the sole material for the clothing of the Hottentots, as well as for a number of other objects. Nowadays, except perhaps in a few remote places, clothing is almost entirely of European pattern and material, but skins are still used for other purposes. Among the Cape Hottentots, it would appear from Kolb's account,[1] the preparation of skins was mainly the work of the men. Skins used for making clothing, karosses, etc., were dressed by the craftsman repeatedly rubbing into the fleshy side as much fat as possible, and then beating them hard with the kirri, until they became quite tough and smooth; or they were alternately rubbed with cowdung and fat, and then carefully dried in the sun. They were then sewn together with sinews, generally taken from the back of an ox, the pointed leg-bone of a bird being used as an awl. Ox hides were either used for lining the hut, or cut into thongs with which objects were bound on the backs of pack-oxen. To loosen the hair the fresh skin was sprinkled with ashes and water, then rolled up and exposed for a day or two to the heat of the sun, and after depilation it was rendered supple by being rubbed in with fat. Finally, if required for thongs, it was pegged out on the ground and cut into long strips of about the same width by means of a sharp iron blade.

CERTAIN RITES OF TRANSITION AND THE CONCEPTION OF ǃNAU AMONG THE HOTTENTOTS[1]

A. W. Hoernlé

114 101 The following notes have been put together from the materials which I collected during the years 1912 and 1913 on two expeditions made among three different tribes of Hottentots. In 1912 I visited the remnants of certain tribes of the Little Namaqua, among whom some fugitives from the tribe of ǃGamǂnūn or Bondelzwaarts of German South West Africa were living. It was a very scattered community on the southern bank of the Orange River, about fifty miles inland from its mouth, and in British territory.

The following year I spent among the ǂĂunin or Topnaars of Walfish Bay and among the /Hei /Khauan, who live now in the territory round Berseba in German South West Africa. This latter tribe crossed the Orange River in the beginning of the 19th century, after its members had absorbed a great deal from the Dutch among whom they had lived, and with whom there had been a considerable amount of intermixture. As a result of [177] the mixed blood and the adoption of many Dutch ways, the pure Hottentot customs and beliefs had been considerably modified among them. They are an offshoot from the Cauquas, who in the time of Simon Van der Stel (17th century) lived in the present Worcester district of the Cape Colony in the valleys of the Breede River,[2] and belong therefore to the so-called Colonial Hottentots, not to any branch of the Namaqua people with [796] whom the other tribes I visited must be classed. It is, therefore, extremely interesting to find that all four of the transition rites (*rites de passage*) which I am about to describe in this paper are practised by them with but slight variations. Whether they brought these customs with them, or whether they adopted them from the tribes with which they came in contact when they crossed the Orange River in their progress northwards, it is impossible to say. The ǂĂunin, though but a miserable remnant of what was never,

[104]

[1] In this paper I have used, as far as possible, the notation employed by J. G. Krönlein, Wortschatz der Khoi-Khoin, Berlin, 1889. /, indicates the dental click; ǂ the palatal; ! the cerebral; // the lateral. χ indicates a guttural ch; the mark ¯ over a vowel indicates that it is long; ˜ indicates that it is nasalised. A short vowel has no special sign; ` represents the low tone of the vowel; ´ the middle tone; ˚ the high one. The sign . under a vowel indicates that it is very short; while ¨ indicates that the vowel is to be separately pronounced.

Nama

perhaps, one of the largest tribes, is probably the one most satisfactory to study, for these people have been marooned for two or three centuries among the sand dunes which form their present home, attracted thither by the famous !náras melon which provides them with food for many months in the year. I travelled in the country five years after the end of the German-Hottentot wars, during which great numbers of the older people perished, and the whole tribal system of the Hottentots received its death blow.

The Hottentots are now a passing people, who have practically given up the struggle of keeping alive their own traditions. What vitality is left is spent in the absorption of the ways of the incoming Europeans. One has, therefore, to be content with what remnants of their former customs and beliefs one can still gather from them. It was only by reviving long forgotten memories among the oldest of the men and women that I could gather up many of the customs of the past. One of my best informers, a woman, reproached me bitterly for encouraging her to think of things she had spent half her life in trying to forget: "You have made me live the old life once more; soon you will be going, and what shall I do then?"

The four transition rites which I shall describe are, however, practised even now among the people I visited, though sometimes in a simplified form owing to the great poverty which prevails. Though I have obtained details from many informants, the main contribution is that of four persons, two men and two women. It is to one of the women that I am most indebted. Hannah[3] !Amatis was, before she married among the ǂĂunin, a member of the //Khau-ǂGôan tribe, where she learnt all she knew from her grandfather. The latter was headman of his tribe, and as she was his favorite, and a very clever girl, he told her all the old lore of his tribe. She became my closest friend among the Hottentots, and to her I owe the framework of my information. She is now a woman well over 60 years of age. Louisa !Kabes is a somewhat younger woman, less intelligent, but very inquisitive. As a girl she used to hide where old and important people were talking, thinking that such as she were far away. She married into the family of the old Captain Piet //Eibib of Walfish Bay, who was long subsidized by the Cape Government, and who was a most intelligent old man. He died some eight years before I came among the people, well over eighty years of age. Gottlief //Ămib was the oldest of my informers, and both he and his brothers had been throughout their lives, not only because of their family connections, but because of their intelligence, the headmen of the captain of the Topnaars. Gottlief was a splendid informer and an admirable character, but he was becoming frail, and his memory was no longer at its best. He often said he was no use, and wished I might have clearer information on what were for him exceedingly weighty

[3] Most Hottentots have now a "Christian" name as well as a native one.

8: Dapper Q-4 (no date) 1933
FX13 Hottentot FX13
Cape Hottentot

FOREWORD.

114 Olfert Dapper, the son of Gerrit Gerritsz. Dapper and his wife Trijntje Heeres, was born in Amsterdam in 1636. Of his private life very little appears to be known.* The available records show that he registered as a medical student at the University of Utrecht in 1658, but there can be little doubt that he soon abandoned his studies and took to writing. The degree of M.D. which adorns the title pages of his books seems to have been conferred upon himself by his own authority; there is at any rate no record of his graduation, nor of his having ever practised medicine. All his energies must have been devoted to reading and writing, for in his comparatively short lifetime (he died in 1689) he produced a number of large and important works. His first book, an historical description of Amsterdam (1663), said to be far superior to anything previously done on the same subject, was followed by a Dutch translation of Herodotus (1665). From now on he seems to have applied himself with indefatigable zeal to learning all that he could about foreign lands. As a result of his studies he composed the great series of geographical works upon which rests his fame. The first to appear was a description of Africa (1668), which met with so favourable a reception that henceforth he devoted himself entirely to geographical writing. In 1670 appeared an account of the Dutch East India Company's activities in the Far East, followed by an exhaustive study of Asia (three parts, 1677-1680), and finally by several works on the Near East.

Dapper's *Naukeurige Beschrijvinge der Afrikaensche Gewesten*, dealing as it does at considerable length with the topography, botany, zoology and ethnography of the whole continent and its adjacent islands, was long regarded as one of the most authoritative early accounts of Africa. For many years after its first publication it was freely quoted, translated and plagiarized. Even so well known an authority on early Cape affairs as Abraham Bogaert, who visited the settlement six times, has in the chapter he devotes to the Hottentots in his *Historische Reizen door d' oostersche Deelen van Asia* (1711) drawn practically all his information and many of his actual sentences from the pages of Dapper. And yet, like all Dapper's other geographical works, the account of Africa was essentially a compilation.

114
127

*The biographical details here given are based upon the short sketches of Dapper in the *Nieuw Nederlandsch Biographische Woordenboek*, vol. 7, and Michaud's *Biographie Universelle*.

114
127

He does not appear to have ever left Holland to see with his own eyes any of the countries he describes. For his material he relied solely on printed sources and on memoranda specially prepared for him. That this circumstance does not guarantee the accuracy of his work is obvious. His great merit, however, lies in the fact that he ranged very widely in search of information, and that he had a shrewd eye for relevant detail. His work was comprehensive and painstaking, and as the first great compendium of modern knowledge about Africa it became deservedly famous.

The pages dealing with the Cape and the Hottentots are based to some extent upon the anonymous *Klare ende Korte Besgryvinge van het land aan Cabo de Bona Esperanca* (Amsterdam, 1652), itself a compilation, which he pillages freely enough when it suits his purpose. He also used very sparingly the records of the first Dutch voyage to the East Indies (1595). The bulk of his information, however, is not to be found in any contemporary published account. He says himself in the foreword to his book that most of what he relates, especially about the tribal divisions, manners and customs of the Hottentots, is derived from manuscript accounts sent to Holland by a certain "diligent observer" at the Cape, and that he has added only a little from printed sources. In his text, too, he refers several times to information sent over by men on the spot.

Theal, in a brief notice of Dapper's book,* points out with justice that the pages dealing with the Cape seem to have been prepared by someone who was not there at the commencement of the occupation, but who had been in the settlement long enough to know all about it, and who was obviously studying the customs, manners and language of the Hottentots. He goes on to suggest that Dapper's unnamed correspondent was probably George Frederick Wreede. There is much to be said in favour of this attribution.

Wreede was a runaway German student who enlisted in the service of the Dutch East India Company, and came to the Cape in 1659.** Here he devoted himself to a study of the Hottentots. In a few years he had acquired a thorough knowledge of their language, and was often employed as an official interpreter and messenger to the Hottentot chiefs. By November, 1663, he had compiled a vocabulary of Hottentot words with their Dutch equivalents, which the commander of the Cape forwarded to the

---

History and Ethnography of S. Africa before 1795, iii, 276.

**On his life and career cf. Theal, *op. cit*, ii, 139-141, 176-177; Godée-Molsbergen, *Reizen in Zuid-Afrika*, i, 215-6.

Directors of the Company in Holland, with the request that it might be printed and some copies sent back to the settlement, where it would be useful. The Directors, though more anxious that the Hottentots should learn Dutch than that the settlers should become familiar with the native language, promised to have the work printed; but the promise never seems to have been carried out.* The manuscripts of the vocabulary are no longer preserved in the Archives of either Holland or the Cape. It is generally believed that they were lent to the historian Ludolf and never recovered, for in a biography written of him by Christian Junker and published in 1710 there is a long Dutch-Hottentot-Latin vocabulary whose source is not mentioned, but which is now universally attributed to Wreede.** The latter was rewarded for his studies with a small grant of money, and offered promotion by the Directors to any branch of the Cape service that he wished to select. He was ultimately appointed commander of Mauritius, where, after some vicissitudes of fortune, he met his death by drowning in 1672.

Wreede therefore seems to have been the most likely person at the Cape to supply Dapper with information about the Hottentots. There is also a certain amount of internal evidence to suggest that the account upon which Dapper drew was written about the time that Wreede's vocabulary was compiled, i.e. 1662-1663. Thus of the old chief Gogosoa he says, "In 1662 he was, according to the accounts of men already there, quite a hundred years old"; he speaks in the present tense of Herry, who died in 1663, and of the Chainouqua chief Soeswa, who died in 1664; he says (erroneously) that the Kochoqua chief Oedasoa died in 1661, but does not name his successor; he gives the exact dates of several events occurring between 1659 and 1662, but not later; and so on. Whether Dapper was in direct communication with Wreede cannot be ascertained; it is equally probable that he may have obtained the latter's account of the Hottentots through the famous Amsterdam burgomaster Nicolas Witsen, to whom many of his books are dedicated, and from whom, incidentally, Ludolf is supposed to have received the loan of Wreede's Hottentot vocabulary.

Dapper's informant certainly managed to ascertain a good deal more about the Hottentots than had previously been known. His long list of tribes, with the careful description of their known habitations and rulers, is the

*The relevant official correspondence is reprinted in Moodie, *The Record*, pp. 271-79.

**This vocabulary is reprinted by Godée-Molsbergen, op. cit., 215-24.

114 first ever printed, the more authoritative list compiled by van Riebeeck being of course preserved as manuscript in the Archives and not published for more than two hundred 127 years. The discrepancies between the two lists seem to show clearly enough that neither Dapper himself nor his informant had access to the official records. His general account of Hottentot life is far more comprehensive than any of its predecessors, and reveals an intimate first-hand acquaintance with the people; while much of the information, especially in connexion with religion, legal procedure and marriage customs, is completely new. It deserves special praise for the way in which, passing lightly over customs simply quaint and curious, it discusses in detail the ordinary, daily life of the people, a feature which modern ethnographers too are now beginning to emphasize as of outstanding importance. With all its inaccuracies (and these are most marked in references to historical occurrences), Dapper's work may justly be regarded as containing the first really serviceable account of the Hottentots.

114 The passages here reprinted from his pages on the Cape are those referring directly to the Hottentots; his description of the country, its climate, botanical and zoological resources have been omitted as irrelevant to the scope of this volume. The text followed is that of the second edition (1676, Tweede Deel, pp. 251-260, 263, 268-278), which, except that misprints have been corrected and several other slight errors rectified, is substantially the same as that of the first edition (1668, pp. 626-636, 643-653). The translation is the first complete one ever made into English. John Ogilby's *Africa* (London, 1670) was based largely upon Dapper's work, and its information relating to the Hottentots (pp. 576-583, 589-595) was all taken from the latter; but a good deal had been omitted, and much of what remains had been paraphrased. I have made no attempt to reproduce Dapper's rather laborious style or employ any corresponding archaisms. Mr I. W. van der Merwe, M.A., Lecturer in Nederlands and Afrikaans at the University of Cape Town, was kind enough to read through my translation and help me over some puzzling passages, but for the final version here printed I must assume all responsibility. I have occasionally taken the liberty of modernizing Dapper's punctuation, which in the original is apt to be confusing; and have used most (but not all) of his marginal notes as paragraph headings.

[p. 5 is BLANK]

9: Ten Rhyne D-5 (1673) 1933
FX13 Hottentot FX13
Cape Hottentot

FOREWORD.

● 1/4 Ten Rhyne's account of the Hottentots, unlike that of Dapper[1] is the product of personal acquaintance with the people. Although typical in some respects of the many descriptions compiled by transitory visitors to the Cape, it is well above the average in regard to the value and amount of information it contains. He nowhere states explicitly how long he was at the Cape, but it appears from the official records that the ship on which he must have arrived, the *Ternaten*, reached Table Bay on October 15, 1673, from Amsterdam, and departed for the East on November 10, after a stay of nearly four weeks. During this time he seems to have inquired fairly industriously into the natural resources of the country and the manners of its native inhabitants; and although his primary interest was obviously botanical, he also managed to learn a good deal about the Hottentots. It is evident from what he himself says that his information regarding the latter was obtained from all the available sources, his own observations, discussions with local European residents, and conversations with such Hottentots as could understand Dutch, of whom he names especially the famous Eva.

When stripped of its verbiage and classical allusions, his account of the Hottentots can by no means be regarded as detailed. Nevertheless his remarks on their mode of life, warfare, cattle trade and medical practices are particularly valuable additions to the scanty information previously published on these topics, and he also has some useful observations on their physical peculiarities and bodily mutilations. His list of tribes, too, is of considerable importance. It shows how within twenty years from the foundation of the settlement the groups in its immediate vicinity had degenerated into mere hangers-on and followers of the Dutch, how tribal distinctions were being lost and individual leaders coming into prominence, and how only the more remote tribes still retained their original character. It is significant too that he gives pride of place to the Hesequa, then valued as the principal market from which cattle could still be bartered in large quantities. On the other hand he says little that is new about Hottentot clothing, dwellings, food and social customs generally; his comments on their religion and system of government are distinctly weak; and occasionally he indulges in some rather fantastic statements suggesting a lack of critical ability or at least a naive credulity.

[R81]

[1] [see 8: DApper, this File. - Analyst]

9: Ten Rhyne D-5 (1673) 1933
FX13 Hottentot FX13
Cape Hottentot

114 Of the man himself but little appears to be known.* He was born in Deventer about 1640, and studied at Leyden under the celebrated Dubois de la Boë. After practising in Holland for a while, he was appointed physician to the Dutch East India Company's settlement in Java; and it was on his way there in 1673 that he passed through the Cape. In Java he worked hard at his professional duties, also making a voyage to Japan, where he successfully treated the emperor for a grave illness. But he devoted himself especially to studies in natural history, above all botany, collecting numerous specimens of the exotic Eastern plants which he sent back to Holland. Of his later career hardly anything can be ascertained, not even the date of his death, but it appears from the title page of his book on the Hottentots that he was a member of the East India Company's Council of Justice. The British Museum Catalogue lists six works from his pen, all, save that on the Hottentots, dealing with medical and botanical subjects. A description of the plant collections he made at Saldanha Bay and the Cape in 1673, together with some other botanical observations of his, can be found in *Plantarum Exoticarum Centuria Prima*, published by the botanist Breyn in Danzig, 1678.

TRANSLATOR'S NOTE.

The Latin text of the present edition is reprinted exactly from a copy of the small octavo volume printed at Schaffhausen in 1686 and now in possession of the South African Public Library, Cape Town.

This 1686 edition was made from a MS roll and was provided with corrections and annotations by the editor. It is not easy to say what the annotations provided by the editor were, as most of the footnotes seem to belong to Ten Rhyne himself; and the text is still in need of correction. In my translation I have silently ignored errors of punctuation. Slight verbal errors have been corrected in footnotes. In the few places where I suspect a deeper corruption I have not suggested any emendation. The grammar may be bad, but the sense is clear enough, and a critical discussion of the text seems uncalled for.

The translation is not the first that has been made in English. Within twenty years of the publication of the original an anonymous version was printed in England (*A Collection of Voyages and Travels, etc.*, printed by H.C. for Awnsham and John Churchill at the Black Swan in

---

*The few details here given are drawn from the biographical sketch in Michaud's *Biographie Universelle*.

9: Ten Rhyne D-5 (1673) 1933
FX13 Hottentot FX13
Cape Hottentot

Pater-noster-Row, London, 1704; vol. iv, pp. 829-45). This version contains a few happy phrases, some of which I have been glad to borrow. It is, for instance, to the anonymous translator that we owe the description of Aeva as "a civil, modest body, of rational discourse." But his is on the whole a poor version, full of mistakes and omissions, quite unfit to be reprinted.

As is characteristic of the time, the Latin of Ten Rhyne is somewhat laboured and affected, often conveying simple information in a pedantic and allusive fashion. But the style is, nevertheless, graceful and sensitive, and the translator feels challenged to render not merely the matter but the manner of the original. However little Ten Rhyne succeeded in learning about the Cape in his brief stay, he was alert and interested and his narrative has freshness and charm.

On the scientific value of the information he has to give it is not for me to pronounce. But I have been at pains to set forth in the footnotes his naive dependence on his classical models for many eloquent sentences supposed to be descriptive of the Hottentots. The curious may find some instruction and amusement here. It is always worth while to impair the authority of print.

A point of general scientific interest in the present work is the attack on Descartes. It is worth noting in this connection that Ten Rhyne had imbibed his hostility to the *à priori* method of interpreting natural philosophy from an early work of Greek science that has attracted much attention in modern times. In 1669 and again in 1672 Ten Rhyne published discussions on the Hippocratic tract On Ancient Medicine.

B.F.

FOREWORD.

● 114 The manuscript account of the Cape and its native peoples, the original text of which is here for the first time printed, was purchased at the sale of the Sunderland library in 1882 by the late Mr. C. A. Fairbridge, who subsequently presented it to the South African Public Library, Cape Town, where it now is. A small quarto volume of 120 pages, neatly bound in vellum, it is evidently the copy of a letter written to an (unnamed) clergyman in Holland, and is dated 1695. How it got into the Sunderland library is not known.

Its author, Johannes Gulielmus de Grevenbroek (as he usually signs himself), was born in Holland about 1644. Of his early life the only facts he reveals are that he visited Italy in 1673, and had also been to Madrid. There is, however, good reason to believe that he was employed at home for some time as a clerical assistant in the Rotterdam Chamber of the Dutch East India Company. In June 1684 he sailed to the Cape in the Company's service, and in October, soon after his arrival, he was promoted to be Secretary of the local Council of Policy. He seems to have accompanied the Commissioner Ryklof van Goens to India almost immediately afterwards, and did not take up his regular duties until after his return (1686). A large number of the official records for the next few years have preserved for us his beautifully clear handwriting and decorative signature. He served as Secretary until June, 1694, when he resigned voluntarily, and went to live at Stellenbosch as a free burgher. Adam Tas, in his famous Diary (1705-6), on several occasions mentions Grevenbroek, then an elder of the Church, but does not tell us much about him. It is evident, though, from stray remarks in this book, that Grevenbroek was on the whole sympathetic with the movement of the discontented farmers against Governor Adriaan van der Stel, although his name is not attached to their memorandum of complaints addressed to the Chamber of Seventeen.

His will, signed at Welmoed, Eerste River, on February 3, 1714, when in his seventieth year, shows him to have been a careful man of business and a grateful friend. Apparently he never married, for there is no reference in it to wife or family. The bulk of his estate, after various legacies to friends and acquaintances in both Holland and the Cape, is left to a certain Isak Schepers. The date of

his death is not known, but it must have occured some time before 1726, when his will was filed with the Cape Orphan Chamber (*Cape Archives O.C. 4 No. 14*). In it he directed that his body should be buried not in church or churchyard, but in the courtyard of the house where he died; and he chose as his own epitaph the words: "Hic exspectat resurrectionem J. G. de Grevenbroek C. F."

That Grevenbroek had been engaged in compiling an account of the Cape and the Hottentots seems to have been fairly well known during his lifetime. The earliest reference to his work appears in Peter Kolb's *Caput Bonae Spei Hodiernum* (Nürnberg, 1719), the most detailed and serviceable treatise we have on the early Cape Hottentots. In discussing the Hottentot customs relating to the Mantis, Kolb says: "For long I did not know what to call this insect, as I had never seen it, nor could I believe that they worshipped such an insignificant creature, although I had occasionally heard this stated. At last Mr. Johann Wilhelm de Grevenbroek, a man of remarkable industry, understanding and knowledge, who after serving several renowned ambassadors had finally come here as Political Secretary to the Illustrious Company, taught me from the notes, which he had likewise made concerning the Hottentots during his residence here, that this insect was really a sort of beetle" (p. 416). There is no other mention of Grevenbroek in the whole of Kolb's work.

Valentyn's *Beschryvinge van de Kaap der Goede Hoope* (Amsterdam, 1726) tells us more about these "notes" of Grevenbroek's. Writing of the Hottentots, Valentyn says: "I have seen a Latin treatise by Mr. Secretary Grevenbroek, who had taken the trouble to write an elaborate and able account not only of their manners and customs, but also of their language; this treatise he allowed me to read in Stellenbosch in 1705" (p. 106). He adds that from it he learned about the dialectical differences of the local native languages as illustrated by the forms of the numerals; and also extracted a small Latin-Hottentot-Dutch vocabulary, which he then prints (pp. 106-8).

There is no further mention of Grevenbroek's work until 1763, when in his posthumous *Journal historique du Voyage fait au Cap de Bonne-Espérance* the Abbé de la Caille, who was at the Cape from 1751 to 1753, violently attacked Kolb as unreliable and inaccurate, and went on to assert that everything Kolb had written about the Hottentots was derived from Grevenbroek. "M. Grevenbroek, . . . an extraordinary man," says de la Caille, "had made some researches into the manners and customs of the Hottentots. After his death his papers were sent to Kolb, who pieced them together without any skill or judgement. This I was

114

told by the most intelligent local residents, especially the Governor, M. Grand-Pré and M. Dessin" (pp. 156-57). And again: "All that Kolb says in the rest of his book [i.e. concerning the Hottentots] is taken from the memoirs of a certain Grevenbroek, Secretary of the Council at the Cape, who had put into writing what the Hottentots whom he had seen had replied to his questions" (p. 322).

The story of this alleged plagiarism is told at greater length by de la Caille's editor. Kolb, it is well known, had been sent to the Cape in 1705 to make astronomical observations, but by his incompetence soon lost the favour of his patrons. He lived for a while without any employment, and was then installed as Secretary to the Landdrost of Stellenbosch; but after a couple of years he was superseded, and returned to Germany in 1713. "Kolb's mission being almost over," says de la Caille's editor, "he discovered that during his stay at the Cape he had done nothing but drink and smoke. Not knowing what to report in Europe or to show as the fruits of his expedition, he applied to some residents of the Cape, who took advantage of the occasion to serve their own ends as well as his. These men had tried several times, always without success, to convey to Holland their complaints against the maladministration of the Colony. The memoirs on this subject which they had sent to the Estates-General in Holland had all been intercepted, and the Colony continued to groan beneath its oppression. They now conceived the idea of dictating to Kolb a description of the Cape; and in order to make it seem more interesting they collected all the current popular beliefs and palmed them off on to Kolb, who did not know the country, together with numerous marvellous details derived from their imagination. These oracles of Kolb's also lifted much of the matter in Grevenbroek's compilation, to which reference has already been made; nor did they ignore themselves in the course of the work, into which they inserted their observations on the government of the Cape, exposing all its iniquities and suggesting the means of remedy. These revelations, coming from a stranger, could be published without compromising anyone. Kolb, delighted at the service thus rendered to him, left the Cape with his work. He caused it to be printed in Holland, *as a translation from the German*. The book was read with astonishing avidity, and the edition soon sold out. The Dutch Government, roused by what was said in it concerning the state of affairs at the Cape, made inquiries which confirmed Kolb's report. The principal officers of the settlement were recalled, and proceedings taken against them on their return," etc. (pp. 317-19).

M

114 A somewhat similar story is told in greater detail by Mentzel in his *Beschreibung des Vorgebirges der Guten Hoffnung* (Glogau, 1785-7). After discussing Kolb's career at the Cape, he goes on to say: "We can note that Kolbe had very little time during his short period of office as Interim Secretary [at Stellenbosch] to travel over the country and to make topographical observations. He had certainly gathered much information and heard many stories from local inhabitants during his eight years' residence at the Cape, but without investigating whether these were authentic or legendary. Unexpectedly, Kolbe came into possession of a store of remarkable information that proved both interesting and useful. Herr Grevenbroek, a former Secretary to the Council of Justice, had made various notes about the Hottentots and other Cape peculiarities. Had he lived longer he would have undoubtedly studied more closely the subject-matter of his notes and arranged everything in proper order. On his death his notes were handed over to Kolbe, who thus acquired a rich collection of material, but bundled together higgledy-piggledy" (Mandelbrote's translation, V.R. Soc., 4, p. 19).

I have thought it necessary to give these statements in full, as they have an important bearing upon the history of Grevenbroek's MSS. Let us first examine the charges against Kolb. The story consists of two parts: (a) that he was the medium through which the discontented farmers of the Cape brought their grievances against the Governor to the notice of the Dutch Government; (b) that Grevenbroek's MSS found their way into the hands of Kolb and were used by him as the basis of his description of the Hottentots. The first may at once be dismissed. The only possible event to which it could refer is the movement of the colonists against Adriaan van der Stel. The latter in consequence of a memorandum conveyed to Holland in 1706 by four of the disaffected burghers was recalled the following year. The whole affair was over within two years of Kolb's arrival at the Cape; and he stayed there for another six years. That his book, which in its Dutch translation (it was originally written in German) was not published until 1727, could have been instrumental in bringing about the recall of van der Stel twenty years previously is utterly ridiculous.

This does not of course do away with the charge that Kolb based his account of the Hottentots on Grevenbroek's manuscript. As we have seen, he himself admits having read it; and there is other evidence to suggest that he used it. His vocabulary of Hottentot words is almost identical with that quoted by Valentyn from Grevenbroek,

and in all probability therefore was also derived from the same source; especially as Kolb says that he made some attempts to learn the Hottentot language and could never succeed. Moreover some of the statements he makes about Hottentot custom and belief are also found in Grevenbroek's account printed below, and nowhere else in contemporary descriptions of the Hottentots. The coincidences are occasionally too striking to be entirely due to independent observation.

The difficulty about accepting in its entirety the story told by de la Caille and Mentzel is that Grevenbroek was still alive when Kolb left the Cape. The latter can therefore hardly be held to have taken away with him the notes found in the dead Grevenbroek's effects. There is on the other hand no reason why Kolb could not during Grevenbroek's lifetime have borrowed substantially from the latter's notes on the Hottentots, or even have received them all from him. We know from Valentyn that Grevenbroek allowed others to draw upon his manuscript, and we also know that both Grevenbroek and Kolb were living at Stellenbosch from 1710 to 1712. Certainly some suggestion of this sort is necessary to account for the total disappearance of Grevenbroek's later manuscript. It is evident from what both Kolb and Valentyn say that between 1705 and 1713 Grevenbroek was in possession of a detailed study of the Hottentots compiled by himself. The account here published is dated 1695, and appears to have been sent as a letter to a Dutch clergyman, who must have had it copied, for the manuscript is not in Grevenbroek's writing. That it cannot be the manuscript to which Kolb and Valentyn refer is evident not only from the date it bears, but also from the fact that it does not contain the long vocabulary on which Valentyn drew.

Now Grevenbroek himself hints at the end of this letter to a future study of the same sort in more detail. "I hope, nay, I am confident, that this slight sketch of the province and description of the country will soon be superseded, for the common good, by another of more powerful eloquence, fashioned in every line, truly and brilliantly, by the hand of a Lysippus." Is it going too far to suggest that Grevenbroek may many years later have seen in Kolb the new Lysippus, and willingly handed over to him the additional notes he had meanwhile compiled? It may reasonably be objected that if Kolb had thus acquired Grevenbroek's material he would have made full acknowledgment to the latter. It is on the other hand equally conceivable, though far less creditable to Kolb, that he may have deliberately suppressed this indebtedness in order to enhance his own reputation. That he was not too

10: Grevenbroek F-5 (ca. 1694)1933
FX13 Hottentot FX13
Cape Hottentot

114 scrupulous about carrying out his obligations is evident enough from his career at the Cape.

All this, however, is pure speculation. The established facts are that in 1705 and later Grevenbroek had in his possession an account of the Hottentots written by himself; that this was never published under his name, and the manuscript seems to have disappeared; and that there is every reason to believe that Kolb actually made much fuller use of it than is suggested by the quotation given above in which he refers to Grevenbroek.

The manuscript here printed must be looked upon therefore as a preliminary draft of the presumably more detailed and now lost account. It is a very badly arranged piece of work, passing confusedly from one topic to another, with frequent irrelevancies and repetitions. Despite its title it is by no means devoted exclusively to the Hottentots. Towards the end there is a eulogistic account of the Cape's natural beauty and fruitfulness which would do credit to any modern publicity agent; the adventures of the ill-fated Guillaume Chenut and the survivors of the wrecked "Stavenisse" (1686) take up far too much space; and running right through the whole is a violent denunciation of the European colonists coming very oddly from one who ten years later was held to be among the champions of their cause. The ethnographical information that makes up the rest is by no means all based on original research. A good deal of it, referring to the Ama-Xhosa, is taken directly from the accounts of the "Stavenisse" survivors, which were copied into the official records of the Cape by Grevenbroek himself in his capacity as Secretary of the Council. He almost certainly made notes for his own use of their valuable and accurate information about the manners and customs of the natives, for there is a very close correspondence between his statements and the official records, although the literary embellishments in which he indulged compare most unfavourably with the simple narratives of the sailors. His account of the adventures undergone by the latter is much less accurate, and suggests that here he was writing from memory alone. In describing native customs, he does not always distinguish clearly between the AmaXhosa and the Hottentots, whom he obviously regarded as people of the same stock; but a comparison of his statements with the relevant "Stavenisse" records makes it possible to disentangle his own contributions from those of the shipwrecked crew. The information relating to the Cape Hottentots alone does not make up more than about a third of the whole. But it is well worth having, particularly for the descriptions of various social customs, mode of life and warfare, ceremonial

practices and treatment of disease. The details Grevenbroek gives in this connexion are often new and sometimes valuable, and show that he had managed to learn much about the Hottentots. Nevertheless, the reputation he has acquired as an outstanding ethnographical authority can only be based on the supposition that his later account formed the basis of Kolb's book. The present account, important as it is in some respects, is inferior both in quality and content not only to that of Kolb but also to that of Schreyer, and in arrangement to those of Dapper and Ten Rhyne. 114

TRANSLATOR'S NOTE.

● 114 The Latin text of Grevenbroek's letter on the Hottentots is now transcribed and printed for the first time. It is a well-written MS in a large hand and rarely offers any difficulty to the reader. I have slightly modernized the punctuation. I have curbed the lavish and erratic use of capitals. I have silently corrected many small slips. In other cases I have preferred to reveal my corrections, using round brackets to enclose letters added by me, and square brackets to indicate letters I would have removed. Very rarely I have had recourse to a footnote in elucidation of the text. But the text still retains many faults and obscurities most of which are probably to be ascribed to Grevenbroek himself and not to the unknown person who made the copy of it we possess.

For the Latin of Grevenbroek is not a satisfactory medium. It is dictionary Latin, laboriously compiled by a man of poor taste and inaccurate though very likely wide scholarship. It is full of tags from Virgil, Horace, Lucretius and others. The alleged elegance of the Latinity consists largely of curiosities of diction culled from Plautus, Cato, the Natural History of Pliny, Varro on the Latin Language and any other available store-house of archaic and unfamiliar words. A peculiarly distressing feature of the style is the accumulation of masses of synonyms which add nothing to the narrative but confusion. Furthermore the sentences are often shapeless and endless, lumbering along from clause to clause till they seem to drop from exhaustion rather than to reach any intended goal.

In my translation I have permitted myself a few archaisms in order to keep some of the flavour of the original. I have kept very close to the sense of the Latin, as it was essential to lose nothing of the information that may be extracted from his pages. But I have also laboured to make my version readable, and if I have succeeded in this Grevenbroek owes me a debt that nobody will ever owe to Grevenbroek.

At the same time I should like to say that to translate Grevenbroek has been a labour of love. In spite of his infelicitous, pedantic, helpless style, the man reveals so much both of his own curious personality and of the Cape society of his day, that a readable Grevenbroek, if I could make it, seemed to me a possession that many beside the anthropologist would be glad to have. For Grevenbroek is

[R 169]

10: Grevenbroek F-5 (ca. 1694)1933
FX13 Hottentot FX13
Cape Hottentot

114 a character. If he repels by his perpetual insistence on his own unmerited and unspecified grievances, he attracts by his honest indignation at the abuses of the time and by his charming, if absurdly expressed, enthusiasm for the Cape and its native inhabitants. He really had something to say that lay very close to his heart; and for that reason it has been a delight to disencumber his thought from the clumsy toils of his laborious Latin eloquence.

One other translation of Grevenbroek exists, that made in Dutch by Dr. J. W. G. van Oordt and printed in the *Zuid-Afrikaansche Tydschrift* for January and February 1886. This was reprinted in 1932 in vol. xxxvi of the publications of the Linschoten-Vereeniging (*Reizen in Zuid-Afrika in de Hollandse Tijd*, uitgegeven door Dr. E. C. Godée-Molsbergen. Vierde Deel). Dr. van Oordt omitted some few portions of the original, notably a page or two dealing with initiation ceremonies. This edition then comprises not only the first English translation, but the first complete translation in any language, as well as the first transcription and publication of the Latin text.

My version was made in complete independence of the Dutch. On comparing them subsequently I was glad to find how closely Dr. van Oordt and I agreed in our general interpretation of the sense of this difficult author. Two sentences of mine embody corrections which the reading of his version led me to adopt. I have also acknowledged suggestions of Dr. van Oordt's once or twice in footnotes.

EDITOR'S NOTE

This number of Bantu Studies contains contributions from three members of the University of the Witwatersrand dealing with different aspects of the Korana Hottentots of the Western Transvaal. Professor L. F. Maingard, Head of the Department of French and Romance Philology, has dealt with the History, Customs and Language ; his son, J. F. Maingard, from the Medical School, has dealt with the Physical Characteristics of the people ; while Professor P. R. Kirby, Head of the Department of Music, has contributed a section dealing with his special subject. The production of such a number as this well illustrates the value of team work in field research. Professor Kirby is responsible for the photographs, and Mr. S. P. Jackson, Lecturer in the Department of Geography, prepared the map. The spelling *Korana* has been retained throughout as the most convenient one for English readers.

The following abbreviations have been used in footnotes in the various articles :—

Arbousset and Daumas=Relation d'un voyage, etc. (Paris, 1842).

B.C.=Report of the Bloemhof Commission.

B.M.B. *or* B.M.J.=Berliner Missions Berichte or Jahresberichte.

Bas. Rec.=Basutoland Records (3 volumes, Cape Town, 1883).

Broadbent=A Narrative of the first introduction of Christianity among the Barolong (London 1865).

Burchell=Travels in the interior of South Africa (London 1822).

Campbell, 1813=Campbell, Travels in South Africa (1st journey, London, 1813).

Campbell, 1820=Campbell, Travels in South Africa (2nd journey, 2 volumes, London 1820).

STUDIES IN KORANA HISTORY, CUSTOMS AND LANGUAGE

By Professor L. F. MAINGARD, M.A., D.LIT.

I. THE PROBLEMS—A GLIMPSE INTO THE PRESENT-DAY LIFE OF THE KORANA

[10] 114 The Korana are a branch of the Hottentot race. They are a very interesting people from many points of view and they present a field of study still fresh and as yet imperfectly explored. To the historian, the mystery of their origin is still a fascinating problem, for they may still perpetuate the original Hottentot tribes who lived at the Cape when it was discovered by the Portuguese. To the physical anthropologist there is much yet to learn respecting their relationship with the rest of their Hottentot brethren, and indeed, with the other races of South Africa. The social anthropologist and the ethnographer are arrested by the remnants of the ancient customs of a tribe which was for a long time, even with its European contacts, a genuinely pastoral one, and by the gradual transformation and even the disappearance of those ancient customs and their changed mode of life. The strange clicks, the tones and the peculiar structure of their language, are another aspect of this people, and one that, because of its unique position in the midst of the Bantu and Bush languages, has still many unsolved problems.

[161] The Korana live, in the present century, in small groups scattered widely over the central portions of the Union. They are a vanishing race. In the middle of last century their numbers were estimated by competent authorities at 20,000, and, in spite of the absence of accurate statistical data for the present day, it does not appear that more than 1000 exist now. If any attempt is to be made to solve the problems that confront the student to-day, it is imperative to go into the field and collect as much of the fast-disappearing fragments of their customs and traditions and language as may be garnered before it is too late.

121 Many people—authors, and reliable authors,—have asserted that "the Korana is extinct." I made it my business to verify their statements. My historical inquisitiveness and my researches into the Africana

11: Maingard Q-5 (1931-1932) 1932
FX13 Hottentot FX13
Korana

nas made up a commando against Thow, and fought them at his werf and killed many of them. The Kafirs desired to know what it was that killed a man and looked like a thorn. The Koranna commando returned and Thow subsequently fell sick and died, whereupon the Korannas again made up a commando and the Kafirs resolved to escape to Sitlagollo, south of Malopo. This is the spot where the Transvaal commando fought against Monsheoa in 1852. At that time the Batlapins and Barolongs did not live together. The Korannas then took Touns and the land of Thow, who was the great chief of the Kafirs."*

Another shorter version which Massow himself repeated in a document of November 1870,[1] is substantially the same. It, however, contains one or two important variants. Klaarwater, the present Griquatown, is the scene of *Tau's* treachery, and not the Orange River, which apparently the Korana had already crossed in this version. A more serious discrepancy is that here it is Massow's grandfather and not his great-grandfather who is murdered. The place of the next encounters between Korana and Barolong, is, more precisely, Taungs itself where, we are told, four battles were fought before *Tau* died and before the Barolong were driven to Setlagoli.

If the genealogies given by McKenzie[2] and by Molema[3] are to be trusted,—and they were confirmed by the deposition of Mooi at the Bloemhof Commission,[4] in respect of the number of three generations from *Tau* to Sifonello, the date of whose death is known to be 1829,—*Tau* reigned some time in the middle of the 18th century, and that would place the battle between him and the Korana before 1750.

There is, however, no trace of these wars in the first European historian of the Korana, J. H. Wikar.[5] He had been among the Korana in the second half of the 18th century, in 1778-9, and he gives a very detailed picture of the Hottentot communities and of their activities on the Orange River. There it runs through miles of desolate country, and a desert of red sand extends right up to its banks. Beyond the Great Falls, between Kakamas and Upington,—a distance of 36 miles—there is a broad stretch of the river about two miles in width, where the water runs in innumerable channels, encircling islands large and small, over-

881

Do not light your pipe in a fire in the veld.

539

If you see anything sick in the veld, do not look at its foot. Bring it to the stad. The old men will look at its foot. If you look at its foot in the veld, you have transgressed, you must go back.

Then the fat of sheep is drunk. Then he is called. He answers. Then stones are struck in his ear. If he is far and he is called, he hears.

A nine year old heifer is picked, he chases it. If he catches its tail, he is a man. If he does not catch it, he is brought back to the " law."

Notes:

113

The *doro* ceremony. For an analysis of the accounts concerning the Nama ceremony and the sources, see Schapera, The *Khoi-san Peoples*, pp. 279-285, Olpp has given the most detailed account for the *Naman*. Schapera omits all reference to the Korana ceremonies throughout this part of his work.

For the Korana, see

(i) Wikar, in G. M. II pp. 103-104.

(ii) Campbell, 1820, II p. 346.

(iii) Wuras. Ms. (1858) published in *Bantu Studies*, iii, p. 291-293.

(iv) Burkhardt. p. 118.

(v) Meinhof. p. 17-18 and 66-67.

114 ●

881

It is the first time that the full *doro* ceremony is given in Korana. Meinhof has published a Korana text of the " laws " and has given a short description of the ceremony in German. Campbell merely says : " They have no rite of circumcision like the Bootchuana and the Morolong nations ; but when a boy enters upon a state of manhood, a feast called Dorro is made according to the circumstances of the father. Sometimes eight or ten oxen are slain upon such an occasion."

By far the fullest account for the Korana is Wuras'. His facts tally with those set out in the two texts above. There are however one or two material points in which Wuras differs :

(a) the fat is rubbed on the boy's body, not drunk,

(b) the " *dunb*, the very act of reception," as his version has it, consists of three parts : (i) " the knocking of the awls," which corresponds to the knocking of the stones in our text ; (2) nine cuts on the belly and nine cuts on the chest of the initiate ; (3) the " laws " given to him.

11: Maingard Q-5 (1931-1932) 1932
FX13 Hottentot FX13
Korana

Note : Henceforth, explained *Iis* and *Meis*, she ceased to be a */ko:s* and became an *oaxais*, until her marriage when she became a *taras* or wife. *Iis* added that they were too poor nowadays to keep up such an elaborate ritual, which sometimes lasted for months.

This ceremonial has been described extremely briefly for the Korana by Wuras (loc. cit.) For the Naman, see Schapera (op. cit. p. 272-279) who analyses all the previous accounts and gives his sources as usual. The fullest Nama description is that of Mrs. Hoernlé (*Harvard African Studies*, ii. pp. 70-74). Her account substantially agrees with the above text. It contains a full timing of the proceedings and lays stress on the festivities and other details. There is in both accounts the same symbolical return to the household duties and the same renewal of the initiate's contact with water after her long period of impurity and seclusion, as well as her inability to do the normal things of life, while she is cut off from her fellow creatures. Likewise the sacramental meal is restricted to women and only to women who are free from their periods.

The *sāb* spoken of in the Korana text is a sweet-smelling powder. *Kheis* brought me some and she and *Iis* separated its constituent elements. They are as follows : (i) */kaep ;* (ii) */ui sāb*, a green lichen growing on stones ; (iii) */hareb*, " veld biesies," roots only ; (iv) */hu !kūb ;* (v) */gwabeb* grows in vleis, only found at Warrenton on the Vaal in winter ; and lastly the */konabab* root, of the colour of the earth, and reduced to small pieces. The mixture must smell sweet (*!gāi ham*). The women use it not only as described above, but also on their armpits and to rub babies with.

It might be well to add the few words I have collected about their marriage. No more elaborate ceremonies now exist. In former times, twenty oxen, they said, were killed for the festivities, which were accompanied by the *≠a:di* and dancing. The *aba gomas* was given to the mother of the bride by the bridegroom and the young bride was welcomed with more festivities and dancing into the bridegroom's kraal. When a child was born a */naes /ko:na gomab*, " an ox for the newborn children " was given to the mother, if a boy was born. If a girl, a cow was given, */naes /ko:na gomas*.

Note :

These terms are used : (i) in conversation with third parties ; (ii) when a younger member of the family addresses an older one. (iii) When the older person addresses a younger one in the family, the personal name is used by that elder person. The practice in (ii) seems to be falling into disuse, to the great sorrow of my informants. On account of the method used here, the lists are not so full as they should be, e.g. the children of the mother's brother, as they do not appear in the genealogies, have not been recorded. The *Nama* family relationships and the terms denoting them have been exhaustively dealt with by Schultze (op. cit. p. 300-303) and by Mrs. Hoernlé (the Social Organisation of the Nama Hottentots, in *American Anthropology*, xxvii, p. 17-23). Cp. also Schapera (op. cit. pp. 230-233). Since our lists do not contain all the possible details, a thorough comparison of the Nama and Korana systems cannot be made here, though it can be said that the two agree with some differences in detail.

There is a further important deduction to make from our genealogical lists in connection with the giving of names. The Nama custom in this respect is well known. The sons take the mother's name, changing its final *-s* into a *-b* to make it masculine and the daughters, the father's name, making the converse change of *-b* into *-s*. Meinhof (op. cit. p. 17) has recorded, from his informant Benjamin Kats, the same exchange of names, without, however, any addition of the *-b* or *-s*. It will be gathered from a perusal of the genealogical tables of the Links Korana, that this practice does not obtain among them. On their being questioned, after the lists had been taken, they professed complete ignorance of the custom.

Then boiling water is poured around it. Then it is covered up. Then it boils itself.

Note :

Beer-making is given under the present heading, as the beer was an essential part of all festivities. It has often been the subject of travellers' remarks, Thunberg, Wikar and Alexander, to mention the most prominent among them. Thunberg (1774 " *Travels*." II p. 150 and 167) calls the substance which acts as the fermenting agent by its Dutch name *moer-wortel*. Wikar (1778-1779, G. M. II, p. 92) has given a very full description : " Every day our company makes beer, the " dregs " (*moer*) through which the beer works is the root of the above-named *haap* or " haarwortel," which is dried and stamped and helps the warm, sweet honey water to work."—a description which concords with the Korana text given to me by *Tabab*. Wikar adds some further interesting details about the feasting that follows. The *||nāib* was described by *Tabab* as " 'n wortel met rooi blommetjes." According to Pettman (*Africanderisms*,) the *Mesembryanthemum Mill* is the root used. It seems that different roots were used in different places.

Games

(i) The *||hu:s*. This game is well known from the descriptions of observers like Schultze (*Aus Namaland und Kalahari*, p. 313-315). The

11: Maingard Q-5 (1931-1932) 1932
FX13 Hottentot FX13
Korana

524 Korana description did not differ from the game as played by the Naman. It may be useful to point out here that the game gets its name from *//hu:*, " To make a hole " and *//hu:s* is thus properly " a hole."

(ii) The *gunukunus*, " hide-and-seek." It is played by two or more players, one of them hiding some small object in one of his hands behind his back and then producing both his hands closed, he exclaims : " *ham !kumiŋ !na ha?* " " In which hand is it ? " If the opponent guesses correctly, he says : *!kaugu*. " You win."

This game is of interest because it is the famous " Hottentot card-playing," to call it by the name under which it was familiar to the Dutch colonists. It has been lengthily described by Sparrman, among others, in his *Voyage to the Cape of Good Hope*, (I, p. 231-233). He, however, missed the essentials of its significance.

[114]

VI. LANGUAGE.

197 This short survey concerns only the language of the *//aremŋ //ais* of Bloemhof and it is limited to its most important aspects. It does not appear necessary to go in a detailed manner into the features which our particular dialect may have in common with the rest of the Korana language and which have been adequately dealt with in the following works :

197 113 (i) Engelbrecht—J. A. *Studies oor Korannataal*, Kaapstad, 1928. It contains a grammatical sketch and a very copious vocabulary.

(ii) Meinhof—C. *Der Koranadialekt des Hottentottischen*, Berlin, 1930. A very thorough exposition of the grammar and the vocabulary.

(iii) Maingard—L. F. *A revised ms. version of the Korana Catechism of C. F. Wuras*, Bantu Studies, v, 112-165. Contains a detailed grammatical analysis of the text and a comparative vocabulary.

PHONOLOGY

194 *Note :* The texts already given preserve the individual peculiarities of each speaker.

(a) *Vowels*. Their pronunciation is not always very clear. Engelbrecht has already noted the indistinctness between the pairs *ẽ* and

GENEALOGY OF THE TAAIBOSCH CHIEFS

Sources :

(i) the deposition of Massow Rijt Taaibosch at the Witgatboom Meeting in 1869. (B. C. 290-291) ;

(ii) the deposition of Petrus Rooy, a councillor of Jacob Taaibosch, at the same Meeting. (B. C. pp. 291-292) ;

(iii) Arbousset and Daumas, pp. 49-50. Their principal informant, it will be remembered, was Hanto ;

(iv) The Bloemhof Korana ;

(v) A document dated November 1870, in Lindley's *Adamantia*, pp. 10-13, which is signed by Massow Rijt Taaibosch himself ;

(vi) certain details about Jan Kaptein will be found in Rev. John Edwards' *Fifty years of Mission Life in South Africa*, pp. 109-110 ;

(vii) and *passim*, in the Bloemhof Commission Report and in the Wesleyan Missionary Notices and the Year's Reports of the same Society.

In the present lists, (i) the first part, has been obtained from Massow Rijt Taaibosch's deposition. The names provided with asterisks are from Petrus Rooy's deposition. The names of the descendants of Massow were given by my Bloemhof informants. The small list (ii) is drawn from Arbousset and Daumas.

This is the least satisfactory of all the lists given here. We have had occasion to remark on Massow's untrustworthiness in some respects (see the early history of the Korana). Stow, as we shall see, has complicated the problem by some unwarrantable blunders in his genealogy of the Taaibosch family, (*The Native Races of South Africa*, p. 298).

The Earlier Generations.

Massow gives one set of ancestors in (i) and Arbousset and Daumas another set in (ii). It may, however, be possible to reconcile them, if it is borne in mind that

(i) the French missionaries naturally used the French spelling ;

(ii) there was no adequate system of phonetic notation for the Native names, the clicks offering a special difficulty.

With these remarks in view, it is possible that

(a) *ktangy* may = *kuenonkei* (*p*)

11: Maingard Q-5 (1931-1932) 1932
FX13 Hottentot FX13
Korana

kt represents here an unknown click, possibly a dental one, in the same way as *kuen* = *kn*, *ue* being a glide sound; the combination *kn* does not exist in French. The *g*=*k*, the second one of the French transcription, as *k* and *g* interchange in Korana. The difficulty is a nasal element of the click in the French transcription, possibly arising from the second nasal.

(b) *knaughoe* may = *konga* (*p*); and (c) *gauw* = *kau* (*p*).

If the above interpretation is correct, then Arbousset and Daumas must have been mistaken as to the direct line of descent of members of this list.

Stow has inverted the line of succession between *Eikomo* and *Kuebib* without any vestige of reason, for there is not a single word in Arbousset and Daumas, from whom he drew his information, to warrant any such inversion.

The Indentity of Hanto = Jan Taaibosch = Jan Kaptein.

There can be no question that these three names denote the same man. The descriptions of *Hanto* in Arbousset and Daumas and of *Jan Kaptein* in Edwards show that both the one and the other are

(i) the Korana chief of Umpukani; (ii) thirty-three years of age; (iii) meet with the same manner of death, by a lion; (iv) have the same physical appearance; (v) are both pious, and these similarities are all the more striking, as the French missionaries actually saw and spoke to the man in 1836, and as Edwards was his missionary for a number of years.

Backhouse, in his *Narrative of a Voyage to the Mauritius and South Africa*, p. 393, has an entry under July 1839, in his Journal: " This late chief Jan Kaptein Taaibosch, a pious man, was killed by a lion; his son (who) was receiving his education at Farmerfield, Albany." Two points are important here, (a) that the names Jan Kaptein Taaibosch are this time all three joined together to denote the same man; and (b) that both *Jan Kaptein Taaibosch* and the *Hanto* of Arbousset and Daumas had a young son.

Hanto came originally from Ramah on the Orange River, and lived for a time at Taungs. He and his brother Gert Taaibosch joined the Barolong chief Moroko, when he emigrated from Platberg on the Vaal to Thaba 'Nchu in 1834 (B. C. p. 263).

Here again Stow was under a misapprehension, when he made *Hanto* and *Jan Taaibosch* two different men, calling *Hanto* the father of

11: Maingard Q-5 (1931-1932) 1932
FX13 Hottentot FX13
Korana

Kopi and *Jan Taaibosch* the father of *Gert Taaibosch*, the latter being in reality the brother of the former (Cp. B. C. p. 263 " Captain Hantu, whom his brother Gert Taaibosch succeeded.")

Hans Taaibosch is the same person as *Kopi*, for the reigning chief in 1838 was *Hans Kaptein* (Papers relating to the Wesleyan Missions, LXXIII, September 1838, p. 2, and Report for the year 1840, pp. 61) and we know that the young Farmerfield student died at the end of 1839 or the beginning of 1840 (Shaw's Report in Report for the year 1840, p. 67).

Omissions.

(i) *Jacob Taaibosch*. He is mentioned as Jan Kaptein's brother by Edwards. At the Witgatboom meeting (1869) and also at Mamusa before Colonel Warren (1878) a *Jacob Taaibosch* appears (*Imperial Blue Book*. C. 2454, '79, p 33-34.) Whether the latter is the same as the brother of Jan Kaptein is not clear.

(ii) *Isaac Taaibosch*, mentioned by Petrus Rooy, as having succeeded *Hans*, (B. C. 293).

(iii) *Goliath Ysterbek*, the chief of the Bethany Hottentots. He is given by Massow Rijt Taaibosch (document in *Adamantia*) as a cousin of Jan Taaibosch. It is not clear whose descendant he is.

GENEALOGY OF THE LINKS CHIEFS

Sources : Informants at Bloemhof ; supplemented by the publications of the Berlin Missionary Society (1848-1854). *Teteb*, *Tabab* and others gave details which are fully supported by these records.

geiŋ !hareip, " great " or " old Hareip " is the " alte Hareip " of the Berichte (1850, p. 37, etc.) He is given as the father of Gert Links, the captain of Saron (1848-1854) and, when Johann Schmidt arrived, was already a very old man (" ein circa 90 jähriger Greis." B. M. B. 1851, p. 122), so that he must have been born about 1760 and been therefore one of the original Korana of the Orange River. If that is the case, he was already advanced in years in 1823, when Broadbent and Hodgson travelled in the Bloemhof district. It might not then be improbable to identify him with the chief *Chudeep*, " a venerable old man," about whom these missionaries speak so much. Phonetically, the identity can be explained, for, in the unsatisfactory rendering of the time, *ch* would represent a click, *-d-* would stand for the flapped retroflex consonant, which is heard by some as *l* and by others as *d* or *r* ; and the *u* would be the obscure vowel, as the tone and stress are on the last

11: Maingard Q-5 (1931-1932) 1932
FX13 Hottentot FX13
Korana

syllable. So that we have an unbroken record of the Links chiefs from 1823 to the present day in this genealogical list. According to the Bloemhof traditions, *geiŋ !hareip* died after 1854, the date of the breaking-up of the Saron Mission. This is not in disagreement with the Berichte.

Ouhanas, " old Hanna " is the pious " alte Hanna, die Frau des alten Hareip " (B.M.B. 1853, p. 85). Her grave is one of the three still extant on the site of the Saron Mission Station.

Gert Links, the captain of Saron (B.M.B. 1848-1854) was still alive in 1869, as he appeared at the Witgatboom meeting. He was then old and ill (B.C. p. 279 ; p. 292). He probably died shortly after.

Johannes Links deputised for his brother Gert at Witgatboom after the first day (B.C. p. 298). He was born near Bloemhof (B.C. 292) and was a much younger man. He succeeded his brother in the Chieftainship. He seems to have died shortly before 1878 (See Report of Sir C. Warren, *Imperial Blue Book* C. 3635, 83, p. 5). His grave is at Saron (See plate 4).

Hermanus Links succeeded his brother (not his father, as Warren says). He was the chief at the time of the differences between Warren and Brune (1878-1879). He died before the end of 1880 (Imperial Bluebook. C. 3114-'82. p. 86). There was another *Hermanus Links* who died in 1915, according to a letter, dated 11th February of that year, from H. Macleod, the Kimberley Law Agent of the Links, acknowledging that news of his death. (Ms. Private correspondence in the possession of *Teteb* of Bloemhof). He must=

Katsilib died at Cape Town, after fighting during the Great War (1915). He would have been the chief, if he had lived. *Teteb* is now looked upon as the *goaxaob*, although he has no longer the power nor the privileges of a chief.

Omissions :

Ursõb, the *Urson* of the Berichte and the *Oelson* of Chapman, the chief of the Links of Bamboes Spruit and Maquassie Spruit. The English traveller who met him on March 15th 1853, calls him the brother of Gert Links (Chapman, p. 128). It is not sure which Gert Links it is.

Matlabane's wife. She was a daughter of Gert Links the elder, i.e. *geiŋ !hareip*. *Matlabane* was a chief of the BaMairi (B.C. p. 292 ; 298). Her name is unknown.

Finally, these members of the branch who appear in the Berliner Missions Berichte, 1851, pp. 122-123, but who were not mentioned by my Bloemhof informants:—(i) *Maria*, the sister of *geiŋ !hariep* ; (ii)

11: Maingard Q-5 (1931-1932) 1932
FX13 Hottentot FX13
Korana

old *Rooy*, the eldest son of *geiŋ !hariep*, a drunkard and ne'er-do-well. Was he the same as *Ursŏb?* (iii) the unnamed daughter of *geiŋ !hariep* and *Ouhanas*, who, according to the Berichte, was not the mother of *geiŋ !hariep's* sons.

GENEALOGY OF TABAB

Habasisap's Dutch name was given to me as "Frans Viljoen." He must therefore be the same Frans Viljoen, "de Korana Kapitein" mentioned by Molitsane as being under him, to the two Free State emissaries Schneehage and Meyer when they visited him in 1859 (*Bas. Rec.* ii. p. 509). This is confirmed by the fact that *Tabab's* birthplace was Senekal, near the then Basutoland border.

PHYSICAL CHARACTERISTICS OF THE KORANA.*

By J. F. MAINGARD, B.SC.

A. INTRODUCTORY

114 During the month of February 1932, I was fortunate enough to have the opportunity of making anthropological measurements on several members of the Links tribe of Korana Hottentots at Bloemhof.

These measurements are the more interesting because the actual physical characters of the Korana and their relationship to other South African peoples have been matters of considerable speculation within recent years. No writer on the Korana has denied that culturally and linguistically the Korana are Hottentots, and the general consensus of opinion seems to be that anthropologically also they are similar to other Hottentots. Yet there are some writers who maintain that there are certain other elements entering into the composition of the Korana. Thus according to Broom (1 and 2) the Korana " appear to be Hottentots who have acquired some strain of Negroid blood and a considerable strain from some Australoid (sic) race." In *Nature* of 1929, Broom (3) attempts to differentiate the Hottentots from the Korana. He writes : " The Hottentot and Korana are very distinct from the Bush. . . typical Hottentots are not improbably the primitive race contaminated by a considerable Bushman admixture while the Korana are apparently nearer to the primitive type, but with a considerable Australoid element." Two years afterwards we find a seeming contradiction of Broom's theory of Australoid admixture in the Korana in the following statement by Dreyer (4) : " Disregarding those Australoids found up to the present in South Africa the Australoid character of which is sought in one or two features only, one need only consider one skull seriously, viz. that described by Drennan " (5), (i.e. the Cape Flats skull). From this statement of Dreyer's it appears that the distinction drawn by Broom between Korana and Hottentots is not generally accepted. In *Nature*

*I wish to record my indebtedness for assistance more particularly to Professor R. A. Dart, who helped me with books and instruments and whose kindly criticisms proved invaluable, to Mr. L. H. Wells for much helpful information, to Mrs. A. W. Hoernlé for allowing me access to her library, to Miss Wilman, the Director of the Kimberley Museum, and to my father, Professor L. F. Maingard.

12: Maingard D-5 (1931-1932) 1932
FX13 Hottentot FX13
Korana

● 114 of 1929 also, speaking of the Springbok Flats man, then newly discovered, Broom (6) regards the Korana as the direct descendants and modern representatives of the Springbok Flats type ; yet Keith (7) in 1931 says of this same Springbok Flats type " He was a tall strong fellow with a big brain, and a long and wide head, a drawn out face, great mandible and small teeth—*a type which we cannot fit into any African type known to us*."

From my experience the Korana can hardly be said to conform to Keith's description of the Springbok Flats individual, but it is possible that some of them may show such features. In any case Keith's description of that skull is not in accordance with what Broom describes for his typical " Australoid " Korana !

Allen (8) tentatively advances the suggestion that the intrusion of the Australoid element into the Korana is due to admixture with Bushmen and that such a strain " may be found mixed with all the Yellow-skinned (i.e. Bush-Hottentot) peoples of South Africa."

Schapera (9) says that " the Korana skulls appear to be somewhat separated from those of other Hottentot tribes, and resemble more closely those of the Bantu-speaking Negroes of South-Central Africa (i.e. the Bechuana) with whom they have been in contact for a long time, but they also approximate on the whole, *more* towards the Bushman type of skull." This is a quotation from Shrubsall which is somewhat ambiguous. Schapera quotes Broom as one of his sources, but makes no mention of Australoid characters in the Korana. No measurements are given.

Further he says " Most (Hottentot) skulls are cryptozygous but among the Korana, mesozygous and phaenozygous are also found," and again " the cephalic index, owing to the greater length and lesser breadth of the Hottentot skulls is definitely dolichocephalic, especially in the Korana skulls." This seems to show that he agrees with Shrubsall in regarding Hottentots and more especially Korana as characterised by a mixture of Bantu and Bush features. He also adds that the Korana mandible as contrasted with that of the other Hottentots, resembles the mandible of the South-Eastern Bantu. Nevertheless he seems to think that still another element contributed to the physical structure of the Hottentot but refrains from committing himself as to its nature.

Sollas (10) apparently considers the Korana as negroids although he is not very explicit. Drennan (11) in his discussion of Bush and Hottentot does not mention them at all. Dart (12) in a general survey of South African Anthropology says " Investigations . . . . have not in my opinion

12: Maingard D-5 (1931-1932) 1932
FX13 Hottentot FX13
Korana

revealed any satisfactory means of separating the Bushmen from the Hottentots physically." He therefore believes it more serviceable for the present "to regard the Bushmen, Hottentot and Strandlooper as members of one and the same racial group, i.e. the Bush race." Without making specific mention of the Korana, he states that the work of Broom and Allen has revealed the presence and wide distribution of an Australoid element in the Native races of South Africa. This appears to be the most logical way of regarding the matter. Hence it would not seem that Australoid features are *peculiar* to the Korana.

On examining the literature to find what ground exists for these statements about the Korana, no data derived from known living or dead Korana could be found.

As making statements about the Korana, before any anthropometric survey of certifiable specimens was available, seemed to me to be somewhat precarious, I availed myself of the opportunity to examine some living Korana of known parentage to see whether they agreed in physical characters with the published statements.

The foregoing review clearly shows the rather unsatisfactory state of our knowledge of the physical anthropology of the Korana. It is therefore important to gather all relevant information which may lead to a real understanding of the physical nature of these people.

Elsewhere in this volume, cultural, linguistic and musical data concerning them have been discussed, and judged according to these standards, there is no doubt that *the Korana are Hottentots*. In the next portion of our study we shall turn our attention to the earliest descriptions of the Korana, to see if new light may be derived from them. The historical method of approach, although seldom used by anthropologists, happens to be of undoubted value in this instance.

It is however essential while discussing the historical evidence to bear in mind the defects inherent in the mode and time of its collection.

In the first place those old observers were not trained anthropologists,—anthropology had not yet been established as a science—nor with very few exceptions, such as Lichtenstein or Holub, were they even medical men. Hence we cannot expect to find any precise anatomical descriptions, but only those of a general and superficial character,—those relating to the colouring or the more striking external features—information in which one may trust the faithful observer, although here and there individual differences in terminology may exist. But when there is a series of corroborative observations, drawn from different authors regard-

Korana

THE MUSIC AND MUSICAL INSTRUMENTS OF THE KORANA.*

By PERCIVAL R. KIRBY, M.A., D.Litt., F.R.C.M.,
Professor of Music, University of the Witwatersrand,
Johannesburg.

114 Although a certain amount of information is available regarding the musical practices of the Nama Hottentots, little firsthand knowledge concerning those of the Korana has hitherto been collected, and that little is for the most part scattered throughout the writings of a few travellers and missionaries. I therefore welcomed the opportunity of accompanying my colleague Professor L. F. Maingard to the Bloemhof area, where he had found quite a considerable number of Korana, many of them of great age, but still retaining considerable mental and physical powers.

The results of my investigation have been grouped under the headings, Musical Instruments, Vocal Music, and Musical Terms.

MUSICAL INSTRUMENTS

126 534 Owing to the fact that these few old survivors of the Korana race are no longer living under their original tribal conditions, and also because the younger generation has been subjected to European influences, the musical instruments of ancient days are, almost without exception, no longer played. But the old people still retain their knowledge of them, and were not only ready and willing to impart information about them but did their very best to construct actual specimens, to perform upon them, and to instruct me in methods of performance. In this way seven distinct instruments, together with the manner of making and playing upon them, were identified ; and they include examples of Percussion, Wind, and Stringed instruments, and also the " Bull-roarer." The information gathered was as follows.

1. *Percussion Instruments*

534 A drum, named */khois*, was made and played by the Korana women. They took the wooden jar or pot, called *//hoes*, made from the willow tree,

*This study deals with a portion of "A Survey of the Music and Musical Practices of the Native Peoples of Southern Africa," now being conducted by the writer under the auspices and with the support of the Carnegie Corporation of New York and the Research Grant Board of the Union of South Africa.

13: Kirby R-5 (1931-1932) 1932
FX13 Hottentot FX13
Korana

534 others are tuned. I could obtain no names for any other flutes; the Korana said that they merely "followed on."

535 115 In December 1931, Professor Maingard obtained a description of the reed-flute dance, his informant being Saul van Eck, an old Kora who also supplied me with information. The *ǂa:di*, he said, were played by men moving in a circle (*ina ǂna:r ǂnammi*). In the middle of the circle was a man with a stick who beat the time. The minimum number of reed-flutes was three, which had the same names as the first three on my list above. But there were often as many as twelve, or even fourteen or more players. The whole kraal would join in the dance, even if they were not playing. The women stamped round in an outer circle, clapping their hands (*ina //am*) and shaking their buttocks (*/hare khuedi*). Four o'clock in the afternoon (*haka kororo:p*) was the right time to begin the dance, which lasted until morning (*//kca:ba*). Oxen were killed for the dancers.

535 621 786 797 After considerable questioning we succeeded in eliciting the information that occasionally there was a kind of "competition" between kraals, in which the reed-dance played a very important part. There can be little doubt that it was this aspect of the dance that roused the missionaries against it, although unquestionably their practice has always been to eradicate all forms of music peculiar to the peoples whom they wish to convert, and in its place to impose that to which they themselves have been accustomed. The inhabitants of one kraal would visit those of another, who met the visitors half-way, the women of each kraal accompanying their men. Oxen would be slaughtered by the hosts for the entertainment of the visitors, and the reed-dance would begin, the women of the one kraal dancing with the men of the other. The dance developed into an orgy, the women abandoning themselves to the men. As my informant put it, "they mixed."

114 533 535 Stow has given us a description of this practice on pages 114-115, but attributes it to the Bushmen, who, so far as I have been able to find out, never originally played reed-flutes; and on page 116 he states that "The Koranas had a dance which was identical with the one described, but as the Bushmen of the north practised it for generations before the Koranas made their appearance on the banks of the 'Nu'Gariep, it is not improbable that the latter derived their knowledge of it from the older race." But it is necessary to quote a passage written by Stow, which should follow the last paragraph on page 115, and which was ill-advisedly deleted by his editor Theal. I reproduce the passage, copied from Stow's original manuscript, with the kind permission of the Trustees of

13: Kirby R-5 (1931-1932) 1932
FX13 Hottentot FX13
Korana

the S. A. Public Library, Cape Town, where the manuscript now is. The passage in question was intended as a foot-note and runs: "The women of the Korana tribes had an exactly similar custom of periodically asserting their independence, and visiting the neighbouring kraals in a body, carrying their flutes with them—all the milk of the neighbourhood having been collected at the kraal threatened, when the same scenes of feasting and midnight revels were carried out." I am forced to conclude that Stow was either misinformed or misunderstood his informants when he made the statement that the women were the players. I have searched the records exhaustively in preparing a complete study of all these reed-flute ensembles which I hope to publish shortly, and in no case save that of Stow is there any suggestion that women played the flutes.

These reed-flute ensembles, in which one man contributes one note only, are of particular interest; it would appear that they represent a stage anterior to that of the classical pan-pipe or syrinx. For even though the maker of a set of these reeds may sound several himself by way of testing them, they are never normally so used in actual performance by these people. I have come across only one instance of the practice, and it has avowedly arisen through relatively recent European contacts. As it does not concern the Korana I shall not discuss it here.

3. *Stringed Instruments*

(a) The ordinary hunting bow of the Korana was called *kha:ɔ*, and from it three distinct types of stringed instruments appear to have been evolved. The first of these is precisely the same in design and materials as its prototype, save that it is much slenderer and is made specially for musical purposes. This instrument is called *!gabus*, and it consists of a slender stock of seasoned *beijebos*, about thirty inches in length, with the bark removed, and thoroughly smoothed where branches have been cut off. Should the wood be too pliable, it may be dried near a fire until sufficiently rigid, but the Korana preferred to let it dry naturally. A groove is cut at one end of the stick and a string of sinew from the back of an ox fixed in this groove by means of a slip knot. The string is then stretched along the stick and secured at the end by being looped round, that part of the string which passes below the sounding portion acting as a kind of "bridge." The tension is adjusted until a convenient pitch is obtained, the pitch being chosen in such a way that certain harmonics of the string may be readily resonated by the mouth. The end of the instrument at which the string is knotted is placed with its tip against the right hand corner of the mouth, the lips holding it securely, although the mouth behind it is open. The stick must not touch the teeth. The

13: Kirby R-5 (1931-1932) 1932
FX13 Hottentot FX13
Korana

533 that it was possible to transcribe them into musical notation without much difficulty. The voice parts of two songs performed with *kha:ɪ* 533 accompaniment were recorded at Pneil by Meinhof in February 1928, and 114 transcribed by Heinitz in his *Struktur-Probleme in Primitiver Musik* in 1931. The sound of the *kha:ɪ*, however, could not be recorded, nor were the transcribed sounds associated with their corresponding syllables.

Further, Heinitz' description of the *kha:ɪ* itself, based upon that of Meinhof, is wrong in several respects; for he suggests that the string is "stopped" by the finger, says that it is made to vibrate by means of a 533 plectrum, and fails to note the distinctive use of the chin. Gotis showed me a method of playing this instrument *pizzicato*. She plucked the string with one hand, using the other for touching it at the "nodes." A further variant was demonstrated when she played as just described, while another woman struck the lower end of the string with the beater. They called this style "playing like baboons." Some interesting rhythmic variation was thus obtained, although the compass of the instrument was not affected thereby. The woman with the beater maintained a steady rhythm, while she who plucked the string was responsible for the variation. After playing, the Korana women slacken the string of the *kha:ɪ*.

533 In my paper of July 1931, entitled "The Mystery of the Grand 114 Gom-gom," published in Vol. XXVIII of the *South African Journal of Science*, I endeavoured to show how it must have been this instrument, or some similar one, which Le Vaillant saw in the hands of a Hottentot woman, and mistook for the *gora*, being in all likelihood misled by the chin action. At the time of writing that paper, I was not aware that the instrument was definitely a Hottentot one; but it seems to me that its presence among the Korana endorses my argument, even though the actual Hottentots described by Le Vaillant were not of that particular tribe.

534 (c) The third stringed instrument of the Korana is, perhaps, most characteristic of them. This is the famous *gora*, or *goras*, for I have heard them use both forms of the name. The *goras*, as is well-known, consists of a fairly straight stick with the bark removed, and seasoned suitably. A string of sinew is fixed to a spatulate piece of quill taken from the feather of a *korhaan*. The string is passed through a hole in the tip of the quill and spliced into itself, never knotted. The quill itself is lashed to one end of the stick by a piece of sinew or *riem*, and at the other end whipped to the stick like the string of the *!gabus*. By applying 533 the quill to the mouth, and inspiring and expiring vigorously, certain

13: Kirby R-5 (1931-1932) 1932
FX13 Hottentot FX13
Korana

harmonics of the string are powerfully produced. As I have gone very fully into the history of and methods of construction and performance upon this instrument in my paper "*The Gora and its Bantu Successors*," published in *Bantu Studies* Vol. V, no. 2, June 1931, it is unnecessary to say more about it here, except to emphasise that it appears to have belonged particularly to the Korana. But I would add the information obtained in December, 1931, by Professor Maingard, when Mulukab, a Korana, who was in the Orange Free State, visited his friends at Bloemhof. When the name of the instrument was mentioned, all the Korana remembered it, but said that it was no longer played by them. Mulukab, however, became wildly excited, jumped up, and applying his traveller's stick to his mouth, hummed a tune and sketched a few dance steps. Mulukab is recognised as an expert on the instrument and can still play it. He added "You play it by yourself. It makes you forgetful of things, and you can be your own company." Plate VI shows Sele:ki, a Kora who lives in the location at Schweizer Reneke, photographed at that place playing upon the instrument.

The *ramki*, the guitar-like stringed instrument universally attributed to the Hottentots, is unknown to these Korana, and the principles involved in its construction are entirely foreign to their musical practice.

(d) Miscellaneous Instruments.

The only Korana instrument known to me which comes into this category is a form of bull-roarer, called *buru-buf*. It is made for and played only by young boys, and has lost any significance it may have had. It is interesting, however, in view of Balfour's suggestion that the bull-roarer may have had something to do with the origins of the gora. (Balfour: "*The Goura*," p. 173). Among the Korana it is made of a flat oblong strip of wood about five and a half inches long, two inches wide and a quarter of an inch thick. The wood is thinned down somewhat towards the tip (the corners of which are slightly rounded), and also along the edges. A hole is bored at the thick end, a string threaded through it, and the ends of the string knotted together. The boy takes the loop of string in his right hand and whirls the bull-roarer round and round in the usual manner. Plate VII shows a Kora boy holding the instrument.

VOCAL MUSIC

A number of songs performed chiefly by old Daob, the blind musician, were recorded on the phonograph, and afterwards transcribed by me. The texts were secured by Professor Maingard who has kindly

14:Hahn L-5 (ca. 1870-1880) 1881 FX13 Hottentot FX13

once correctly established, the natural offshoot will be a true scientific etymology. This science is *the* telescope with which, where all other records fail, we can draw prehistoric times into our immediate view, and which allows us a look far back into "the very dawn of man's life."

It is an urgent want for us here in South Africa that a Standard Orthography for the Native Languages should be introduced in all official, educational, and public departments. The task is not as difficult as it may appear at first sight, and where there is a will, there is a way.

In the present Standard Orthography we write the clicks as follows:—

The Lateral ǁ,	[1] ǁa,	[2] ǁna,	[3] ǁkha,	[4] ǁga,
The Cerebral ǃ,	[5] ǃā,	[6] ǃnā,	[7] ǃkhā,	[8] ǃgā,
The Palatal ǂ,	[9] ǂā,	[10] ǂnā,	[11] ǂkhā,	[12] ǂga.
The Dental ǀ,	[13] ǀā,	[14] ǀnā,	[15] ǀkhā,	[16] ǀgā.

The importance of the clicks will be best illustrated by giving the meanings of these words here at once, thus, [1] to wash, [2] to drop, [3] to be able, [4] to split, [5] to fall, [6] to light, [7] to bore, to perforate, [8] to serve, [9] to wash, [10] to pour, [11] to refuse, [12] to plant, [13] to be sharp, [14] to filter, [15] with, [16] isolated, separated, thin, &c., dotted.

Those who wish to inform themselves about the nature of these clicks and their bearing on the phonology of the Hottentot language, I refer to Henry Tindall's excellent "Grammar and Vocabulary of the Namaqua-Hottentot Language," and to my "Sprache der Nama."

In Tindall's book, however, and in my own no mention is made of a harsh faucal sound peculiar to the old Cape Hottentot dialects—of which Witsen and Leibniz have supplied some materials—to the ǃKora-Hottentot and to the Bushman languages of the ǃKham, ǃAi‡, ǃNuni, ǃKoang, Hei‡guis, Matsanakhoi and ǃGabe. I write this consonant, which most resembles a forcibly produced *short croaking sound*—just as if a person is endeavouring to get rid of a bone in the throat—with the Hebrew

14:Hahn L-5 (ca. 1870-1880) 1881 FX13 Hottentot FX13

114 ʒ (ajin). *The very fact that this sound is produced by expiration and not by inspiration places it among the consonants proper, and not among the clicks.**

Most of the materials contained in this treatise have steadily accumulated during the last nine years. Aware of the responsibility resting upon me, I have been careful to adduce such facts only as I can with full confidence declare to be genuine productions of the Khoikhoi mind.

The following pages were written down in their present shape in the months of August and September last year, as is known to Professors Max Müller, of Oxford, and Friedrich Müller, of Vienna, and other friends to whom I either wrote or spoke on the subject at the time.†

CCC I mention this the more as to-day a copy of the *Ausland*. February 16, 1880, comes to my hands, in which an article, Die Religion der sogenannten Wilden, reviewing Gustav Roskoff's book, "Das Religionswesen der rohesten Naturvölker," Leipzig, 1880, contains views and opinions coinciding so strikingly with those expressed by me, that the reader could easily be led to believe that either I must have perused Professor Roskoff's work, or that he had corresponded with me. This, however, is not the case, and therefore this peculiar coincidence may serve as a striking evidence of what I say, towards the conclusion of the third chapter, about the *psychical identity of the human mind*. At the same time it is a great satisfaction and encouragement to find that one does not stand alone with his views, and that there are comrades and fellow-labourers in the battle-field, where one least expected them.

I desire to inscribe these leaves to the memory of the late Herr Geheimrath Hans Conon von der Gabelentz, and to Professor August Friedrich Pott, of Halle. These scholars will always be mentioned first in the history of

* Vide Theoph. Hahn, "Sprache der Nama," § 2, &c.

† The full manuscript was read over to my friends Profs. Walker and Marais of Stellenbosch.

14:Hahn L-5 (ca. 1870-1880) 1881 FX13 Hottentot FX13

still at the time when Bartolomeo Diaz discovered the Cape, and when Governor Jan van Riebeeke hoisted the banner of the Netherlands at the foot of Table Mountain, below the old Khoikhoi kraal '||Hu-ǃgais. And such we find it still to be amongst the tribes of Great Namaqualand, and the remnants of the ǃKora and the so-called Cape Hottentots.

The orthography of the few specimens of the old Khoikhoi language of the Cape Colony, given by Witsen, Kolb, Valentyn, Ludolf, Leibniz, Thunberg, Spaarman, Le Vaillant, Barrow, Liechtenstein, Burchell, &c., is very much distorted, when compared with that of the excellent publications of Schmelen, Knudsen, Vollmer, and Tindall. Nevertheless, the language of the Khoikhoi tribes, such as the Kochoquas, Charigurunas, Hessaquas, Outeniquas, Attaquas, now swept from the face of the earth, and the present living idioms of the Namaquas, ǃGonaquas, ǀKhauas, ǃAmas, and ǃKoras, and few remnants of the Chrichriquas, the present Griquas, show the same structure, the same sex-denoting tendency, the same agglutinative peculiarity, the same decimal system of counting, and an equal abundance of abstract ideas and expressions well fitted to interpret the most sublime and sacred feelings of the human heart.

An unmerciful fate has overtaken the Khoikhoi; the most powerful tribes have been annihilated, and with them their traditions, sacred as well as profane. Those still extant have lost so much of their national peculiarities by contact with civilization, and have adopted such a number of Indo-European beliefs and customs; and the Christian ideas introduced by missionaries have amalgamated to such a degree with the national religious ideas and mythologies, that for this reason I have in the following pages preferred to give less than I could give, lest I should be accused that from a certain natural interest in, and sympathy with, the Khoikhoi, I had been carried away to assign to them a higher station in the

14:Hahn L-5 (ca. 1870-1880) 1881 FX13 Hottentot FX13

of civilization in our colonies will be removed. Only a sound study and an unprejudiced knowledge of the native mind will qualify us to produce a sound and safe native policy.

We will learn to appreciate in the native what is good, and be anxious to bring the good qualities to a harmonious development. For his faults and vices our education and training will supply the necessary remedy. This would be the practical value of the study of Ethnology, under which heading I comprise the theoretical study of the South African languages, for the purpose of learning the prehistoric condition of the Aborigines, and their present natural condition, customs, manners, and religion.

When Bopp, Pott, and Grimm laid the foundation-stone of that glorious work, the Comparative Grammar and Comparative Mythology of the Aryan races, we should not forget that more than twenty centuries had contributed towards the bricks and mortar and tools with which that magnificent temple was erected. And here, in South Africa, what have we to boast of? Since Sir George Grey left our shores, and Dr. Bleek is not more amongst us, it almost seems that the work, so energetically commenced, is going to collapse. We cannot yet think of constructing such an edifice, which could stand a comparison with that grand temple erected by Bopp, before all the materials are prepared and their collection is secured. Our task, and that of the next generation, is to collect every possible and reliable material; and what already is collected should be thrown on the market, to be moulded and shaped into bricks. The linguistic and ethnological world, both of Europe and America, daily ask, *Quid novi ex Africa?* The foundation-stone is well laid, but where are the languages, the myths, and legends of those nations, of whom we had some dim idea, and whose existence has been confirmed by the discoveries of Cameron and Stanley? And in the most southern part

14:Hahn L-5 (ca. 1870-1880) 1881 FX13 Hottentot FX13

114 of our continent—that is, British South Africa, a vast territory bordering in the north on the banks of the Kunene and Zambesi rivers—there lives a most unique race, represented in two peculiar branches of the Hottentot race, by the Khoikhoi and Bushman family. What may I ask, has been done to secure the necessary materials for a comparative study of their languages, mythologies, customs and manners? There are sundry translations of parts and extracts of the Bible, but more or less in one and the same Khoikhoi dialect. Twelve dialects, spoken in Great Namaqualand, are still unrecorded. The little we know of the ǃKora, which bears the most ancient type of the Khoikhoi, like Sanscrit among the Indo-European languages, is very insufficiently known, and this tribe is now on the point of dying out. Of the old Colonial Khoikhoi, the so-called Cape Hottentot, we know little or nothing. The few words recorded by Witsen, Ten Rhyne, Hervas, Kolb, Valentyn, Leibniz, Spaarmann, Thunberg, Barrow, Liechtenstein, and Le Vaillant, and few others, are written in such unintelligible and distorted orthography that they are useless for comparative purpose. Even the student who is well acquainted with a Hottentot dialect is hardly able to use these specimens with any success.

Four years ago a man of the tribe, to whom the Moravian missionary, George Schmidt, brought the Gospel, died at Bredasdrop; eight months ago, another old Cape Khoikhoi died at Moddergat, Stellenbosch district; another last year close to the Paarl; and six years ago one in Cape Town, who all spoke their old language.

The late Dr. Bleek therefore was misinformed when he stated that the old Cape type had entirely died out. There are at this moment some alive, *and it is of vital importance that our Government should grant* a small sum for the purpose of searching for such individuals, and collecting from their lips these long-forgotten dialects.

Nama

114 perhaps, one of the largest tribes, is probably the one most satisfactory to study, for these
101 people have been marooned for two or three centuries among the sand dunes which form
[262] their present home, attracted thither by the famous !náras melon which provides them with food for many months in the year. I travelled in the country five years after the end of the German-Hottentot wars, during which great numbers of the older people perished, and the whole tribal system of the Hottentots received its death blow.

124 The Hottentots are now a passing people, who have practically given up the struggle
181 of keeping alive their own traditions. What vitality is left is spent in the absorption of the ways of the incoming Europeans. One has, therefore, to be content with what remnants of their former customs and beliefs one can still gather from them. It was only by reviving long forgotten memories among the oldest of the men and women that I could gather up many of the customs of the past. One of my best informers, a woman, reproached me bitterly for encouraging her to think of things she had spent half her life in trying to forget: "You have made me live the old life once more; soon you will be going, and what shall I do then?"

[796] The four transition rites which I shall describe are, however, practised even now among the people I visited, though sometimes in a simplified form owing to the great
115 poverty which prevails. Though I have obtained details from many informants, the main contribution is that of four persons, two men and two women. It is to one of the women that I am most indebted. Hannah[3] !Amatis was, before she married among the ≠Ǎunin, a member of the //Khau-≠Gôan tribe, where she learnt all she knew from her grandfather. The latter was headman of his tribe, and as she was his favorite, and a very clever girl, he told her all the old lore of his tribe. She became my closest friend among the Hottentots, and to her I owe the framework of my information. She is now a woman well over 60 years of age. Louisa !Kabes is a somewhat younger woman, less intelligent, but very inquisitive. As a girl she used to hide where old and important people were talking, thinking that such as she were far away. She married into the family of the old Captain Piet //Eibib of Walfish Bay, who was long subsidized by the Cape Government, and who was a most intelligent old man. He died some eight years before I came among the people, well over eighty years of age. Gottlief //Àmib was the oldest of my informers, and both he and his brothers had been throughout their lives, not only because of their family connections, but because of their intelligence, the headmen of the captain of the Topnaars. Gottlief was a splendid informer and an admirable character, but he was becoming frail, and his memory was no longer at its best. He often said he was no use, and wished I might have clearer information on what were for him exceedingly weighty

[3] Most Hottentots have now a "Christian" name as well as a native one.

3: Hoernlé E-5 (1912-1913) 1918 FX13 Hottentot FX13
Nama

matters. Cornelius Goliath was chief of the Berseba Hottentots, a very capable man who had kept his people out of the war with the Germans, and had therefore been allowed to preserve his tribe and its lands intact. He spoke excellent German, and was much impressed with the necessity of absorbing as much of the incoming culture as would enable his people to be at less disadvantage in the common concerns of life. He was therefore not much use as an original contributor, but was invaluable as a check on the statements of others. During many weeks he had supper with me each evening, and spoke willingly of what he knew.

Common characteristics of all transition rites among the Hottentots. All periods of crisis in the lives of the Hottentots, whether of individuals or of groups, afford admirable illustrations of those rites which A. van Gennep has called "rites de passage." There is always the separation of the person from his usual surroundings, his preparation for a new group in society, and, finally, his reception into this group. A person in such a crisis acquires a characteristic unknown in the group to which he has hitherto belonged. He is no longer protected by any group solidarity, and is therefore exposed to danger on every side. He must retire from contact with other people, and */karesin*.[4] But he is also a danger to other people, and more especially to the animals and other living things on which the community depends for its livelihood. Hence his seclusion and his scrupulous abstention from his usual tasks. Such a person is said to be */nau*. It is essential that he be initiated, as it were, with the least possible delay, into that group of his people which already possesses the new characteristic which he has acquired, in order that he may have a normal place in the community once more. But here there is a difficulty, for a !nau person may work untold mischief on anyone dealing with him, who might also become !nau. Therefore only persons who have passed through all the stresses and strains of human life and no longer fear anything, who are beyond good and evil, one might almost say, are qualified to deal with such cases. None but very old men, and women past the age of childbearing, satisfy this condition. They alone can be called upon to restore the !nau person to the community. But not any old woman or old man will do. It must be one who has the same characteristic as the !nau person. Only a widowed person can safely deal with one !nau by recent loss of wife or husband. Only one who has had a given disease and been cured of it is fit to officiate for a sufferer from that disease. Preferably someone is selected for this task who, besides the other necessary qualifications, has had an extremely bad attack of the disease, the worse the better.

Seclusion or separation of some kind occurs in all cases, but the method of initiation, if we may call it so, varies according as the crisis is one of two kinds. In childbirth,

[4] "Take care of himself", in this special way. The word is used only in this connection, both of the individual himself and of others who, knowing they may be a source of danger to him, are considerate on his behalf.

Korana

121 of the Gubbins Collection at the University and of the Municipal Library of Johannesburg, had convinced me that that could not be the case. Thanks to the kind assistance of my friends, Rev. H. R. Higgs and Mr. C. Lefevre, of Bloemhof, and I must also add, thanks to the good offices of Rev. John Motseleng, the Native minister at Bloemhof, I was able to discover the remnants of the once numerous tribe—the Links Korana—at Bloemhof, which I visited in December 1931, and February 1932.

123 My knowledge of their language created rapid contact with them.
161 I found in the location about twenty-five of them—all that remains apart
177 from a few stray farm hands in the district and perhaps also on the Free State side of the Vaal River, living their lives apart from the Bechuana who surround them, and preserving the ancient language of their forefathers. But the pastoral life over the vast veld, the countless flocks and herds, exist no more; their old customs, because of the influence of civilisation and of Christianity, have gone.

115 I tried to pick up the broken threads of their old tradition and of their former culture. The old men helped me. There was *Tabab*, a descendant of the old chieftain stock, once a fighter in the battle of Mamusa (1885) a man of about seventy or eighty; *Teteb*, the nephew of the old chiefs of the Links, a slightly younger man; *Saul van Eck*, the son of *Willem*, the Catechist of Rev. Brune of the Saron Mission Station, nearly as old as *Tabab*; *Matiti*, with wrinkled face and bent double with old age and nearly, if not over 100; *Juli*, still older, a wizened old figure of a man, silent through age, and old *Daob*. This last of the old generation was recounting his memories and mentioned "Boomplaats." That word gave me a clue to his age. It is, as is well known, the name of a battle fought in 1848 between Andries Pretorius and the English. *Daob* said he was a grown-up man at Thaba 'Nchu, a Mission Station a short distance east of Bloemfontein, when he saw the Boers of Pretorius rushing through after their defeat. If we take twenty years, as a minimum, to mean the age of "a grown-up man," then he would be at least 104, and probably much more, for he called *Matiti* "a boy." His appearance did not belie his great age. He was nothing but skin and bone, very tall and slightly bent, blind, but extraordinarily active physically and mentally. His speech was quick and his memory amazing. An expert musician, he was of great help to my colleague, Professor Kirby, who accompanied me on my second trip. Such was the group of old men, three of them centenarians, who are now the repositories of the tribal lore of the Links and of their ancient traditions.

The old women, *Kheis*, the wife of *Tabab*, a stately dame, of the royal lineage of Mamusa, *Go:tis* and *Meis*, two very old, wrinkled

11: Maingard Q-5 (1931-1932) 1932
FX13 Hottentot FX13
Korana

specimens of their sex, and *Meis's* younger, very much younger sister, *Iis* were of great use in reviving the sometimes failing memories of their menfolk, in giving full details of the */habab* ceremony and in playing the musical instruments peculiar to their sex.

The younger generations included */Gobo ≠xa* (Piet Kraal, 52), *Tsi:ta*, the son of *Teteb ; !Kutsi*, a man of mixed Griqua and Kora descent, the son-in-law of old *Tabab ;* his wife, *Oreas* and *Ebis* her sister ; *!gasibe*, the twenty-two year-old daughter of *Iis*, and *Kwakwalis*, */Kutsi* and Piet Kraal have a large family of young sons and daughters.

Both *Tsi:ta* and */Kutsi* work for very small wages in town. The old men, so the Magistrate of Bloemhof informed me, have small pensions. They seem very poor. In fact, it is a wonder to me how they live, in the location, when they have to pay small rentals to the Village Management Committee for the site on which their mud brick little "pandokkies" stand. They seem to feel unhappy in that restricted space. For a number of years they tried hard to regain possession of the Saltpan. *Teteb* showed me a mass of correspondence in which Hermanus Links, their late chief, engaged with a Kimberley lawyer for that purpose. Even a petition was sent to the Governor at the Cape. But in vain.

The older women seemed fairly busy with their household duties, cooking the scant family meal in modern iron pots, which have replaced the old clay *su:di*, on the smoky wood fires outside. They no longer have to milk the cows as their ancestors did when they came home in the evening ; nor do the old men, as in the days of their youth, spend their time in hunting and seeking new pastures for their cattle and sheep. Unable to adapt themselves to the new ways of life, and too old to work, they seem to lead an aimless life, reminding one of Tennyson's Lotus Eaters,

> "Surely, surely, slumber is more sweet than toil. . . .
> "Oh ! rest, ye brother mariners, ye will not wander more."
>
> • • • • •

I searched the district for more Korana. There is a very small number living at Christiana. I motored to Schweizer Reneke—the old Mamusa,—where I discovered a very old man, *Xras*, who had almost forgotten his language, his son and wife and a small family ; and another very old man, *Sele:ki*, who told me about the battle between David Massow and the Dutch in 1885. They vaguely said that there might be a few stray Korana working on the farms in the neighbourhood. At Wolmaranstad which I visited this last May, through the kindness of Mr. Thomas S.

11: Maingard Q-5 (1931-1932) 1932
FX13 Hottentot FX13
Korana

115 Leask, I discovered *!Korakje* at Witpoort. He informed me that he was the only one of his kind living in the neighbourhood. He appeared to be a man of between forty to fifty and spoke his language still fairly fluently.

At Shepperd Island, some ten miles on the Vaal River, above Bloemhof, I met Abraham Links, a young fellow of about twenty, closely related to the Korana at the location. He motioned to Verlaaten Kraal to the east, where he said there were a couple of Korana women, with a few children. I could find no more Korana. Truly, a race that has nearly disappeared.

II. THE PROBLEM OF THE ORIGINS

127 In the Cape Town of the early Dutch settlement, and especially in official quarters, there had been a great deal of curiosity and interest about the vast expanse of the unknown North, an interest and curiosity awakened by the fabulous tales of the wealth and culture of the far-famed Monomatapa and of the great Northern river, which had fallen from the lips of old Herry, the fascinating Eva and other Hottentots in the entourage of Van Riebeeck, and quickened by the expeditions into Namaqualand and further north. Nothing worth discovering had been found, but the official explorers of the XVIIIth century—Hop, Marais and Roos, etc.,—had succeeded in reaching the lower Orange River and penetrating, beyond it, into the country of the Great Namaqua.

It was, however, not until 1779 that the veil was lifted from the still mysterious regions of the Upper Orange River and the life of the unsuspected Korana tribes in those remote districts disclosed to Baron Joachim van Plettenberg by Heinrich Jacob Wikar, who had " absented " himself from his post of scribe in the Company's service and who had for two years wandered along the banks of the Great River. He had travelled in 1778 and 1779 as far as what is probably the modern Prieska, and had come into contact with the Kuringais and had learnt of the existence further east of the Kei or Great Korana, bounded towards the north by the marvellous Briqua or, as we call them nowadays, the Bechuana.

How came these Hottentots to be located there? Had they wandered from the centre of the African Continent through the vast and waterless Kalahari or along its more fertile borders as far as the Orange River, in prehistoric times, or had they migrated from the south, break-

11: Maingard Q-5 (1931-1932) 1932
FX13 Hottentot FX13
Korana

127 difficulties had to be pointed out, before coming to a statement and an analysis of the traditions that concern us here.

173 One body of traditions on the origin of the Korana contains a few discordant elements, but agrees in the main, namely that of the Taaibosch tribe, from which we possess three versions, one from Hanto, chief of the Umpukani Korana, and two—separated by a year's distance—from Massow Rijt Taaibosch, the great chief of the Mamusa branch.

115 173 Hanto was one of the original Korana of the Great Orange River. He had come from Ramah, on the Orange River, with his tribe, first to Taungs, then to Platberg, and in the company of the Barolong of Moroko and the Wesleyan Missionary Archbell, had migrated finally to Umpukani, near Thaba 'Nchu in the Free State. There, in April 1836, Arbousset and Daumas, of the "Missions Evangéliques de Paris," found him and used him as their principal informant, for, being a chief, he was the principal repository of the historical lore of his tribe, and as an intelligent man, he could give them a clear account. This was the story:

173 *Kora*, the ancestral chief of the tribe, was the origin of the name *Korana*. He had lived, with his tribe, about eight generations ago, in the neighbourhood of Cape Town, and had ceded to the first white settlers, such portion of his territory "as could be covered by a skin cut into riems." His son, Eikomo, who succeeded him, (for Kora died young), was so hard pressed by the intrusion of more colonists, that he had to retreat to the Brak River (presumably the tributary of that name which flows from the S.E. into the Orange River). There he met a tribe of Bushmen from whom he obtained, by treaty, the lands around Griqua-Town.[2]

115 173 In February 1869—thirty-three years after—at a gathering of the Native tribes of the Western Transvaal summoned at Witgatboom near Christiana by President M. W. Pretorius, Massow Rijt Taaibosch gave his version of the coming of the Korana.[3] He was then the Grand Old Man of his nation, being over 100 years of age, according to his own testimony, and had therefore had the opportunity of hearing the talk of the older generations, in whose minds the memory of the old deeds of the tribe were still fresh, as they were nearer the events they were relating. Further, the telling of the story is authenticated by the judicial character

---

[2] Arbousset and Daumas, p. 49-50.

[3] The second version is to be found in *Lindley-Adamantia*, p. 10-12. It will not be given here, as it is of minor importance.

Korana

of the occasion—a judicial commission, in the presence of an assembly of Native chiefs who were all allowed freely to give their evidence. Thus the peculiar circumstances of the occasion, added to the picturesqueness of the details and the almost inaccessible nature of the documents in which they are imbedded (the Bloemhof Commission Blue Book exists in only a few printed copies), make it well worth quoting in full the very words of the old Korana chief: "Massow says, he came from Cape Town; that the white people had come there from beyond the sea, and had asked for a small piece of ground. Our captain was called Khora. The white men asked for a piece of ground of the size of an oxhide, which they cut to riems. Then they told the Hottentots to pull out the riems, the end of which they fastened to a cannon, saying they (the Hottentots) might keep the copper if they did draw it away. When the Hottentots did pull on, the Whites fired the cannon, thereby killing the men that were drawing it. They thought they were struck by lightning. They then fled to Hottentots' Holland Mountain and thence we dispersed. Hottentot and Koranna are the children of one father. The Hottentots remained there and the Korannas came up to this side. The Hottentots then asked the Korannas to re-unite, but they would not. The Hottentots then sent their women to be married to the Korannas, but the latter would not do so. The Hottentots are the elder. The Korannas went on to this side of Nieuwveld, Cape Colony, near the Spitskop, called T'Koup. Then they came below Great River and having crossed the drift called Kornaar (or Zanddrift)."[4]

Here are seemingly no discrepancies, for the geographical data can easily be reconciled, in fact, in this respect, the two versions supplement each other,—for the route followed by the "trek" would then be from Cape Town to the Ghoup (that is the beginning of the Karoo), through the Nieuwveld range of mountains, then to Spitzkop, then up the course of the Great Brak River and thus to the south banks of the Orange River at Sanddrift. It would then seem that this part of the early history of the Korana is decisively settled, and for all time.

But consider, however, yet another version, that collected by Rev. John Edwards, who was fluent in Dutch, the second language of the Korana, who had lived among them as a missionary and had their sympathy and knew the selfsame Hanto whom he calls by his Dutch name of Jan Kaptein or Jan Taaibosch,[5] and from whom he most probably learnt that "the Korana came originally from Namaqualand

Korana

Korannas place no control on their passions, and abandon themselves to excesses of which it would be a shame even to speak." The so-called "tang-tang" in this description is explained in another passage by Arbousset, in which he describes a similar dance by the Baroa (Hottentots) of Mokoma (Arbousset; English translation p. 353). "Supper being over, the women with their children and the young men set themselves to dance during the first watches of the night, to the sound of a wretched tam-tam" (the French term for a gong, but occasionally applied to drums by some writers, e.g. *Catalogue du Musée Instr., Bruxelles, vol.* 4, *p.* 3) "made of a small earthen pot, in the form of a quoit, and covered with the skin of a gazelle, well softened after having been stript of its hair." 534 535

2. *Wind Instruments*

(a) Signal whistle named *//arey :as*. This instrument consisted of the shin-bone of a springbok, or the leg bone of an ostrich, one end of which was sheared off at right angles to its length, and the marrow removed. A piece of *riem* was attached to it so that it could be suspended from the shoulder of the player. It was sounded by being held against the tongue of the performer in the same way as the *≠a:di* (to be described next) were held, and it yielded a shrill penetrating note of considerable carrying power. It was used by the chief for summoning together the men of his tribe, and it was worn and blown by his headmen. 534

A similar whistle is described by Kolbe as being used in battle by the Hottentots, who employed it to direct operations in the field. One of his plates actually shows the whistle-signallers of two opposing armies each seated upon an eminence, apparently controlling the respective forces. My Korana informants, however, knew nothing of this practice, and, had it been in use among them, it is certain that the older men would have known it in view of the fact that some of the Links people (including Tabab, one of my informants) were actually engaged in battle at Mamusa so recently as 1885. 534 726 202 [115]

(b) Reed-flute ensemble, called *≠a:di*.

This was formerly by far the most important musical feature of the Korana, since it was not only an organised ensemble of many performers, but was really part of the social life of the people. Although it has in the past been frequently noted among the Nama and also the Bechuana, there are but few references in the works of travellers and others to its existence among the Korana. These are Wikar, 1778-9, Wuras, 1858, Stow, 1880, Engelbrecht, 1928, and Meinhof, 1930. But while the 534

13: Kirby R-5 (1931-1932) 1932
FX13 Hottentot FX13
Korana

"Vaderlandze of fluytjesriet." The Hartebeestrivier, is, of course, a tributary of the Orange on the South side, about Long. 20½, Lat. 29¼. 133

Wuras, in his *An Account of the Korana* (MSS. 1858), states on p. 295 (reprinted in *Bantu Studies, Vol. III. p.* 287), "The Aas (the reed play or dance). The day on which the play begins, the men make flutes of reed all of which must have the same tone" (sic). "They then stand in a circle, the music master comes round and listens, if all the flutes are in tune. When he declares them to be in unison," (sic) "the dance commences. The men blowing the flute move in time in a circle; the women form a second circle, and, enclosing the men, dance round them clapping their hands. The dance lasts the whole night. The greatest immorality prevails during these plays, of which there are several. In some of them they imitate the howls and cries of different animals, and at sunrise the men rush to the kraal and catch the sheep and goats for the day's feast, howling like many wolves." 533 535

Engelbrecht and Meinhof practically confine themselves to giving the name and simple definitions of the instrument. Engelbrecht calls the flute *ǫās* and describes it as "a flute made of reed. Of these, different sizes existed, and the tone was also different. The people stood in a circle, and thereupon played and danced." Meinhof calls the reed-flute ≠*'ās* and the reed-dance ≠*'ā-s/aī-b*, and further states, "They" (the Korana) "have no drum," (sic,) "but like the Nama, they have a reed-flute. The women sing and the men play upon the reed-flute." 534

My informants were the oldest men, since the reed-dance has been completely stamped out by the missionaries, some of whom have recorded their pleasure at succeeding in eradicating it. In the Report of the Wesleyan Methodist Missionary Society, Year 1830, p. 44, written from Plaatberg, occurs the following statement regarding the Korana. "During the last year we have got several hymns into use among the people whom we frequently hear singing them in their private houses; and the rapidity with which the songs of Zion supplant the melancholy lora" (printer's error for *gora*, v. infra) "and the whistling reed is truly surprising." This then, was the view of the missionary Archbell, shared, it may be added, by many other missionaries. This particular mission was started in 1827 and ended in 1833. That the "songs of Zion" had no very lasting effect upon the Korana will be seen when their vocal music is discussed. One old man, named Matiti, undertook to make several reed-flutes for me. The proper material was, they said, river reed, but as the only available supplies in the Vaal River were either distant or in deep water, they only procured one stem as a sample. This 533 177 797 534 814 115

13: Kirby R-5 (1931-1932) 1932
FX13 Hottentot FX13
Korana

534 824 115 type of reed is thin, being not more than half an inch in diameter (outside measurement) and having a bore of about three-eighths of an inch in diameter. It is regarded as suitable for the manufacture of reed-flutes because of the comparative uniformity of the bore and because the trifling nodal obstructions inside the reed are easily removed, leaving a clear-bore tube. Matiti cut off a length of this reed measuring about 15½ inches, and cleared the bore with a length of wire, since a suitable straight stick was not available. One of the women had in the meantime obtained a handful of ordinary rushes, and she now chewed these, throwing away the pith and leaving the tough fibre, which she straightened out and handed to the old man. Matiti took some of this fibre and rolled it into a ball, which he proceeded to chew. When it was more or less compressed, he took it between his finger and thumb, and pushed it into the wider end of the pipe, forcing it down by means of the wire plunger. I may mention that at first he tried to push it into the narrow end, his sight not being too good, but the others pointed out his error and set him right. He then tried to sound the flute, but since the plug of rush fibre was not air-tight, no clear note could be produced. Upon this, a woman fetched some water, which Matiti poured into the tube, and kept there for some minutes until the plug had swollen, after which he emptied it out and tested the flute as before. This time the tone was clear and ringing. The reed-flute was held in the left hand, the orifice being laid above the hollowed tongue, and not against the lips as is the case with the tube of a panpipe. No " ictus " could be obtained. The fingers steadied the tube against the chin.

534 115 I then endeavoured to have a set constructed, and for this purpose several reeds were obtained from gardens in the neighbourhood of Bloemhof. From these reeds Matiti and another old man, Tebeb, prepared six reed-flutes, but were not very well satisfied with them. They seemed to find difficulty in remembering how they should be tuned, and suggested that their oldest living friend, named Daob, who had his home at some little distance, should be sent for, since he was a musician, and knew all about these things. We were, however, only able to get hold of Daob on the day before our return from Bloemhof, but he proved to be a particularly interesting personality. Daob was completely blind, and consequently our investigation was much hampered. But his vitality and good humour were amazing, and when the set of reeds was put into his hands, he felt them all over, tried to blow one, and finding difficulty, tested all the reeds at both ends by suction, to see whether the plugging was efficient. Apparently he was annoyed, for he burst into Bushman, and then told the ancient Korana that they knew nothing about the reeds,

13: Kirby R-5 (1931-1932) 1932
FX13 Hottentot FX13
Korana

but if they got the proper material for him he would show them (he called them " boys ") how flutes should be made. I shall have more to say about old Daob when discussing stringed instruments and vocal music.

The reeds were kept by one man who acted as the leader in the reed-dance. A case made of a piece of a tree trunk hollowed out by a curved iron tool was used for keeping the reeds in. This hollow wooden case was suspended by a *riem* from the branch of a tree, so that the flutes might be kept in shade. They were not kept inside a hut since the heat of the fire would tend to dry up the plugs and tubes. But whenever the reeds got too dry for use, they would be thoroughly soaked in water. Should a reed split, it could often be made usable, if not too far gone, by being " whipped " with wet rushes, which, when dry, drew the edges of the crack close together. In place of the wooden flute-case a bag of cowskin was often used

Women never played the reed-flutes (this directly contradicts Stow); only grown men might perform upon them. Immediately after they had passed through the *doro* or initiation ceremony, the boys would be taught the steps of the reed-dance, and how to play upon the flute. The leader, who was called *!khon!a !kausab*, was the teacher. The men, having been provided with their reed-flutes by their leader, would stand in a circle, and would move round, dancing, counter-clockwise. The men's dance steps involved a leaping movement. The women formed a wider circle outside that of the men, and executed a graceful tripping measure quite different from that of the men, and moved in the opposite direction. Occasionally, however, they would roll their buttocks about in characteristic manner. The flutes were sounded in succession, beginning with the highest in pitch, which was played by the leader. The women clapped their hands in time to the music of the flutes. Owing to the fact that a proper set of flutes was not obtainable, I was unable to arrive at the pitch of the various pipes, but a curious point arises in this connection of which I shall speak when describing the songs of the Korana.

The names given to the first four flutes were as follows,

(1) *≠ko:≠ko:ɪ*
(2) *!namis*
(3) *geiŋ≠a:ɪ*
(4) *tusana*

The meaning of the third of these names is " the big reed," which particular flute appears to function as a kind of " tonic," since from it the

13: Kirby R-5 (1931-1932) 1932
FX13 Hottentot FX13
Korana

534 others are tuned. I could obtain no names for any other flutes; the Korana said that they merely "followed on."

535 115 In December 1931, Professor Maingard obtained a description of the reed-flute dance, his informant being Saul van Eck, an old Kora who also supplied me with information. The ǂ*a:di*, he said, were played by men moving in a circle (*ina*ǂ*na:x* ǂ*naammi*). In the middle of the circle was a man with a stick who beat the time. The minimum number of reed-flutes was three, which had the same names as the first three on my list above. But there were often as many as twelve, or even fourteen or more players. The whole kraal would join in the dance, even if they were not playing. The women stamped round in an outer circle, clapping their hands (*ina* //*am*) and shaking their buttocks (*!hare khuedi*). Four o'clock in the afternoon (*haka horoo:p*) was the right time to begin the dance, which lasted until morning (*//kua:ba*). Oxen were killed for the dancers.

535 621 786 797 After considerable questioning we succeeded in eliciting the information that occasionally there was a kind of "competition" between kraals, in which the reed-dance played a very important part. There can be little doubt that it was this aspect of the dance that roused the missionaries against it, although unquestionably their practice has always been to eradicate all forms of music peculiar to the peoples whom they wish to convert, and in its place to impose that to which they themselves have been accustomed. The inhabitants of one kraal would visit those of another, who met the visitors half-way, the women of each kraal accompanying their men. Oxen would be slaughtered by the hosts for the entertainment of the visitors, and the reed-dance would begin, the women of the one kraal dancing with the men of the other. The dance developed into an orgy, the women abandoning themselves to the men. As my informant put it, "they mixed."

114 533 535 Stow has given us a description of this practice on pages 114-115, but attributes it to the Bushmen, who, so far as I have been able to find out, never originally played reed-flutes; and on page 116 he states that "The Koranas had a dance which was identical with the one described, but as the Bushmen of the north practised it for generations before the Koranas made their appearance on the banks of the 'Nu'Gariep, it is not improbable that the latter derived their knowledge of it from the older race." But it is necessary to quote a passage written by Stow, which should follow the last paragraph on page 115, and which was ill-advisedly deleted by his editor Theal. I reproduce the passage, copied from Stow's original manuscript, with the kind permission of the Trustees of

13: Kirby R-5 (1931-1932) 1932
FX13 Hottentot FX13
Korana

533 left hand supports the stick by grasping it at a convenient point, but no pressure must be brought to bear upon it, since the tightening or slackening of the bow would cause the pitch of the string to vary, and this is not desired by the Korana. With the right forefinger the player plucks the string, the principal sounds being executed with a downward action, and the subsidiary ones with an upward action. I have indicated these in the examples quoted by means of the signs used by violinists for downward and upward bowing, ⊓ and ∨ respectively. The string, of course, produces but one sound when plucked, although implicit in it are the overtones known as the "harmonic series." These the Hottentot has recognised, and has discovered or learned that some of them may be isolated and reinforced by the variable cavity of the mouth. The following examples will show the nature of the performance: they were played by Tabab, who is seen performing on the instrument in Plate VII. It will be understood that the prime tone of the string is present throughout, although it is not the main sound; it serves as a kind of drone to the bugle-like tune played on the harmonica. This instrument is best sounded in quiet places, when its sweet tones can be clearly heard.

Ex. 1. ♩=120.

534 (b) A second development from the hunting-bow is played exclusively by the women. It retains the original name of *khaːr*. Like the *!gubus* it is made from a branch of *henjeshus*, about three-quarters of an inch to one inch thick and about thirty-eight inches long. The bark should be removed, and the wood allowed to season, although in the example made for me the bark was left on and the wood dried by fire. A stout string of twisted sinew is prepared, and is secured by a slipknot in a groove made at one end of the stock. This end is then placed on the ground and the stick forced into a semicircular form, when the other end of the string is secured to the tip of the stick just as in the case of the *!gubus*. A thin piece of seasoned wood or reed about fourteen inches long and an eighth of an inch in diameter serves as a beater, for this
533 instrument is normally sounded by striking. The player, having tuned the instrument (to suit her voice), seats herself upon the ground, and takes the bow in her hands. The lower end, where the string is knotted, she places upon a bag of skin (*//hoːb*) or a dish of willow wood, which
● [115] acts as a resonator. (Gotis, who played for me, and who appears on Plate VI, used a one-gallon paraffin tin as a substitute and is placed to her right.

13: Kirby R-5 (1931-1932) 1932
FX13 Hottentot FX13
Korana

harmonics of the string are powerfully produced. As I have gone very fully into the history of and methods of construction and performance upon this instrument in my paper " *The Gora and its Bantu Successors*," published in *Bantu Studies* Vol. V, no. 2, June 1931, it is unnecessary to say more about it here, except to emphasise that it appears to have belonged particularly to the Korana. But I would add the information obtained in December, 1931, by Professor Maingard, when Mulukab, a Korana, who was in the Orange Free State, visited his friends at Bloemhof. When the name of the instrument was mentioned, all the Korana remembered it, but said that it was no longer played by them. Mulukab, however, became wildly excited, jumped up, and applying his traveller's stick to his mouth, hummed a tune and sketched a few dance steps. Mulukab is recognised as an expert on the instrument and can still play it. He added " You play it by yourself. It makes you forgetful of things, and you can be your own company." Plate VI shows Seleki, a Kora who lives in the location at Schweizer Reneke, photographed at that place playing upon the instrument.

533 [114] [115]

The *ramki*, the guitar-like stringed instrument universally attributed to the Hottentots, is unknown to these Korana, and the principles involved in its construction are entirely foreign to their musical practice.

534 184

(d) Miscellaneous Instruments.

534

The only Korana instrument known to me which comes into this category is a form of bull-roarer, called *buru-buf*. It is made for and played only by young boys, and has lost any significance it may have had. It is interesting, however, in view of Balfour's suggestion that the bull-roarer may have had something to do with the origins of the gora. (Balfour : " *The Goura*," p. 173). Among the Korana it is made of a flat oblong strip of wood about five and a half inches long, two inches wide and a quarter of an inch thick. The wood is thinned down somewhat towards the tip (the corners of which are slightly rounded), and also along the edges. A hole is bored at the thick end, a string threaded through it, and the ends of the string knotted together. The boy takes the loop of string in his right hand and whirls the bull-roarer round and round in the usual manner. Plate VII shows a Kora boy holding the instrument.

VOCAL MUSIC

533 126 115

A number of songs performed chiefly by old Daob, the blind musician, were recorded on the phonograph, and afterwards transcribed by me. The texts were secured by Professor Maingard who has kindly

13: Kirby R-5 (1931-1932) 1932
FX13 Hottentot FX13
Korana

533 edited them for me. I am responsible for the adjustment of the Korana
126 texts to the melodies. It is interesting to point out that old Daob at first
115 was unwilling to sing because he had no other singers to sing with him.
His voice was high in pitch, and in spite of his great age (he was well over a hundred) his intonation was excellent and clear-cut.

533 Ex. 3. *Mittlab /noãs kjesa*
539

This song is descriptive of a quarrel between Daob and another man named Mittlab over the ownership of a cow. Translated, the words mean

Mittlab ! It is his cow !
Mittlab ! It is his cow !
Old Daob ! It is his cow !
Daob ! You have a beard all over your face !

13: Kirby R-5 (1931-1932) 1932
FX13 Hottentot FX13
Korana

533 But an exactly similar scale occurs in a set of four reed-flutes which I possess, and which were made and played by the */aua gowab sān* or Red-Dunes Bushmen who live near the western fringe of the Kalahari desert, and who have doubtless been in close contact with the Nama Hottentots. The scale of this set of reed-flutes is

Ex. 11.

aiās dlgās //huis gomas

As regards the method of singing displayed by Daob, one was at once struck by the crispness of his rhythm. Slurring, when used, was deliberate, and in this connection it is worth drawing attention to the fact that, in several of the songs, there are two sounds sung to one syllable. Otherwise there is a considerable agreement in general outline between the words as sung, and the same words as spoken; and this agreement applies also to the relative emphasis of the various syllables. In fact, so "musical" was the speech of certain of the Korana, and so definite the relative pitches of the speech tones, that frequently speech constituted melody, in which one seemed to hear at least six distinct pitches. Nevertheless I am not at this stage prepared to dogmatise on the point since I have not so far been able to obtain sufficient material upon which to generalise.

533 177 539 [115] In addition to the songs performed by old Daob, four Korana women sang a couple of songs. The first of these, reputed to be a lullaby, was sung by Gotis and Keis. European influence is apparent in this song.

Ex. 12. *hada //nāu*

13: Kirby R-5 (1931-1932) 1932

Korana

The words of this song, which was sung with the drawl that appears to be inevitable when the Bantu, unguided by Europeans, attempt to sing European melody, were 533 177 539

hada //nāu he: buruxa mis,

which means

Let us listen to this wonderful little word.

The second song affords an even better example of the use to which the backsliding convert may put the " songs of Zion ; " for here, what is palpably a hymn tune, or rather the two upper parts of one, is turned into a lullaby, with secular words. In this case also, the laziness of the rendering was characteristic, and quite opposed to the crisp execution employed by Daob, in spite of his years. The singers were two younger women, Iis and Kwakwaris. [115]

Chapter XII

The Hottentots

[170] The seventeenth century Dutch gave the aborigines of the Cape of Good Hope region the name "Hottentots" because of their peculiarly clicking language. According to contemporary authors "Hottentot" was an insulting term for a stutterer. This nickname has stuck to the people. 101

As far back as their history extends, the Hottentots have never united in one nation. Even the oldest Dutch [171] settlers at the Cape report of tribal wars. In addition to this, beginning with the seventeenth century, the Hottentot tribes were pressed back by the white race from the south and in the nineteenth century by Bantu invasions from the north. As the Hottentots were thus compressed into an ever narrowing area, increasingly bitter battles for pasture grounds and water holes resulted and the processes which for ages have commingled the yellow-skinned nomadic tribes of South Africa were accelerated: migrations over an extensive area; the scattering of related elements; and the union of unrelated ones into a new tribal community under a new leader. We will not enumerate the tribes which succumbed during these struggles; the sources of their oldest history are obscure. The best accounts of the past century are missionary reports. (65) 175 619

65. Berichte der Rheinischen Missionsgesellschaft zu Barmen.

We can pass over the few remnants of the Hottentots that are left in the present Cape colony; they are vanishing, physically debased and spiritually estranged from their people in customs and language. They are the Korana and the Griqua and a few families scattered among the Boer farms that work as day-laborers. Only north of the Orange River a number of Hottentot tribes remained strong and relatively pure, linked with the tribes or hordes who had fled across the great river to escape pressures of civilization. Both, the aborigines and the refugees, were undisputed masters of Great Namaland up to the beginning of the eighties. Now fate has also caught up with them. The tribes, still important political factors before their last attempt at revolt, will be distinguished by name for only a short period. As history has taught, the differentiation of the tribes disappears with the captaincies (that greatest danger to peace which has now, we hope, finally been removed). Of the Hottentot tribes north of the Orange, with whom we first became more closely acquainted about the middle of 131 619

the nineteenth century, five had already been destroyed in native wars before our armed intervention in the disorders of Namaland. Their former territory (as of 1852) is indicated on the map by broken lines, for the borders of the remaining tribes (as of 1890) by unbroken lines (cf. map legend). At the moment it is not possible to foretell what the situation will be in regard to their numbers, their captains and their dwelling places, when the country is at peace again. At least the names of the tribes can be listed here: [172] a) Na!ma·n is the name the Hottentot gives to those tribes who have lived for generations in present-day Great Namaland. They are: 131 6A

1. The ǂAo·/nin or !Go·/men, who are sometimes called ᵓ/Na·ranin by their neighbors because of their gourd (naras) fields, the Topnaars of the Boers.

2. The !Kχa·ragai·kχoĩn, shortened to !Kχa·r(a)kχoĩn, the Franzmann Hottentots or also called the Simon Kopper people after their captain.

3. The //Ha·bobe·n or Veldskoendragers.

4. The ! Ga·miǂnũ·/n or Bondelzwarts.

5. The //Kχau·/gõa·n or Zwartboois now settled in the northern kookoveld outside of Namaland with a few scattered exceptions.

There are also others, who, although today they are scattered, still live in the memories of the natives as ancient tribal communities.

6. The //Kχau·ben or the Rooi Natie.

7. The /Kχa·roᵓõ·an or the Tsaibschen Hottentots of Keetmanshoop.

8. The // Ogain or Grootdooden.

b) ᵓGũ!nũn is a designation for those Hottentot tribes, who emigrated from the present Cape Colony to Great Namaland at the turn of the nineteenth century. The following, usually called Orlam, belong here:

9. The !A·maĩn or Bethanie Hottentots.

10. The /Hai·/kχau·an or Berseba Hottentots.

11. The /Kχo·besin or Witbooi's.

12. The Gai·/kχau·an or Amraal Hottentots of Gobabis.

In addition there is the tribe, extinct since 1889 which, under the leadership of Jonkers and Jan Afrikaner was the most feared of all the Orlam tribes.

13. //Aʇ·χa//a·en or the Afrikaaner.

These thirteen names will soon be all that is left of the old tribal divisions of the Hottentots. Before the destruction of the language, ideas and customs of this people, inevitable as its political destruction ensues, 1/4

everything that can at least be saved, at least for the ethnologist, should be brought to safety. I tried to carry out to the best of my ability this duty that belongs to every scientific traveler, insofar as my chief task, research in my own special field, permitted, I made it a rule to note down only those things I saw and experienced in direct, personal contact with the natives. Only in the chapter, "Midwifery" did I find it necessary to depend upon the experiences of a local white woman. Well aware that the experiences of an [173] individual can only be spotty, I still prefer to paint the picture of the Hottentots as it appeared to me and not to draw with another's pen, even when the gaps are large, because in an area that leaves so much to the interpretation of the individual, I would only trust myself an interpretation of those things which I myself have observed.

G. Fritsch (68) has made a compilation of the most worthwhile ethno-

68. G. Fritsch, Die Eingeborenen Südafrikas, ethnographisch und anatomisch beschrieben, mit Atlas. Breslau, 1872.

logical material that was available up to 1872. But since the work of Theophilus Hahn, (66) published in 1867, there have been no coherent

66. Th. Hahn, Die Nama-Hottentotten. Ein Beitrag zur südafrikanischen Ethnographie (Globus, vol. XII, 1867).

original investigations of the folk life of the Hottentots. I will merely mention Ratzel's(70) presentation here. It cannot be my job to discuss the

70. Fr. Ratzel, Völkerkunde, 2nd ed., 1894.

problems of the comparative ethnology of the South African peoples from the viewpoint of the specialized literature. I shall only report my own observations, developed independently, often merely stated as facts for more expert people to evaluate.

In regard to the Hottentot script inserted in the text, refer to what is said in chapter V, A, about the language.

I was always spurred to further research by seeing that where, on the basis of older reports, it was least expected, the old individuality of the people in respect to the family and the individual, had often remained

surprisingly pure, in spite of all cultural influences. But in the social and political area, most has been irreparably lost. 177

Capitulum I

The Body and Its Care

A. The external appearance of a Hottentot has little that is attractive. 142
The posture of the body of neither the male nor the female of any age has 171
the dignity that is usual among the Herero in youth and early manhood. The [516]
tall, slim form of the Herero has a well developed musculature in the male sex and in the female sex a moderately developed Panniculus produces beautiful forms and symmetry. This naturally heightens the attractiveness of all motions in the case of the youthful body. Only [174] a strap girdles the loins of the Herero in youth. A knee-length skin shirt covers the front and the seat, but with every step the entire line of the thigh, the slim hip line and the transitions to the groin are revealed. The body of the Hottentot is too small in spite of its good proportions and normal muscular development, and it is usually so distorted by scraps of European clothing that its [291]
movements have no charm. The motions of the female bodies are somewhat clumsy because of an oversized seat and young girls who lack this ornament are quite unsteady in the movements of their limbs. [Picture. A young Herero woman (compare the figure of an older Hottentot woman on page 180)] $\frac{1}{A}$

The limbs themselves are more delicately formed. Their hands and feet are smaller and thinner than is usually the case in adults of our race and in South Africa are only surpassed by the miniature limbs of the little Bush women.

That part of the body which we know best in ourselves and others and 142
by which we form our first judgment of a person either consciously or unconsciously, is the face. The physiognomy of the Hottentot, although ugly, attracts our attention in two ways: It is always interesting to observe spiritual animation in this strange mirror, and even more so when we become better acquainted with it through the years. And then it is a strange feeling to apply the concept of the animal species which is prompted at first glance by the contrast of our features and theirs to our own race.

A closer comparison*, taking into account the areas that correspond and

*Measurements will be given in another place.
The following accounts concern only the living body.

$\frac{1}{A}$ [see p. 88. – Analyst]

142

those that deviate, produce the following: The top of the skull has no special characteristics. The forehead is moderately curved. The crown, which slants in a moderately steep direction toward the sides [175] lies well-centered, rarely protrudes forward and even more rarely backward and the knobs of the parietal bone do not stand out. The back of the skull is never flat, and projects forward sometimes moderately, sometimes considerably. When looked at from above, the top of the skull has a definitely ovoid form, the pointed pole turned toward the front.

The most characteristic part of this view of the skull is the narrowness of the forehead, but otherwise the brain section of the forehead reveals nothing remarkable. It is moderately rounded, of medium height and steepness but the protuberances of the forehead are not marked. However the projection of the eyebrows gives the forehead a strange appearance (especially in the lateral parts. A glabella roll is usually lacking).

The cheekbones usually spread out so far to the side that the cheeks under the eyes protrude like two powerful swellings.

The chin is barely rounded, runs to a point and recedes. Thus the whole face appears pointed not only upwards above the eyebrows to the edge of the hair but also downwards from the cheek bones to the chin, when all the peculiarities of the above-mentioned parts are well-defined.

The Hottentot's nose is to our eyes of extraordinary ugliness. The nasal bone is set so deep that in many cases it is not externally evident at all where the root of the nose is joined to the forehead. The bridge of the nose is so wide and rises from the face with such a flat saddle that it nearly disappears. The lower part of the nose is all the more prominent. The bridge which in profile progresses sometimes in a straight line, is sometimes concave and sometimes convex, ends in a flat bulb at the place where our nose is pointed. This bulb continues to form a short, uptilted nose base. The enormously wide, blown-up nasal wings spread out sufficiently at the bottom so that one can look into the large transversely placed nostrils as easily as into two chimneys.

The prognathism of the jaw is often emphasized by a proboscis-like extension of the lips. The upper lip with its shallow, middle furrow appears long when compared with the lower lip. The lips, brown, thick, cracked and puffy surround a medium-sized and normally straight mouth line. The receding chin and the sunken bony part of the nose make the area of the jaw protrude even more like a snout. (cf. Illustration, p. 176). The

142

teeth are usually in a straight row, and, as is typical for ours, show an increase in size [176] in the upper incisors toward the middle of the jaw as well as of the bicuspids and the molars of both jaws and a similar decrease in size of the lower incisors.

The eyes, which have a dark-brown iris, peer out of lids of medium length, which are not widely opened. The connecting line of the outer corner of the eye with the middle of the caruncula lacrymalis often reveals a faint slanting of the lid (towards the outside and upwards), although this slanting is not at all evident to the casual glance nor does it deviate from corresponding findings in our race. The space between the eyes is large.

Even if there were no crows feet in the area of the eyelids, the fold of the upper lid is usually so well developed that the lid itself disappears at the middle and sides under it. In many cases a fine skin fold extends around the outer corners of the eyes like a sharp seam, sometimes passing without interruption into the medial part of the lid fold, sometimes separated from it by several millimeters of unfolded skin. (Anatomically this) corresponds to an epicanthus, but it is differentiated from the typical Mongolian fold in that it leaves the caruncula lacrymalis free. The well developed caruncula lacrymalis covered with nictitating skin [Picture. Hottentot of the tribe of the Topnaars, about 20 years old.] is hidden under the tarsus of the lid in the rare cases in which it is not exposed. The part of the conjunctive tunica normally protected by the lids when the eyes are at normal aperture, is smooth and of a bluish-white color. On the other hand, the exposed part which suffers greatly from dust and smoke has a yellowish [177] color and an uneven surface. I never saw the upper tarsus descend with a sharp edge. The black lashes are short and thickly massed. The eyebrows are usually short and narrow, sparse, relatively thickest in the middle; the individual hair is curly. Sometimes the eyebrows are straight, sometimes curved; they are low and placed horizontally, (sometimes ascending towards the outside) and do not meet.

[Picture. Hottentot of the tribe of the Topnaars, about 20 years old. (The same person depicted on page 176.)]

For purposes of orientation in the comparison of physiognomies, the portrait of a young Herero is included here (pages 178, 179.) (cf. also the portraits of the Bergdamaras [Kaffirs] the Betschuans and the Bushmen that follow later).

The ear is usually flat against the head. Either completely or semi-adhering lobes are the rule; I saw a Darwinian point only in the rarest cases and usually only indicated on the incurved helix.

[177]

Hottentot of the tribe of the Topnaars, about 20 years old. (The same person depicted on p. 6 (A).)

The Hottentots and the darker Bushmen whose skin is light-brown or fawn-colored stand alone among the blackish-brown to black human races of their neighborhood. A pale, fawn-colored, brownish-yellow is the basic color of the Hottentot's body. On the face the skin is often brown but on the sole of the foot, it becomes the slightly tanned skin color of our race, even more so under the nails of the feet and hands, sometimes seeming yellower, sometimes pinker. They do not have our bright red lips. The mucuous membrane of the mouth (including the parts of the lips which are invisible when the mouth is closed) [178] and of the throat is a dull red tinted with violet. That is also true of the vulva. The glans penis, however, is a bright pink color. I never saw a single case of circumcision.

The Hottentots cannot consciously move either the muscles of the skull or the ears, only the platsyma, as I later tested.

[Picture. Herero, about 20 years old]

The body hair is extremely scant. Because of this and the strong curl in each fine hair, wherever the hair grows in bunches (except for the eyelashes, the eyebrows, the moustache and the beard), it mats together into separate, isolated tufts between which the skin shines brightly. But these visible parts of the skin are not bald: The implanting of the hair in the skin is regular, at least no group arrangement can be identified which would correspond to those matted tufts. That is true for the hair on the skull as well as around the genitals and in the armpits. The stronger the spiral curling of the individual hair and the scantier the total amount of hair is, the firmer and smaller the tufts. There are variations in all stages from compact formations that measure only a few millimeters across to loose clumps that are centimeters large. Only in a few rare exceptions is the hair on the head so strongly developed that it forms curls as long as the finger, thickly massed, but individually differentiated, which then stand straight up in confusion or dangle around the head in a fantastic way (cf. Plate V.) The Hottentot himself [179] designates the black round knots of hair on his head with the same word that means goat dung (!noŋra-s). The Boer compares these hair knots with peppercorns and calls the Hottentot "Pepperkopp". Among several hundred Hottentots I met only one bald one.

The Hottentot has only those parts of a beard that our race has best developed, namely, a weak mustache (especially developed towards the side) and a chin beard. The separate hairs of these are well developed. He does not have side-whiskers and a complete hair covering

171

Herero, about 20 years old.

under the chin and on the neck is lacking. It is only suggested here and there by separate hairs. 142

[Picture. Herero, about 20 years old (the same person that is pictured on page 178)].

The physiognomy of the Hottentot receives a heightened expression through the premature appearance of wrinkles. The corner wrinkle from the mouth to the nose and a fine wrinkling of the skin under the eyes, appear very early, along with forehead wrinkles. With age the lines increase and develop into wrinkles to such an extent that they rob the face of all expression and extend over the neck and breast in long, parallel stripes (cf. Plate XVII). The skin of young and healthy individuals of both sexes is stretched stiff and fresh across the soft parts (cf. Plates XII and XIII). 142 145

The fatty padding of the female body is generally considered ornamental. The breasts are fully developed. Accumulations of large masses of fat on the buttocks and on the outer side of the upper thigh (steatopygia) often produces a distorted figure in the matrons. Such enormous development and such definite localization are a peculiarity of the race as [180] is the enlargement of the small lips of the vulva to form an apron, which will be discussed in another place. 142 [832]

B. Posture of the Resting Body

However neglected the external appearance of the Hottentot seems to be at first glance, I still discovered here and there certain rules of deportment, concerning the posture of the resting body. It is forbidden to lift the knee above the level of the head as is the case when lying on one's back with the knees bent. The designation for such a position is !hõ!//goa *. 516 576

* I could not find the word "!hõ!" listed anywhere; it is as sharply differentiated from !ho!- to be bent, as from !hõ!- to mock. As far as I could determine the meaning . . . [Picture. Hottentot woman of Bersaba, 1.48 m tall, about 40 years old with well-developed fatty buttocks.] from the native usage, it has the sense of "uncouth." A man speaks thus to another with a noticeably large set of teeth: [181] "sa arii ǂtoma !hõ! //gũga (e)ĩts" i.e. "Your

142
301

Hottentot woman of Bersaba, 1.48 m tall, about 40 years old with well-developed fatty buttocks.

teeth are as uncouth as those of a dog." The excessively large horns of an ox are called !hõ! //nãgu. An oath that is often heard is: "!hõ! ≠ǂaraga ũ" i.e. "You with the big testicle." (Here as in other cases of groups of words that belong together, I have only indicated the tonal level of the vowels where there was a question of a special differentiation.)

A Hottentot, who found one of my people in the described position, struck him on the knees with the words "ne !hõ! //goabats gye nĩ ʃũ", i.e. "you should stop lying with such uncouth knees," because it brings bad luck, as I found out in reply to my question.

Placing the knee high, which is unavoidable when a long-legged person squats, is mocked. Thus a tall slim Herero girl was teased with the words: "/ũitsibeb kǂoma gai //goaga (e)ĩs," i.e. "you with your tall (towering) knees like a fly." (The fly itself is called !hõ! //goab because of its long legs which seem just as uncouth as the knees of the squatting, long-legged person).

A woman who is half resting on the ground seems to be in a squatting position at first glance: The upper part of the thighs go straight up and the knees stand correspondingly high and are severely bent. (If the woman still wears her native costume, she pulls the front apron between her legs and under her seat when she sits down.) But the body does not rest on the knee joints as it does when squatting, but sits upright on the heavy fatty padding of the seat. Men or thin people can sit in this position without back support only when they have relatively long hips; otherwise they sit on a foot-high stool that folds up (≠nũais), the top of which is covered with straps. If the woman, who is sitting on her fatty buttocks, wishes to do needle work, she spreads her upper thighs a bit and thus gives her arms sufficient freedom of movement.

If the woman is nursing a child, she sits down the way an oriental woman does, with upper thigh spread and flat, crosses her bent lower legs and draws them up in such a way that the leg of the one side rests on the foot on the other. In the trough thus formed by the woman's legs, the nursling lies so safely that the woman has both arms free for work. I also frequently found older men sitting on the ground in the position of nursing women.

[182] The younger men usually sit down in such a way that they rest on the ground without back support on the hindmost part of the

seat, their legs slightly bent and half spread out in front of them. 516
The upper trunk is bent slightly forward, the back curved, the outstretched arms rest with their elbow joints on the knees or are crossed on top of each other under the knees. I can still see them today, as I did so often then, sitting around the evening fire, their hands spread out over the warming logs as if blessing something, their heads leaning back to let the smoke pass by. The winter mornings are quite cold. Then they turn towards the early morning sun in a remarkable position: they spread their legs as far as they can so that even the flat under parts of the legs will receive full sunshine and no limb will cast a shadow on another.

If they are in a good mood, they praise the beneficence of the rising sun in their own pictorial language. Half singing and half declaiming they repeat many times: "gabu aib gye /gĭrib ŏaba, sores gye ti ŏasa," i.e. the cloud shadow is the son of a jackal (scornfully), the sun is my daughter."

C. Expression of Emotions

The male Hottentot imposes a certain reserve on himself either 201
from cleverness or from consideration. In the female sex, where this [157
reserve usually disappears, a comparison with the Herero woman shows 171]
great differences. The facial expression of a Herero woman is masked by a brown, earthy, fatty salve, with which the face as well as the rest of the body, the leather clothing and the three-pointed cap is rubbed. Such a woman, when she is listening to the conversation of those sitting around and is leaning motionless against the clay hut, seems to be made from the same dark clay which suddenly comes to life when the whites of her eyes and teeth light up at a word that concerns her.

A Hottentot woman is never this quiet; if the conversation is solely 201
concerned with objects which take up her attention more than usually, 521
she gesticulates vivaciously. If passion is the chief concern (even if it is only alive in her memory), then scarcely any part of her body is still: the upper part of her body is now bent forward, now sideways, her arms wave back and forth in front of the listener's face. Sometimes she points with ridiculous clarity to the wall of the hut to indicate the distant setting of the tale, sometimes the index finger of her [183] right hand will be balanced in the hollow of the left to aid in the explanation.

Actually we must keep in mind, that the Hottentots have borrowed a great deal from the gestures of the foreign peoples in their present surroundings. Their receptivity for foreign things is great. When this is considered, the number of gestures which can be considered original because they are unique or dominant among the Hottentots, is greatly reduced. As a gesture of affirmation, they usually throw back the head slightly at the same time shutting the eyes. This is frequently observed, especially among the women. 201 [177]

Negation is expressed in a careless manner by an inarticulated sound with the mouth closed. The sound resembles a short, light cough, only it is voiced somewhat with a notable rise in tonal level at the beginning and a fleeting fall at the end.

They themselves call an expressive gesture of astonishment *//a·mana·m (from *//a/m - covering to hide and ǂams - mouth). For this gesture they cover the mouth and the entire lower half of the face with their hand flat and turn the head to one side, at the same time raising the eyelids. Lifting the upper eyelids (without raising the eyebrows), which I often observed during a conversation whenever there was a sudden dawning of recognition or awakening of interest, can only be designated here as a common human mode of expression. 201 152

Shame cannot be recognized by a blush because of the fawn-colored character of their skin. Bending the head sideways and covering the face with the elbow is a frequent manner of expressing the feeling of shame.

I found a gesture of repugnance or strong dislike very marked among the women. The face is turned to one side and slightly tipped backwards from the person against whom the gesture is directed. The eyelids droop limply, the mouth is distorted into a snout, the upper lip coming quite close to the nostrils as though to plug them up. Using the same gesture, called ǂonam, a person who has overeaten turns aside when food is offered to him.

It is no longer possible to decide whether embracing and cheek kissing as a tender gesture of greeting is original among the Hottentots or a gesture they have adopted. An old woman embraced and kissed one of my young companions with feelings of joy, when he [184] returned to her dwelling after years of separation. She summoned other women and couldn't express her joy sufficiently. Her eyes were too deeply encased in wrinkles for me to see if she was weeping. One may probably consider weeping as an expression of joyful emotion a

form of expression that also belongs to the Hottentots, as they have their own designation for it: //ha·ru. 201 152

Two women reached the opposite end of the scale of emotion and one of them sought me out to bandage her. In a fight her opponent had bitten her across the nose, in the neck and on the thumbs. 578 152

D. Nourishment

Let us now leave the Hottentot's body and observe what kind of care it receives in health and in sickness. A race that restricts itself to gathering the plants necessary to existence that grow wild in nature without having been led by the meagreness of this means of subsistence to attempt agriculture, is certainly at a low cultural level. Even where water lies right under the surface in river beds and may be reached by digging, and where fertile flood-lands with dried silt left by the river make gardening possible, as has been done by white men, the Hottentot has not been able to force himself to work systematically. Here and there they enclose a little piece of land with brush, call it !hana·b and plant in these "gardens" calabash gourds, aba·s, which they hollow out for butter jars, or they plant gourd fruit, b(e)ri·tsa/mab, an edible fruit, which is green with white spots and the size of a child's head, but they are quickly bored by such activity. At any rate it is only thanks to the constant influence of the missionaries if the Hottentot persists with his garden at all. 231 [222] [312] [415] [797]

From home training he knows only three activities that provide his food: gathering; hunting; and cattle raising. Later we will see how he has more or less perfected the two latter activities. Right now we will consider how he transforms the raw products, which we may assume as given, into food.

I. Animal Food

Animal food is supplied by the sea to the coastal Hottentots. Seal meat (cf. p. 41 ff.) [185] provides a highly-prized roast, especially when it is strong. The fat is not valued as highly, but it is still eaten. At the time of the seal hunt the coastal dwellers will go anywhere to get the offal. They even go out seal hunting 225 [262]

alone but only if they do not have to leave the mainland, but can get the individual animals that occasionally wander on the main beach.

They also hunt penguins, take the eggs from the nests, kill young, inexperienced cormorants with a kirri or fish with a hook bought from the whites. In general, however, the Hottentots, that today life along the coast, have become so completely accustomed to European food in the service of the whites, that they no longer know how to acquire food in the ways their grandfathers did. Eighty years (6) ago they

6. Benjamin Morrell jun., A Narrative of Four Voyages etc., from the Year 1822 to 1831, New York, 1841.

still fished in Whalefish Bay with wooden spears four-and-a-half meters long, which were cut from a heavy hard wood, caught heavy fish, weighing seven to ten pounds, with them at a distance of 25 meters and pickled them with salt which they obtained from salt springs near the bay.

With bow and arrow they killed quantities of seabirds, especially in the nesting season, buried them in the sand to get rid of their fishy taste until they turned green, then cleaned out their insides, skinned them and left them lying twice twenty-four hours in the sun; the rotten meat, so prepared, is supposed to have kept for many months.

A favorite food of the Hottentots, mentioned by Morrell, was warm, raw intestines of freshly slaughtered cattle.

Dolphins, which come right up to the beach in Whalefish Bay, may have been captured. The customs which were formerly observed in the preparation of dolphins are still well remembered. They took off all their clothes and naked cut up the dolphin. Touching the animal with the body except with the mouth was considered harmful. During the work they avoided touching themselves with their hands and used a little piece of wood for scratching. The flesh of the animal was cooked in sea water, rinsed in cold sea water and squeezed out. Before they put on their clothes again, they cleaned their bodies of any bits of the animal that might be clinging to them.

Among the lesser sea animals, certain mussels and snails have always formed one of the chief foods of the coastal dwellers from the Cape of Good [186] Hope up to Cape Cross. Great heaps of patellate shells mixed with bits of pottery and the remains of ostrich eggshells lie half buried in the sand dunes near Port Nolloth. Concerning the mollusks used for food, turn to page 31.

The large lobster, Jasus lalandii Lmk., which is evidently caught following the methods of the whites in a flat net set in a round frame and baited with snails, is also eaten. 226 [227]

The animal world of the interior offers more plentiful and tastier nourishment. Various antelopes and cattle are the chief source. There is scarcely any part of the body that is not eaten. That is the only thing that brings any variety into the meat diet, because the preparation of the meat is uniform: boiling it in water; roasting it in the fire; baking it in the hot ashes (the head whole); and drying it in the air are the only recipes. The last method is used with meat that is not eaten immediately or when the hunt has been so successful that not all the meat can be carried home. It is then cut in large thin pieces, salted and dried in the air (/hã↑, v.). 224 [262] [252] 251

In order to make even the skin tasty, they first roast it in the fire so that the hair burns off, then cut it in strips, beat it with stones until it is soft and boil it in water or preferably in milk. 252

Meat soup, suro·b, is not highly prized. On the other hand, the fat, either raw or as drippings, is the tastiest thing there is for the Hottentot palate. At times it is drunk hot by the cup. What they cannot finish in one sitting is saved to the last drop: a piece of freshly removed oxskin is shaped into a pompadour while wet and blown up. The bag then dries until it is hard and firm in its shape. Then an opening about the size of a thaler is cut off leaving a sharp edge and a strap is put on as a handle. Into this bag, //gu·bus, they pour drippings or melted butter and close the opening with cow dung. [262] 251 415

However highly the Hottentot prizes the results of the hunt, he reveals himself first of all as a herdsman by his high evaluation of milk. The Hottentot whom culture has not degenerated prefers milk to all other nourishment and in their folk tales it works miracles as the elixir of life. Warm from the cow (*/ai·χadai·b) or cooled (*/ãdaib), the fresh milk is mixed with various vegetables according to the time of year: the blossoms of the Acacia horrida willd. (//ha·reb, the flower of the thorn tree) and the green pea-sized fruit [187] of the ebony tree (Euclea pseudebenus E. Mey., called: !na·rus) are chewed and spat into the milk. The green leaves of a plant with a bulb-like form (*/kχabĩb) are pressed dry in a pot over the fire and then mixed with milk to make a kind of dough (cf. vegetable foods). 262 252 234 [773] [824]

Milk that has been set aside, partially soured, yet still fluid, is, because it supposedly tastes like urine, called piss milk, */ũdaib. *aũdaib is milk, soured and allowed to become thick in a pail, the cream of which (!aobeb, also used as sweet cream) is churned into butter.

415
252
234
281

Butter calabash, encircled with hide.
1/5 natural size.

Making butter, //nubu, is done in the following way: the sour milk is poured from the wooden pail into a calabash, aba·s. This gourd flask, the narrow opening of which is closed with a wooden plug, is rolled at a slant on a soft base that is usually made of skins. This is done in the bright sunlight or near a fire. After rolling for about three hours, the gourd is finally moved so slowly that the butter can collect on the top. Then the fluid is drawn off and drunk, and the butter, aba//nu/i·b, i.e., calabash fat, is piled in a wooden pail (!kχao, verb); it is eaten either fresh (*!kχao//nu/i·b) or fried (*/gē·be//nu/i·b). 415 252 234

To increase the amount of butter the fresh thicker roots of a plant which resembles in habitat a Portulaca of the Kalahari, is placed in the milk calabash. Because the body (/kχāb) of the plant is well covered (χa) with hairs (/ũ·/gu) it bears the name /ũ·/χa/kχā·s. 234 252 [824]

The mashi a madila of the Bechuans corresponds to the */hu·nin/hu·ni-milk of the Hottentots. The fresh milk is poured into a similarly-named calabash which has an opening cut out the width of a hand and is left standing for about two days until it is curdled, leaving a watery sourish fluid at the top and a firm mass at the bottom (!hare·b). 171 234 252

[188] The wooden milk pail (//hoē·s) is preferably carved from the wood of a willow-like tree (≠hũi·b) that grows abundantly in the Orange River wadi. A handmade funnel, //kχaru·s, also seems to belong to the original dairy utensils of the Hottentots; I did not get a chance to see it. 415 234

Fresh goat's milk is the chief food of the Hottentot children; the adults also drink it first in order to keep the cow's milk for butter. 234 262

In addition to game from hunting and the products of cattle raising there are many foods of "the little people" as they might be called, which the Hottentot seeks in the wilderness or obtains by chance. An impoverished, nomadic folk has to rely on gathering its food in such a manner. [855]

There are no mammals that the impoverished Hottentot will not eat: mice; hares; rock rabbits; porcupines, "dwarfs" (probably Cynictis penicillata G. Cuv.), wildcats and jackals; I saw them all put in the cooking pot. Even hyenas are eaten. Eating their heart is supposed to make one extremely sleepy, a superstition that evidently originated from the heavy daytime sleep of the hyena. 262 136 [825] [827]

Birds other than those hunted (cf. Hunt) are sometimes caught and eaten by children. On the other hand the adults sometimes do not despise turtles and lizards. The turtle, *//kχuri·s (in Little Namaland: /hu·ǂrob), is killed with a stone and roasted in an open fire in its shell. Meat and eggs are enjoyed without anything added to them. If the woman wants to use the shell as a buchu box, the soft parts are scooped out, the intestines removed and the rest roasted. [Picture: Zonurus polyzonus Smith. actual size] 1/1

Several kinds of lizards, such as the one pictured here, called *//uru·s, are roasted in the hot ashes and eaten primarily by the young Hottentots. [189] The fat of the //uru·s and of a new Mabuia species which is taken from the body of a freshly killed animal, is wrapped in grass by the children and sucked like candy.

The insect world also provides the Hottentots with several welcome dishes. The most modest one consists of a kind of beetle called *!nuǂms. These beetles are eaten only by the children, roasted or raw, after the head, legs and wings are pulled off. [Picture: larva of Acanthophorus capensis White, on the left hiding in a passage made by itself, about 4/5 natural size). 2/1 The starvelings "Bushmen" who roam around in Great Namaland eat a large black beetle, Acanthophorus capensis White, called */naori·b, prepared in the same economic way. The finger-sized larva of this beetle, the thorntree worm, *//kχũ·ǂu·ǂnis, bores into the heart wood of the Acacia horrida Willd deep long tunnels, which it fills with its excrement. The digested wood mass, often drenched with the fluid rosin of the tree, overflows out of the bore-holes and solidifies to a dark-brown crisp mass which looks as though it had a sugar coating. It is eagerly collected and eaten by the Hottentots, both young and old. [Picture: Acanthophorus capensis White. About 4/5 natural size.]

[190] The larva themselves are also a delicacy. In order to reach them, they burn the thorn tree when it is moribund or dead. With sharp sticks they pull out of the glowing wood larvae that have cooked in their own fat. Or they wait until the larva sticks its rear out of the bored hole for passing excrement and spear it with a thorn.

Finding a home of edible termites demands sharper eyes than finding the thorn worms. One must find the place to dig down into the underground dwelling of Hodotermes viator (Latr.). The dung of the animals gives the first indication, tiny balls that lie in heaps ranging in size from very tiny ones to those as large as mole hills. In the area of these dung heaps can be found the mouths of the underground

1/1 [see p.16(A)-Am.] 2/1 [see p.16(B),-Am.]

passages, pea-sized openings in the ground. If one follows these passages, one will come to the house at varying depths, sometimes only 1 to 1 1/2 feet under the surface, if a rock or hard layer of ground sheathes the soft ground and gives the house protection from above. Sometimes, however, one must dig down 6 feet before one reaches one's goal. 222 136

The underground dwelling has the shape of a lens, about 1/2 meter in circumference and 20 to 25 centimeters high. The material used for building is a brittle, fragile, yellowish-grey, paper-thin mass; it is resistant to water. One can immerge the house in water for days without its falling apart. It merely becomes soft and less fragile. 136

The house is built up of about 40 stories, each averaging about 1/2 centimeter in height. Although at first glance the labyrinth with its many hundred rooms that communicate on all sides may seem complicated, nevertheless a simple principal of construction can be divined: the spiral passageway. The innumerable spiral passageways are sometimes widely separated, sometimes right next to each other, sometimes with even, horizontal flights, sometimes with sharp angled axes and correspondingly steep paths, but the construction is always such that the course of each passage passes into that of the neighboring one without any interruption. Thus chambers, halls, corridors, gates and columns arise.

The composition of the inhabitants changes according to the season. In July of 1904 I found in one structure eggs, larvae in all stages up to the adult worker, workers of various sizes, large-chinned soldiers, [191] three queens about 2 1/2 centimeters long, and finally,* in addition to a few undeveloped insects, numerous nymphs,

*In the nests of Hodotermes viator (Latr.) I found a new Cetoniinae, Trichoplus aepytus Kolbe. The Hottentots know this companion of the termites well. It is about 9 centimeters long and of an even black color. They call it //k‡au≠ams.

mostly without wings.

These fat white nymphs, that are 12 millimeters long, are the goal of the Hottentot. First he shovels the whole house with its inhabitants and clinging earth into a sack. He sorts out what is edible in his hut. To do this he shakes the mass bit by bit into a vessel containing lukewarm water and stirs up the bottom with a stick 222 252

until all the insects are swimming around on the top. Then he scoops them up with his hands, squeezes out the water and dries them over the fire until the edible ones can be separated from the rest. The pure "Hottentot rice," *!gibes, obtained in this manner, has already been slightly roasted while drying over the fire and is usually eaten without anything added. 222 252

I have often seen the insects eaten alive while being collected. While the old man fishes out the insects from the dark muddy water, the children squat around and put in their mouths anything that is crawling about. I found the animals without taste when eaten alive but when roasted they taste very good.

One dish, that cannot be depended upon every year, but which is very hearty when offered, is migratory locusts. Wherever a swarm has landed, it covers the ground and loads (!ga/e) the bushes by the thousands. Therefore the Hottentot calls the insects that sit on the branches *!ga/e-hu/ms. Among these, the females loaded with eggs, *!kx̃u/i-hu/mti, are the most in demand. When they have retired to their nocturnal quarters after the day's work, which consists of egg-laying, and hang massed together on the branches, the Hottentot sets fire to the bush. It flares up all over. The next morning the ashes are swept up with branches, gathered up in skins and spread out on large flat rocks. The insects with eggs are sorted out. The others are only collected if there are not enough of the ones with eggs. The collected insects are put in sacks and brought to the huts on oxen. [262] 222

[192] There the mass is spread out, women sit in a circle around it and pulverize it with stones. When it is prepared, the soft light-brown mass is loaded into skin sacks and stored. When stirred up with milk it is supposed to be better tasting than when raw. 252 [262]

Although a swarm of locusts is a terrible plague, often destroying pasture lands, still locust burning time is a festival, at least for the young people. When the area of the locust plague is far away, the young people are released from the watchfulness of the old people, who stay home near the huts, and they now enjoy unrestrained freedom, particularly in the sexual sense. 786 731 [834]

The superabundance of food allows communistic principles, always a living force among the Hottentots, to be practiced without restrictions. A person who has gathered locusts may not prevent another from eating them. Even a gesture of refusal is despised. Whoever violates of this custom, will, according to their belief, be punished by becoming sick from the locust meal. However bestial a meal of 262 576 [753] 262

locusts may seem to us, the Hottentot honors it. A Hottentot told me, with a wonderful mixture of Christian and heathen fantasy, that God himself, when he came down from heaven and lived on the still unpopulated earth, lived for a long time only on lucusts. Should he then be ashamed of it?

2. Vegetable Foods

The vegetable foods of the Hottentots consist of wild plants* with

* The plants that belong here are mostly little known botanically and from the point of view of nourishment. Mention of them in writings is so scattered that I shall disregard summarizing these fragments and restrict myself to an account of my own few observations.

the few exceptions named above (garden crops). The most important from the point of view of quantity and nourishment are: a) the underground parts of certain plants that are filled with reserve materials such as rootstocks, tubers, or bulbs (cf. the analysis in the appendix).

The edible "field onions" (Cape Dutch: uientjes, called kʇai-ran) have various forms. The Iridaceae are represented in the plains around Kubub primarily by a Babiana species (called *ǂgũnub), which are easily identified in the dry season by their withered leaves. On the other hand, a field onion grows in the Kububer mountains which can only be found [193] when the rain has brought out the young leaves. The Hottentots call this kind which I could not classify *ǃgao-beb.

[Picture: Babiana spec. 2/3 natural size. Moraea spec. 2/3 natural size. ǂha-ǂob. 2/3 natural size.]

Both Uientjes species are gathered by the sack in good years. The type mentioned first is prepared in one of two ways; it is either [194] roasted in hot ashes, or the onions are cleaned of their skins while fresh and chopped up in a sack by beating them with stones. When the whole mass has been dried in the sun, it is salted and cooked with milk to a porridge.

The bulbs of another edible Iridaceae, a Moraea species with peculiarly turned leaves (called ǂgarib), is supposed to have given its

137
262
name to the place Karibib (ǂga-ribeb).

Similar to bulbs are the undergroud reserves of edible Oxalidaceae. 221
The uientje of the Oxalis genus, called °/ũ-/ robis by the Hottentots, is eaten either raw or roasted in ashes. Another kind (°ǂha-/ob) is also crushed in boiling milk. The Oxalis obtusa L.f. (called !kʒa-ros) is [252]
considered poisonous for cattle. The baboon digs up a related non-poisonous kind. [Picture: Grielum humifusum Thbg. 2/3 natural size]

Because of their effect on the body, several field onions should be 137
mentioned here, which have not been classified botanically. The 221
!hafni-Uientje (50), (57) is supposed to cause a swelling in the parotid

50. H. Schinz, Deutsch-Südwestafrika, Forschungreisen (1884-1887) durch die deutschen Schutzgebiete etc. Oldenburg and Leipzig, 1891.

57. J.G. Kroenlein, Wortschatz der Khoi-Khoin, Berlin, 1889.

gland if overindulged in. I heard a Hottentot shout at a Bergdamara who had such swollen cheeks: "ǂkʒara-!goreb kʒoma !hanʒa tanasa ǂ," i.e. "you, with an onion head like a male zebra." The zebra is well-known for its broad head and neck.

It is said of another uientje with yellow blossoms and a brownish-red bulb, that eating too much of it when the plant is sprouting [195] causes blood in the urine. The name, °/ao-beb perhaps also alludes to the color of the edible part.

Which plant the Bergdamaras call °!kʒũ-aireb, and which plant corresponds to the °/a-mareb of the Hottentots, I was not able to determine.

If one cannot collect the leaves and the blossoms that belong to 137
the underground tuberous objects that the Hottentot digs up, it is 262
usually impossible to classify them. Thus I can only give three names here: Grielum humifusum Thbg. (called: °!kʒu-ib, or °tsã/xaǂgai-eb), a Rosaceae with herbaceous juicy branches that creep along the ground and bright sulphur-colored blossoms which furnish the Hottentots a dish from its carrot-shaped underground parts. [Picture, Ceropegia spec. 1/2 natural size.] The same is true of an Umbelliferae, a Peucedanum species. A twining Asklepiadaceae of the Ceropegia family forms edible tubers like potatoes with a yellowish-brown, wrinkled and bumpy surface. The raw tubers are hard but juicy and cool enough to be refreshing.

Ceropegia spec. 1/2 natural size.

[196] I would like to direct the attention of future travelers to the following plants, the leaves and blossoms of which are greatly desired, if he would like to become acquainted with the wild field fruits of the old inhabitants of the country:

a) "omami gaub is a plant with succulent leaves; the carrot-like underground part has a stong purgative effect. The name of the plant expresses this drastically: "one lets it fall (!gau) at the door (ams) of the hut (oms)", or, more optimistically translated, "one just makes it to the courtyard." [Picture, omami gaub. 1/2 natural size. The "Ostrich foot". 2/3 natural size.]

) "!ga-/marib- (3. st. cf. p. 352.) or #ha-hab has a smooth, carrot-like, underground part and thin, narrow leaves, 3 centimeters long and crinkled at the edges.

)"/kfu-bus forms juicy root formations as big as a child's head.

Pelargonium incrassatum Curt., called "/a-mi#si-b, the "Ostrich foot", (so called because of the shape of the budding leaves) is the last of the plants which should be mentioned here because of their edible underground parts.

b) The chief fruits are gourds and cucumbers because of the abundant water in their flesh and the food content of their seeds.

The Topnaars in the region of Walvis Bay received their name !na-ranin from the gourd fruit !na-rab, the Acanthosicyos horrida Welw., on which they live for a large part of the year (cf. Analysis in the appendix). The nara matures in the first four months of the year; the chief harvest time is in February and March.

Then the kraals become desolate. The poorer families depart for the dunes with all their belongings, either taking their mat house with them or building a scanty shelter of brushwood, which can scarcely be called a hut, and only return to their old dwellings to get water when it is unavailable in the nara field. Wealthier Hottentots stay at home and have the nara brought to them by slaves and only go out for the day on a visit or for inspection. [Picture. Half-ripe nara fruit. 2/3 natural size]

The individual families have inherited rights to definite nara bushes (cf. Plate IX above and illustrations, page 146, 147). That is the only case known to me of private ownership of immoveable property outside of the hut area among the Hottentots. The Hottentot defends his nara bushes from attacks by fellow tribesmen by bringing a legal complaint before the captain. No quarter is given the Berg-damaras and Bushmen. I know of several cases in which the thieves

were simply shot down at the place by the nara bush where the owner found their tracks and meted out the death sentence. If the captain takes notice of such an occurrence at all, he never takes the side of the slain man. 222 423 628

[198] For the preparation of the nara I found that the Hottentots in the Walvis Bay region possessed bone knives made from the ribs or the lower leg bone of cattle. The word for such a bone knife, *ǂā-ros (3, f) seems to me to mean "the little sharp one" (ǂā - to be sharp, -ro, dimin., -s, personal suff., fem.). [Picture. Ornamented Bone Knives of the Topnaars, about 1/2 natural size.] 252 412

The fruit is cut in half with these knives, and in times of abundance, eaten raw. The insides, which can easily be separated from the rind when the fruit is ripe, fall naturally into five double sections, have a pale reddish-yellow color and are saturated with a cool sweet juice, which in taste and aroma, is not unlike a thin vanilla-flavored egg drink. But a single fruit suffices to produce on the tongue and gums of the novice an unpleasant feeling of soreness. 262

The nara achieves its greatest importance as a national dish when it is preserved and stored in the huts for provisions. The peeled fruit is cut into pieces the size of walnuts. The ripe fruits are cooked with a little fat, the unripe with a little water as well and stirred to a pap with a whisk of the most primitive kind, *dōdi-b (also called !no/bo-s). Then the hot mass is poured into a sieve, a grass basket, *gabiras, which is shaken up and down by its strong handle until the sulphur-yellow or brownish-yellow pap has strained through. This is poured out on a dune, after a slightly slanted bed has been smoothed out for it. After one or two days, the mass has solidified to a dark-brown flat cake, heavily encrusted with sand at the bottom. [Plate IX, Nara Dune in the Kuiseb River. Salt Crusts in the Namib behind Walvis Bay.] [199] Such a nara cake, *ǂgoa/g(a)a-ribeb, is about 1/2 meter wide and 3/4 of a meter long and 3 millimeters thick, flexible, kneadable, tough, shining with dark streaks when cut, brownish-yellow and frayed when broken. It has the spicy smell of fresh pumpernickel and leaves a greasy sheen on the fingers. When I was first shown the cake, I watched the old torn dirty rag expectantly as it was being unwrapped and in which I expected to see the delicacy, until I realised that it was the cake itself that was being handled. It tastes better than it looks: sweet, powerful and aromatic; it dissolves slowly in the mouth. 251 262 [415]

Each fruit contains about 250 seeds. They remain in the sieve, are spread out to dry and loaded into sacks. The soft inside of the kernel can be bitten out of the shell and is just as tasty as it is nourishing. Most of the seeds are crushed along with the shells, in a large strong wooden cup, to a brown mass that is like coarse meal. [200] This is formed into bite-size pieces by hand and eaten without anything else added.

[824 771] The cup for mashing ʻhai·os (the one depicted here, was carved from the wood of the ana tree [Acacia albida Del.] by a Hottentot) resembles the wooden vessel in which the Boers and the Bastards crush [412] wheat and perhaps stems from it. The pestle, //õ· ab (- arm) comes from the wood of the giraffe acacia [kameeldoorn]. The other Cucurbitaceae (for example, Cucumis, Citrullus and Coccinia) of Namaland are inferior to the nara. Of the gourds, which they call 137 252 262 tsa/ma·b, the Hottentots eat only the sweet kind with its meat. Only the cattle eat the foliage and fruits of the bitter kind, ʻso·robe-tsa/ma·b (Citrullus colocynthis L.). The Bushmen eat its seeds. On the other hand, gourds are decisive for the life of man and beast in large sections of the Kalahari (see above). [Picture. Pestle for nara seeds. 1/3 natural size.]

Of the edible tree fruits, in addition to those of the !asenki bush [Zizyphus mucronatus Willd.] and of the black ebony tree, the "wild fig," /no/ma·s, and the seeds of an Anacardiaceae, a tani bush, (Rhus celastroides Sond, called !a·nas) should be mentioned. We will become acquainted with the frûits of the Grewia flava D.C. (called ǂaũ/s) in the Kalahari.

c) The resourcefulness of the Hottentot in his search for food, must have led him long ago to the discovery that certain ants gather seeds that may also be consumed by humans. Thus large black ants, [222] that are not yet classified, gather the seeds of the Aizoa capensis Thbg. which, enclosed in wing-shaped lamellae, are set fan-shaped in the ribbed fruits. The Hottentots plunder the stores of the ants ("ant food"), roast the seeds in a pan, crush them with stones and eat the meal.

Especially prized are such ant stores that consist exclusively or predominantly of seeds of the Aristida grasses. Such a supply of grass is called tsa·/mab. The women boil them with milk to make a porridge.

[p199]

[201] Finally, the food called //kχuni-b, which consists of the seeds of the candle bush (Sarcocaulon) are eaten. The Hottentots, with whom I collected these seeds, maintained that a snake, called //kχu-ǂnibe-b, often lives with the ants that gather these seeds. Another name for this questionable snake, that is more interesting from the ethnological standpoint than from the zoological one, is °!ga-riao!ga-ǂmi. !gariaob is an alert, hard working, young man; !gaǂm is to kill. The name thus means "young man killer." According to the story, this snake winds itself around the ankles of the ant food thief and holds him tight until a poisonous snake comes at its whistle to kill him. [Picture. Wooden winnowing basins, the lower one decorated with a burned in pattern. 1/4 natural size.]

Cleaning the ant food from dust and stones is done in a flat, long wooden vessel (°/nu-bi!o-reb). The mass is purified from the dusty admixture by simply swinging the vessel up and down in the air far out from the body. The dust flies up in the air while the heavier parts fall back into the vessel. The food is cleaned from stones by a peculiar double motion of the vessel. The right hand holds the dish loosely on the narrow side and pushes the vessel forward and up. The left hand supports this motion, while it lets the vessel glide upwards in the rhythm of the right (holding the middle of the long side loosely with the thumb and grasping the under side with the rest of the fingers). All the stones collect way in the back and the food in the front part of the dish.

d) Several plants will be mentioned here, the leaves and blossoms or meaty stem of which are eaten as vegetables.

An Asclepiadaceae, Trichocaulon pedicellatum Schinz, forms thick meaty knobs, shaped like a club or a pear, which has given the plant the name !naǂbaǂkχaǂrab, which means rhinoceros testicle. After pressing out [202] or sucking out the unpotable juice, the meat is eaten raw. And the other hand, two thorn-covered succulents (called /goǂa-b and !kχo-bab) are sought out because of their juice. A somewhat sour juice in the meaty leaves of certain Geraniaceae is also refreshing.

The wrinkled branches of Pelargonium crithmifolium Smith, P. carnosum (L.) Ait. and P. zonale Willd. (called °//huǂms), which are covered with a greyish brown bark and are reddish inside when freshly cut, are roasted in hot ashes.

A Liliaceae, Anthericum drepanophyllum (Buk.) Schtr., called °/kχo-rob, furnishes a pleasant tasting vegetable.

415
531

[201]

Wooden winnowing basins, the lower one decorated with a burned in pattern. 1/4 natural size.

[Picture. Anthericum drepanophyllum (Buk.) Schtr. 1/2 natural size. 137
Pelargonium zonale Willd. 5/6 natural size.] 222

The leaves and flowers of the /ũ/robis, of the Oxalis genus are 262
dried in a pan over the fire, crumbled and kneaded in fresh milk when
cooled. The milk then curdles. All the coarse fibrous parts are re- [252]
moved, the leaves and blossoms separate into small pieces and are
eaten.

Several compositae offer edible blossoms. The blossoms of two Gazania species (one white and one yellow, both called °!go·bo//nã/s) are eaten with pleasure, either raw or stirred into a porridge in boiling milk with salt.

A number of compositae are grouped together under the collective name °/gī·gye/ga·mes, to which those with edible blossoms also belong [203] such as the Berkheya corymbosa D.C. The above-mentioned Hottentot term, however, also includes a Hydrophyllaceae with edible [824]
blossoms, Codon Royeni Thbg. and is also used for Compositae which cannot be eaten such as Eremothamnus Marlothianus O. Hffm.). It must also be considered that many of the above-mentioned blossoms are only occasionally eaten by adults, but one cannot pass them by [855]
without any comment, because they are of importance for the nourishment of the children, who have to get along by themselves and can satisfy their hunger with them. The same is true of the gum-resin (hai·rab) of the acacias. [Picture. Codon Royeni Thbg. Natural size.]

3. Luxuries

Luxuries of the natives were formerly infusions made from legumes 222
and herbs of various kinds. Even today the capsules of Ectadium 272
virgatum E. Mey. and the seeds from the pods [204] of the Acacia 137
hebeclada, D.C. which are as long as a finger and stand stiffly upright, are roasted, ground and infused while boiling. Similarly they use the seeds of a pod-bearing bush called !kχã°s, which is easily recognized by its soft leaves, longer than one's finger and piny needles, which are set in pairs at the root of a long, yellow, hard, sharp thorn that is a centimeter long. A fern is also brewed as tea. 177
But since the natives have become accustomed to our coffee and tea, 272
the above-mentioned plants have ceased to be important, at least in the household of the healthy Hottentot. In addition the Hottentot has become a slave to alcohol and tobacco since coming into contact with whites.

Tobacco is indispensible to Hottentots of both sexes. It is the first thing they reach for after waking up in the morning. They have it in the form of large rolls or in firmly packed flat American packets. Because the smoker first cuts (χao) it, then stuffs (//hā/) it in his pipe, they call it ᵓχao//hā/b, unless they prefer the foreign word ta·bagab. Wild hemp, da·ab, which the Bechuans are so fond of smoking, is not unknown in Namaland but is more rarely used. The Hottentots are economical smokers. They inhale the smoke deeply, and keep it in as long as they can and let it slowly trail out of their mouth and nose. Particularly economical smokers wipe the tobacco tar into a little leather wallet, ǂnuni·//ga·/rus. If their supply of toabcco is used up, they cut up the leather that is drenched in nicotine and smoke the pieces mixed with chopped straw. [415]

Alcohol was always known to the Hottentots. When they live way out on the veld and cannot get this stimulant except as their ancestors did, [205] they still brew their honey beer, !kχa/rib. 273

The wild African honey bees (called !habu·b) in Namaland usually build their honeycombs in caves, more rarely in hollow trees. The Hottentot knows exactly the individual parts of the bees' house. He differentiates exactly the pollen (ǂna/o·b) stored up in the comb from the virgin honey (hū·/danib). His generic term for honey is dani·b. The waxy bee cells which are joined together into a comb and which float to the surface after being emptied when one makes sugar beer, are called ᵓ/ha·/mi. The honeycomb in which the brood lies is differentiated by the word /ā/b, and ᵓtsēb or tsērab is the word for the material which the bee uses to roof over the honeycomb. [134] 222 [273] [825]

The cave, near which the bees are seen, is first poked with a long stick as thick as one's finger. If honey sticks to the tip of the stick, a firebrand is placed in the entrance to the cave to drive the bees as far away as possible. Then a man creeps into the cave and breaks off the honeycomb with a wooden forked hoe.

If the cave is too small for a man to creep inside and if the only entrance is a slit the width of a hand, then they use a special honey stick, ᵓ!a·rub or !a·nib. They cut a long stick about the thickness of the little finger from the branches of the taai bush or even better from the roots of the thorn tree and attach to the front end with strips of leather two lighter little pieces of wood //gaĩnkχa, the length of a finger, that have a sharp point and are faced towards the back. 222 413 [405] makes a forked hook, which takes hold of the honeycomb when the stick is withdrawn from the bee hole. Finally, the Hottentot makes a honey bag, °//kxo·rob, from the hide of an iguana, in which he collects honey. [Picture. Honey stick, 1/5 natural size.]

4. Salt

263 317 Salt exists in Namaland in the coastal desert in sufficient amounts for household use. (Cf. Plate IX, below.) The women collect the salty earth in pails, fill them up with water, leave the liquid till it is clear and then pour it off into a flat dish and leave it in the sun to evaporate.

[206]

5. Eating Meals

264 Eating meals is not associated with any special time. Only breakfast, as the first meal of the day, has a name, so·bos. When at the hut the time and place of a meal is determined by the arrival of the cattle, when traveling by the division of the marches into treks, and on the hunt by a lucky shot.

264 415 Th: branches of Mesembrianthemum Marlothii Pax (cf. page 85) are often used in the field for dishes and plates, but other bushes are also used. In permanent households the wooden !ore·s serve as eating dishes. A large wooden spoon, //go/a·b is used to serve the food from it to those sitting around. [Picture. Wooden Spoons, 1/5 natural size.] There are no specific eating habits. Only two occasional customs, which are observed here and there when people are in a good mood, came to my attention. If the hunt for bulbs has been successful, then everyone sitting in a circle around the full pot 264 enjoys a childish pleasure called °a·m//ga·ro. It is not an improvised jest but a custom well known to the people. One after another, each may help himself as long as he succeeds in catching the bulbs which he must throw into the air in his mouth. Even old people participate in this game.

264 524 Tsu·bugu/ho·ru is a game which the children play. They cut up a piece of meat given to them in common into small pieces, place the pieces one after another on a stone, and as soon as the hand of the person who places the meat there is withdrawn, the others quickly try to seize it. The piece belongs to the quickest.

E. Care of the Skin

515 The care the Hottentots take of their skin cannot be judged exclusively by our standards of cleanliness, principally because water is so valuable in that land.

1. Cleanliness

[207] During the hot season of the year, when there are great accumulations of water, as in the area of the Fish River, the Hottentot bathes. It is even said that he swims excellently. (66) But he shuns

66. Th. Hahn, Die Nama-Hottentotten. Ein Beitrag zur südafrikanischen Ethnographie (Globus, Bd. XII, 1867).

wash water as a daily method of keeping clean.

On the other hand, fresh ox dung and cow dung take the place of water, brush, and soap, and the dry air substitutes for a towel. However extraordinary this may seem at the first glance, such a way of washing is effective. The moisture in the manure suffices to loosen the sweat that has dried on the skin, the fine plant fibers scour ever more effectively, the drier they become in the course of the rubbing and finally the flat hand brushes off the last bit as a light dust from the part of the body that has been cleaned and at the same time pleasantly rubbed.

2. Massage

302 237 In order to give their skin the necessary suppleness, the Hottentots smear themselves with fat (ǂkx-aus(c)n or so/bos(c)n). They smear at least the face, the skin of the head, the hands and arms, but best of all, they like to smear their whole body. This is especially true of the women.

302 415 237 The containers for fat, ᵓǂkx̃ū-nas or ᵓǁgō//nā̃ǂs, which are found in every hut where the inhabitants have pride in their appearance, are cut out of an oxhorn and the two openings are closed with cowhide, the bottom being firmly attached, the top moveable. The fat from

the tail of a fat-tailed sheep is preferred to that of cattle or goats because of its softness. The grease is poured into the ox horn containers over a small skin strip that lies inside, from which the salve can be conveniently stripped off in small quantities between the fingers.

Greasing the body with fat is also a thorough massage. The word !gu·ri designates both. For relieving a general [Picture. Horn Fat Containers. 1/4 natural size] sick feeling and for increasing [208] a feeling of well-being (for example, to induce a pleasant feeling of tiredness before going to bed), massage is the Hottentots' favorite kind of body care. [Picture. Pricked Ornamentation around the Horn Fat Container. 1/2 natural size. The vertical lines follow the natural pattern of the horn.]

3. Cosmetics

They try to give their skin a pleasant smell by powdering themselves with buchu (//nõe(e)n). The buchu, sãb, is a fine brown powder which the women make out of the following ingredients, sometimes, just one, sometimes mixed, according to what is available or to individual taste:

a) from the short, fleshy leaves of certain Mesembrianthemum species, which they call gai- and °ǂgari-ǂga-eb. Instead of these leaves, the aboveground and underground parts of the most varied kinds of bulbes are used to prepare buchu, such as the slim bulblike, swollen root part of a Cyperus species.

b) Lichen are favorite ingredients for buchu. The Parmelia hottentotta (Thbg.) Ach. is scraped off stones and therefore is called °/u-i//kxao-b, i.e. "stone scratch." Other lichen for buchu have the names °!na-/roheb and °!u-/risã-b.

c) The powdery spores of a mushroom [Bauchpilz] (it seems to be a Podaxon species) are already so fine a powder, that the women hang the dried spore container by a thread around their necks [209] and it empties itself on their necks and breasts. The underground parts of the mushroom are dried and pulverized.

The women keep the buchu herbs which they collect in a little bag, which is made preferably from the skin of a lamb that was born prematurely or has been taken from the body of the mother. The skin is removed in one piece. The parts of the plants are pulverized on a stone either as soon as they are dry or after a brief roasting over the fire. The powder is then frequently mixed with fine quartz dust.

//gure-s, shaken into a flat, wooden dish, tsari-s, and purified of the coarser elements by winnowing.

The powder thus obtained is put in a tortoise-shell box, !ûi ros, which is the indispensable toilet article of every woman and grown girl. The front opening of a tortoise shell is enlarged by cutting out a piece of the belly shield, the back opening is closed up with the blackened rosin of the same plant from which they make beads. [Picture. Buchu boxes. 2/3 natural size.] Sometimes the dried skin and the retracted hind legs of the animal make enough of a closure. Sometimes the back closure is a hardened pulp made from the freshly crushed saliva gland of a cow instead of with rosin. A piece of soft jackal's skin serves as the front closure and as a powder container at the same time. A leather hand strap is pulled through a hole in the belly shell.

The men rub only their armpits and neck with buchu but the women rub their whole body except their face. [210] With it they wipe off menstrual secretions and sweat from the skin and I was not able to check the account of one Hottentot that the women also sprinkle the vulva and vagina with buchu in order to win back maidenly charms by the contracting effect of the powder.

Sometimes, because of the pleasant odor, the women incense themselves (/ie(e)s) with buchu by placing the powder on hot stones and letting the smoke penetrate their clothes. Buchu is sprinkled on the skin swaddling clothes of babies and on the shrouds of the dead, and on graves.

To make the color of their skins more beautiful, women and girls paint (/hoa/ba) their faces. The powder of a piece of clay called !naub, that is colored red by iron oxide is mixed into raw fat that has been made soft by chewing, and the salve is rubbed on the face with a finger. When the stone is lacking, iron rust is used as a substitute. The effect is that of an even brownish-red covering of the face, which even in our eyes, increases the charm of a pretty young face when it is well shaded in.

A remarkable beauty product is a dark brown sticky mass, which is at times found on the surface of rocks in layers as thick as one's finger and is called "stone sweat," °/o-i aon-(e)ni (cf. Analysis in the Appendix). Little pieces are rubbed on a rock with water as though they were India ink and rubbed over the greased face. The smeary spotty distribution of this make-up is ugly.

Nama

302
415

Buchu boxes. 2/3 natural size.

The Hottentot women love to paint dark, fantastic masks on their faces. 302
Black or red powder is rubbed with a leather cloth on the face which has 396
been previously greased. They get black powder from the knotty parts of 829
the lower trunk of a Pelargonium, which are thoroughly roasted and then a dusty, crumbly, dark mass can be easily knocked off their bark. Those who prefer red make a powder called *!gaib from the dry heartwood of a giraffe acacia. When the face is all powdered, the painted parts of the face are sharply outlined with a damp tip of a cloth in front of a mirror. Here and there the face is wiped clean, until the face is partly covered as with a Mardi gras mask, out of which sometimes only the eyes and nostrils peer or perhaps the side parts of the forehead and the cheeks show, according to the taste of the artist.

4. Care of the Hair

Care of the hair is usually completely neglected. Along the coast, 302
the Hottentot sometimes washes his head with the yokes of raw penguin eggs in order [211] to encourage the growth of hair. I never saw anyone with his hair cut. An old-fashioned Hottentot used to brush his hair with the rough, dried mucous membrane of a cow's tongue.

A jackal's tail or a silver jackal's tail corresponds to our handkerchief 293
or they use a thick bushy tail of the Otocyon megalotis Desmar, or at times 829
a bundle of ostrich feathers; *!na-bes or gams is the name of this handkerchief.

The coastal Hottentots have more fleas and the inhabitants of the more [136]
elevated parts of the country have more lice.

F. Medicine

The medicine of the Hottentots has not been aided at all by the ex- 826
cellent anatomical knowledge which each person acquires in his childhood 753
from cutting up slaughtered cattle and wild game. They have no or only isolated and confused ideas about the functions of the individual parts of the body and if there is no externally evident reason for the trouble in the sick body, they do not use their anatomical knowledge.

Thus they attribute various pains in the upper leg or even in the lower 757
leg to a falling of the intestines. Massaging in the direction towards the 757
abdomen is supposed to press the displaced intestines back. But first the sick

eg is massaged in the direction towards the foot to empty them. Thus 753
he excrement is supposed to be pushed out; where it goes does not 757
worry them. The actual success which they often have with this cure
onfirms the diagnosis sufficiently in their eyes.

1. Surgical Treatment

Their procedure is clearest when surgical treatment seems necessary. 757
a) Blood-letting is a universal treatment for every difficulty localized
o any extent. In the simplest case, cuts about one centimeter long,
go-regu, are made in the skin above the ailing part of the body. Nearly
ll the Hottentots, whom I examined closely when taking physical meas-
rements, showed traces of this blood-letting. In one case the pubic area
nd the small of the back were covered with some forty scars a half
entimeter long. The wounds had been made when he was a child by
is father to cure "the deep descent of the intestines into the lower
unk" from which the child suffered.

[212] They call blood-letting in the narrower sense *!hui-ǂkxo-rub 5
pening a vein). It is used particularly for stiffness and pains in the
mbs and is supposed to prevent them from swelling. The patient must
rst take a hot drink before the cutting. Then the blade of a sharp
nife is placed across the vena mediana cubiti in the elbow joint of the
ght arm and the handle of the knife is struck with a little piece of wood
that the blade enters. They take about 300 centimeters of blood as
r as I could estimate.

Bleeding /go/m follows the opening of the vein. A goat or calf horn
rves as an instrument for bleeding (*!hũ-///nã/, from *!hũ/ - sucking
arrow out of bones), by cutting off the point, they make a second
pening for sucking which the bleeder puts in his mouth. The opposite,
der opening which is also filed smooth is firmly pressed on the bleeding
t. They do not empty the horn filled with blood on the ground but on
wet cake of cow dung to get rid of the sight of human blood quickly.
Picture, Horn for Bleeding. 1/2 natural size] [Picture, Closing a
ound].

The wound is closed in the following manner. They stick a thorn, 752
firmly into the skin, twice (by c, to the right and also to the left
ar the vein a) in such a way that it lies diagonally across the cut b.
nder the free end of the thorn they slip a thread and tie it firmly

757

[p212]

752
284

Closing a wound.

together. The skin between the places where the thorn has penetrated 752
is thus raised in two folds, which press firmly together and so close the vein. The thorn is then shortened at both ends so that it disappears under the swelling made by the thread. The arm must be carried in a sling until the thorn and thread come out spontaneously.

[213] To the west of !Hoarxa!nas, in the border territory of the 757
Witbooi and the Red Nation, a small health resort, Hottentot style, is supposed to have existed when there was still plenty of water. People who had any kind of sickness and wanted to have their veins opened, waded barelegged in the pond of /Oas and let themselves be bitten by the numerous leeches which lived there.

If one other than a doctor may be permitted an opinion and if one may support this opinion by the language usage of the Boers (which is well known to the doctors in the Cape Colony), then I would like to claim that, judging from the most obvious symptoms, the sickness which the Hottentot calls "xu/!xo/a-b, or more frequently calls ǂi-laib, [169]
borrowing from the Boer Dutch "vuilziekte," is syphilis. Individual syphilitic sores are superficially opened with a half-sharp instrument that tears rather than cuts (for example a quartz splinter). The wound is washed with sea water by the coastal dwellers, with a soap made from ashes of a bush called /xganis by the natives of the interior. Then the wound deepened by scraping. As soon as the bleeding stops, they sprinkle the wound with seaweed powder. The strong hollow stalks of the 273
Ecklonia buccinalis (L.) Hornem. (called "//hãã'b), which the sea casts up everywhere are slowly charred (not turned to ashes) and the coals pulverized. Before putting powder on the wounds, the sick person takes two swallows of sea water.

If the sores appear all over the body, then, as a native witness reported, the sick person is washed and the skin is scratched with fingernails until the body streams with blood. One man does the scratching, but others are needed to hold the patient firmly, who kicks about wildly from the pain and sometimes goes limp, forcing the process to be interrupted. Powdering concludes the procedure. If new sores form under the scabs, the skin is torn open again.

For assistants of the opposite sex, only the spouse or old people are permitted. The treatment itself may only be performed by those who already have had the sickness. Otherwise, they say, the treatment would be of no avail. But they also recognize the danger of infection, [753]
for the sick person may not share either bed or eating or drinking utensils with healthy people. They believe that the person is cured after the disappearance of the sores and that immunity has been acquired.

[214] b) A treatment other than bleeding is used for some foot ailments. One sickness is designated as "Fotzenfuss," ǂnũãgyeǂâi-bes, or pea-foot, ǂâi-!naro-s which begins with the swelling of the whole foot or of individual toes. The parts of the sole that one steps on become painful, turn red, and the skin peels. In the middle of the inflamed area, a longish dark foreign body, about 2 centimeters in size, ǂhâ-s, shines through. To hasten its discharge, the foot is placed in the stomach dung of a freshly slaughtered goat and kept in the small stomach of the same animal for the night. If the inflamed area opens, then they warm and soften horse manure in water, smear the foot with it, and tie it up until the dark foreign body leaves the wound. 757 [278]

During the cold season, the Hottentot often suffers from bloody festering cuts on the inside joints of his second to fourth toes. The sickness is called ǂa-ragyeũî-bes, i.e. "curling toes."

Festering cuts, ǂa-bagu, in the skin of the heel, are smeared with ear wax and sometimes stitched with thorn and bast if they do not have a needle and thread. To heal wounds in the toes, the foot is placed in the warm, uncleaned reticulum of a goat or a sheep, or, best of all, of a cow (because it is the biggest). The foot is kept there until the contents of the stomach have cooled. The method of healing is known to every Hottentot by the name ǂhâ-/ra[illegible]. [752 278]

The freshly removed skin of the lizard of the Agama genus is considered a good plaster to put on the feet when the skin has peeled. The fresh brain of these animals is smeared on as a salve. The dried root of the Zygophyllum cardifolium L. f. (called ǂnu/hâib because of its brown leaves) is made into a salve for wounds after being pulverized and mixed with fat. 757 278 752

I have not been able to differentiate the various kinds of sores which have the name !nu-/nge.

Characteristic of the metaphorical language of the Hottentots is the expression which describes the spreading of the seat of a disease: the sickness "builds huts" (om, v.). 753

Splinting (/gom-) of a broken bone (ǂkõa-s) is the final surgical accomplishment we shall mention. They tie five narrow strips of wood around the broken limb, which they tie to each other at both ends, so that they make a kind of casing. The limb is first wrapped in a skin, taking care that the blood can circulate freely. 752

[215] 2. Midwifery

One can gain an insight into the intimate problems in this field only after one has acquired the confidence of the older women after a lengthy stay in the country, making a serious broach of the question possible. Once one has this confidence, one is probably safe from deliberate lies. However, one should never depend on the information of one person, but always test the reliability of what one has heard on other people in different places, without ever revealing the least bit of information which one has already acquired. In this way with time and patience I was able to acquire information that was plausible and not contradictory about a series of points from the natives. It was impossible for me to make direct observations in this area. I have tried to fill out the gaps by having a trusted person show me personally the techniques which I had learned were used with pregnant women, those giving birth, and those who have just given birth. 124

a) Pregnancy (!kūi, !go/m, v.). The Hottentot woman does not usually consider missing a period the first symptom of pregnancy, but rather the discomforts of pregnancy, *//gao-rab, such as loss of appetite, nausea, vomiting, etc., assuming that the person concerned otherwise does not suffer from these disturbances. The loss of color in the face during pregnancy they designate with the same word that is used for make-up: /ho/ho. Whether the afore-mentioned custom of painting the face originally had some connection with pregnancy is difficult to decide. 843

The Hottentot women claim that they can definitely determine pregnancy in the second month by massaging the abdomen and by feeling the changed uterus through the wall of the stomach. As soon as pregnancy is suspected, the greased abdomen is massaged 2 to 3 times a week by two women for 1 to 1 1/2 hours. The massage begins at the middle line between the breasts and works downward. They work sideways along the curve of the ribs with wide spread thumbs, and work back again with all five fingers flat, from the area above the iliac crests to the front wall of the abdomen. They listen very carefully to see if they hear a gurgling in the large intestine. If they have found gas, [216] they are satisfied. They push it down on the left side of the body until it escapes to prevent it going "to the head," because there it would produce fever in the woman. The massage ends with a gentle pressing upwards of the groin on both sides of the middle line between the breasts. [153]

While doing this they can feel the uterus and determine each time how much it has been enlarged. 893

Pregnant women sometimes tie a leather band, do-mrob, around their body to prevent the abdomen from drooping. [242]

They do not say anything themselves definite about the sex of the expected child. They suspect a boy when the opening of the uterus is broad.

The child is not considered living until it is seven months along. [761] They are well oriented about the position of the child in the uterus. They distinguish precisely whether the back of the child is turned towards that of the mother, and correspondingly, the forehead of the child is facing the abdominal wall of the mother. One can therefore say that they distinguish readily the first and second head position (each in its most customary sub-type). They know that these positions are the only normal ones.

It can be assumed from the above that they recognize abnormal positions but they do not correct them either before or during birth. [879] Inserting the hand into the vagina to examine it is unknown.

The pregnant woman does not have to follow a special diet. They [263] are only careful to avoid constipation because that makes delivery more difficult and hinders the lochia from discharging.

Precautionary rules of another kind are linked with the deeply rooted belief in the "mistakes" of pregnant women. The stories that the Hottentot women tell correspond in principle with those of the women of our race. As is characteristic for a pastoral people a pregnant woman who still honors the customs of her parents may not be present when an animal is slaughtered; otherwise her child would be born with a slit throat. The woman may not do anything on the mat house with her arms raised up high, in order to protect her child from being strangled by the umbilical cord.

Their ideas about the location of the embryo in the body are in remarkable contrast to their good anatomical knowledge [217] of animals. 843 826
According to their belief, conception occurs in the bladder, //xuru-s. A second bladder forms there in which the embryo is enclosed. The uterus is merely an appendage of the embryo, which disintegrates during the ejection of the water, tsa/nu-b, the afterbirth and blood. It grows again during the next pregnancy. Because of this opinion they often have one word for the uterus and the afterbirth, //hâi. More enlightened ones distinguish the two, calling the uterus //hâi, "that which stays in the mother" and the afterbirth in our sense, ǂhâi. They often explain

bladder difficulties of pregnant women in this way: During the growth of the embryo there is a greater burden on the bladder and it is not up to this.

They reckon the time of delivery inexactly. Their count begins with the new moon following the first indications of pregnancy. Each new moon is noted with a notch on one of the poles of the hut. When they have cut nine notches, they prepare for the happy event. For example: a woman notices on January 25th, 1904 at the time of the first quarter of the moon that she is pregnant. On the day of the next new moon (February 16th) she makes the first notch and at the ninth new moon (October 9th) the last one. Now she awaits the child, 246 days after the first signs of pregnancy. The pregnancy calendar of a white woman would estimate the birth at the end of October.

b) Delivery. (//oa-s, giving birth, !na-/es, being born; one also hears the word ‘u’hu-s, relief, hõ/s, getting. oa-s means calving of cows and, when said of a person, is scorned as a vulgar expression). I [278] have seen women immediately before delivery with a staff of midwives in readiness. Once I saw six women squatting around in one hut scarcely 3 meters in width. Mixed in with the smoke of the sooty fire was the smoke of the coffee which they burned and of the pipes which steadily made the rounds. It was difficult to recognize the woman who was the cause of this gathering who lay on the floor in the background covered with skins. I was also able to visit women after they had given birth and find out about the details of the birth. But in spite of many personal connections with several families and their many relatives I was never able to be an eye-witness at a birth. Even when the pregnant woman expressly gave me permission to attend, [218] I would either hear about the event just after it had occurred, or if I had found out about it in time, permission had subsequently been withdrawn. Consideration for the woman in labor, which according to the prevailing opinion of the Hottentots does not even permit the presence of a male Hottentot, forced me to give in. I am therefore particularly indebted to my honored old friend, Frau v. B., who grew up among the Hottentots and has been [129] active for decades in their huts as a midwife. She became very well acquainted with the birth practices of the Little Namaland Hottentots where they are still removed from cultural contacts. I have thoroughly tested the information that she gave me. My research in Great Namaland before and after she gave me this information makes me fully prepared to accept the responsibility for the following even without the personal guarantee of my authority.

Cases of Hottentot women giving birth in the fields and cheerfully carrying the babe home in the evening or delivering herself in a warm cow stall (66), cannot be considered average. Sufficient number of

66. Th. Hahn, Die Nama-Hottentotten, Ein Beitrag zur südafrikanischen Ethnographie (Globus, vol. XII, 1867.)

cases of Boer women giving birth under equally primitive conditions while traveling are known, but that would not allow one to draw conclusions about the customs of our race. Birth among the Hottentots, as with us, occurs in orderly circumstances and is an event they prepare for carefully.

Whoever can, has an experienced midwife, even if she must come from far away. The Hottentots give this important woman various names. She is either the !kgõ-ris, i.e., "she who catches the child (!kgõ)," or the ǂnũ-ris, i.e., "she who sits there (ǂnũ)," waiting hours, even half a day until she can take hold. Corresponding to our chief midwife, insofar as she makes the decisions, is the "!kgõi-/naǂaos, "the woman who cuts the umbilical cord."

Usually there are several women present at a birth and not merely as observers. When the first strong pains begin, the woman in labor lies on her left side. The women now group themselves, as far as I could determine, in the following way. One sits behind the woman in labor at the head of the bed and supports her shoulders and back with one knee to keep her in a half-upright, half-lying position on her side. Opposite the first sits a second woman who puts her right arm around the upper part of the woman's body. Her job is to bend the woman's upper body forward as soon as a pain begins, to hold the head against the breast and to place a cloth on the woman's mouth [219] so that she cannot scream out. It would mean the death of the child if the mother should lie on her back or stretch her legs. Her left leg, bent at the knee, lies flat on the floor. The right leg, also bent, is straight up, its thigh spread out as far as possible, its foot braced against the knee of the left leg. The third woman, who sits near the foot of the bed opposite the woman in labor, has two jobs. With her left hand she must hold the woman's leg in the position just described. Her right hand presses on the abdomen with spread thumb against the uterus to control the progress of the delivery. The old woman, who takes her place opposite the third woman behind the woman in labor, has charge of the delivery. Her left

hand, constantly feeling, lies on the buttocks of the woman in labor. 847
Her hand follows the forward movement of the child's head across the coccyx to the perineum and on to the vaginal opening. As soon as her right hand, which is between the legs of the prone woman, feels that the head is coming through, she has the woman bear down as hard as she can at the next pain.

Once the head is out, they do not wait for more labor, but draw the child out, taking it by the chin.

The only definite interference in the delivery which they attempt 845
is enlarging the vaginal opening if the child is not delivered after strong labor-pains. First they try to enlarge it sideways. If that does not help, they stretch it lengthwise. In one case four women are supposed to have had their fingers in the vulva. If this stretching is not successful, then the perineum is deliberately torn, often up to the anus, to make room. No attempt is made to heal such a tear, because, as a Hottentot woman explained to me as an obvious fact, the path of the next child would be blocked.

All the motions of the hands are done under the skin blanket which 849
covers the woman in labor. During the delivery she is given soup to strengthen her. Assistance at birth is exclusively the domain of women, whether old or young, mothers or not.

Here and there they vaguely connect the east wind with the labor of [921]
a woman. When the east wind blows, one can sometimes hear the question: "Which woman has delivered today?"

[220] Cutting the umbilical cord is done without delay. The cord is tied approximately in the middle with sinew or bast from a thorn tree and then the long end thread is fastened to the left leg of the mother to prevent the cord from slipping back. Sometimes they tie the thread to a pole. Right behind the place where it is tied the cord is cut, leaving the knot on the mother's end of the cord. A span's width from the navel [804]
of the child (they measure between their spread thumb and middle finger) the cord is tied again and cut. The mother is given some of the blood that drips from the cut, if she is bleeding too heavily.

The old woman who had charge of the delivery cuts the cord. She [759]
is also the only one who is paid. The usual payment was two goats for a boy and one for a girl.

They do not differentiate between dead children and seemingly [787]
dead ones and do not know any methods for resuscitation. Prophetic gifts are ascribed to children who are born with a "helmet," //gu-haras (lateral clicking sound), our good luck cowl.

They usually bother very little about the afterbirth. They do not care whether it comes out after one hour or days later. In one case the afterbirth still had not come out after 3 days, the woman had developed a fever and the umbilical cord, which was tied to a pole of the hut, had shriveled up to a dry rope. None of the women thought of interfering. A doctor who was traveling through removed the afterbirth. 844

However, in other cases, medicine is given when the afterbirth does not appear. A resin comes out of the lower trunk of a bush called *ǂho-ms, which becomes incrusted with sand and dust and hardens into dirty lumps with a rough surface. This mass, */nuru-b, (cf. Analysis in the Appendix) is crushed and brewed with hot water. This drink, especially when prepared strong, is also considered a good way to produce bleeding after birth, because they consider it fatal if it does not occur. Sometimes they try a favorite remedy, wrapping in skins, if the afterbirth still has not appeared on the third day. The tail end of a freshly removed goat skin that is still warm is pressed (the wet side towards the inside) on the woman's loins, drawn between her legs and spread out on her lower body. [278]

The afterbirth is buried in the ground.

[221] The nursling. Not much is done to the new citizen of the earth. He is not washed but wiped off with a skin, his whole body greased and wrapped in a skin after the umbilical cord has been wound in a circle. A salve made from fat and the powder of burned ostrich egg shells is always kept prepared for him. This is rubbed on the child's forehead, temples, and nose, and especially in his nostrils, to produce sneezing and thus expel mucus. The fontanels are well greased because they believe that sicknesses enter there most readily. [278] [753, 826]

The newborn children of the pure Hottentots that I saw on the morning after birth had rosy, not fawn-colored skin. [Picture. A Nursing Topnaar Hottentot Woman, about 35 Years Old].

When the umbilical cord falls off, they rub in the wound a charred, dry, tindery powder which is prepared from the underground parts of Oxalis caledonica Sond (called */hoǂae-s). If the wound is inflamed, this mass is rubbed on mixed with fat. 846 278

A widespread prejudice that seriously endangered the continuance of the Little Namaland Hottentot race, was that the mother's milk was not considered good for a child until the third day. Until then the newborn was given skimmed goat's milk or cow's milk, unless another woman who was nursing a child, also nursed him. In other cases, when the poor 853

artificially-fed creatures were given the breast on the fourth day, they were often too weak to suck greedily. 853

[222] The child is weaned by the mother rubbing the bitter juice of an aloe on her nipples. If the mother suffers because the milk is no longer being taken, she is milked a few times directly into the ashes of the hearth fire. Just as the milk fizzles away there, it is also supposed to dry up in the woman. 862 [278]

d) Childbed. Directly after delivery the woman is covered up as warmly as possible so that she will sweat. 877

Eyewitnesses reported to me a peculiar custom which is probably no longer practiced today. Several women press firmly on the hip bone of the woman who has just given birth and is still lying on her side. Sometimes this process of "hip sitting" [illegible], is done in such a way that the person performing this act, while placing her foot on the hip of the woman, takes hold of a hut pole with her arm in order to press against the woman even more firmly. The purpose of this is to press the bones together again which, according to their beliefs, were forced apart by the act of giving birth. That also explains the rule that the woman in labor must lie on her side. The bones of one side are supposed to press with their weight against those of the other side. If she were on her back, her pelvis would, as they say, spread apart.

A Hottentot woman (of the old school), does not touch water; not even after the delivery is washing attempted. A white woman wanted to place a cold wet cloth on a Hottentot woman who was bleeding severely and had fainted several times. When she took it from the water and wring it out, the native women left the hut and made the white woman responsible for the death of the woman which they believed was unavoidable after touching her with water. 946

The new mother rests in bed until the third day and sometimes until the seventh day. Only the blanket under her is changed. To take care of her needs, the woman leaves her bed from the first day.

To help the after-pains disappear, a hot infusion is given, made from the same roasted and crushed rooty formations that are used in the case of navel wounds.

After the seventh day, or sometimes not until after the tenth day, the new mother usually pursues her usual activities. I have not been able to check the information of one woman [223] that menstruation begins a month after birth, even when a child is nursed. [811]

In conclusion, a word about multiple births. It is not considered good luck to have twins. A case of triplets occurred in the year 1897 895 [771]

in the place called Spektakel. The Hottentot woman, Anna Marie, bore during her second marriage two boys and a girl, who were still alive in the year 1902. Her husband was Johannes Fortani, the descendant of a freed Negro slave. I also heard about a case of quintuplets in the year 1884 or 1885. The father, Jacobus van Neel, was a Bastard, the mother, named Trein, produced three girls and two boys. The children were alive at birth but died immediately afterward. 845

3. Use of Medicine

Hottentot medicinal knowledge and methods of healing become less clear, the nearer they approach the field of internal medicine. The use of medicine is all that seems to me worth mentioning. 757 278

The Hottentot leaves nothing untried. Aside from practical success, either imagined or real, another consideration also guides him at times. He knows that among the plants of his country there are many healing ones. He also knows of many ailments for which there is probably some healing plant with which he is not acquainted. Further, every herd boy knows that the goat is not dainty in the choice of the plants it eats; it eats nearly everything and so probably, (as the Hottentot reckons) it also eats the healing plants that he is not yet acquainted with. The effective substances of these plants are transferred to the goat and are partly retained in its manure. Therefore goat manure is believed to contain healing properties. 757 278 825

Thus the treatment of chickenpox, /kyb-tas, consists in the following: the sick person is given a drink several times a day, in which about 1/2 liter of diluted milk is cooked with a handful of fresh (or double the amount if old) goat manure. Lean goat meat is the only other nourishment that he may have. 757 278

Whether the following treatment reported to me by two separate eyewitnesses, is used very much, is uncertain. Several men killed a goat, pulled off its skin as quickly as possible in order to place it on the sick person's body while still warm. It may well be that this wrapping works as a beneficial irritant to the skin.

[224] The dried body of the so-called "jump" snake ǂhao-/ho/ao-ǂ'i, Scelotes capensis Gthr. is considered an infallible antidote for snake bite. A few finger widths above and below the bite a deep cut is made, each about 1 centimeter long and the blood is sucked out of each of these cuts for about a half hour with the bleeding horn. Then a small scrap of 752 825

the dried lizard, scarcely a millimeter long, is pressed into the wound and rubbed in with charcoal. The snake wound is washed with water. 752 825

[Picture. The "Jump Snake," Scelotes capensis Gthr., 1/2 natural size.]

The use of snake poison as an antidote for poisonous snake bites is perhaps also worthy of scientific investigation. 752 278

A Hottentot, who knew the poisonous snakes of his country well, made it a habit to pursue immediately the snake that had bitten him. He cut out its poison sacks and, squeezed a little of their contents into water and drank it. He dried the rest of the poison and preserved it carefully.

Another person drank the fresh bile of a cobra (called !hum- //hui- b) as a preventive against the poisonous effects of snake bites. This is not [151] an isolated instance, because men who do this are called /ao/!gâ aon, i.e. snake poison men. People are certain that the skin secretions of such poison eaters (whether rightly or not must still be determined) heal poisonous snake bites. The poison eater rubs some of his sweat into a small cut made right next to the patient's bite. Or he dissolves what he has scraped off his skin in water and the man who has been bitten drinks it. Whoever has smelled the sweat-soaked clothing of a Hottentot will find the assertion plausible, that, if the sweat of poison eaters does have the power to heal, then [225] a little moisture squeezed from a piece of his clothing is effective.

Many Hottentots follow the same rule which the poison eater does (fighting the effect of the poison immediately with parts of the poisonous animal itself), when they have been stung by a scorpion. Without delay they seek out a living scorpion, squash it and place it immediately on the wound that has been artificially widened. At the same time the sick person is given a thin solution of tobacco juice as an emetic, on the basis of an unclear idea that this helps get the poison out of the body.

It seems that tobacco juice (pipe emery) when rubbed into the wound itself or into a cut next to it, is effective as an antidote for snake bites and scorpion stings.

One wonders whether there are other useful medicines to be found in the treasure chest of Hottentot medicines, in spite of their blind 757 278 testing and the self deception of doctors and sick people among the natives.

The excrement of rock rabbits, !aũ- /aru- b, which piles up five high in caves is considered a cure for every kind of body retention. A piece

752
278
136

The "Jump Snake," Scelotes capensis Gthr.,
1/2 natural size.

the size of a walnut is dissolved in about 1/3 liter of hot water and the drink is taken hot. It is supposed to cure constipation, inability to pass urine, irregular periods, and to further the discharge of lochia. In the same category belong the supposed effects of the so-called "stone sweat" which was mentioned earlier. 757 278

Their medicines for venereal diseases arouse as little confidence as the ones just mentioned. For protection against gonorrhea, "!ga/ms, the man or woman rubs a knife tip's amount of a powder, which has been prepared from the roots of the "!garisab plant." [751]

> "When I am unable to mention the botanical name, I at least give the native designation which will be a help to later investigators. [223]

into a little wound cut to the right and to the left of the groin. They treat gonorrhea itself locally by dabbing the milky sap of the fresh leaves of a plant called "!gu/bi-b or "xamexa/rab into the urethra. Or they dig up the plant and drink as much as possible of a hot infusion made of the crushed root.

It is recommended to syphilis patients that they drink a swallow of their own urine early in the morning. A tea made from the strongly aromatic [226] fleshy leaves of a Geraniaceae (as it seems) which smells strongly of turpentine is supposed to cure syphilis sores.

4. Magic

The medicinal art of the Hottentot is closely allied with magic. Anyone who wishes to may become a doctor, called !gai-/aob or magician. The Hottentot term is derived from the magic stuff, !gai/b, which he carries with him in a box. The vegetable ingredients of this stuff consists of roots of a most varied assortment of plants, the flesh and bones of different kinds of chameleons, elephant shrews, bats, and of a little bird of the family of Sylviidae (called ≠oregu) are dried, and placed sometimes in coarsely chopped form, sometimes pulverized in the raw fat of a billygoat, with which the magic box is filled. It is supposed to extract the effective substances from the various ingredients. 755 756

The magic box is also the Hottentot's poison supply. Whereas billygoat fat possesses only healing properties, the other ingredients are said to have a poisonous effect when secretly mixed with the enemy's tobacco or smeared on the bit of his pipe.

The box is also a soothsaying apparatus. A thread is placed in the fat. The end which sticks out of the closed box is lighted and held towards the wind. The direction of the smoke is followed by the Hottentot, if he does not know where he should look for a runaway cow or a lost companion. If he wants to catch up with a companion on the way to a meagre water hole so that he can water his oxen first, he ties a knot in the thread and lights it. Just as the glimmering fire goes out and is stopped, so his companion is supposed to be stopped until caught up with. Whoever has the reputation of controlling events in this way, is usually highly regarded as a doctor. Besides conscious deceit, medicinal magic has many procedures which are based on faith and perhaps work by suggestion. Pains in the head and limbs are charmed away by two rather large glass beads, !gai-/!a/mus, which serve only this purpose. A thread is tied firmly around the head and the two beads are placed close together in the middle of the forehead. If in the course of hours they slip far apart, then the pain has to be gone.

[227] A Hottentot woman ties a loin chain, //mĭ-b, made of round little pieces of ostrich eggshells, around her own or her child's hips for pains in the abdomen.

The so-called "fright illness" of children which supposedly manifests itself by the child fainting for no particular reason, gets its name !kxa/us from the eland antelope, whose skin is highly prized as a cure for this illness. The skin is cut into small octagonal pieces and into strips 1/2 centimeter wide, dried, and made supple with eland fat. The cure consists in the following: a little piece of the skin, scarcely the size of a lentil, is turned to ash, pulverized with the fingernail, mixed into a swallow of milk, and fed to the child. The strap is bound around the child's breast as the illustration shows. When it falls off of its own accord several days later, the cure is considered successfully concluded. In the case that I knew about the magician received a goat in payment. [Picture. Fastening on the strips of the eland skin. In the neck region: Enlargement of the knot.]

Inadequate and irregular food, privations of all kinds, uncleanliness, premature sexual intercourse and excessive use of alcohol and tobacco are the principal destructive forces from which the Hottentot's body suffers. Tuberculosis (//noba-b) and venereal disease are extensive. Syphilis claims many victims.

Although probably based on superstitious fear, the custom of the Hottentots of destroying a hut after a death has occurred in it and re-building it somewhere else on new ground is of great practical hygienic value.

Capitulum II

The Hut and Handicrafts

A. The Hut

The hut, o-mi, of the Hottentots is characteristic of nomadic housing. It is airy, yet protected against wind and rain, light in weight, [220] simple in material and in construction and therefore easy to take down, pack up and rebuild in another place.

1. Material and Construction

a) The framework of the hut is best made of thorn tree wood because of its elasticity. Next to be used is the more brittle hakjes (Acacia detinens Burch.) thorn. Other woods are used only as a last resort.

The dome shape of the hut demands that the framework of the hut have a definite curve.* The freshly pelled and trimmed branch (about

*This curve is the basis of a Hottentot designation for rainbow as tertium comparationis: °/a-hi|ha-/nab, i.e. "rain hut-pole."

5 centimeters across at the base) is placed flat on the ground. One end and the middle are weighted down by heavy stones. The free end is bent and braced against a stone block and kept in this position until the wood has dried and therefore stays bent. Or they place the branches in bundles upright in the ground, tie the free ends together, bend them down and hold them with a strap which is anchored to the ground. [Picture, Framework of a Hut].

392
361

Framework of a hut.

The finished poles for the framework, !ha/nagu, are sunk in the earth vertically, making a circle with a diameter of 3 and 1/2 to 5 meters. They use from 20 to 60 poles, depending on the size of the hut. The upright parts form the framework for the walls and the thin curved ends the framework for the roof. The whole structure looks like a beehive. The finished framework looks like a wide-meshed woven net. It is about 2 and 1/2 meters high on the average. [229] Wherever the poles meet or cross, they are tied together with thongs or bast strings. The poles with a flat arc which go into the ground at a sharp angle and form the lower part of the wall are specially designated as °!na/nihaigu. There are usually four pairs of these. Larger huts sometimes are given necessary support by a pole the thickness of an arm which is sunk upright into the ground in the middle of the hut and supports the middle of the roof. The Bechuan hut also has this feature. Correspondingly it is called °/gurihaib or kxā!nab, also °/naihaib, because it stands in the "navel" of the hut. The men build the framework of the hut.

b) The mats which form the roof and walls are made by the women. The material for making the mats is furnished by a reed grass, usually called rush, a Mariscus species, of the Cyperus genus from stalks glistening with fat and therefore called /hu- mi-haru s by the Hottentots. The plant is abundant in watery places. [Picture. Cyperus, Reed for a Mat Hut.] [Picture. Bone Needle for Sewing Mats. a) side view, b) full view. 2/3 natural size.]

The reeds are pulled out one by one (not cut) and put aside until dried.

Piercing and hemming (kxa-iam or °kxa-im) a mat requires a great deal of work. The woman sits in the manner described earlier (cf. p. 181) on a skin on the ground. The mat she is making lies in front of her, irregularly rolled up. She takes about 20 reeds from a loose heap, which is piled up beside her, places the bundle in front of her feet, adds the new reeds to those already bound. The toes of her right foot hold the reeds in the desired position on the ground while she is doing this. To sew the reeds together she uses a bone needle, °/kxa-ru nā-b, made from a rib or a leg bone. The woman holds the threaded bone needle with her left hand and with her right she pushes 3 to 5 reeds at a time over the point so that they are pierced through. [230] Then the speared reeds are drawn off the needle onto the bast thread and added to the ones already in a row."

"In Little Namaland I saw that the mats are not pierced by the threaded needle but by a

chaukwe--41A N-5 (1903-1905) 1907 FX13 Hottentot FX13
Nama

342
412

Cyperus, reed for a mat hut.

2/3 natural size.

flat iron awl. The awl was placed on a slant so a path for the thread would be held open. A reed was threaded instead of a needle and then worked into the opening. The Little Namaland people call this reed /kʔo-reub, but the Topnaars use this word to designate the end of the bast thread that is threaded into the bone needle. 342 285

When a few thousand reeds are lined up in this manner, they are pierced and sewn again in reverse order a few centimeters from the first row of sewing (see the arrows in the illustration). This is repeated in alternate directions until each meter long reed is pierced 16 to 18 times.

The free ends of the reeds are now bound together as the picture shows either in pairs or in threes and tied to the outer sewing thread all along the mat. Whatever part of the reed sticks out beyond this hem is cut off evenly with a knife leaving an amount the breadth of a finger. [Picture. Piercing and Hemming the Mats (Plan). a) Reed, b) Sewing Thread, c) Hem Thread.]

The mat is now ready for use. It is generally called /haru-b (3, m.). A mat called !gʔi/b is prepared from considerably longer and stronger reeds.

The length of the mat varies with the size of the hut (it must span the whole dome in one piece) and depending on the mat's position on the dome, is between 4 and 8 meters long and not quite 1 meter wide.

The reeds in the mat are placed only sufficiently close together to keep out direct sunlight. They let in enough scattered rays through the cracks to light up the hut pleasantly and also enough air to ventilate it. In comparison, the clay hut of the Herero is gloomy and dank but offers better protection against the rain. Only when it drizzles slowly and the mat has time to swell do the reeds contract to form a rainproof roof. [231] A mat lasts 10 to 15 years. When it reaches that worthy age it is called /ha-mi. [m]

c) The mat is fastened to the framework with straps or bast threads to the loops of the sewing threads that stick out like handles, in other words along the narrow sides of the mat. Mats (usually three) are hung (na/mi) with their long sides parallel to the ground from the bottom of the hut wall to about the height of a man. They thus embrace the framework like a crown. The edges overlap a great deal. The other 342 285

Piercing and hemming the mats (plan).
a) reed, b) sewing thread, c) hem thread.

mats are placed over the framework vertically to the others, usually so 352
that they run from door to door. [Picture. Completed Mat Hut.]

1. The furnishings of the hut consist of nothing except the barest [352]
necessities of daily life. Two doors, only one of which is ever used, the other being kept closed, control the ventilation. The door openings, "ǂnamaxa, i.e. "hut mouths," are about 60 centimeters wide and 1 and 1/2 meters high and are opposite each other. The front one faces east. The door itself is a hard goat skin or calf skin that has been dried stiff, "ǂgũ/kwagwa. A thong is fastened on each side and in the middle of the upper edge. These can be fastened to the hut wall in bad weather. If the inhabitants go out, a stone is placed on the overlapping edge of the skin to close up the hut completely. Here and there someone would remember that in the olden times elephant ears were made into door skins. [Picture. Floor Plan of a Hut. a) Front Door. b) Back Door. c) Fireplace. d) "Raiser" e) Framework Poles. f) Side Rooms. g) Back Room.]

[232] On the inside the levelled ground is covered with skins, ex- [352]
cept the hearth, located in the front half towards the door. 354

If the family is large, a hearth is built outdoors beside the hut and protected from the wind by a semicircle of transplanted bushes. But even if the cooking is done in such a kitchen protected from the wind, //haob, there is always a hearth in the hut. The evening fire that is lighted immediately after sunset unites the family and the inevitable boarders, friends, relatives and neighbors.

The sleeping places, ǂã-rogo, are right on the ground. All kinds 513
of skins are used as mattresses and sheep skins (cf. p. 234) as covers. 352
The sides of the hut, ǂanixa, i.e. the area behind the hearth to the right and left of the back room, (see below) are the best places for sleeping, and are reserved for the master and his wife and after them the older members of the family. The unmarried servants, hired man or maid-servant, usually Bergdamara people or Bushmen who look after the children and the cattle, sleep near the door.

The household utensils (cf. handicrafts) and the food supplies hang 415
from the poles of the framework or are packed in sinew nets or in skin 352
sacks. On the floor in the back room, ǂgu-rub, i.e. of the room between the place for the fire and the back door, stands the so-called "raiser", ǂhã/s, made from four vertical branches with twig stubs that are used as hooks for hanging things on. (ǂã/ti).

[331]

I used as the basis of my description those huts which did not yet show signs of the rapid degeneration which are seen today in all areas of Namaland culture. In twenty years will there still be any mat huts like the ones described here? Gradually they will all be a patchwork of rags and discarded objects from white households as are those of Angra Pequena. And where formerly the huts were close together (67) in a

67. P. Kolben, Caput bonae spei hodiernum etc., Nürnberg 1719 (it was available to me in a German translation in Capetown).

circle, surrounded (66), (68) by a hedge of clipped thorn bushes and

68. G. Fritsch, Die Eingeborenen Südafrikas, ethnographisch und anatomisch beschrieben, mit Atlas. Breslau 1872.

joined to form a kraal (//gaũs, !hafs), and where now scattered groups of huts (!harigu) stand together, soon there will be straight streets easily supervised by police, just as in Keetmanshoop, and finally the last traces of the native dwellings will be swallowed up by the barracks of the locations.

8. Preparation of Leather

Before the white man came to the country skins of domestic and wild animals were the only materials used for clothing and blankets by the Hottentots. Today it is hard to find traces of this custom. The traces are there but you must know how to track them down; for example there are the skin sack dresses of the women who have not quite divorced themselves from the customs of their ancestors in spite of all printed material and bright cheap cloth, and who still preserve their karosses and skin aprons. Or out in the veld one can find traces in the huts of impoverished cattle herders who can only occasionally afford the luxury of European articles and the rest of the time carry on their handicrafts as the Hottentots did 50 years ago. I learned from such people.

did 50 years ago. I learned from such people. 28|

1. Tanning, /no-ro, in the broadest sense (usually women's work). [86]

a) The process itself involves the following techniques: The freshly removed skin is first spread out to dry with the hairy side up, usually on the hut so that it will be safe from dogs.

When the skin is dry and hard, it is softened up with the juice of succulent plants which are pounded (ǂa-mai) into the fleshy side of the skin. [128]

The excess liquid is poured off and the skin rolled up so that it will not get dry too soon. The woman then kneels on the roll, after she has spread out flat just as much as she can work at a time. The fleshy side of the skin is sprinkled with sandstone powder and briskly rubbed (/mi) with a piece of tanning stone (ǂkoms) the size of one's fist. [103]

When the sandstone has rubbed off all the scraps of meat, they let the skin get half dry again, full it (/no-ro in the narrower sense) and knead it then as they would laundry and then rub soft fat into the outer side.

The skin is now certainly dry and pliable but if it were soaked through by the rain, it would again become hard and brittle when dry. To prevent that, the skin is tanned with the crushed and softened red bast of the Acacia horrida Willd. (ǂhai, probably borrowed). Then the skin is placed for an hour in red bast lye, with the bark bundles [129] [38] wrapped in it, until it is saturated. It is half dried again, [234], and then spread out for about another half hour in a flat trench and covered (//ha/n) with slightly dampened sand. In conclusion a man takes the skin by the tail, another by the head, women and children grasp the sides and they pull and stretch it smooth.

Finally dried in the sun, the skin is permanently soft, rainproof and dyed a pretty reddish-brown on the inside.

b) Useful objects made from tanned skins are: α) Floor skins, 28| ǂgo'a-n. They are the carpets of the huts. Young cattle, goats, sheep, 352. springbok and duikerbok furnish the material. A single skin of this kind is called ǂgo'a-s. ǂgo'a-b is the large rug which consists of about six floor skins that are cut and sewn together with strips of sinews.

β) Skin covers, "Kompersen," ǂna-mti, made from sheep, jackal, 28| Octoyon megalotis Desmar), rock-rabbit or lynx skin, used as a fur 29| cloak or kaross, a comfortable, solid and warm article of clothing for women (see Plate X.). Today it has been almost entirely replaced by [177] European clothing.

γ) The front apron °(!ga/a-b, 2, m.) of the boys is a skin flap, which is cut from any soft skin. Goat, rock-rabbit and jackal skins are used most frequently. (See Plate XI.) The skin is fastened to a strong belt, °//k!a-ngun, which goes half way around the body and often has a zigzag ornament. The name of this ornament, °/hõ/am/hoas, expresses the fact that a similar black and white pattern is burned into the lip of the wooden milk pail.

δ) The back apron (!gõ/s) of the girls (also specially called /gõ-/hes as a female article of clothing) is always made of sheepskin, preferably from a brown and white or a black and white checked one. The hairs are taken out with a chisel-like instrument except for a narrow edge and wide corners. The bright edge of the fur contrasts well with the reddish-brown leather. The back apron covers the seat and legs to the knees. The hat is called ui-mi!gõ-/hes after this piece of clothing because the flying skin of the hanging animal looks like the back apron on a woman.

ε)A11 the fur caps, /gabati, which I saw were made from the back skin of the aardwolf. The back comb of the animal forms a comb of long bristles the length of the cap. (See Namib- Bushmen, p. 98) [Plate X. A Hottentot Woman from Keetmanshoop in an Apron. A Topnaar Hottentot Woman with a Child in Aba Skin. A Hottentot Woman from Keetmanshoop in a kaross.]

[235] ζ)The so-called "rogue's sack," /hõ a/hõ s, should be mentioned. It bears this name because it is used for keeping little objects stolen or withheld from someone. The one pictured here is made from the skin of the "dwarf" (Cynictis).

η) A net bag is knotted from strips of chamois skin.

2. Letting the Skin Rot, /õ/õ

The fresh skin is crumpled up firmly and, wrapped in a tanned skin, set out in the sun. During the night it is placed by the fire to hasten decomposition. They also bury oxskins knee deep in the floor of the hut next to the hearth. After 3 to 4 days the skin stinks and the hairs can be easily pulled out. The skin is rolled up after depilation and a man places both his feet on it and works on it from above and below and sideways with his feet until it is soft and nearly dry. Then the fleshy side is rubbed with fat. [Pictures. Cap made from the back skin of the aardwolf. 1/6 natural size. /hõ/a//hõ/s. 1/5 natural size.]

[p.236]

Cap made from the back skin of the Aardwolf. 1/6 natural size.

/hã/a//hõ/s. 1/5 natural size.

All skins which are to be cut into straps are prepared in this way. 281
An entire ox or oryx skin is cut into one long strip starting at the edge 283
and going in an increasingly narrow spiral (//hari·, vb.). Further
preparation varies depending on whether the straps are for packs or for
oxen.

[236] a) The pack strap, !ga/e!haũ/b, must be flat, so that it lies 281
properly on the beast of burden and does not chafe by rolling. There- 492
fore, in contrast to the ox straps, it is not twisted. [Picture. Net Bag
Knotted from Skin Strips. 1/7 Natural Size.] Because the irregular
outer contour of the skin, the raw strap is cracked in many places and
has corners that splay outwards. It takes a whole day to snip away the
irregularities and stretch the twisted parts smooth. The finished strap is
about 2 1/2 centimeters wide. The scraps are made into hobbles
[Spannfesseln] or nose straps for the oxen that are ridden.

b) For making ox straps (forehead straps for tying up oxen), the
spiral strips that are cut wet from the stinking skin are hung up on an
overhanging branch of a strong tree as shown in the illustration and
weighted down. A piece of wood the size of a man's leg and bent like
a knee is fastened with straps to a large heavy stone. The turning stick
is placed between the wood and the stone. The man goes round and
round like a donkey around a tread mill, until the long strips of skin
that hang down loosely next each other are shortened to a firmly
twisted rope. [Picture. Twisting the Ox Straps]. Then the man pulls
out the stick, lets the overwound rope unwind and then twists it again
in the opposite direction. From time to time the [237] rope is rubbed
with fat. This work is continued for 4 to 5 days and by then the strap
is round, firm and pliant. It is then divided up into individual ox
straps. Whether this method of preparing leather was original with the
Hottentots or whether they borrowed it, seems to be uncertain. I saw [?]
Boers as well as Bechuans (in Kanya) preparing leather ox straps in the
same way.

c) Straps for sewing shoes (!ã·gu) are made preferably from the 281
skins of the steinbok, whips, sa/migu, are woven from goat leather, 283
probably following the example of the Boers. The kudu bull supplies 492
the best material for the whip end. The genuine sjambok, !na/ba·b is
cut from hippopotamus skin.

d) Women and girls make their front apron (here specially called 294
/a·bill) in the following way. [Picture. Apron Front of the Girls.
1/4 natural size.] A rectangular piece is cut from a prepared [illegible]
goat skin. One has tried to connect the word /a·bill, [illegible] 196
a woman's front apron with various word stems.

[237]

Apron front of the girls.

The apron -- naturalia non sunt turpia -- may occasionally drip. Schinz (50) derives 196

> 50. H. Schinz, Deutsch-Südwestafrika. Forschungsreisen (1884-1887) durch die deutschen Schutzgebiete etc., Oldenburg and Leipzig, 1891.

the word from the verb "to rain" and translates it as "drip." That is not possible linguistically since "to rain" is not /a-bi but /abi-. Krönlein (57)

> 57. J. G. Krönlein, Wortschatz der Khoi-Khoin, Berlin, 1889.

connects the word with the designation for "to slit," obviously connecting it with the apron's slit strips. But the word used for slitting the skin for medical reasons is pronounced /a^bi- (3. st.), which is different from the word for front apron in its initial, tone level, its word-tone, and the place of its accent. [Ed. note: These terms are explained on pp. 143-151.] In my opinion this is a case of three words which are not derived from each other; there are three stems with the same arrangement of letters, each one of which is independent phonetically and in its meaning.

1/4 natural size.] A rectangular piece is cut from a depilated sheep or goat skin. Then one side is slit (from the future bottom edge) into long strips about 2 millimeters wide. On the opposite end an edge about 15 centimeters wide is left, the future upper edge of the apron. The piece of skin which has thus been cut is folded three times so that the hanging strips are thick enough to cover nakedness. The upper edge is folded [238] and the strap that holds it up is drawn through. The strap tsõ-ab, is one centimeter wide and sewed to the apron to the right and left. It is drawn around the hips and fastened in back. 294

e) The economy sack, /na-ma//hã/s, holds all the household scraps which might perhaps be useful later. Here a few coffee beans may be lying about, there gourd seeds, here a strip of leather, there 415

somebody dropped a piece of tobacco -- all such things are placed in 415
the wide sack which hangs by its two straps on the hut's bracing poles.
For making it, two goat or klipspringer [Oreotragus saltator (Layard)] 281
skins are fitted together at the edges and sewn all around with sinews
except for a place in the middle of one of the sides. This opening is
just large enough for a hand. In time of need one reaches into the
sack; it is the last resource. A handful of coffee and a few pipefuls
of tobacco are certain to be found among the odds and ends that have
collected there.

f) Poor Hottentots use their pillow, ǂkʗa·bis, to store tobacco. A 415
pair of square pieces of the same size are cut from the skins of goat, 276
sheep, klipspringer, or steinbok, sewn together on three sides, the
pocket then stuffed with klipspringer hair or ox hair or feathers and
then closed. If someone wants to save tobacco for hard times, he
crumbles it, cuts a stitch of the pillow, sprinkles the crumbs into the
stuffing (/kʗaũb) and sews it up. In this way he keeps himself from
nibbling. He must be in desperate need before he decides to rip up
the pillow in order to separate a thimble full of tobacco from the heap
of hair.

3. Fresh Drying

a) The part of the back skin of an oryx or a cow that is to be used 294
for leather soles, is stripped off fresh, cut into long rectangular pieces
(/kʗa·na, vb.) and dried hard. The stiff flat pieces are placed on a
bed of fresh cow manure, then covered with cow manure or buried in
moist sand until they have become soft. Then they are rolled, beaten
with a stick until soft, dampened slightly in wet sand, cut, and used
without further treatment. The hairy side of the skin becomes the out-
side surface of the shoe sole (//ha/bo·b, also means shoe). It is to be [294
assumed that sandals, /kʗabu·s, were the original foot wear of the 177]
Hottentots, not the shoe pictured here [239] which they now normally
wear.

b) The skin of a goat, a young calf, an oryx calf, or a steinbok is 415
made into a large water bag, ǂga/ba·b. The left front leg of a freshly 281
killed antelope is slit lengthwise and the slit extended to the area of
the front shoulder. The whole body is shelled out of this opening.
Head and legs are cut off and the openings tied up as are the anus, the

shoulder opening, and bite or shot wounds. The skin of the right front leg serves as a mouth for filling and emptying and has a stone closure which can be easily untied. The freshly removed skin is turned inside out, the fleshy side is cleaned of all bits of meat and fat and then dried. The hair is left on and covers the inside of the sack. [Picture. Woman's Shoe. 1/4 Natural Size.] [Picture. The stone closure of the mouth of the skin water bag. The mouth is bent around and a stone (a) is put in the bend and the mouth is fastened to itself below the stone. The little stars indicate the beginning and end of the tying thread (on the right knotted around a little piece of wood. cf. next figure.]

Water stays fresher and cooler in sacks made of animal stomachs which the coast Hottentots, for example, make from the stomach of the Antarctic fur seal. [Picture. Permanent closure of an opening by means of a piece of wood and string. Holes are pierced in a circle around the area which is to be closed. A small stick of wood is stuck through these holes (direction indicated by arrows). To make the wood firm, a thread is tied in the manner illustrated.

4. Mixed Treatment

a) The skin of a goat, calf, oryx calf, steinbok, springbok, klipspringer, or a duikerbok are used for the knapsacks called //hõ‡ti. [240] The animal's head is cut off and then a cut is made in a curve along the hindquarters and across the perineum. The skin is loosened with the fist and pulled off the body inside out. They first let the skin become rotten in the way described before. [Picture. Traveling Knapsack Made From a Goat's Skin. 1/6 Natural Size.] After depilation and it is dry, it is tanned as described in paragraph 1. In the finished sack the former hairy side is on the inside and the bottom of the sack is the former head end of the animal. [Picture. Small Household Knapsack, Made from Kid Skin. 1/6 Natural Size.]

The larger knapsacks are used for keeping all the things needed when traveling on foot, thus corresponding to our rucksacks. Smaller sacks serve as little purses. The women use them for their buchu herbs, the men (sometimes also the women) use them for pipe tobacco, and for tinder and flint. [241] Because of the last two items, the bags the men use are called doro //hõ‡s*

*The tinder box which is sold to the Hottentots by the white men is designated by the same

word stem doro- which means "to bore." That is a vestige from the time when the original means for making fire, long since in disuse, were little boring sticks such as the Bushmen still use today (cf. Kalahari). 196 372 [m]

b) The upper leather is cut from the stomach skin of an oryx, a cow, or young calves. If absolutely necessary they use the fresh skin of old animals. The treatment is the same as that for knapsack leather. [Picture. Doro /ho̱ḍs, about 1/4 natural size.] 281

c) The half-grown Hottentot cuts his back apron from the skins of a goat, steinbok or klipspringer. (cf. Plate XI). Sometimes three long straps about 4 centimeters wide hang from the bottom edge of the apron down to the ground. They consider it decorative when the straps flap in the wind.

C. Rope Making

The building of huts and the making of useful skin and leather objects (called sa-ran, when they are used directly on the body as covers or clothing) require rope and thread. The sinews of wild and domestic animals supply the best thread for sewing skins together. But for sewing mats together bast thread, tsu-rib, not sinew thread, //aba-b, is used. 283

The best material for making rope is furnished by the Acacia horrida Willd. The freshly topped branches are cleaned of twigs and thorns and quickly drawn through the hot ashes of the fire. The bark is then banged loose from the wood at one end of the branch, freed with the finger nails and pulled off in strips. [824]

The rest is women's work. The outer bark, soro-b and the layer of red bark lying underneath, *basib (probably borrowed) are not used for making rope. Only the innermost white layer, which is easily slit off, is usable. From these white fibers, /a̱ḍb, the wet [242] layer that lies directly next to the wood is separated from the outer, tougher layer that is not wet. The fibers are hung up to dry, later softened again in lukewarm milk (in an emergency in water), put in the mouth in lumps, sucked dry, and chewed up. Now the fibres are ready to be twisted into rope.

The following work the women do not like to do and sometimes refuse to do in the presence of young men. Sitting sideways on the floor, they bare one of their legs nearly to the hips. [516]

Nama

281
415

[241]

Doro //hõ/ɪ. About 1/4 natural size.

they bare one of their legs nearly to the hips. The flat surface of the leg 283
serves as a base for their work. Two bast fibres are stretched out across the leg, held between the fingers of the left hand and with the right hand rolled firmly over the skin of the leg so that each fibre twists over itself. During this rolling motion towards the knee each of the two fibres is twisted individually. They are rolled back immediately which twists them together into one thread.

They solve the problem of making one long knotless string many meters in length out of hundreds of short fibres in the following way: [Picture. Twisting of Long Strings From Short Threads (plan)].

1. (See Figure I.) The end of thread a, which is to be lengthened, is spread out in a fork shape. Thread b, also spread in a fork shape, is placed on thread a so that its longer tine lies on the shorter tine of thread a and its shorter tine is on thread a's longer one. Thread b_1 is half as large as a.

2. (See Figure II.) Each fork that consists of two fibres or threads that lie loosely beside each other (until *) is twisted into one thread by rolling it towards the knee. The reverse rolling makes the twisted tines into a single piece of thread. Thread b_1 is now anchored. The free end of thread a is now forked making two tines, one longer than the other. The latter now is attached to the free end of thread b_1.

3. (See Figure III.) A double rolling motion brings the loose ends together to **, making a new piece of thread. The longer piece of thread b_2 is placed on the last little end of thread a, and the shorter side of thread b_2 is placed on the free end of thread b_1 and all these pieces are twisted together to one piece of thread to ***. [Picture. A net bag of sinews. 1/6 natural size.]

In this way all the shorter threads are twisted into one string, the strength of which leaves nothing to be desired. [Picture. Making the sinew knots in the net bag.] [Picture. Joining the net stitches at one of the two ends of the bag. 2/3 natural size.]

The only useful object made exclusively [244] of sinews (and 283
preferably from those of an oryx) is a large net bag, ~~fu'i.s~~, which is 415
used in the hut as a kind of bag drawer for keeping all kinds of things. 286
When traveling it is used as a rucksack for bedding. A similar bag is 484
also knotted from narrow strips of chamois skin.

D. Wood Carving and Basket Weaving

Wood carving and basket weaving will be mentioned here briefly for continuity. The following wooden objects have already been mentioned: the chair (p. 181), the whisk (p. 199), the winnowing basin (p. 201), the spoon (p. 206), the mortar (p. 200), and the honey stick)p. 205). The text illustrations round out the picture of all the main types of wooden dishes and pails. [Picture. Repair of Wooden Article.] An informed Hottentot told me that the wooden vessels mentioned, which today have been supplanted chiefly by European metalware, are still made here and there, half boring them out and half scraping them out with an instrument which is called *//gare·s. The latter consists of a knife blade bent at right angles to its wooden handle. Unfortunately I did not succeed in acquiring such a tool.

Of interest is the way in which the Hottentots mend wooden dishes. Leaks and cracks in the dishes and pots are sealed with tough root fibres. To the right and left of the crack (a), holes are made in the wood and a root thread (b) is drawn through the holes across the crack, so that it bridges it on the outside. [Picture (244 and 245). Wooden dishes. 1/4 natural size. a, d, e: //hoĕti, usually milk containers. h and i: the same with root mending. c and f: !ao//hoĕti, milk pails, "neck bamboo." g: ≠aigaĩ //hoĕs, "foot bamboo." b: !ore·s, dish used for eating.] [246] A cross thread (c) is twisted around these bridges in the way the illustration shows. Only two parallels of the latter thread are shown. The scale is enlarged so that the method of twisting could be seen. Next to * is the end of the cross string; it is firmly fastened with several twistings. The entire repaired area is rubbed with fat. Gradually enough dust collects in the root weaving so that the hole is completely glued together.

Except for making mats, basket weaving is insignificant. Besides the nara sieves (cf. p. 199) only the fish baskets should be mentioned which the Hottentots use for catching fish in the Fish River. I did not get to see one.

E. Use of Clay, Stone and Metal

Work with the above materials has remained at the most primitive stages.

1. Formerly the Hottentots made simple urn-shaped pots by kneading and baking them out of clay and sand. The fragments found in

[Refer to diagram on p. 59 (A). — Analyst]

old snail refuse heaps along the southern coast from the Cape of Good Hope to Port Nolloth prove this. They no longer make them. But prehistoric time in Namaland is relatively recent; historical information about the Hottentot people dates back only a few centuries. It was, therefore, worthwhile to look for one of those old clay vessels, prehistoric fragments of which I had found buried in the sand along the coast near Port Nolloth, in the huts of the present-day Hottentots. The only one I found, after much vain effort, is pictured here. [Picture. Baked Clay Vessel of the Old Kind. 1/4 natural size.] The clay vessel is called ǂgo/asūⁿs, i.e. clay pot. Another word for it *ǂkʟoē.kʟoēsūⁿs, was of interest to me, since it was the only case, in which the old, native tribal designation of the Hottentots (see p. 322)[1] came to my ears.

On the one hand imported European wares have replaced the clay vessels. On the other hand the impoverished Namib nomads [247] have sunk back to the lowest imaginable cultural state in their cooking utensils, since, instead of pots, they put the breastbone of an ostrich, called *//gūⁿs, on the fire.

2. Stone, as found in nature, today plays a subordinate role in the household of the Hottentots. [Picture. Stone Mill for Hand Use. 1/4 natural size.]

Only one stone utensil is as indispensible today as formerly: the handmill. It consists of two stones, a thin flat stone, */ui aib - always masculine gender) as a base and a round stone*, */uiams (always feminine

*The gender of the endings of both words is emphasized, because their contrast in this connection is preserved intact and this type of opposites is typical of Hottentot language usage. The flat stone is always masculine because it is angular and slim (it has a large surface area in relation to its mass), while the compact round stone recalls the round thickset forms of the female body and therefore has a feminine ending.

In the neighborhood of Kulub there are two watering places next each other, *ǂkʟanu·b and *ǂkʟanu·s, each on a slope of a high rise of primary rock. One of the hills is slender with a more pointed crest. This watering place is differentiated sharply from the other

one by its masculine ending. The name for the other one is the same except it has a feminine ending, since the top of the hill is massive and more gently rounded. 193 196

Whereas in the above case it is the contour, in another case it is the size of the objects compared that determines the choice of the gender ending. Thus the Hottentot words for women's breasts and buttocks are masculine, and the words for the corresponding parts of the male body have a feminine ending because those parts are less well developed.

Thus the Hottentot is always aware of the sensuous origin of his rules for gender.

gender) which is rubbed on the flat rock back and forth in a straight line and at the same time rolled slightly. Roots, pods, coffee beans, buchu herbs, paints for make-up, in short everything used in powder form, is ground on this mill. 412 324

The three cooking stones, !nõ-ti, on which the cooking pot rests, the whetstone, /kχõ-/uis, and the flint, !nõ-hs (not rare at Keetmanshoop) with which they strike sparks on the tinder (usually rotten wood) against an iron handle, are the other three natural stone articles which the Hottentots use. [372]

Neither the sandstone nor limestone of the tablelands nor the gneiss and granite of the mountains of their homeland are suitable for stone work. But locally there is serpentine, the existence of which has been proved (42) in Kaukausib and on the southern side of the 324 [135] [317]

42. E. Freiherr Stromer von Reichenbach, Die Geologie der deutschen Schutzgebiete in Ostafrika, München and Leipzig, 1896.

Brandberg in Kaokoland and [248] is suspected in other places that are known only to the natives. The Hottentot cuts the serpentine with his knife and makes pipes. He uses as a model for these pipes the ones that can be easily made from the marrow bones of middle-sized mammals and which are used when the stone is not available. This bone pipe, !hai-b, is used a great deal. The part where the marrow 324 276

was is plugged up sufficiently with a bunch of grass so that the ashes are not sucked in. The ordinary serpentine pipe, /uiǃkʔõb, is used in the same way. One would take it for a cigar holder made from a European pattern, if the Hottentots smoked cigars. [Picture. a and b are bone tobacco pipes. c - e serpentine pipes of native design. f. a serpentine pipe of European design.] On the other hand the European cutty is obviously the model for the pipe form which they call ǃha·bes. 324 276

3. One metal was treasured by the Hottentot before his contact with European culture, namely copper, which he probably got by barter from his Bantu neighbors to the north. With the disappearance of native jewelry and because it is easy to buy or steal all the needed metals from white people, copper has been mostly supplanted by iron and brass. The male [249] Hottentot cuts three kinds of jewelry either from iron, brass or copper, more rarely from lead depending on the material available. 325 301 [439]

Women and girls wear bracelets and armrings, ǃganuti, right above the wrist, sometimes ten pieces in all. I saw men wearing only one, if any, on the right wrist. [Picture. Bracelets. 4/5 natural size]. A single design is made by scratching, notching and hammering. The patterns, always on the outside, resemble those of our prehistoric times and are the only interesting thing about these ornaments. Neither the material nor the instruments used in making them are original with the Hottentots, but are borrowed from the white man's workshops.

[250] In the simplest form, the arm decoration is a plain ring-shaped rounded, open, undecorated iron wire, shaped like a D in cross section or square-edged and slightly rounded on the outside. Such a smooth undecorated iron band is depicted in figure a.[1] 325 301 57

The brass bracelet b is square-edged with tapering ends and is decorated with hammered or cut cross-lines, which diverge from the middle of the band towards both sides. These lines are crossed by long irregular grooves, running near the edges and parallel to them. A copper bracelet (c) with rounded edges is primitively decorated with irregular thickset cuts across the band and grooves that run the length of it.

The square-edged brass band d has irregularly spaced notches along the edges and a clumsy unconnected line down the middle. These notches are cut so that they converge towards the middle line in better-grade work. Thus in the narrow iron band e, the notches are so deep

[1] [For pictures of bracelets discussed in the text, see cat. 116, p. 62(B). -Analyst]

that the material has swelled up and created a raised design. The next iron band f has a "fishbone" pattern as I call it as an analogy to prehistoric ornamentation at the suggestion of my honored colleague Dr. Eichhorn. The pattern is regularly interrupted by small smooth spaces. We find this pattern again in primitive form in the thick, flat copper wire band g, in the iron band h, and finally, in its clearest and most regular form with divergeing angular lines towards the open ends, in the brass ring i. 301 325 531

The zigzag decoration is widely used, equally popular as a decoration for wooden dishes (burned in), on apron belts (woven in), and on serpentine pipes (scratched on). It is cut or hammered into the bracelets of the Hottentots. Sometimes it is a straight continuous line (k), sometimes a system of two or three lines which are not always connected. (l). The two square-edged bracelets with the zigzag ornamentation are made of brass.

I saw a pattern with dots only on brass (m) and copper (n) bracelets. The dots were arranged in rectangles, circles, or in rows of two or three, hammered into the material as if by a stamp.

The last kind of ornamentation to be mentioned are the cross-hatched or diamond shaped fields of various forms on bracelets. [251] A thin, square-edged, bandlike iron ring (o) has four fields shaped like parallelograms with checks made by vertical and horizontal lines. A metal band (p) that shines like gold, whose cross section is flat on one side and flat-roof shaped on the other, has two rows of triangles filled with notches, the base of the triangles runs along the outer edge and the apex touches the middle. One iron band (q) with its flat D - shaped cross section is reminiscent in a remarkable way of the "prehistoric triangular pattern" with its regular cross-hatching. The last of the arm rings (r) pictured here has an irregular combination of notches along the edge, long grooves and checked triangular fields.

Arm rings with hooks and eyes are occasionally made of spiral brass or iron wires wound around a wire axle.

There is no native designation for finger rings. Women sometimes wear as many as 15 on the third, fourth, and fifth fingers of both hands. [Picture. Finger rings of copper, brass and iron. 9/10 natural size].

Earrings, !gamti, are popular with both sexes. The children's ear lobes are pierced by their mothers between the third and fourth years. The ear lobe is first kneaded between the fingers for some time and then pierced with a needle bent into a curved shape. The bleeding is stopped with hot ashes from the hearth fire. When the ears are 301 304

301
325
531

Finger rings of copper, brass and iron. 9/10 natural size. Iron earrings. 9/10 natural size.

completely healed after several days, the needle is removed and replaced by an earring. There were many complaints about painful swelling of the ear lobes after being pierced. [Picture. Iron earrings. 9/10 natural size.]

Necklaces of rosin beads are one bit of jewelry which holds its own against all imported bright glass kinds, even though difficult to make and unassuming in appearance. [252] The yellow rosin of an Othonna species (called ≠gũ/s) is rubbed with the cold coals of the hearth fire. This mixture (a powder) is warmed with a burning piece of wood and kneaded with the other hand at the same time. The warm mass is rolled into sausages with the flat of the hand on a smooth surface. Little pieces are taken from these sausage rolls and formed into pills over the fire. The pills are put on slivers of wood (so that the wood goes through them) and after hardening, strung on sinew, often alternating regularly with bright stones or glass beads. The bead necklaces (called the same as the plant from which they are fashioned) are often combined to a thick bundle of chains, *//ga·/mi, which has good trading value among Hottentots. A chain which will wind ten times loosely around the neck and reach down to the breast has the value of a nanny goat. [Picture. Necklaces. Top and bottom: made of rosin. In the middle: made of ostrich eggshells.]

Imported glass beads are popular. The large-beaded necklaces are differentiated by the word !a/ms from the small-beaded ones *ga·rab. Ankle rings, *!go·ro!kxu·ib, consisting of thickset rows of little glass beads, are still occasionally worn under the skin shoes.

[253] Capitulum III

The Hottentot's Mode of Living

Great Namaland, a typical dry area of South Africa, has such scanty growth in its limited area that it cannot provide the animal world with sufficient food and water. The characteristic animals of the South African grassy plains, at the same time its most valuable wildlife, the antelopes, must roam over extensive areas just to get a meager living. Like the predatory animals, the hunters follow these herds; wherever the native has exchanged this unsettled way of life, which one day leaves him in need, the next day with a surplus, for the regulated life of a herdsman, he finds himself forced more than ever to wander, the more numerous his cattle (/go·an) become. [Picture. South African ox wagon.]

493

South African ox wagon.

Under normal rainfall conditions these wanderings to the pastures (ǂhabu·, v.) are regulated as to timing and goal by years of experience. During droughts, finding pasturage is more difficult and more urgent and more families than usual prepare for wandering. We know enough cases when the entire tribe has left its dwelling place. For an extensive journey, the hut is taken down and packed with poles, mats and household goods on oxen. The well-to-do Hottentot owns an ox wagon, of that well-known heavy kind, of 10 to 22 span, which the Boers introduced into South Africa. Before that time, the wandering Hottentot is supposed to have made a bed of strong branches on which he packed his reed mats, skins and household goods, harnessed oxen in front of it which then dragged the whole affair as if it were a sled. Just as the wagons supplanted pack-oxen, so have horses nearly supplanted oxen in Namaland as mounts. Nevertheless one still sees oxen [254] whose nostrils are pierced for the wooden bridle. 221 233 492 493 494

Thus, the Hottentot sets forth for the pastures riding and by wagon, if possible. The half-grown children have to drive the calves and smaller animals. They must drive them slowly, so that the animals can keep grazing and the lambs can keep up. Therefore it is customary for those who drive the small animals to leave early in the morning before the old people. The cattle are usually driven too quickly for them to graze properly while moving and therefore are left in the fields overnight. 233 221 484

Two hundred and fifty years ago the Hottentots were the wealthiest cattle owners in South Africa from the Tropic of Capricorn to the Cape of Good Hope. Van Riebeeck was a sober observer who didn't write his diary for the entertainment of the public. When he says (69) that at 175 233

69. H. C. V. Leibbrandt, Precis of the Archives of the Cape of Good Hope. Riebeeck's Journal, Part I - III, Cape Town, 1897.

times in the area of Table Mountain the land was covered with cattle as with grass, we may believe him. In the first decades of the nineteenth century herds of cattle and sheep containing many hundreds were still not unusual. At that time it seems that the Bushmen did most of the hunting. Today part of the Hottentots have sunk to the level of their despised enemies and serfs. Today the Hottentot must 233 178

earn his living as a herder and a hunter unless he enters the service of the white man. [Picture. Namaqua trek ox, about 6 years old.] 233 178

A. Domestic Animals and Cattle Industry

1. Cattle

Tied up with the unsolved question of the origin of the Hottentots is the problem, how they came to own cattle. How did this people at the extreme southern end of the ancient world come into possession of this [255] domestic animal whose origin is to be sought in Asia? Egypt is considered the country which brought cattle raising from western Asia and handed it on to the pastoral people of Africa in prehistoric times. A narrow strip of land, which runs along the east coast of Africa from the upper Nile to southern Cape of Good Hope and is inhabited, except for a few areas, by cattle-owning Negro tribes, is perhaps the route that cattle followed as a domestic animal from north to south. (71), (72). 233 174

71. E. Hahn, Die Haustiere und ihre Beziehungen zur Wirtschaft des Menschen. Leipzig, 1896.

72. G. W. Stow, The native races of South Africa, London, 1905.

a) The cattle-robbing expeditions of the Hottentots into the territory of the neighboring Bantu tribes (especially the Hereros, partly also the Ovambos), in addition exchanging cattle with the Cape Dutch of the south, and the Bechuans of the east has mingled the cattle of Namaland all together, so that the race which the Hottentots originally owned, i.e. at the time they were discovered, can no longer be clearly determined. [Picture. Hottentot cow. Breadth of the horns: 71.3 centimeters. From the highest point of the forehead to the upper edge of the nose at the upper nostril: 53.5 centimeters. Front height of the back: 129.5 centimeters. From the middle of the horns to the root of the tail: 195 centimeters. One race is differentiated by the settlers as the Namaqua cow. It supposedly differs from the Hottentot cow by having a shorter, thicker head, shorter legs and

Hottentot cow. Breadth of the horns: 71.3 centimeters. From the highest point of the forehead to the upper edge of the nose at the upper nostril: 53.5 centimeters. Front height of the back: 129.5 centimeters. From the middle of the horns to the root of the tail: 195 centimeters. One race is differentiated by the settlers as the Namaqua cow. It supposedly differs from the Hottentot cow by having a shorter, thicker head, shorter legs and squattier body.

squattier body.] The only clue is a tradition maintained by the natives and the settlers which designates a certain cattle type as native to Namaland and the model of the old cattle of the Hottentots. This cannot be proved. It is probably only a general likeness. Two such cattle are presented here.[1] An expert on domestic cattle will perhaps be able to distinguish what is characteristic of the Namaland race by a comparison (73) of these pictures with those of the "afrikaner," the 233 174

73. H. v. Francois, Nama und Damara, Deutsch-Südwestafrika, Magdeburg (ohne Jahrangabe). [n.d.] ed.

Bechuans' and Damaras' cattle. */hō·nati is the name the Hottentot gives [256] cows imported from Europe, whose most noticeable characteristic for him are its small horns.

b) The propagation of South African cattle has certain common characteristics in spite of the different racial mixtures. At the time of the best pasturage, i.e. in the fall when the summer rains of the so-called "great" period have fallen, in other words in our territory in March and April, the bull copulates most frequently and most effectively. Since the cow carries for nine months, calving time comes in December and January. The irregularities in the arrival of the rain and therefore of the sprouting of the pastures cause the time of copulation to vary and along with it the calving time. [Picture. "Afrikaner" cow, native to the former Free State and the Transvaal, 5 years old with her third calf.] 233

The Hottentot keeps careful track of the increase in his herds by noting the life history of each individual cow. He knows the age of his cattle better than his own. He also knows about each cow in his herd, whether she is pregnant (*tra·nu, v.) and calving (!kya/n/ī) for the first time, or whether she is bearing for the second or third time (/gam and *!nona· //kxum go/ma·s).

When the part right under the root of the tail of the pregnant cow loses its tension and the inner parts shake under the skin with every step, the calf is expected that same day. A herdsman [257] has to guard the cow then specially and bring the mother and the calf immediately back to the house.

The milk secretion of the South African cow, in contrast to our native cattle, has preserved its original function as a phenomenon of

[1] [See cat. 116, p. 66(A) and 66(B). --Analyst]

reproduction, is periodic like the latter, and adapted in quantity to 233
the nutritional needs of the calf. Therefore the Hottentot calls the milch cow *//ora·go/mas (from //ora·, to bear). When the calf is old enough to nourish itself, the milk secretion stops and the cow "goes dry," */õ or ũ/. The milk production of a single cow varies greatly. There are native cows who give milk, although in diminishing amounts, until shortly before the next calf, if the pasturage is good. If all the conditions favorable to milk production occur simultaneously, even the South African cow is supposed to be able to give 10 to 15 liters a day. About 4 liters a day seems to be average for the "afrikaner" race. (73) In dry years under certain conditions the cow gives so

73. Ibid.

little milk that the calf starves and therefore milking cannot be considered.

If the calf dies early or is born dead (≠kxa/m), the cow at first gives only a little milk, 1/2 to 3/4 of a liter night and morning during the first week, except for the "biesmilk" (see below) which is easily drawn off. Gradually, with proper treatment, the cow will give as much milk as one with a living calf. If the calfless cow does not wish [232]
to give milk, the Hottentot blows air in her genitals or he deceives her with the skin of a dead calf. All kinds of cattle, whether cows, goats or sheep which are milked without the aid of the calf or lamb are called oro·s. The milk production of the South African cow is supposed to be greatest after the third or fourth calf.

c) Although milking is man's work among the cattle-owning Bantu [171]
tribes, among the Hottentots it is regularly the work of the women and girls, the man only doing it to help out (concerning milking time see management of the herd).

Before being milked, the cow's hind legs are tied together with straps; if a peaceful animal above the ankle, if unruly right under the shoulder. Ones that buck are also firmly tied to a pole near the hut or to the kraal by a strap around the horns. The three methods of tying are differentiated as *!go·robis, *ǂī·bis and *χo·mais.

[258] If the cow is standing, the calf is allowed to suck for a short time (the younger ones longer than the older ones) and then the woman comes with the wooden pail, drives the calf away from the udder with a stick and milks. Where there are many cows, milking is done all

at one sitting. In other cases the calf is permitted to suck for a second time. The milk, which the cow gives then, the "after-milk," /gubib, is, according to the Hottentots, thicker and also much yellower than the first milk which they call ai·daib or "pre-milk." The after-milk is therefore thinned with water. The milk which the cow gives after the calf has sucked for the third time, is called °tsaũ/gubib, the fourth milk °tsaũ!gã//gubib. But the cow is rarely milked in this fashion to the last drop. 233

From the usual after-milk the Hottentot distinguishes a milk called ǂnunidaib, which is obtained when the cow has pastured for several hours after the first milking and then is milked again after the calf has sucked a second time.

The milk, //ha/mi, "biesmilk," that is drawn off immediately after calving is considered harmful to the calf because it curdles into a hard mass in the stomach. The Hottentot values it all the more for himself. He usually drinks it boiled and diluted with regular milk. [272] The cow's teats must not come into direct contact with this milk and therefore are moistened with saliva. If the udder is inflamed the ailing parts are rubbed with a salve made of fat and powdery spores of a mushroom (°ǂhirasãb, i.e. hyena buchu). If the biesmilk is yellow, it is called °!kũã//gyere//ha/mi, after a bush with yellowy green leaves. If it is white it is called °da//ha/mi. [824]

d) The management of the herds of a cattle owner in Great Namaland, which for the reasons mentioned above extends over a wide area, is simplified by the dryness which makes so much land necessary. Water stays permanently at only a few places well-known to man and beast and both know also where you can find temporary watering places after a good rain. These are the ideal gathering places for the scattered animals. [312]

Only the full-grown cattle have complete freedom to roam since they need neither protection nor guidance. The oxen, go/ma·gu, depending on the time of year, come every 2 to 3 days and sometimes every 4 to 5 days to the watering places and are easily captured while they are drinking when they are needed for work. In emergencies they must be sought in the field. [259] The man who has this job can recognize by the tracks which cross his path in all directions which are surely those of his herd. Further, he can pick out the track of the particular ox he is seeking among them all. Senses which have been

sharpened for generations and practiced since youth, and then the knowledge that a mistake will cause him to wander around half-starved and without success for days, enable him to accomplish things which no white man can equal. [Picture. Damara Trek Ox. Breadth of the horns: 1.60 meters.] 233

The cows, go/ma·ti, are driven to the pasture early in the morning, then left to themselves. Evenings they come back of their own accord to the kraal. The milking cows know that they will find their calves there and the others are accustomed to go with the mother animals. Old cows which can no longer have calves are fattened for slaughter by placing them with the oxen. The latter wander farther afield than the cows that come home every evening, and therefore find better grass and graze longer, as they do not lose any time wandering back and forth. A sterile young cow, ǂgõ/a·s (also called gau'/kʊãs i.e. fat body), is [260] usually left with the herd as an ornament because she normally stays well-nourished and has a shining coat.

The calves (called tsaũna until weaned) are separated from the cows in the evening after they have sucked and placed in a kraal. The kraal, !ha/ra·s (3. st.) is usually made by the Hottentots from topped thorn bushes, more rarely from stones and clay and is an outdoor enclosure about as high as a man. The mother animals bed down in the open near by. Early in the morning the calves are allowed to go to their mothers and then are driven out into the field in a different direction from the latter. They stay out until evening under the constant guard of a herder. Only when a calf becomes seriously thin is it allowed to go along with the mother to the meadow (sao', vb.). [Picture. "Afrikaner" bull, 9 years old.]

Breeding in the sense of a selection of certain animals or a regulation of the time and place of propogation is unknown to the Hottentot. The bull, //gõ/b, rules with complete freedom over his harem in the field, at the watering places and in the kraal. During the rainy season, from October and November until February or March he follows the cows closely. At the beginning of the dry season, after he has impregnated them all, he absents himself and lives alone in the field until the time of the first rains. Only when he cannot find enough water does he come near the kraal to drink. Otherwise he (//an) "lives" outside. Because of this and because of his bad temper, he is called [232]

233

*//kxao//an//gō!b. //kxaob- is the big poisonous thorny spurge (see p. 150) that everyone avoids. This "pasturing bull" attacks all other bulls and uncastrated [261] calves and sometimes pursues men. One sees him pushing his horns into the ground. [824]

If the pasture land is bad for a long distance away from the settlement, the cattle are sent for weeks or months away into the farthest fields under the supervision of one or several herdsmen, who stand guard over the cattle (!haro//an or //gaũmaĩ//an).

e) Whereas the bull goes his own way undisturbed all year round, at times half wild, and the cow peacefully lets herself be outsmarted at the milking pole, the young ox must be subdued if he is to be of any use. As long as the ox is untrained, he is called *//kxamgo/mab, young ox, no matter how old he may be. [Picture. A South African ox wagon with a span of 18 oxen. The driver with the long zweep, 1/4 the leader squatting, and the oxen guard in the wagon.]

The Hottentot who has the job of catching the young untamed ox, quickly makes his way through the crowd of cattle in which the ox is standing and places a stick between its legs. On the stick is the noose of a "catching strap" about 10 meters long. The frightened animal jumps forward with one foot, it does not matter which one, and is caught. Four to six men hold tightly to the other end of the strap and wait until the animal has more or less worn itself out with raging. Then two men approach the ox cautiously from behind, the one to the right, the other to the left, holding a long strap right across the back of the ox. When the strap is across the horns of the ox, one man goes [262] around the ox at a respectful distance, makes a noose and lets the other man tighten it. While the animal is now drawn to one side by the men with the "catching strap" and by the one who holds the noose on his horns, another man twists the animal's tail in an arc across its back in the opposite direction with such violence that the ox falls down and gives up all resistance. The Hereros are said to do the same thing. [171]

I have not observed how the Hottentots castrate, dabi-, the animals. I found out from the natives that formerly rich Hottentots celebrated the successful conclusion of a mass castration by slaughtering a calf. The meat was supposedly boiled with the testicles of the castrated animals and mashed. When the horns of the calves are between the length of the little finger and a hand, they consider it the proper time for castrating. A bull that is castrated later is distinguished from the other oxen by the term *kxoa-kxoa-dabi-b, because he has become 1/4 [i.e., whip. -Andrzej]

"strong" (kx'oa-kx'oa-, vb.) by the postponement of castration. Actually 232 he is stronger than those castrated young but he does not have anything 233 like their endurance. [Picture. Nama ewe, height of her back 76 centimeters.] I was not able to observe how they train the riding oxen and the pack oxen (both called !ga-rub) and how they accustom the draught and trek oxen (ǂgaēgo/mab) to the yoke.

2. The Sheep and the Goat

Sheep and goats have exchanged their roles as to relative numbers 233 in the herds of the Hottentots in the course of the last century. The [178] fat-tailed sheep, gũ'b, according to reports from the beginning of the previous century, (6) once existed in tremendous numbers, but are now

6. Benjamin Morrell jun., A Narrative of Four Voyages etc. [so printed in Bib., ed.] from the Year 1822 to 1831. New York, 1841.

fewer in number than the goat, b(i)ri-b, which formerly was not kept at all. [Plate XI. A Topnaar hut under a giraffe acacia. Hottentot boy in an apron.]

[263] What the original race of sheep kept by the Hottentots looked like can no longer be determined. The illustrations here show sheep that are today designated as the Nama race by the settlers and natives. The same is true of the goats. [Picture. Nama wether.] [Picture. Nama goats.]

Goats and sheep are tended during the day in the field as are the calves and during the night are kept in the kraal. Individual goats or small groups do not need tending. They quickly get used to coming back home by themselves in the evening, recognize dangerous predatory animals which threaten them and flee, whereas sheep are stupid. But a larger herd of goats or sheep always needs a herdsman. Without him (not counting dangers and theft) the animals crowd each other in the pasture or scatter too far. An important job of the herdsman is to collect the animals in the shade of a tree or rock during the hot hours so that they rest. This gathering of cattle seeking shade is characteristic for the noon landscape of the pastures.

The lambs (//kx'aogu) and kids (b(i)ri-rogu) stay permanently in a special kraal as long as they are little and are allowed [264] to go to the

233 mother only in the morning and evening. When they are larger they go with the herd. To wean them, the udders of the mother animals are smeared with manure (ǂhau·ǀbe, vb. I heard older people say ǂhau·ǀra

The billy goat (ǂkʰaǀra b(i)rib, i.e. testicle goat) as well as the ram (baib, i.e. the butting one) (57) always pasture freely with the

57. J. G. Kroenlein, Wortschatz der Khoi-Khoin, Berlin, 1889.

herd. However, the former at times leaves the herd of goats when he has serviced them all and tries to gain entrance into another herd, usually not without a fight.

[565] The goat is the chief milk animal (3/4 to 1 liter per day) of the poor, i.e., of the great majority of the Hottentots. Young billy goats are castrated and later slaughtered for a festival. Since their meat is tender in comparison with that of uncastrated goats, these kapater are called tsau· b(i)rigu. The sheep has a subordinate role in the herds of the Hottentots in numbers and in usefulness. The milk is only occasionally taken, for example from the animals which have lost lambs. The wool is only used on the skin but the meat is preferred to that of the goat and is made more delicate by castrating the rams. The tail [262] fat is the most desired part of the body because of its softness (it has the consistency of goose fat when tried) and its good taste.

3. Differentiating the Individuals in a Herd of Cattle

As a good herdsman, the Hottentot naturally knows each animal in his possession. Since the draught-ox in front of the Boer wagon pulls at command, the Hottentot gives him a name, a Cape Dutch name, 233 as he learned to from the Boers. [Picture. Kapater of the Nama goat 552 race] I only came across two instances [265] in which he gave his cattle (cows) names from his own language: bituru·s and ǃxã·sas. The latter name indicates that the cow was once found in a field by the present owner when he was fleeing (ǃxã) during war time.

More suitable for orientation and comprehension than individual 233 names is the designation of each animal according to color and marking. How extensive the scale is that the Hottentots use may be seen in the following list which I collected in numerous conversations with herders.

1: Schultze--73A N-5 (1903-1905) 1907 FX13 Hottentot FX13
Nama

233

[p.264]

Kapater of the Nama goat race.

233 One is forced to define more precisely several popular designations. Checked: a few, large, irregular colored areas, often joined together. Spotted: numerous medium-sized separate colored areas. Speckled or dotted: innumerable, little, separate colored spots. We may disregard the solid colors.

a) The following designations are exclusively for cattle (unless otherwise stated):

1. *ǂkχ!na/m: With any general coloring, a black spot on each side is characteristic.

2. /hõ: black and white checked; (also for sheep, goats and dogs).

3. //gani·: Reddish-brown and white checked; (also for sheep, goats and horses).

4. *ǂnũ!/garu: speckled with black and white, (also for sheep goats and dogs). The marking of the guinea-fowl, for example, is characterized with /garu· (cf. the leopard).

5. */a·ba/garu·: speckled red and white.

6. *!aũ!huni·: referring to the greyish yellow-brown coloring of the rock-rabbit; (also for horses, goats and dogs).

7. *!u/ri ǂgui!gã/: white around the mouth, nostrils and end of the nose bridge.

8. /a·baχ!gã·/: general red coloring with a white back (not the reverse as might be surmised from a translation that is close to it but contradictory in meaning).

9. ǂnũ/χ!gã/: general black coloring with a white back.

10. *ǂnũ/!na/meri: general black color. Belly white to the flanks.

11. */a·ba!na/meri: general red color. White belly.

[266] 12. *ǂnũ/!nã/: general black color. Middle of the forehead and bridge of the nose white; (also for horses, goats and dogs).

13. */a·ba!nã/: general reddish-brown coloring, otherwise like 12.

14. *!buni!nã/: general yellow coloring with a blaze i.e. white stripe on the middle of the forehead and the bridge of the nose.

15. ǂnũ/!ao: any general coloring, but a black ring around the neck.

16. */a·ba!ao: like 15 but with a reddish-brown ring around the neck.

[Picture. A fat-tailed wether of the race of sheep indigenous to the Boer States.] 233

17. *!nā/kχao: any general coloring, but with white on the buttocks, also for goats.

18. *!huni· //gani·: yellow and white checked; also for goats.

19. *!nā//aē: any general color, only white in the groin.

b) only valid for goats.

20. *ǂnū/ǂūra: spotted black.

[Picture. Fat-tailed sheep indigenous to the former Free State and the Transvaal, 3 year old ram.]

21. */a· baǂū· ra: spotted red.

22. *!goa/!ao: with a blackish-brown band around the neck.

23. */haiǂga·e: white behind the ears.

24. *!kχan!gã/: with a light-colored stripe on the back like an eland antelope.

[267] 25. //aru·: (used by old Hottentots) speckled black and white.

c) Valid only for sheep:

26. *ǂu/niam·: black marking around the mouth (the black coloring on the mouth of the white sheep is as striking as the black jaws on a colorless insect larva (/u ni·s).

27. *ǂnū!- or /a·ba-χõ·b: with black or reddish-born cheeks.

28. *ǂa·rib, also called *b(i)ritsinã·χas by children when teasing, is what a sheep or goat with naturally stubby ears is called.

[Picture. Four year old ram of the same South African fat-tailed race. (Tail white)]

A favorite hobby of the Hottentots is collecting (/gẽ, vb.) animals colored the same. To this end they trade cattle, sheep and goats. The Hottentot marks his cattle by definite cuts or notches, piercing or lopping the ears. 233 523

4. The Horse

The horse lives free in the fields as the cattle do and is easily caught at the watering places. Sometimes, especially in the broad plains of the Kalahari, the horse begins to turn wild and flees as soon as it sees a man coming from afar. If the tamer horses (easy to catch when alone) become accustomed to the leadership of such a shy animal, the owner is in a critical situation. In one case shooting the unapproachable horse was the only way of getting possession of the others. 231

Nama

Four year old ram of the same South African fat-tailed race. (Tail white.)

The mares are guarded, and as the foals are an easy prey for the leopard, they are kept in a kraal at night. 231

The way the Hottentot trains a horse will not be discussed here because this is so strongly influenced by the European way that we were not able to learn anything that is peculiar to the people. [177]

[268] The Dog

Along with cattle and sheep, the dog has been a Hottentot domestic animal for generations. It keeps thieving raiders away from the cattle and is easy to tame with milk. He does especially outstanding service when the Hottentots are hunting dog-like predatory animals. He chases the oryx antelope successfully. I am not able to say anything about the outward appearance of the Hottentot dog. My efforts to photograph one failed as well as several offers to buy one. [224]

The Hottentot tries to accustom (//ama·, vb.) the usually shy animal to him by his smell. For this purpose he smears some of the sweat of his armpits on the dog's nostrils or he carries a piece of raw meat for several hours in his skin shoe and then feeds it to the dog. Bitches that are not supposed to become pregnant are burned in the genitals with a hot iron. The animals are then so sensitive to touch that they fend off all dogs.

B. The Hunt

Hunting among the Hottentots has acquired European touches since the introduction of firearms and horses. Technically they hunt resembles that in our homeland but actually rises sky high above it when one sees that a hunter is not just a good shot but also a connoisseur of wildlife and of natural history. The Hottentot is also a just hunter. He does not kill indiscriminately, because he normally avoids any activity which goes beyond his own and his family's needs. The unparalleled commercial hunting and slaughter of the Boers in general and of certain sport speculators of other nations, which within a short time has wiped out irretrievably the noble wildlife down to the last animal in wide areas, is a shameful blemish on the history of civilization in South Africa. Climatic changes and epidemics have thinned out the wildlife at the same time. 185 224 [177]

136
224

1. The Wild Animals*

*This will only be a list, and when it seems valuable in the interest of lucidity for those not familiar with local conditions, there will be a brief description of the huntable animals of Great Namaland [Footnote goes on to p. 269] according to their most obvious characteristics. Closer observations about their way of life and a completion of the list from the zoological standpoint will be given later.

The wild animals which the Hottentot still hunts represent only a skimpy remnant of the wealth of his former hunting grounds. All the wild animals which can be hunted are called am/nēn, [269] χa·manin, *χabaran or χamaren. The large wild animals of the Hottentot hunter are, except for the ostrich and the zebra, only of historical interest. Foremost stands:

1. The elephant, Elephas africanus (Blumenb.) (Cape D. Oliphant)[1] called ǂkχoa·b.

Although for two generations or longer no Hottentot has seen an elephant in his homeland, I still found a few recollections from the time when it was hunted. It is supposed to have been a major rule that none of the hunters should have intercourse with his wife the night before a hunt; otherwise the elephant would point at him with his trunk and throw earth at him. The guilty one could no longer take part in the hunt then.

224
136
832

The position of the teats in front on the breast and the shape of the vulva awoke the easily excited sensuality of the Hottentots. One Hottentot told me the following hunting story: Two brothers-in-law went out and after a successful hunt the older one warned the younger one not to approach the downed elephant from behind, but he paid no attention to the warning and was punished by an uncontrollable erection which made him walk lame (*/ĩ) and still makes him the laughing stock of all hearers of the joke. The wording of the story was: kχoē /uigukχa χa ĩ gye gye !auhe ǂkχoana. okχa gye ǂkχoasa gye !gam. ob gye gaiba go sĩ tsĩ: "tã kχaos /kχãb ai ĩ," ti go mĩ. χabeb gye ǂkχama go ĩ tsĩ ǂkχoas di /oasa mũ tsĩ ǂgũi tsĩ /ĩ go /kχĩ. ob gye gaiba: "tareē dĩ tsi?" ob gye: "m'm, χũ tomaĩ" ti go mĩ.

[1] [i.e., Cape Dutch or Boer. – Analyst]

Nowadays the elephant has vanished from Namaland forever. In 136
the northern parts of Herero Land it is supposedly slowly returning.

Formerly the elephant was widespread in South Africa. In the Transvaal, in the territory of the Matabele chief, Moselikatse, Captain Harris found an astonishing number of elephants, alone in a valley, peacefully shut off, hundreds of giants. Today a hunter could roam through the Matabele land and the Mashona land for a year without finding an elephant. Kaffraria, Natal and Zululand which were inhabited by large elephant herds in the previous century are now forever depopulated. In northern Bechuan land (in the territory of the Bamangwato) and especially in [270] the Ngami Lake region the brutal business of the ivory hunters flourished. It has been estimated that for the annual world consumption of ivory a total of 100,000 elephants are killed. (74) South Africa has paid its tribute and is now bankrupt

74. H. A. Bryden, Kloof and Karroo, London, 1889.

in the ivory market. Only a few herds of elephants are kept in the southernmost tip, in game preserves in the Addo-Bush, in the Knysna and Zitzikamma forests.

2. Of the rhinoceros, uncertain whether Rh. simus Burch. or Rh. bicornus (L.), -- (Cape D. rhenoster), there is only a vague remembrance in Namaland, based on the name !na/ba·b. The name of the plant mentioned on page 201 indicates that the rhinoceros was formerly well-known in Namaland. As late as the second half of the eighteenth century the Rh. bicornis was widespread (cf. p. 168, no. 75) in the Cape colony. The last one is supposed to have been seen in the Addo-Bush in 1849.

3. The true quagga, Equus quagga Gmel. has been completely exterminated. Not even its Hottentot name remains for certain. Only once did a native mention the name /goa-χab when I enquired after the vanished zebra that only has stripes on the front half of its body.

We have only a small amount of usable information about the former extent of the quagga in South Africa. It is certain that it once lived here in great numbers. In the great Karroo and in the plains of the northern Cape colony, in Griqualand and in the Orange Free State, it was usually found in the company of the black wildebeest and the ostrich. The Boers hunted the quagga to feed their Hottentot and Bushmen slaves and thus to save their cattle. They traded their hides

and did not desist until the last quagga had vanished from the earth. 136
That was achieved about 1880.

4. The zebra, !go·reb, is known to the Hottentots in two forms, which we differentiate as Equus Zebra L. (= E. montanus Burch (Cape D. wildepaard) and E. burchelli Gray (Cape D. bonta quagga). The first zebra, which the Hottentot himself designates as the smaller kind living in the mountains, he calls *//kǂao·!goreb, probably from the spurge (cf. p. 150), the juice of which he uses to poison the animals [224]
at their watering places. Another name for E. zebra is */hõ·/!goreb, i.e. "the one marked black and white." This designation, which would be suitable for all zebras, is only understandable as a diagnostic term taken from its antithesis: [271] the dark striping of E. burchelli, that inhabits the broad plains, is scantier than that on the other kind, the white basic color of the body shines out and is broader and therefore they call this kind *!u·/ri!goreb or the "white zebra."

The remote mountain country in the west of the lower course of the Fish River and the eastern Namib plains in the northern border country are the last refuges of small zebra herds in Great Namaland.

At the end of the 80's the Equus zebra could still be found in the mountainous parts of the eastern Cape colony. In the mountains around Naroekaspoort (74) (70 miles from Willomore) a zebra herd,

74. Ibid.

except for one male zebra, was killed by the Boers and the natives. The lonely animal attached itself to the horses of a farmer that were pastured in the open, followed them on all their wanderings, followed them even into the kraal of the farm. There the zebra starved to death, since it refused to eat even the food that was brought to him from his former pasture grounds. [Picture. Equus burchelli Gray.]

5. The hippopotamus, Hippopotamus amphibius L., (Cape D. Zeekoe), called !kǂaos or *ikǂums, formerly numerous in all the rivers on the Cape, exists today in only a few examples in the lower course of the Orange.

6. The giraffe, Giraffa capensis (Lesson), (Cape D. kameel,) called !na/i·b, as older travel reports all relate, could still be found at the turn of the [272] nineteenth century in Great Namaland but is now wiped out there and lives only in folk tales. [Picture. Young male giraffe.]

7. The ostrich, Struthio australis L., (Cape D. vool struis), called /ami·b (Illustration with the folk tales) can be met in all parts of Great

Namaland, and in greatest numbers in the transitional zone of the Namib to the hinterland. I also saw them south of the Orange in the Little Bushman land. 136

Because of its incomparable sharp sightedness the Hottentot also calls it °//ga°ba mũ°s (from °//ga°ba·-to see far in the distance, mũ°s - eye). The native hunter distinguishes among the females a certain hen that appears alone in a flock, is easier to drive off and has a tendency to grow fat. He gives her the name °ã·bes, distinguishing it from the other female ostriches which he calls °/hai·! noro·s, "the one with the fallow back of the head." /naba·b (3. st.) is the young ostrich. 136 224

Next to the ostrich the bustards, Eupodotis species, are the stateliest wild birds of Namaland. 136

8. The lion, Felis leo L., (Cape D. leeuw), called ǂa·mi, has also disappeared today from the Namib and the bordering territories, its last refuge, and is only found in the northeast, in the transitional zone between Great Namaland and Kalahari.

9. The kudu, Strepsiceros capensis (A. Smith), called ǂaib begins the series of antelopes. Large, strong and of a wonderful symmetry, the kudu is rightly considered [273] the noblest horned wild animal of the South African savanna, just as in our woods the deer is, which the kudu also resembles in size. It is also like our deer in that only the male has antlers. There is no more beautiful trophy that the horns of an old kudu bull with their bold spirals,

The color of the kudu is a plain yellow grey. About seven narrow whitish stripes cross the back and hind legs. From the root of the tail to the back of the head, a stripe of somewhat longer hair grows along the middle of the back. It is too short to be called a mane. [Picture. Felis leo L.] But a stately beard begins between the lower jaws of the bull, descends down a middle line, decorating the front surface of the darker grey neck and continues sideways above the shoulders as a little neck-mane.

The kudu loves dense undergrowth and is restricted to the interior of Great Namaland in the mountainous parts. It becomes frightened when it observes an enemy. The nearest relative of this marvelous antelope,

[274] 10. the eland, Taurotragus oryx (Pall.), called !kǂa/ns is quite the opposite in its outward appearance. The short strong legs with the clumsy hoofs and the awkward burden of the bulky, extended body reveal nothing of the antelope. The long dark mane on the

1: Schultze--89A N-5 (1903-1905) 1907 FX13 Hottentot FX13
Nama

Felis leo L.

136 forehead of the bull, the well-developed dewlap and the hump on the back over the shoulders rather give the impression of a gigantic bull. The long thin tail with its (black) tassel is also similar to that of a bull. The antlers of the male consist of strong stubby cones, of the female of less strong, slimmer and somewhat longer cones, which go up at an angle towards the back with a markedly protruding spiral twist in the lower half. Eight to ten thin whitish stripes across the back, which dissolve into the lower parts of the flanks, recall, as does the greyish-yellow of its general coloring, the skin of the kudu. The eland seems to be restricted to the extreme northeast of Namalagid and even there is rare.

11. The "gemsbok," Oryx gazella (L.), called /gaêb, is the antelope of the flat semi-desert country. The border territory of the Namib and of the hinterland is at the time of the best pasturage his favorite territory.

The gemsbok has the size of a small deer. Next to the springbok, he has the most varied coloring of the south African antelopes. The basic color of the trunk and neck is a light grey-brown, that becomes whitish on the flag. A dark-brown stripe goes along its back, continues forwards to the short mane of the back, backwards broadly along the small of the back and into the long bushy tail, that at times seems very dark-black. A similar dark stripe extends from the throat down the middle of the neck and forks between the front legs. The prongs of the fork diverge as broad bands along the stomach and proceed to the hind legs. The white wedge-shaped field, which they have a tendency to bite into, continues to the area of the knee of the hind legs. A broad dark-brown band surrounds the upper leg of the front legs. The white area of the knees and hoofs is interrupted on the front side by a long, dark-brown spot. The black-brown marking of the face resembles a deep and richly cut mask which contrasts sharply with the exposed parts of the face that shine a brilliant white.

Young gemsbok, with little horns about the length of half a finger and bent at the ends, are colored an even light-brown. Only the bushy [275] end of the tail has a lot of black hair. A dark stripe that extends from the front edge of the eye towards the corner of the mouth indicates the black facial coloring of the grown animal (blurred over the forehead and nose). The Hottentot calls an oryx calf up to this stage /kya-reb. 136 825 An older calf, the horn of which is the length of a small arm is called ‘nanb. Finally the hunter differentiates the grown animal before the first

pairing as ǂnũ///nãũseb, i.e. "black horn," because the horns still have a fresh dark color, not the grey flaky surface of the older animal. The native hunter calls the old gemsbok bull that has been driven from the herd, //naisib. [Picture. Antidorcas euchore Zimmerm. Young springbok ♂] 136 125

The horns (in the male stronger and stubbier) are like two strong spears, ringed in the lower half, up to one meter long, which diverge slightly on the flat of the forehead and then rise towards the back at a slant. The Boer name, "gemsbok," which has been accepted everywhere in South Africa, shows, as do so many other names, what a childishly vague memory of his school-days the Boer had when he approached the animal world of his new homeland. 136

12. The springbok, Antidorcas euchore Zimmerm., called //gũ, is in build, marking and size the prototype of the delicate light-footed gazelle. It has the size of a large deer. The symmetrical body rests on tall, slender legs; a slim neck bears the little head with the lyre horns. From the lower shoulder a dark-brown, wide band rises up obliquely and continues to the hips and separates sharply the light yellow-brown of the back from the snow white of the belly. In front, the brown of the back continues to the neck and the outer sides of the front legs. In back, it extends along [276] the outer side of the upper hind legs, but leaves the whole front half of them free. The flag is also white. From it a sharply drawn white stripe runs down the middle of the back and ends shortly before the center. The white of the belly also covers the breast and extends as a narrow band down the middle line of the neck to the throat. The face of the springbok is also white. The large dark eyes peer out expressively. A dark-brown band, that unites the upper lip with the front corner of the eye, enlivens the features. A spot over the eye and one on the forehead (at times, especially in young males, extended over the whole bridge of the nose) complete the simple, yet lively marking of the little animal.

The springbok lives on the open plains in herds of many hundreds, sometimes of many thousands. His striking movements have given him his name. The animals jump so high that in spite of the speed of each motion, a measurable length of time passes before they touch the ground again. They seem then, when they have nearly jumped straight up into the air, to stay up there for a second with all four legs. Even more graceful are the motions of these animals when they are suddenly disturbed and are propelled into the air as if by an invisible power, now to the right, now to the left, expressing their excitement in whimsical jumps which go half-forwards and half-sideways. Then they

1: Schultze--82A N-5 (1903-1905) 1907 FX13 Hottentot FX13
Nama

136

[p275]

Antidorcas euchore Zimmerm. Young Male
Springbock ♂

set off in full flight. And then sometimes one sees them jump straight up into the air in the middle of the speediest gallop, leaping over the bushes like a kangaroo. The back is bent, the head outstretched and the broadly unfolded flabellum, a bundle of long snow-white erect hair, shines out. 136

The lamb of the springbok is called //gu·nib by the hunter. The old ram who has been pushed out of the herd is called */gu·riseb or */gurimāb, i.e. "he who stands alone." [425]

13. The steinbok, Rhaphiceros campestris (Thunberg), called !a·ris, is a small (the size of a fawn) reddish-brown antelope that usually grazes alone. The male is armed with straight, thin, smooth, black, pointed spearlike horns that rise straight up. There is often a striking black spot on the bridge of the nose, that extends halfway up to the eyes. Sometimes one hears a Hottentot, who wishes to make fun of someone's dirty nose, say: "!aris k‡oma ǂnū ǂguisa ũ," i.e. "you, with a nose black as that of a steinbok." [522]

[277] 14. The klipspringer (see illustration p. 278) Oreotragus saltator (Layard) (Cape D. klipbok), called //k‡aĩ·is or //k‡aĩ·sis, could be called the chamois of South Africa. It lives in small herds exclusively in clefted mountain country. With certainty and grace it climbs over the cleft rocks. Without taking a running start, only bending the hind knees slightly, he jumps nearly straight up into the air the height of his own body to ascend the steep steps of the weathered gneiss and granite hills. He knows how to judge distances so accurately and so to judge the amount of strength needed, that even after a bold leap he can land with extraordinary certainty on an edge scarcely a handsbreadth wide. The hoofs of the little animal do not extend flat towards the front in a pointed triangle, like those of other antelopes, but are shaped like powerful cylinders that go up at a slant. The animal stands on the outermost tips of these hoofs as though on cothurni. [Picture, Rhaphiceros campestris (Thbg.) Steinbok ♀]

The skin of the klipspringer is also remarkable. Thick bristly hairs form a soft, elastic cover, which rustles peculiarly when a hand runs over it. The tips of most of the hairs are colored a light yellowish and are set off sharply from the exposed dark parts of the shafts of the hair. The skin, that from a distance seems to be uniformly greyish-brown, proves on closer inspection to be brilliantly variegated. The male has horns like those of the steinbok.

1: Schultze--83A N-5 (1903-1905) 1907 FX13 Hottentot FX13
Nama

136

[p.277]

Rhaphiceros campestris (Thbg.). Steinbok, ♀

15. The duikerbok, Cephalophus grimmi (Gray), called *tõa·s or 136
also */ha/nu·s, lives, as the steinbok does, alone or in pairs. The male, more rarely the female, possesses a short, straight pointed spear-horn. The duikerbok ducks to the ground as soon as he has seen an enemy, and creeps away to a stretch protected by the thick bushes that are its favorite habitat.

[278] The blue wildebeest, Connochaetes taurinus (Burchell), called /g̃ũ·ob, resembles, as does the closely-related gnu, pictured below, more closely a small calf than an antelope in its outward appearance, especially in the formation of its head, including the antlers. The basic coloring of the body is sometimes a darker, sometimes a lighter grey that changes into a light brownish tone on the small of the back and on the legs. The throat and the side parts of the front of the body are banded across. Sometimes they are broad, brownish-black, connected stripes, sometimes narrow, split stripes. The bushy black tail nearly rests on the ground. A long-haired semi-erect black mane extends from the back of the head to about the middle of the back. Behind the corner of the mouth, a bunch of hair like a beard sprouts forth. Towards the throat it becomes a thin shaggy mane that continues down the middle of the front of the neck for a ways. [Picture. Oreotragus saltator (Layard). Young klipspringer, ♂] I have seen neither the blue wildebeest nor his tracks in Great Namaland, only in Kalahari. If and where it might still be found in Great Namaland today, I cannot tell.

17. The red hartebeest, Bubalis caama (Cuf.), called //kxama·b, concludes the series of antelopes in the hunting districts of Great Namaland. It may [279] still be encountered in the most northern and north eastern border territories (Komas Highlands, Rehoboth and Nosob territory).

Right above the prominent swellings of the eyebrows, the tower-like sub-structure of the antlers rises. In front, it drops in a straight line to the forehead and to the bridge of the nose that is greatly lengthened and slanted steeply. In back, it drops in just such a straight line to the neck which sets stiffly on the shoulders. Thus the back of the animal's head seems to be completely missing. The nape of the neck and the bridge of the nose on the forehead run to a high triangular point. Antlers, that are bent back in a remarkable way, are set in this area. They are massive in the male, slim in the female. [Picture. Connochaetes gnu (Zimmermann). Black wildebeest. A bull.] The animal's back rises gently toward the front and then with a hump over the shoulder area. The overall coloring of the hartebeest is a light

Connochaetes gnu (Zimmermann). Black Wildbeest. A bull.

136 chestnut-brown that is darkened on the head and front legs, especially on the outer side. A blackish-brown broad stripe extends over the bridge of the nose to the forehead and two wads of hair stick out obliquely right under the eyes like dark warts the size of a walnut. They seem to be more pronounced in the male than in the female as is the marking of the head.

[533 825] [280] The tail is insignificant: "!naësi gye ǂkʔaris ǂaresa ĩ" "it has gotten a small tail from its trotting (because of its many motions wiggling its tail)" sang a woman in a hunting song about the hartebeest.

Whereas the antelopes are hunted both for their meat and their skin, the hunting of predatory animals, if one does not consider it as self-defense, is exclusively for the skin.

136 825 18. Of the predatory animals of Great Namaland, the leopard, Felis pardus L., (Cape D. tijger), called /garu·b, is the most dangerous. [Picture. Bubalis caama (Cuv.) The red hartebeest?] The Hottentot distinguishes two kinds of leopards. One of them, called !hurdu·/garu·b, is supposed to have smaller spots and to be generally yellower than the other kind. Since this leopard not only plunders, but kills all the cattle in the kraal that he can get hold of, he is especially feared. He inhabits the flatter lands and the valleys. The second kind, which is less bloodthirsty, darker, and simply called /garu·b, inhabits the mountains.

According to the beliefs of the native hunters, the leopard, unless he is attacked, only springs at people who look at him [281] but leaves unharmed the person who walks by him without glancing sideways. Thus because the leopard does not wish (ǂkʔã = to refuse) to be noticed (ǂhau/) (-he pass. ending, -sa adj. ending, gye auxiliary vb.), the (old) Hottentots call it ǂhau·/hesagyeǂkʔã·b. Apparently also an old hunter's name for the leopard (for I heard it only from old men) is ǂhũiseb.

136 19. The cheetah, Cynaelurus guttatus Herm., (Cape C. luipard), called !a·rub, may be recognized at first glance by his dog-like, slim legs which are made more for running than for jumping and clawing. His skin has small round black spots that are undivided, not grouped together but far apart on a light brownish-yellow background. Its back [522] seems to be stretched out lengthwise. Occasionally one can hear a Hottentot teasing a tall man with the words: "!arub kʔoma gaʔu !gãba ũ," i.e. "You with a long back like a cheetah." The animal is a rarity in Namaland, more numerous near Kalahari.

20. The wildcat, Felis caffra Desm., (Cape D. graauwkat), called /hã/a·b, is the commonest of the small cats of Great Namaland. It

1: Schultze--85A N-5 (1903-1905) 1907 FX13 Hottentot FX13
Nama

136

[p.280]

Bubalis caama (Cuv.). The red hartebeest, ♂.

136 resembles our house cat, the most but is stronger and above all has longer legs. The tail is slightly bushy at the end. The basic coloring is grey, mixed with light-brown tones, which are more prominent on the ventral side as far as the throat. The bending side of the front legs and of the hind legs from the heel down is colored more or less black. The stretching sides and outer sides of the front legs are spotted black, those of the hindlegs from the knee down have black crossbands. The rich black banding of the tail is irregular. On the belly as well as on the inside of the legs and in the area of the throat, the brownish-yellow sometimes lightens to a pure white. There are also black horizontal bands on the inside of the front legs.

21. The lynx, Felis caracal Guldenst., (Cape D. rooikat), called !hā‿b, is not uncommon in Great Namaland. The tufts of hair on the ears prove the identity of the pelt at first glance. The pelt is nothing special, colored an even brownish-red with little shading. Only on the head, ears and upper lip and on a stripe between the inner corners of the eyes and nose does any black appear.

Whether the other kinds of cats known in South Africa, the so-called tijgerkat, Felix serval Erxleben and the little Felis nigripes Burchell can [282] be encountered in Great Namaland, I cannot say. The Hottentots with whom I hunted, did not know them. The former is supposed to be not uncommon in northern Namaland (51), the latter

51. K. Dove, Deutsch-Südwestafrika, Ergebnisse einer wissenschaftlichen Reise im südlichen Damaralande, (Ergangzungsheft Nr. 120 zu "Petermanns Mitteilungen," 1896).

could wander over from Kalahari in the east.

[857] 22. A favorite wild animal of the youthful hunter is a Viverridae, the "dwarf," a Cynictis species, probably Cynictis penicillata (G. Cuv.), (Cape D. geel meerkat), called °!u‿ri/ēb, not unlike a weasel in flight. The little animals can often be seen sitting upright in front of the holes of their colony.

A related, but somewhat larger and darker kind, the °ǂnū//ēb of the Hottentots, seems to belong to the Herpestes genus.

Whether the genet, Genetta, exists in Great Namaland, as I assume it does, I was not able to discover. It does not seem to be numerous although it is common in Little Namaland, in southern Hereroland and in the Kalahari and therefore could penetrate our territory from the south, the north and the east.

136

23. The skunk, Zorilla striata (shaw.) (Cape D. stink muishond), a black and white striped Mustelidae is called /ga'mirob, the star, by the Hottentots, following the superstition that the little animal lives in the stars and falls to earth as a shooting star.

Of the martin family there are two representatives to be named that are quite unlike each other in their manner of living. First:

24. The honey badger, Mellivora ratel (Sparrm.), called */ha'rebab or */ha'retsub, a relative of our badger, is outfitted with such thick skin than he can plunder bees' nests unpunished. The white on its back contrasts sharply with the deep brownish-black of the rest of the body. The white cap which covers the skull and which extends to the side to within a finger's breadth of the eye and somewhat further down in the middle of the forehead, continues broadly over the neck and divides into two branches on the shoulders. These extend along the sides, diverging toward the rear and join together again at the root of the tail. In the middle of the back they turn into a variegated shield that appears generally grey.

25. A fish otter, probably belonging to Lutra capensis schinz, is dependent on the larger pools of the Great Fish River. The Hottentots call them !ho'mi, the same name they give the coastal eared seal.

[224 281]

Of the middle-sized predatory animals, the dog family provides the hunter with the most numerous and best pelts. In the first rank is [283] 26. the "caparism" jackal. (See the illustration in the folk tales), Canis mesomelas Schrbr., (Cape D. fox), called /gī·rib, also frequently called /gai·rab by old Hottentots, derived from */gai = disorderly singing. The howling jackals circle around a fallen animal or a campground where they smell meat.*

196

*I cannot agree with the derivation of the word from /gīb = odor of fat and from that the designation of the jackal as "the runner after the smell of fat," (57) since the desig-

57. J. G. Kroenlein, Wortschatz der Khoi-Khoin, Berlin, 1889.

nation for odor of fat is not /gīb but /gī/b. */gī·'ri - to roast a piece of fat on a stick over the flame.

136

The light golden-brown color of its pelt has also given it the name gold jackal. A broad black stripe mixed with white covers its back like a caparison from the neck to the root of the tail and the upper parts of the flanks. The last two thirds of the long thin brush are black; the throat and a line along the upper lip have a whitish color.

27. One of the prettiest of the South African jackals is the silver jackal, Vulpes chama (A. Smith), called !kxama·b. The round brush, as soft as wool, is larger than the thin body and is just about as long. The body itself is no larger than that of a Cape hare. The back and the nape of the neck, the outside of the upper legs and the root of the tail are silver grey mixed with a fine dark color. The rest of the body is yellow-brown, shaded variously. The broad end of the brush is black and there are black specks on both sides of the first third.

A belief of the hunters is that whoever says the name of the silver jackal while hunting will not catch one. Whoever is forced to speak of it, therefore calls it *≠gai-/hetoma·b, i.e. the one (-b) who is not (toma) called (gai/) (-he a pass. ending). [224]

28. Like the silver jackal, the Otocyon megalotis (Desmar) (Cape D. A-jackal), called //ā/b, is a small, harmless fellow that never attacks a herd. Its greyish-brown pelt is highly prized. The bushy tail is long, but thin, its tip colored a blackish-brown.

29. In contrast to all its South African relations the Cape hunting dog, Lycaon pictus (Temm.), is dangerous in the highest degree. In packs he chases the fleetest game, attacks herds and even men.

The Cape hunting dog does not have the fine pointed nose of the jackal, nor the broad skull of the hyena. One would be more likely to take its head [284] for that of our household dog. Its pelt is checked a blackish-brown, white and a light brownish-yellow. On its neck and behind its shoulders the yellow flows together to form several rather large spots. A dark stripe usually extends along a middle line between the eyebrows over the skull and continues over the nape, becoming narrower. The trunk and neck are very long in proportion to the head. Inevitably we compare the animal to a house dog and therefore the legs seem to us to be relatively long and strong. The thin slightly bushy tail reaches a little farther than the heels.

Because the front black part of the animal's nose stands out from the lighter areas next to it like a "mush beard," the Hottentots call the wild dog *!ga/u·b (from *!ga/u· « to have food sticking around the mouth). The name of the animal may also not be mentioned on the hunt. [224]

136 30. That the spotted hyena, the Hyaena crocuta (Erxl.), (Cape D. tijger-wolf), developed from a crossing of the leopard and the hyena, is the firm conviction of the Boers. The dark-brown or black spots, which are scattered over the whole dirty yellow-grey short-haired pelt (except for the head and the lower part of the throat), plus its lust for killing and the force with which the animal attacks cattle, actually remind one of the leopard. Otherwise the animal outwardly as well as by its inner structure is a true hyena.

31. The brown hyena, Hyaena brunnea Thunbg., (Cape D. strand-wolf), differs from the tijgerwolf, in its smaller size, and in the uniformity of its brown to grey coloring which has only a few rather large vague dark spots. In the more beautiful ones the marking is somewhat sharper. Dark bands circle the front and hind legs. The markings are clearer on the former. The pelt has long hair, only the broad skull with the coarse stubby nose is covered with short-haired fur. The head sometimes seems to be peering out of a mane because the fur is especially thick and long behind the pointed ears and jaws.

How the Hottentot differentiates between the two hyenas just described, I was not able to determine with certainty. It is only certain that the general term for hyena, ǂhĭ·ras, is further specified in ǂnũ/beǂhĭ·ras and !na/ibeǂhĭ·rab. I surmise that [285] the first word refers to the darker one (ǂnũ/ = black), H. brunnea, the second to the H. crocuta, the markings of which have always reminded the hunter of the giraffe (!na/i·b). Added to that is the constancy of the gender differences of the two names. The former always has a feminine ending, the latter a masculine ending. That would correspond objectively to the differences in the strength and character of the two animals and subjectively to the language sense of the Hottentots. But this is just mentioned as a guess.

32. The aardwolf, Proteles cristatus (Sparrm.), called /gĭ'b, concludes the series of predatory animals. This small predatory animal, about the size of a fox, resembles outwardly a hyena despite its gracefulness. The skull seems broad, the back slants down and ends in a dark, bushy tail, like that of the strandwolf, but the five toes on the front legs and the peculiarities of its teeth show that the animal is neither hyena nor dog and give it a special place as a representative of its own family.

Four to six black horizontal bands cross the yellow-brown trunk. They run into a black stripe that runs along the middle line of the back, which spreads out into a spot where the back is highest. The

136 legs are likewise striped horizontally. The hair is longer and stiffer on the nape and back where it forms an erectile comb. The forehead and cheeks have short, silver-grey fur which contrasts sharply with the regular black of the rest of the face.

33. The rodents play a subordinate role in relation to the antelopes and the predatory animals. The prejudice which the Hottentot formerly had against the hare, !õ·as, as wild game (66), has now vanished.

[224 177]

66. Th. Hahn, Die Nama-Hottentotten. Ein Beitrag zur südafrikanischen Ethnographie Globus, [Bd.] XII, 1867.

They differentiate three kinds: the largest, Lepus saxatilis Cuv., rock hare, (Cape D. koolhaas), which they call !kǂa·erab, seems to resemble our field hare in coloring, since a light brownish color mixed with black forms the basic color of its fur.

The Cape hare, Lepus capensis L., (Cape D. vlackte haas), called /kǂa·rus, is smaller. The young animals are called */a·bara-ǂga·en because of their reddish translucent ears. A light grey with light yellowish tones and black mixed in form the basic color of its somewhat rough fur.

While the rock hare and the Cape hare have a little tail that has black wool above and white wool underneath, the last kind, Lepus crassicaudatus Geoffr., (Cape D. kliphaas), called tso/aru·s or tso/ara·s, is easily recognized [286] by the even brownish-red color of its thick bushy powerful tail.

34. The Cape Jumping Hare, Pedetes caffer (Pallas), called *ǂa·rab is common in the northern border territory. Whoever prefers to ride during the night because of the oppressive heat of the day, often sees this kangaroo-like animal jumping among the savanna bushes in the moonlight. The hind legs of the animal with their greatly lengthened toes have been transformed into powerful jumping legs and only two short little arms hang in front of the body as front legs. The body is a yellowish grey-brown above and white underneath. The long bushy tail is yellowish-brown above and black the last third. [Picture. Hystrix africae australis (Peters.)]

35. The porcupine, Hystrix africae australis (Peters), (Cape D. ijzervark), furnishes a tasty roast. Many kinds of hair cover the body. Flexible strong hairs are only to be found on the limbs and the belly. The quills that are at first weak, stiff and about the length of a finger

1: Schultze--90A N-5 (1903-1905) 1907 FX13 Hottentot FX13
Nama

136

[p.286]

Hystrix africae australis (Peters.).

begin right behind the ears, lie like a dark-brown pelt. Towards the back they change suddenly into pointed white and dark-brown banded quills that are as thick as a pencil. From the nape to the beginning of the quills there is a comb of long flexible bristles that extends down the middle line of the back. When the quills are erect, the animal seems to be twice as tall as it actually is. The rattles at the rear end of the body complete the list of the animal's weapons of terror. 136

[287] The Hottentot name for the porcupine, !noa·b, is perhaps connected with !noa· = to become grey. Both words correspond in initial tone level and rising word-tone. !noa·b would then mean "grey head," corresponding to the general impression that the nocturnal animal arouses in the dark or the pale light of the stars.

36. The mouse and rat-like rodents are hunted and eaten by adult Bergdamaras as well as by half-grown Hottentots. A study of the skins and skeletons that I collected, will tell us how to classify the rat-sized animal which they call *!haēb. duru·s (3. st.) is a collective name for various mouse species. They distinguish a night mouse, tsū·χudurus or !uru·s, and a kind with a pelt striped lengthwise belonging to Arvicanthis which they call *≠goma·b. [E24]

37. The ground squirrel, Xerus capensis Kerr., is called */ga·eta ≠nā/b.

38. The smallest hoofed animal, rodent-like in its mannerisms, the rock rabbit, Procavia (Hyrax) capensis (Pall.), (Cape D. dassie), called !aũ/b, often finds its way into the hunter's pot. The young are called *//gi/bigu. The rock rabbit inhabits the clefts in the rocks in great numbers near watering places.

39. In conclusion there are a number of mamals to be mentioned which the Hottentot occasionally traps rather than hunts regularly. He will not let the aardvark, Orycteropus afer (Pall.), called /kχubu·s, escape if he should happen to meet it during the day in an open field. But he must be really suffering from hunger before he will decide to undertake an uncertain difficult ambush at night in front of its hole. (See Kalahari.) 224 136

40. Hunting the elephant shrew, Macroscelides, called baus (in Little Namaland called !kχau/≠guib) is an amusement for boys. They differentiate two kinds as far as I could see, justifiably so: a lazy one, which is easily caught, "sleepy mouse," *//um·baus, and the "quick mouse," *!kχoē·baus, which can be recognized by its bald ears that shine through reddish when it is alive. [857]

41. The baboon, Papio porcarius (Boddaert), (Cape D. baviaan), called /nē·/rab, or as the older people call him /nō.rab, is seldom

nted by the Hottentots. The hunter knows its way of life exactly, 136
tinguishes the outpost of the baboon herd as !kχē.aob, "scout," and 224
e oldest leader as °/ga/ro /nē/rab, because it presses toward the water
st [288] (!ga/ro·) and does not allow any of the other thirsty ones in
e herd to drink until it has assured itself of its fill.

The Hottentot considers a small ape that lives in the trees a kind of
boon. It is of the genus Cercopithecus, and is supposed to live in the
ange bush country. They call it °/hai·/nē/rab, i.e. "pale baboon"
cause of its color, or //o.regyeb, kobold (from //o·re = to cause mis-
ief). [Picture. Papio porcarius (Boddaert). Old male.]

The rage and persistence with which a herd of baboons will attack 136
eopard, their chief enemy, in a body and tear it apart is known to 825
ery native hunter. The herdsmen maintain firmly and unanimously
t the baboon catches goats and milks them right into its mouth.

2. The Kinds of Hunting

The Hottentot differentiates the short hunt of one day as !aus from an 224
pedition, !ha/mi·, that takes several days or weeks.

[289] a) The Hottentot shows his mastery in the stalking [of game].
ly the Bushman can compete with him in the art of tracking wild game
χuri·, //ga/m, u°ru). First he sights the game at great distances and,
spite of all protective coloration which deceives our unpracticed eyes,
cognizes it from nearby without error. In reading tracks he has de- [151]
loped the sharpness of his senses and the combining power of his intel-
ct to such an extent that the white man seems a fool beside him. One
ed only watch a Hottentot once as he follows an antelope which has
en shot and run off. Where there are blood and tracks, following the
il is child's play, but where we would stop baffled by a field thickly
vered with pebbles, each like the other, he points out one stone in a
ndred. Its underside will have been turned ever so slightly towards
e sun and he will know that the hoof of the fleeing animal turned it
d will then point out the direction with his finger where the search
st continue. Then thick thornbushes will blot out the view, the ground
overgrown with tangles hiding all clues. The Hottentot observes the
rounding bushes, suddenly swerves a few steps to one side and brings
ck a leaf to which a couple of bristles cling. Therefore the animal
s brushed by here. He follows the new direction and although hours

Nama

136

[p. 288]

Papio porcarius (Boddaert). Old male.

may pass, he finds the place where the wild animal lies dead. 224

Stalking supplies him with an unsurpassed knowledge of the way of life of the game. Although it might not seem to us to be sportsman like, still to the native hunter, to whom each bullet is of great value in the wilderness, it seems the safest to creep up on an oryx and wait quietly until it goes into the bushes after grazing to sleep away the hot noon hours. The Hottentot then follows it noiselessly and shoots the sleeping animal from close up.

Dogs are indispensible for hunting predatory animals.

Protected by the herd of cattle, the herder approaches the steinbok which is innocently grazing with the goats and the sheep and kills it with a precise stone throw (ǂno/a·s), or he corners klipspringer with his dog. The dog also performs good services in hunting oryx. Under certain conditions the dog stops it so well that the Hottentot can kill it with the assagai, his "throwing knife," //haĭ/gõab. One especially smart dog had the habit [290] of biting the cornered gemsbok in the nostrils, so that the animal could not move from the spot. The dog finally fell victim to a dying gemsbok, which it had carelessly approached, with a short motion of the neck sideways and back, the animal that was already shot down plunged a horn into its body.

b) The chase on horseback, !ha/e·s, seems to have been undertaken early by the Hottentot, if the information of a native hunter, who told me that elephants were hunted in this way, is based on truth. The elephant supposedly was the pursuer, since one rider after another let the elephant chase him until the animal was so exhausted that it could be overcome. [492]

The eland is supposed to be easy to chase.

Pursuing the ostrich on horseback is more successful than stalking which is difficult even for the native because the bird is very far-sighted. [492] [223]

A single oryx is a beautiful sight in itself, similar to a grazing stag. But no comparison with the game and landscape of our homeland, will suffice when one has had the good luck (as I did in May, 1904, south of Kubub) to see about 250 of these wonderful animals standing together, suspecting no danger, their heads deep in the grass, so sharply lighted by the evening sun that the movements of each animal could be clearly followed. Then suddenly they become aware of the riders. The uneasiness of the nearest ones spreads to the whole herd and in a few seconds the whole herd is off at a gallop and soon only a great yellow cloud of dust reveals the direction of the fleeing animals. Then one must dismount quickly and be very calm for a sure shot.

224

A peculiarity of the oryx, which makes their pursuit easier, is their habit of always fleeing in the direction against the wind. An oryx herd that one approaches from the east, for example, will always flee to the north if there is a north wind, never towards the west. In this case one only needs to swerve towards the right, if the horse can hold out long enough at a fast gallop, to see the wild animals fleeing close by across one's path at an angle from the left.

c) Waiting at water holes is the surest way of ambushing the larger antelopes and the zebra.

[291] The leopard usually does not drag its booty into its cave when it does not have young, but tears it apart in a hiding place not far from the place where it made its kill. Therefore the Hottentot follows the fresh tracks of the robber from the kraal it broke into to the place where it ate. He kills it when it comes back to fetch the rest.

The animals that burrow (Oxycteropus) or live in clefts in the rocks (rock rabbits) are ambushed in front of their holes in the morning or evening.

The sociable antelopes, especially the springbok and the gemsbok, wander during the dry season from the interior of the country towards the west into the area of the winter rains. They wander slowly, sometimes in accustomed places, sometimes seemingly blindly across the veld, towards the north winds that bring the rains. The Hottentot is accustomed to place himself in the protection of a kraal made of bushes beside the place where the game will pass (*/ga-nob). The enormous mass migrations, which the springbok undertake during droughts, are to be differentiated from the minor migrations that depend on the season and the local pasture conditions. The mass of migrating springbok (Cape D. trekbok) is at times so wide and so thick, that avoiding human settlements cannot be thought of. Actually the animals overrun the courtyards, trampling the crops and the gardens. In the year 1892 (74) the

74. H. A. Bryden, Kloof and Karroo, London, 1889.

civil commissioner of Little Namaland had to distribute about 100 guns to the Boers to turn aside the charge of the springbok herds. In one case the springbok overran a farm in such a dense and wide column that a part of them -- since none of them could turn aside -- were pushed into a cattle kraal and massacred there. The column will divide around an ox wagon. The animals swerve to the side as much as the pushing animals

behind will allow, then close in again a few steps behind the wagon. 227 Such a trek can go on for days and nights without interruption. Like the hyenas and jackals (formerly also the lions and leopards), the Hottentot follows the train of springbok (ǂdoē//gūs). As late as the year 1896 (19)

19. W. L. Sclater, The Mammals of South Africa, 2 vols., London, 1900 - 1901.

a half million head were observed in a springbok train in the northern Cape colony.

d) Hunting by driving (see story no. XIII) seems to have been the way of hunting giraffes formerly. Today only hare are hunted that way. Hunting a single hare with dogs is difficult, for [292] the dog usually considers the hare that has been chased and bitten to death as its own property and the hunter must run quickly or the dog will end up with a full stomach. It is more rewarding to hunt hare by surrounding them. [Picture. A kirri. 1/5 natural size.] The dogs stay at home then. An area of about 100 meters across is encircled, and half the hunters on one arc presses toward the other half which stands still. In this half-encircling the center ǂāē, and wings, /gubi·s, are differentiated, the latter being called by a comparison natural to a pastoral people, //nā·/kya, horns, or //oa·kya, arms.

The startled hare is laid low with the kirri (!hō·as, best made of tai [292] bush wood). Throwing the kirri, ǂgūē or /nami·, is done with the arm raised sideways for throwing and in such a way that the wood whirls through the air nearly horizontally. Depending on whether the handle end or the club end hits, the booty is stabbed or knocked out. Then the people shout: "/kyaru !oaē, ǂam ǂam /araē, nāū /aoē, aū /aoē, ǂkagu ǂaise!" The hare's stomach is roasted to a crisp in the fire. Before that the newly slain animal is struck on the ribs with the kirri until the body cavity is filled with blood. Then the gutted hare (the chest organs stay in the body) is baked in the hot ashes with hide and hair left on. The thick [262 blood cake in the inside is a tasty morsel. Thus the afore-mentioned 262] cry of the drivers and hunters becomes understandable: "Karu hare, you crisp stomach (ǂam ǂam = to make a crackling noise, said of crisp things), you thick blood (nāū, aū = thick, /aob = blood), thick blood, you sweetheart (ǂa·es, is a marriageable girl) of the boys!" (a-ǂagu) (up to the last address, the suff. of the 3rd pers. sing., -s, is used instead of that of the 2nd pers.).

Both upper leg bones of the hare are broken; if this is not done, the hunting dog's legs will become stiff, according to hunter lore. The hare's throat must not be slit when the animal is cut up.

224

e) Trapping is well developed and corresponds to the Hottentot's predilection for outwitting his victim, whether man or beast.

Pitfalls, which the Hottentots seem to have copied from the Bergdamaras, are used for catching zebras. On the paths of the wild animals to the water, as a native hunter reported to me, [293] a ditch about 3 meters long, 3 meters deep and about 1 meter wide is dug out with straight sides and covered across the top with light twigs of freshly cut bushes. The Bergdamaras call such a pitfall !gai-seb.

Stone traps, !nu-!gu, are used for catching jackals and hyenas. The Hottentots build a jackal trap out of large flat rocks. It is about 3/4 of a meter high and about 2 meters in diameter and resembles the base of a little round tower. When closing up the top opening, a hole is left through which one can look into the inside of the trap room and hit the captured animal in the back with a cudgel. [Jackal trap, near Aruguams (p. 167, no. 63)]. The jackal gets to the bait by a side opening. The bait is in the center of the room. As soon as the animal tugs at the bait, an apparatus made of sticks is loosened which causes a heavy stone to fall down in front of the entrance. Sometimes it falls straight from above, sometimes at an angle from the side. [Picture. Hyena trap on the flatland to the north of Chamis.]

The hyena trap is built stronger than the jackal trap. Heavy flat rocks are built up, so that there are holes but held by their own weight to make a square structure. The inside room is about 1 1/2 meters long, a good 1/2 meter wide and 3/4 - 1 meter high. Large flat stones form the roof. On one of the narrow sides of the [294] structure a wide entrance, 1/2 meter high and 1/3 meter wide, is left open. Right behind this opening a horizontal chink is left open in the roof and surrounded by especially strong stones, so that the wall will stand the weight of the falling stone. In the back or the room is the bait (intestines of cows and such) tied by strings along the floor to two upright sticks on which a stone weighing a hundred pounds is loosely set. By tugging at the bait the hyena pulls the sticks out from under the stone which falls down and seals up the entrance. A thick wall of irregularly piled up blocks of stone braces the side walls on the outside. The roof is also weighted with such stones so that the whole stone building is a structure 3 1/2 meters long, 2 meters wide and easily 1 1/2 meters high. Such a trap stands for years.

The "jerking gallows" (see Kalahari) is a good name for the type of trap used for catching small antelopes, especially the klipspringer. A fresh branch, thick as an arm and several meters long is placed firmly in the ground, the thick end down. A noose of strong sinew thread is

224 [p. 249]

Jackal trap, near Aruguams (p. 187, no. 63)

Hyena trap on the flat land to the north of Chamis.

attached to the top end. Down the middle of the noose, fastened firmly to it at each end, is another string, to which the klipspringer's favorite food is attached. The trap is set when the thin end of the branch is bent down to about 1/2 a meter above the ground. The branch and the noose are tied together with a sinew string that must be especially strong as it must take the entire pull of the branch and later has to hold the caught animal. The noose is held flat on the ground by four short pegs. The klipspringer pulls up the pegs as soon as he tugs at the middle string of the noose. The branch jerks up, pulling the noose over the animal's neck and raises it into the air. It is then hanged as though on a gallows. 224

Spring traps, //nõ-agu, are used for catching porcupines and smaller mammals, such as mice, which are a popular food of the Bergdamaras. The setting and springing mechanism is more complicated than in the above-mentioned traps. A flat stone (a) is leaned at an angle against a bracing stick (b). This stick rests lightly on the ground. On the outermost edge of the top of the stone a wedge (c) is inserted between the stick and the stone. A little horizontal stick tipped slightly upwards (d) gives the slanted brace support on the side. One end of it is placed securely under the edge of the stone, the other extends beyond the brace. [295] The brace and the horizontal stick are pressed against each other by the !a-n(a)das- wood (e). This small piece of wood is kept in place by a taut sinew string that is tied to the wedge. [Picture. Spring trap. a) stone, b) brace, c) wedge, d) horizontal stick, e) !a-a(a)das- wood. f) bait.] As soon as the horizontal stick is knocked down by the animal getting the bait (f), the side support is removed from the brace, at the same time the !a-n(a)das- wood slips out and disturbs the precarious balance of the whole structure by moving the string on the wedge. The Bergdamaras call the little pieces of wood that are used for making spring traps °/hâ/n-n.

Capitulum IV

Social Life

A. Family

1. Establishing a Family

a) The reaching of marriageable age, when menstruation first occurs, !naru-b or /ha/ha-b, is a joyful occasion and, as the first pledge of future 89/[582]

224 [p.295]

Springtrap. a) stone, b) brace, c) wedge,
d) horizontal stick, e) !a·x(a)das-wood, f) bait.

family happiness, is celebrated accordingly. The girl is separated from 881
the other inhabitants of the hut by a mat wall. She puts on her jewels, [582]
relatives and friends bring her arm rings and put chains of beads around
her neck. Some of them are kept as presents. The parents slaughter and
serve honey beer to the guests.

[296] Before the Hottentots adopted European clothing the girl exchanged her girl's apron for that of an adult; this custom has been abandoned. But another custom has still been maintained here and there where it could be concealed from the watchfulness of the mission. Males from 881
the smallest child to the aging man (old men are excuged) have their scrota 751
rubbed with buchu powder as a preventative for venereal disease by the girl menstruating for the first time. The practice of this custom is called */na·ra/ra/ra·. (*/ra/ra·b = the testicles. */na·ra is the gentle stroking of the cow's udder, the calf of which is dead. It is supposed to have the effect of persuading the cow to give milk. The scrotum is rubbed just as gently with powder.)

When the first menstruation has ended, the girl is washed by a woman 881
from head to foot with wet cow manure (sheep manure is better) which 515
has been stirred to a thick porridge with a little milk. (cf. Care of the Body, p. 207). This stuff is smeared on the body in the usual way and rubbed in. It dries quickly on the warm skin and at the completion of the cleansing falls off of its own accord.

Thus cleansed, the girl comes out of the separate room of the hut. 881
This coming forth of the girl, *//a/m/ai (//a/m is the special term for 582
the above-described method of cleansing with manure. /a·i = to go out) is the visible sign to all the inhabitants that the girl has reached marriageable age. Up to the time of the first menstrual period the girl is considered a child, /gõ·as. But from that time until she is married she is called oemes (not oeisis (57)).

57. J. G. Knoblein, Wortschatz des Khoi-Khoin, Berlin, 1889.

The vanity of the girls is often employed in furthering the develop- 832
ment of their charms. The areola of the nipple is hard at the beginning 827
of puberty. A slightly stringy liquid can be squeezed out of the nipple with sufficient pressure. When the breasts are just beginning to develop, and the area around the nipples becomes firm, the girls squeeze out this liquid assiduously to further development of the breasts. The liquid that can be pressed out of the mammary glands at the time of the beginning of puberty is called *//gu·rurubeb.

341 [145]

Menstruation usually begins between the thirteenth and fifteenth years. From then on it is called *//kx̃a/a·es(e)ni, i.e., "moon sickness," from the regularity of its recurrence. It supposedly lasts three days on the average and is scanty. [Picture. Plate XII. Topnaar Hottentot Girl.] At this time they often [297] paint their faces with a dark greasy salve. (See Care of the Body, p. 210). [302]

Those who are menstruating are not allowed in the kraal, let alone to do the milking. It is difficult to get reliable information about the end of menstruation. I know of two women who had children when 47 years of age and of another aged 55 who still had periods. In general the appearance of the climacteric does not seem to deviate from the norm for our race. [145]

b) Marriage, !ga·meb, is the goal which the girl seeks. I was astonished how carefully regulated customs have still been maintained in secrecy where the ethical customs have not degenerated or have not been clothed in Christian guise. Chance observations and occasional remarks of my companions gave me the clues which I had only to pursue with patience to find out the remnants of original folkways that are still well preserved under the varnish of semi-civilization. 581

A man who wishes to find out if a girl reciprocates his feeling of love hands the girl of his choice a little stick. If they are both in agreement, they break the little stick, each holding on to one end, and throw the broken stick towards each other's breast. The man is now the *taob of the girl, the girl the *taos of the man. They then enter into a love relationship as the word (tao = to be ashamed) indicates and as the old custom actually demands, which places on them the following duties of modesty. The betrothed may not speak to each other nor hand each other things. Anything they wish to say or give to each other must be done through an intermediary, a man or a woman. Violations are expiated by atonement presents -- they are actually love tokens and so the whole thing is a game of hide and seek that has become a fixed custom. 584

This can continue for months, a year, or longer before the relationship becomes closer. That can then happen in two ways; openly by asking the parents or secretly by a symbolic action which indicates the girl's agreement to complete surrender. The lover takes off a skin shoe when the two of them are alone and throws it to the girl. If she leaves the shoe unnoticed, the offer of a premature union is rejected. If she wishes to accept the proposal, she returns the shoe.

Magic is also involved in intrigues of love. An effective means of separating lovers, according to the opinion of informed [298] magicians, 584 832

Plate XII

Topnaar Hottentot girl.

is contained in the jumping legs of the grasshopper. A girl who is supposed to be alienated from her lover is asked -- as often happens without harm in daily life -- to pulverize a heap of dried buchu herbs. A grasshopper leg has been secretly crumbled up between the leaves. When the girl has finished and rubs her hands that are dusty from the buchu powder in her armpits as is customary to get them clean, she unknowingly rubs in that magic potion that kills her love. In other cases the grasshopper's legs are packed deep down in the bone pipe. The pipe then makes the usual rounds and when it has been ascertained that the loving pair got some of the leg pieces to smoke, then the magic is considered a success. I also knew a case where the parents of the girl consulted a professional magician, who smeared a little stick with the contents of his poison box (see Medicine, page 226), broke the stick and threw the pieces away with the words: "ǂâ/gu hã kxoëra gye nĩ /go/ra," i.e. "the two who love each other are to separate." 584 832

Before the whites became a dominant factor and destroyed the old customs, love outside of marriage was punished. Old Hottentots, who observe with misgivings present day actions, have told me that on numerous occasions, independently of each other. The guilty ones were either both thrashed with the approval of the parents or the girl's share of the punishment was transferred to the boy. The punishment was carried out at the direction of the sub-captain; in other words it was an act of public morality. 177 836 684

The parents of the young man undertake the wooing. Etiquette requires a rejection of the offer, much discussing back and forth and finally acceding to the request. The man is not supposed to think that they were waiting for him. 584

The wedding is celebrated with much slaughtering. The bridegroom or his parents must supply the festival roast (cf. folk tale XXXIV). But sometimes both families participate in the wedding slaughter, !gũ/ǂâs. Poor people sometimes trade their only milch cow for one that can be slaughtered in order to fulfill their wedding obligations. 585 431

On the wedding day the young man and the young woman each give their respective mothers-in-law a cow, abago/mas, in remembrance of the time when they carried the boy or girl as a baby in aba skin (see below). And because they nursed them at the breast, that wedding cow is also called ǂamago/mas. The term kxã/go/mas, [299] which I heard more rarely, means that something is returned (= kxã/) to the mothers to which they are entitled. The present is supposed to compensate the mothers for the loss of their children.

The arrival of the young wife, tara·s, in the husband's village is celebrated again with slaughtering, a greeting to which she is entitled (cf. folk tale, LVIII). 585 [601]

Today only a few Hottentots could afford several wives, as ancient custom allows, because of their impoverishment. Also the relationship between the sexes has deteriorated to such an extent that it is not necessary for a man to have the intimate relationship with several wives officially sanctioned. 177 595

2. Intra-Family Relationships

a) In the relationship of husband and wife, the honored position of the wife differentiates the family of the Hottentots clearly from that of the Hereros. The woman is considered the mistress of the hut in all household matters. Thus under certain circumstances she has the right to refuse her husband the right to enter the hut. She manages the food supply. Her husband asks for milk and she gives it to him. In addition, the fact that she does the most important job in the household of a herdsman, namely the milking, differentiates her from the wife of a Herero. The honored position of the woman in the marriage relationship does not prevent occasional quarrels in which the husband makes full use of his physical superiority. 593 171 562 462

Only barrenness lowers the esteem of a wife permanently.

b) The relationship of the parents, //gũ·ǂra, to the children, /gõ·an, 854 [601] Caring for small children, aba·, is naturally the mother's business. She carries her child on her back in a lamb skin called //hani·b (see Plate X).

"//Haniba !kχara !", i.e. Drag the aba skin after you!" is shouted to little children when they sneeze (sĩ°). In other cases I heard the mother wish the sneezing child "!oǂman kχao !," i.e. "push your rear !" (°-an seems to be a reflexive particle). Both wishes refer to the eagerly-awaited first attempts of the child to walk. The baby tries to get up from its helpless sitting position on the floor and at first always falls back again on its rear. When it can walk, it drags the aba skin, which it has by then outgrown, after itself and uses it as a toy. 854 866

[300] The parents assign each child, even grown ones, a certain cow for its use (°maĩam, i.e., placing to the mouth). The child may only milk for itself this one cow, ǂ/bes, mornings and evenings. During the day, when the cattle are in the pasture, he is served what is left of his milk. Likewise those who are married sometimes get four or five cows from their parents. 855 422 [585]

In bringing up the children I have only observed ordinary punishments for obvious misbehavior or foolishness. Formerly education also extended into late boyhood or young manhood (83), but today it is mostly left to

83. See 88. 88. J. Olpp, Aus dem Sagenschatz der Nama-Khoi-khoin (Mitteilungen der geographischen Gesellschaft für Thüringen zu Jena, Bd. VI, 1887).

the young people themselves (see page 309). The power of the parents in training their children has declined since the whites have become dominant. Where formerly the son, /gõ·ab, as long as he was only half-grown, was dependent chiefly on his father for his support and therefore also felt morally dependent on him, today he can make himself independent at an early age in the service of whites. The daughter, /gõ·as, who was formerly dependent on her parents until she married, can support herself with her charms and even get all the little luxuries she desires.

But in spite of the shattering of the parents' power over the raising of the children, the prestige of the parents in the family has still been preserved. That is clearest in advanced age. The grandparents are not forced by anyone in the family to work and each person has the obligation to be of service to them. That old and helpless people are exposed, as one occasionally hears claimed in the country, is a fable in my belief or is confused with the emergency customs of the Bushmen. For such a treatment of aged people is a direct contradiction of the viewpoint of the people as reflected most clearly in the sagas and tales. The address ti //nao/b or ti //nao/osa, i.e. "my grandfather" or "my grandmother" is used also as an expression of great respect for people who have no relationship whatever to the speaker. The folk tale no. XXIV gives us a picture of the domestic duties of a child.

The terms for father and mother vary, depending on whose parents the words refer to. A child always addresses its father with ti°dīb or dā·tse, and its mother with ti ais or aise: my father! my mother! The expressions dāda·b and mama·s are probably borrowed from Cape Dutch.

[301] The Hottentot feels it as a coarse malapropism that the children of the Namib Bushmen address their parents sao/b and sao/os. "For these designations are reserved for the case when one is speaking of parents of someone whom one addresses as "thou", whether one is addressing a child or an old man: sa sao/b, thy father etc.

If it concerns the parents of a third person, the term used is usually //(e)ĩb di //gũ‿b (respectively -s) or //(e)ĩb di ĩ‿b (respectively -s), i.e. his father (respectively his mother). 601

Without breaking the above-mentioned rules, the following expressions that I also heard frequently are correct: sa //gũ‿b, sa ĩ‿b, thy father and correspondingly thy mother. Further I heard (e)ĩb di dāb(ais), his father (his mother).

The stepmother is *õ!gã‿//gũ‿s, i.e. "the mother who stands behind the one who bore the child."

The designation *abo·b for the father I found only in the language of the folktales, never in conversation.

c) I noticed a great variety of addresses used between siblings. At first I thought I was hearing terms of endearment or teasing names. But when I sought to determine their meaning, I came upon rigid norms which indicate the Hottentots' strong sense of age rank even within the sibling circle (!gãb, -s, -n = brother, sister, siblings); it is the exclusive privilege of the older siblings to call the younger ones by name. The younger siblings designate the oldest sister, the person who commands the most respect among the siblings, as *ausis (3. f.), when speaking to her or about her. The next oldest one or ones are called *sirõ·s (3. st.). The younger siblings address the oldest brother as *a·budib. The next oldest one or ones are called *bi·dirob. [561]

d) I have been able to find out the least about the in-law relationships. The relationship of the four in-laws to their married children is the same in address as it is between parents and children; they use the second person singular. The in-laws are called /u‿i·b and /u‿i·s in the third person.

The wife is called *!oaras in address by her husband's relatives or when she is spoken about in the third person. By all the feminine relatives of her husband, with the exception of her mother-in-law, without consideration for differences in age, she is called ǂaɛ̃.s.

[302] /u·‿iaob means brother-in-law. In the word /u·‿igukǂa, that is used to designate two brothers-in-law, the reciprocal particle, -gu, seems to express the equality of rank between the two in relation to each other and the onesided relationship of respect for the parents-in-law.

Some light on the position of the brother-in-law in the family is shed by the phrase with which the Hottentot occasionally appeases a whirlwind: "/u‿iaob //goɛ̃!" Just as one does not make the children cry in the presence of the brother-in-law by spanking them and does 784 789

not quarrel, but behaves properly, so the wind is warned not to throw the objects around so wildly that it has seized: "The brother-in-law is there!" 784 787

e) Nephews and cousins (direct and by marriage). The relationship of the children to the siblings and brothers-in-law of their parents is regulated in the following way. The children are called by name by them, but the children use others words in address as well as in conversation. 601

1. They call the older brother of the father and the husband of the mother's older sister *gai·dāb, i.e. literally "great (or old) father."

2. They call the younger brother of the father and the husband of the mother's younger sister *dā·daro·b, i.e. "little father" (-ro is a diminutive particle).

3. They call the elder sister of the father *mĭgyi·s.

4. They call the younger sister of the father *mĭ·gyiro·s.

5. They call the older brother of the mother and the husband of the father's older sister *o·meb.

6. They call the younger brother of the mother *o·mero·b; the husband of the father's younger sister o·meda·b.

7. They call the older sister of the mother *ais gais or *gai mās, i.e. as in No. 1, "great mother."

8. They call the younger sister of the mother *ai·ros or *ma·maros, i.e. "little mother."

The male Hottentot calls only the children of his sister nephew and niece, //nu/ri·b, -s. A female Hottentot has no //nu/ri·b or //nu/ri·s. There is no word to designate the children of her siblings. The way the children refer to her has been mentioned above.

Children of siblings address each other in the manner mentioned above for siblings. Only in one case did I see the terms of respect omitted between the children of two brothers.

[303] Between a woman's children and her brothers there is a relationship that (aside from the ties between parents and children) is considered by the Hottentots, the closest that can exist between two related generations. Whether this relationship has a background connected with the rights of inheritance I was not able to establish. I believe not. Whatever it is -- a naive, sympathetic rapprochement between the mother's brother and his nephews sometimes expressed by the uncle's consciousness of his duty to love the children of his sister, sometimes by the children's friendly feelings of dependence on the 604

uncle, is all that can be directly observed. This relationship is expressed by a special kind of trading. The uncle (in this case the brother of the mother) has the right to appropriate a damaged or mutilated object from the nephew. At the next opportunity the nephew compensates by taking a corresponding perfect object. Thus once a young Hottentot took home a milch cow with calf and ten goats as recompense for his mother's brother taking a horse with bad hoofs years ago. "Ruskop" cattle (hornless or with loose horns), goats with stubby ears, cattle with asymmetrical horns, a skin blanket with holes, a cracked wooden pail, a stone pipe with a broken edge, etc., etc. may be appropriated by the uncle. Sometimes he looks through the entire hut of the nephew to find something like that. If his visit is a surprise, he can make a lot of good finds. Otherwise the young wife has hidden all the doubtful objects of her household in time. The nephew's right of choosing is called //nu/ri//gab, that of the uncle *ũ//gab. In none of the cases known to me did I hear any complaints of misuse of these rights. This relationship is generally based on such mutual trust that it would not be egotistically exploited. 604

The preferential position of the brother of the wife in the family is reminiscent of the old Indo-European views (84). [[171]]

84. B. Delbrück, Das Mutterrecht bei den Indogermanen, (Preussische Jahrbücher, Bd. LXXIX, 1895).

3. Name Giving

We have two chief groups of family names, /o-/nti, which we must differentiate if we are not to be confused by the diversity that rules here. 551 553

a) The first group might be called that of the parent names. We must first state that each Hottentot family name can be used, depending [304, Chart. Family Tree of a Topnaar Family to Show How Names are Inherited.] [305] on whether the masculine (-b or -ba) or feminine (-s or -sa) personal suffix is added, as the name for a boy or a girl.

The general rule is that the son inherits the name of the mother and the daughter that of the father as the main name. If, for example the father is called gomarib and the mother //k!unibes, the son is called

551
553

Family Tree of a Topnaar Family to Show How Names are Inherited.

[304]

551
553

//kχunibeb and the daughter gomaris.

The son adds a secondary name to this main name when he is grown up. The main name of the father with the insertion of the syllable -mã̄ before the final personal suffix serves as the son's secondary name. The son of the afore-mentioned parents is thus called //kχunibeb-gomarimã̄b. (There seems to be less use made of such double names by the female sex. The daughter of the parents mentioned above would have as a full name gomaris-//kχunibemã̄s.)

In order to convince myself that this method of name-giving is pursued consistently for several generations, I have traced back the names of a family as far as the memory of my authorities reached. I was assisted by the village elder of the Topnaar settlement in Rooibank behind Walvis Bay. The result proved the consistency of this rule of name-giving.

In everyday life there are consequences arising from the way names are inherited that could easily lead to confusion, except that, as we will see, a second group of names provides a remedy. The rule by which children receive their parents' names results first of all in full brothers having the same name and all full sisters having the same name. A simple consideration, using as an example, the last generation of the second family tree, results in the following: the same main name, /kχu·nuχab, which the brothers have, will also be the name of all their cousins that are the sons of a maternal aunt, in other words all sons of /kχu·nuχas' sisters. Different from these and differing among each other are the names of the cousins who derive from the father's and mother's brothers. The cousins that stem from the father's sisters are all called sa·naχab.

Analogous are the relationships among the sisters of the brothers /kχu·nuχab: the chief name, which they have, //nī·χas, is also the name of all their cousins that are the daughters of a paternal uncle, in other words, daughters of the father's brothers. The daughters of the father's sisters would all be called sa·naχas. The maternal cousins, that are the daughters of an uncle (of a brother of the /kχu·nuχas), would [306] all be called gãs. Differing from these and differing among each other are the names of the cousins that stem from the mother's sisters.

Although the parental names reveal the origin of the bearer to another Hottentot sufficiently so that they suffice for identification in a foreign kraal, they still do not provide enough differentiation within the

narrow bounds of the family. The names of a second group fill this gap. We will call them, 551 553

b) Nicknames.

In the simplest instance, these names are a simple characterization of the person based on an identifying mark or a fact. Thus a young Hottentot girl with thin hair on her head was called ǂgā'ŝ, i.e. baldy, bare-headed. A young boy was called °/gu·ru//a·reb, because he was left-handed. A man who stood cold well was known by the name °!kχai·t(o)mab, as "one who is not (t(o)ma) cold (!kχai)." Another, notorious for being unpunctual, was called °!aũ·'//kχui·b, "he who makes you wait (!aũ') in vain (//kχui·, to miss)." A feared cattle thief in lower Swakop territory was named for the color of his hair °/haihãb, the "dun horse." A peaceful old man who had planted near the water a tobacco bed that was always green (!am) was called !a·mχab etc.

Certain events are the basis of two other names: °hã·/gyeb, i.e. "he who came," because this man came to this place from far away and now lives here. A boy, whose mother died shortly after he was born, received and kept the name, by which a Hottentot designates a newborn being, whether man, lamb, or calf, that is raised on the milk of a strange woman or different mother animal: °hã·ŝib.

Such names can attach themselves so firmly that they become the first name of a person for all his life. It is not unlikely that such nicknames were formerly the original and only names of the Hottentots and that even today they still become main names that can be inherited and thus bring new elements into the vocabulary of parental names.

Sometimes only those closest to a person can understand the personal connection in the name of the person. Thus I have not been able to find out the references of the various nicknames of Hendrik Witbooi which I heard many times: !hu·iseb, °/gã·mab and °kχabu·b.

Some of the nicknames are terms of endearment which are only used for a certain time and then forgotten or only used occasionally. [Pictures, Plate XIII, Topnaar Boys]. [307] Thus a Hottentot woman called her little son °ǂkχa-ri!kχu·bib, i.e. "the little viei." She wished to indicate that the sight of her child made her as happy as an expanse of water does in the dry desert. Another mother had a naive pleasure in the pretty ("clean") privates of her little daughter and therefore named it !a·nuǂnũi·s. A Hottentot child, that had Negro blood from its father's side and thus had a darker skin color, was usually called °ǂnũ·/sagyeanu·s by its mother, i.e. "you who are so sweetly black."

1: Schultze--108A N-5 (1903-1905) 1907 FX13 Hottentot FX13
Nama

Plate XIII.

Topnaar boys.

Occasionally the white man gets a nickname. Thus a Hottentot once remarked of a worthy missionary, remembering gratefully a good deed performed for him by this man with black mutton-chop whiskers, calling him °ǂnũ-/nôgũ-/oatse, "oh, thou son of a black-cheeked sheep." This was an image that is close to the shepherd and would always be considered a compliment by a Hottentot. (See illustration, p. 263). 551 553

The Hottentot's marked sense for satire expresses itself freely and happily in teasing names for his own people and for his white masters: °//kxa-naib was the name of a boy with a stomach that stuck out (from °//kxaa, to forego evacuating the bowels); °//go-re-ũũa-tao/a-b a boy with an awkward posture, "whose neck vertebra was in his buttocks"; °!ho/nqõe, i.e. the "mountain cheeks," was the name of a Negro with fat cheeks; °ǂkaũe-b, i.e. "bag of bones," a thin fellow; °//gaorab was the name of a dirty fellow "who tastes horrible," etc. 551 552

Boys in their adolescence with their mixture of childish and adult characteristics also evoke the mockery of a Hottentot. One such youth in his late adolescence was called °a-ru//gui-b. The word aru- means driving the young lambs away from the old animals that go to pasture, while the young ones stay by the hut. The word alludes to the childish features of the boy. //gu-i means in the language of the herdsman: a bull calf that actually should be castrated but that still has its testicles; the word alludes to the awakening manhood of the boy.

Indicative of the decline in polygamy is the fact that a man who still enjoyed this luxury was known by the name °a-mi!kxoa/go-ita-naeb, i.e. as one "who has many (/gui) wives (taes, i) just as an ostrich (ami, i) has hens." [508]

The Hottentot find weak points in the bodies of the white men even more easily than in his own. A person who he thinks has too long a neck is called the "necky one," °!ao-!kab; another person's [308] mustache hangs over his mouth (ami) as a dog's lips (°//ga/hu-b) over its snout and so he is called °//gabu-!kaa-mi.

Another is named for the peculiar expression of his eyes for a gecko lizard of the same name, a Rachydactylus species, °!na-nigyeemũũ, another one, because of his stamping gait °!nũ-/arib, the "heel man." The Hottentots in Kubub called an especially tall man !a-hatoma!nao-b, i.e. "he who does not have to climb (!a-ha) on the wagon to load it" (!nao).

They called another !a-oa/ũ-hataxa-s (with a feminine ending) because he lets his head (taxa-i) hang loosely to one side and dangle with

every step, and carries it as though his neck (!aos) were "wet" (/ā i.e. like a soft, flexible juicy flower stalk). His opposite, a man whose pride expressed itself in a perpetual stretching of his backbone, was called "the hollow one" *!nā/b by the men; by the women: */ā-aŋ!ā-b, because his penis (!āb) was new (/ās) i.e. very potent. 551 522

That the bow-legged person (*//kxō-aob), the person with a pot belly (*//ā-otab), the person with red hair (*/a-batasa-b), acquire an epithet before an hour has gone by is obvious.

Other teasing names refer to events. A high official who sometimes got off his horse during a trip to pick up a stone or a beetle was called the "junk collector," *ka-boreb, from the first day of the journey. Another was named *!u-/rila-ogurab, "the white-throated raven," after he was seen in a stiff white collar and a black coat for a reception, although he was usually dressed shabbily.

Finally a soldier who spent a whole day stubbornly wooing for the favor of a Bastard girl who refused him was generally called *ǂnū-soreǂgā-√b by the Hottentots at his station, "he who sits (ǂnū) there even when the sun (so-ros) goes down" (ǂgā√).

4. Children's Games

I have been able to observe children's games frequently. 859

a) When they are an imitation of the activities of the adults, they reflect the double nature of the Hottentot as a herdsman and a hunter. The boys sometimes catch mice alive (a simple task when they have found a nest), shut them up in little mud kraals as milk cattle and castrate the males except for one which they keep as the bull of the little herd. 524

[308] When hunting with little home-made bows with feathered foregoats reeds as arrows or with stones as their only weapons, they call the lizards their springbok, the elephant shrew are elephants, (see p. 287, no. 48) a rat-like rodent the lion and the striped mouse the zebra. The wild animals are properly skinned and cut up. Whoever has killed a bird, plucks it and makes a good trade as is done with ostrich feathers. 859 526

The Boers' ox wagon is also so popular in Namaland that the children have taken it over into their games. Large winglew grasshoppers are acceptable draught animals. They yoke the strong insects that are half the length of a finger to a little hand-made ox wagon. They attach the yoke to the rope that draws the wagon and span the animals properly, first the left rear ox with the yoke strap on the outside, then the one on the right 859 527

with the strap next to the drawing rope etc. They seem less interested in the wonderful sight of 24 grasshoppers yoked together than they are in imitating as well as they can the customs of the adults. 857 524

In their games, in spite of all the childish activity in any particular one, there is often much that has an educational value. The boys do not always band together just for brief games and then scatter; they often organize themselves together for a year or longer. They elect a chief, a captain, who chooses his lieutenant; as all older boys do, these two choose younger ones as personal servants. Punishment for disobedience, a tribute of tobacco or food, is not merely playful; it is often quite serious for a boy who has to earn his own keep. The captain has to abstain from using physical force. He delegates one of his group to carry out any punishment that he considers necessary. The adults allow their boys to be judged by their contemporaries and thereby strengthen the system of the self-education of youth. 857 561

Because of the early sexual maturity of this race, it is not surprising that the boys often have sexual intercourse before they have outgrown childish games. In one case the boy had to pay the chief a tribute. In another case the captain even decided arguments in love affairs. He took a girl away from one boy and gave her to another and thus overstepped the bounds of childish play. 836 857

When there are no clashes with other groups to satisfy their belligerent feelings, war games are sometimes arranged. If, for example, [310] one of the cattle guards has found a thorn bush with wasp nests, then the group arms itself with sling shots which they make out of a piece of skin and two straps. They take their stand about 20 paces from the tree. It is now the duty of the lieutenant to climb up the tree and to break a piece of the nest loose and bring it to the captain. It is no easy test of courage for the boy, clothed only in a leather apron, to approach the angry swarm. Once he has completed this task, the band begins the bombardment of the nests. In the case that I remember the boys did not succeed in destroying the nests. As a punishment on that evening they were not allowed to drink milk from their goats which their parents or masters had turned over to them for their needs. 857 526

Outwardly, the //abi game imitates the military customs of the adults only symbolically. In the imagination, however, they are clearly visible. A thorn from the giraffe acacia or the thorn tree is placed on a thin stick that is slightly longer than a finger. This arrowlike toy is clasped between the fingers as the illustration shows and flipped forward and down by withdrawing the thumb, sending it into a pile of reeds as long as a finger. These are in the open or covered with sand so that they will not scatter when the thorn

lands among them. The speared reeds are supposed to be cows and are 857
therefore called go/mati. The children themselves feel like victorious 526
soldiers who are dividing their booty by games of chance. [Picture. Position of the haul in the game of raffling booty.]

The imitative games of the Hottentot children are particularly worthy 857
of notice as they represent the only stage in their life in which an artistic 527
drive seeks definite outlet. The half-grown boys between the ages of about 323
eight and sixteen make toys from clay, and bake the clay in a fire to give 532
it nuances of color as well as hardness.

The figure of a white man is in the middle of the first group, standing behind a horse. [See Figure I. $\frac{1}{2}$] The narrow [311] high bridge of the nose of our race astonishes the Hottentot with his wide low nose and provokes him to caricature. On the right next to this figure is a smoking, native woman with [steatopygia]. Behind her, with the pigs, is a boy by an iron three-legged Boer cooking pot. The wooden nose piece is interesting in the riding ox. [Pictures I., II. The fat-tailed wether is bucking a billy goat. The kneeling guard aiming his rifle with one closed eye shows careful observation.] [312] Figure II shows a pair of ostriches on the left, the male emphasized by its natural ornament of feathers and by its size. The artist, at any rate, did not see the giraffe in Namaland, but probably in some zoo in the Cape colony. The oryx antelope and the springbok are recognizable by their pointed horns and lyre shaped horns respectively. Of the two scorpions with their threatening stingers raised up, the one on the right is better made. The young herdboy has plenty of opportunity of observing baboons. The events reproduced here he has obviously observed carefully. The other figures represent a frog, an iguana and a turtle.

The last group of clay figures (Fig. III) represents an ox wagon, which the old Boer with his long whip directs from the front box, while the native guide seeks the way. [Picture. Figure III]. I would like to point out especially the naturalistic reproduction of the lead oxen that are pushing powerfully against the yoke.

In these sculptural attempts one can recognize everywhere the ability to reproduce the characteristic element of the object from direct observation, without contemplation. It is the same primitiveness that differentiates the drawings of prehistoric man from those of our children, who reproduce objects more intellectually (with whom they are now being closely compared).

It is strange that the Hottentot's undoubted ability to reproduce things in sculpture is extinguished when the age of childish games is passed.

526
[525]
[313] Betting games are played by boys with throwing sticks in two ways. A stick as long as an arm, called //a-rab, best cut from the wood of a Rhus species or a Grewia, is seized by the thick end (about one centimeter in diameter) and thrown down flat on the ground with such violence that it bounces up and shoots forward like an arrow.

The game with the somewhat shorter */kxaui's sticks is related. They are seized near the pointed end and, after a running start as in the previous game, thrown towards a bush in such a way that the twigs (the smooth Cyperus bushes are especially adapted for this) stop it in its flight. The stick flies in a wide or narrow arc with the heavy end towards the front over distances greater than I could span with a stone.

524
The children practice their finger skills with little juggling games. For example, they hold three pebbles in each hand while squatting on the ground and throw two symmetrically in front of them, dropping both hands at the same time, -- as everyone believes, one from each hand. Then they open their hands and laughing show you three pebbles in one hand and one in the other. It requires no little skill to throw two pebbles from a hand which just a second ago was tightly closed in such a way that one falls down below the hand and the other falls sideways in front of the other hand. [Picture, /kxaui's- and //a-rab throwing sticks.]

526
They compete in skills in another way by making twisting paths in the sand and trying to run the paths as quickly as possible without making a misstep. During the game they call on a buzzard-like bird with the words: "hisarase, //gama daose, hisabese, //gama daose," i.e. "Hisaras, the waterway, Hisabes etc." (Why they call on this particular bird, whether it shows the way to water as the flight of the doves does, is not clear.)

524
The hole game, called //hui's is widespread in South Africa and played with equal pleasure by Hottentot children and adults. I watched the natives play it with special interest since it demands thinking and is played with passion. Without reference [314] to the way this common game is played in other parts of South Africa, I will reveal here briefly the observations I have made among the Hottentots about this game.

a) The game is played by two sides (I and II) that sit opposite each other, with any number of players. The team mates can all discuss each move but one person carries it out. [Picture of the plan of the game.] 1/4

β) The playing field consists of four rows of holes, each row having sixteen to twenty-two holes, dug out of the sand by hand, called //hui-'ti, which are divided evenly between the two sides. In the first row (a) of each side each hole is filled with two tokens, in the second row (b) only the right half of each team's row. Small stones, often goat manure, are used as tokens.

1/4 [For picture, see Carnap-Host, col 116, p. 314. - Ann/rst]

526

/Aexqu²s- and //a·rab, throwing sticks.

[p. 313]

524

γ) Four beginnings are possible. You can move:
from a^7 to b^6 and b^5
or from a^8 to b^7 and b^6
or from b^8 to b^7 and b^6
or from a^9 to b^8 and b^7.

δ) Moving the tokens. Only during the first move is one permitted to take tokens from the middle of one row and place them in the other row. After that one must move without skipping a hole and only counter-clockwise. Moving from one row to another occurs only around the right hand corner of the playing field (see arrow).

Moving consists in the following. The player picks up the tokens from one of his holes and divides them singly in the following holes. If the player ends his move in a hole containing more than one token, he must pick these up. They are taken out and moved forward. If, however, he ends with only one token in the last hole, the opposing team plays. If two or more tokens end up in the last hole that is used, and if at the same time the opponent has one or more tokens in the corresponding hole (of the same number) in row b, then one does not take the tokens from the hole where one ended but robs his opponent of all his tokens, which [315] lie in the row with this hole (i. e. all the tokens which are in the holes with the same numbers of the opponent's a and b rows).

One moves the stolen tokens according to the rules that obtain for moving them in one's own holes. The number of tokens in a hole can increase at will.

The winner is the team who succeeds in taking away all the opponent's tokens in the way indicated.

c) As an imaginative game, an amusement of the children and the women should be mentioned which consists in making certain rhythmic noises. The toy is called ǂa-bubu-s. A rectangular, flat little piece of wood is pierced in two places and a leather string is pulled through the holes. By swinging the two leather strings are so twisted that the piece of wood is set by rhythmically tightening and loosening the strings in a lively whirling motion as the string twists and untwists. Depending on the rhythm used they imitate the sound of a trotting horse, then a galloping one, then one running away. By blowing on the whirling wood they make the fleeing horse snort. A thin piece of wood serves the same purpose, the name of which, //ha-buhaib (from ha-bu = the running away of a shy animal) is evident from what has been said before. A little stick or a stalk of a certain kind of grass is placed between the lips and moved up and down with a finger, so that its humming imitates the rushing hoofbeats of a horse that has gone wild.

857 [517] 524

Before we leave the children, it should be pointed out how their common activities unite them in friendship. The boys and the girls or both together, when they are coevals (//hā-ǂ, vb.) and have grown up in the same place, consider themselves comrades (/gui//hā-ǂn) their life long. Each is the °//hā-ǂsab or the °/hō-ǂsab of the other. Usually I did not hear them call each other by their names but they addressed each other in a special form of intimacy as ao-tse in the masculine and a-χase in the feminine sex. It is not necessary to list individually the duties of those of the same age to each other. The general duty of this comradery which includes all the others is sticking together in all phases of life.

[316] 5. The Dissolution of the Family

The dissolution of the family usually occurs early under present-day conditions. Formerly the large stock of cattle, similar to one of our large peasant farms, held the family together for a long time in the interest of economical operation and complete use of the property. Today the Hottentot is forced to earn his living at an early age in the service of the white man and so the children often separate when they are only half grown.

To what extent the death of one of the parents loosens the family ties cannot be measured without a knowledge of the laws of inheritance. I have not made any studies in this field.

I was only able to find out about burial customs. As they are maintained today, they are a mixture of old traditions, of Christian influences and of the progressive degeneration of the folk customs. The eyes of the corpse are closed, the body washed by old women and stretched out on its back. The arms are placed at the sides and the hands placed next each other in the lap with the back of the hand up. Skins are used as a shroud. They are wrapped around the body with the hairy side in and sprinkled with buchu powder and then sewn together. The face is kept uncovered *until shortly before interment*, then the tip of a skin that has been kept for the purpose is placed over it and sewed together loosely.

The body stays alone in the hut, lying on covers on the floor. The relatives, neighbors and friends spend the night together outside singing. Before the body is buried, the funeral feast begins. The men who dig the grave eat before they start the work. When the grave is about 3/4 of a meter wide and scarcely the depth of a man, a low, narrow side niche for the body is hollowed out at the bottom along the side of the grave. Usually burial takes place on the afternoon of the day after death. The

wrapped body is lowered by straps. Then two men descend and arrange the body in the niche in such a way that the pit is on its right and the head is turned towards the west. The body, the burial of which I witnessed, was placed stretched out on its back. A squatting position is said to have been originally customary. (68) 764

68. G. Fritsch, Die Eingeborenen Südafrikas, ethnographisch und anatomisch beschrieben, mit Atlas. Breslau, 1872.

The niche is closed by thick brushwood, which covers the entire floor of the grave. There is a layer of stones on top of the brushwood. [317] The grave is then completely filled with earth or sand and a hill formed. Stones which are piled up in several layers above the ground complete it. A large stone, vertically set, rising half an arm's length above ground or sometimes a gemsbok horn mark the head end of the grave. This method of burial offers the best protection for the corpse from hyenas and probably can be explained from this point of view.

All the relatives and friends, even down to the smallest children who normally do no work, help to fill the grave. As we placed flowers, they strew aromatic buchu powder on the mound.

Whoever returns to a grave after a long absence places a stone, a piece of wood or a branch there. The same thing is done by people who come to a place and find a friend no longer alive, as a symbol that he too helped to bury him. 765

Whoever dies quietly, continues to live as mildly in the dreams of the survivors. Whoever dies violently or deliriously, appears during the night to the survivors as a horrible ghost. But the question whether every departed one continues to live in some form or other as a shade I have never found considered. Their phantasy ends in the story of the hare, whose cowardice defrauded men of the immortality which the moon had promised them (cf., folk tale XXX). 775

Rain, storm or heavy clouds that appear about a week after death are sometimes thought to be a sign that the gall is flowing out of the decaying body. Also each change in weather, calm, storm, cold, heat, and thunderstorm, are thought to be a visitation of the dead. The Hottentots once believed a large cirrus cloud to be a visitation of a dead white man. 787

2

B. The Tribal Community

The scattering of the population over wide areas and their unstable manner of living, both a result of the climatic conditions of the country, has not permitted the social and civil life of the Hottentots to establish rigid norms. In addition, the confusions of the last years have swept away the ancient customs that had persisted until recently, so that a unified presentation of the social life of the Hottentots in their state and community is impossible today. The traveler [318] can only note those basic beliefs that he finds in his dealings with the natives which are still alive among the people even though they may not be publicly expressed. The little that I can report here concerns the Hottentots' views about property, sexual relations, and power. 178

1. Property

The only instances of private ownership of land probably occur only in the nara-fields of the Kuiseb region behind Walvis Bay. The hut is movable property and the so-called "gardens" were originally foreign to the Hottentot and do not count here. The usable stretches of land, the pasture areas, are common property of the families who have their cattle there. The right to this pasture area exists only as long as no stronger community contests it. Battles for pastures and cattle have been fought by the Hottentots among themselves from time immemorial. The lack of organization beyond the narrow tribal bounds has contributed greatly to the splintering of national power. 423 [721] [649]

Within the tribe (another ethic exists in regard to the white man) private ownership of movable property, especially cattle, is sufficiently protected. Theft is considered a serious wrong and is very severely punished (see Power). 422

Repayment of a debt (again only among themselves) is considered a matter of honor but is often taken lightly enough: "ǀâes ge ǂkereya cta nĭ te ma tsi," i.e. When the rock-rabbit gets a tail (i.e. never), I will give it back to you." 426

In spite of the Hottentot's strictness in preserving his own private property rights, he is not at all miserly. He not only divides the last thing he has with his own people, he is (and was particularly so as all the older accounts testify) particularly hospitable to passing strangers. It would be superfluous to prove again that this hospitality was not based on a shrewd expectation of getting some advantage, but on a deeply rooted feeling of brotherhood. 425 [579]

This characteristic is also clearly revealed in a kind of love token giving for which there is no designation in German and which is therefore best called by its native name "soregus. This is introduced by drinking a toast. With the words: "ũ soreb" or [319] "sore //gams," i.e. "this is sorewater," a drink is handed to the chosen one (male or female) from which the giver has first taken a sip. A boy who entered into a closer relationship to an old Hottentot in this fashion, received a horse and several sheep and goats as presents. He survived his benefactor, but still feels obligated to make a present to the man's children -- twenty years may have passed in the meantime -- even though no one could force him to do this. Women also enter into this kind of relationship with each other. Without asking for a return favor, a woman presented her favorite, a little girl, several goats. Years later she received a sack of coffee in return. Characteristic for the sore relationship is the fact that there is no legal protection as would apply in trading but that it is based on mutual trust. A review of the driving forces behind this giving never gave me reason to assume that avarice was involved. The joy of giving, a characteristic of the people, is in any case one of the main springs of the sore custom. Whether that was the original one or whether sexual attraction has always been involved (see below) I do not dare to decide.

2. Sexual Relations

Sexual relations among the Hottentots are no longer regulated as formerly in the interest of the tribal community by ethical rules. Except for those families that hold faithfully to the teachings of the mission, no one is shocked by even the freest relationships. Formerly ethical strictness was also found among the Hottentots. Eye-witnesses of the times thirty to forty years ago report that a girl who had sinned was whipped by her parents with straps in the presence of the guilty man and that the man was then given the same punishment in the presence of the girl. Another girl got the same treatment when the women who were massaging her found striated marks on her of an old, secret pregnancy. Today the Hottentot mothers think differently. The morals of married people are not any better. The sore relationship mentioned above, although in most cases completely honorable, can also mean a concealed agreement to an intimate relationship outside of wedlock.

Magic sometimes stands in the service of lechery. /na/m/na/m means enchanting to secure someone's love. The mouthpiece of a pipe [320] is secretly smeared with the contents of the medicine box. The man smokes

a little and hands the pipe to the woman whose love he wishes to obtain. 832

In spite of their lack of morals, rape is considered a severe crime. One would scarcely need to mention this if one did not occasionally find 839 an opposite notion among the whites in the country. There was one incorrigible Hottentot who crept into huts at night to rape women that were [684] sleeping alone and he had one testicle cut off (according to the account of an old Hottentot), with the threat of losing the other if he should offend again. The man who performed this half castration died shortly afterwards and the Hottentots of the kraal believed that to be a warning that their methods were not above criticism and they never did it again. Such cases [304] may have perhaps given rise to the idea that one-sided castration is a Hottentot custom.

Abortions are nothing unusual. A hot infusion of the urine of a rock- 847 rabbit (see Analysis in the Appendix), drunk (when necessary) for several consecutive days, is considered an effective method of inducing an abortion. They call the procedure itself "ǂ//nāǂ, i.e. "to drink and to fall."

In order to complete the dreadful picture, the oaths that have a sexual 578 content which one hears frequently should be mentioned. First it should be emphasized that even in cases of the freest sexual traffic (professional prostitution excepted), the feeling of shame has not completely vanished. The deed is free, glances and words wound. Therefore curses which insult the feelings of modesty, such as the frequent "gaixāba u," "you with the big penis" are considered a matter of provocation even by the least prudish person. The ugliness of the image increases further the insult: "!ara χāba ūts," "you, with a penis like the swelling around the genitals of a baboon." ("!a·ras is the brilliant reddish, naked, outcropping of skin around the genitals of the female baboon which periodically swells up considerably.

Worst of all are the curses which not only wound one's modesty but also one's sense of piety, since they are aimed at the person and at his mother or his sister. "!haĩǂnũĩsoats," "you (-ts) son (ōab) of the genitals (ǂnũĩs, vulva), as horrible as the dirty scum on the milk calabash." (!haĩs) The curse ūs !gāsa χaē "go sleep with your sister," will make even the most phlegmatic Hottentot furious.

[321] The insult "ǂgũĩts go hā o" "oh, you have become rigid" (/gũĩ, to have an erection) is intended to make a person look ridiculous.

The conditions in the relations of the sexes document the rapid degeneration of the social life of the Hottentots.

3. Power

622
623

Power within the tribal community at the time of my stay in Namaland, was, as it had been for generations, in the hands of a chief, gao-aob or "gao-b, a "captain," and of a council of older men, with whom the captain discussed all important matters, sometimes leading in an arrogant way, sometimes led by the others, according to his personality. The right to sit in the council is not tied to specific conditions. Ability, experience and age qualify one. But in many particulars this ancient Hottentot form of government is today strongly influenced by the Cape Dutch models and Christian elements (cf. the followers of Hendrik Witbooi) (73).

73. H. v. François, Nama und Damara, Deutsch-Südwestafrika, Magdeburg (ohne Jahrangabe).

If the Hottentot kraals which are under one captain are far apart, the captain places a relative as a kind of governor in charge of the distant one. In this way the ruling family branches out into clans that are widely separated and distinguished by special names (frequently borrowed from their ancestors). The Topnaars differentiate the relations of their capitain in this way: /hai begu, mũ//(e)ĩn and !nɑ̃abagu.

The decision about war and peace, about migrations and trade relationships, the settlement of legal quarrels and the setting of punishments was, until recently, the authorized power of the captain and of his council. The last attempt at rebellion by the Hottentots against white rule will have completely eradicated the native form of government. With Hendrik Witbooi, *in his own way a respectable person, its last representative has departed.*

C. The Relationship of the Hottentots to the Foreign Races in their Home and Neighborhood

101
619

This relationship will only concern us briefly and only in its personal aspect, to the extent that it adds to the picture of native character.

It is assumed without argument that the Hottentots have given expression to their own pride in the phrase by which they call themselves, [322] elevating themselves above all other people: KKoĕ-khoĕn, "people of peoples," in the same glorifying sense that we use when speaking of the "Book of Books." This concept must be modified. If one asks a Hottentot: "mã !haos khoĕsa?", i.e. literally "A man of what tribe are you?", he answers

Plate XIV

Bushman from the Sandfeld, of the tribe of the Gobanin.

1; Schultze--121A N-5 (1903-1904) 1907 FX13 Hottentot FX13
Nama

029

either "na-ǃmata," "I am a Nama," or he assumes this knowledge and understands the question as a doubt of the purity of his humanity and then he answers: "kxoē-kxoēta," "I am a true person." The doubling has the same meaning here as in the answer of a Hottentot in reply to a skeptical question: "tarebe hāba?", "What kind of a horse is that?" the answer: "hā-hāba g(u)mo," "oh, but a horse-horse," i.e. a true horse. With the doubling of the designation "person" the Hottentot is saying that he is a person without anything foreign in him, that he is no half-way creature such as a Bushman Bastard or a despised Bergdamara, who they consider related to the baboon (cf. folk tale XV). In the same sense the Hottentot would understand the answer "kxoē-kxoēta" from the mouth of a white. Thus if the designation kxoī-kxoin was a collective name for all the Hottentot tribes (it does not seem to be so any more among the people) then it did not have the meaning of "elite people" but was only the designation to show that the Hottentot, while living surrounded by other people, was conscious of his "genuineness," i.e. of the racial purity of the origin of his humanity. That does not exclude the idea that he also acknowledged the same in other peoples. Individually, however, his estimate of foreign races was determined by his experience.

1. Personal Relations With the Other Natives of South Africa

a) The Bushman occupies the lowest place. The Bushmen, of all the South African human tribes, probably have the oldest ties with the Hottentot. But when and how they became his slaves we do not know. They are despised and treated with the greatest severity. Stealing cattle, for which they cannot compensate as they have no property, is punished by death. The nomadic hunting life of the miserable remnant of the Bushmen in Namaland does not permit any intermarriage with the families of their masters and makes their position of dependence seem slacker than is usually associated with the status of slave. [Plate XIV. Bushman from the Sandfeld, of the tribe of the Gobanin.] [323] It is based less on force that on the willing subordination of the weaker people, in the expectation of small handouts of the necessities of life although also with the knowledge in the back of their minds that they are completely without rights.

More closely tied to the Hottentot families are the Bergdamara or "mountain Kaffir". We will not discuss the mysterious origin and the ethnological characteristics of these very dark, thickset, middle-sized people any more than we discussed the Bushmen. We are only interested in the Hottentots' opinion of them.

648

The first contact of the Hottentots with the Bergdamaras goes beyond any time from which we have historical dates. Pieter Brand, the companion of the explorer Willem van Reenen (14), who led an expedition in

14. G. M'Call Theal, History of South Africa, Vol. I - VI, London, 1888-1902.

September 1791 into Great Namaland, found the language of the Hottentots in use among the Bergdamaras. Their own mother tongue seems to have been forgotten at that time as it is today. Although the Bergdamaras have obtained their freedom under the German protectorate and have been freed from the yoke of the Hereros as well as from that of the Hottentots, they have often remained in voluntary dependency as household servants as the Buhmen have.

Although generally known as good-natured and docile and therefore treasured by the whites, the derogatory name given the Bergdamaras by his oppressors has remained. The Hottentot calls the Bergdamaras ǂau-daman, i.e. shit Kaffirs." I also heard them called ǂhau/kxoĩn, i.e. (according to the claim of the Hottentots themselves) "Manure people."* A friendly

*Derived from ǂhau/b = manure. Krönlein (57) [114]
57. J. G. Kroenlein, wortschatz der Khoi-Khoin, Berlin, 1889.

does not know this word and derives the above designation, which, according to him, the Bergdamaras have given to themselves, from the word for "to be right." But to my ear it is not ǂhau/ but sounds like ǂhau-, the two vowels pronounced separately and with a rising (one third) accent. I can only place my opinion beside Kroenlein's as the actual result of my findings without deciding which is better. Schinz (50) mistakenly writes !haukhoin and his

50. H. Schinz, Deutsch-Südwestafrika, Forschungsreisen (1884-1887) durch die deutschen Schutzgebiete etc. Oldenburg and Leipzig, 1891.

typesetter muddled the click even more in the index.

half joking address, also used for the baboon, which the Hottentot sometimes uses with a Bergdamara, is °/no-ro /kxo-nibetse, with a reference (unclear to me) to an edible plant. Or he calls him the same as a baboon, °/hu-nitsi /hai-tse, mockingly, saying he is as pale (/hai) as the /hunis tree (a Boscia species).

[324] Of the tribes that are grouped together as Bantus on the basis of their common language structure, we can pass by the Ovambo, /nabe-n, and the Bechuana, b(e)rin, i.e. goats, as only coming into occasional contact with the Hottentots. The Hottentots have only tested their strength in centuries of ancient enmity with one Bantu tribe, the Ovaherero, who penetrated into the lands south of the Kunene about 100 years ago. (70)

70. Fr. Ratzel, Völkerkunde, 2.Aufl., 1894.

The power of the immigrating Hereros was broken by the Hottentot tribe of the Red Nation and the followers of Jonker Afrikaaners about the middle of the previous century. But from the beginning of the sixties the tide turned and after bloody battles the Hottentots were completely defeated. But a subordinate role of conquered and victors similar to that between the Bergdamaras and the Hottentots did not develop. [Picture. Hereró, 17 years old, with his mouth open to show his teeth. The four lower ones have been broken and the upper center incisors filed.]

The great wealth of cattle, about which all the battles revolved, gave the Hereros the name go/ma-damab, i.e. °cattle Kaffir.° Another mocking designation for the Hereros is °ǂna-/nomagye//habo-kxoũ-an, i.e. °the human - (kxoũ-s, fem.) children (o-an) with skin shoes (//habo-), who do not (tsuma) look around (ǂna/s)°: The crafty Hottentot, who never leaves a place without looking back to orient himself as to what is happening behind him, thus expresses the heedlessness of his opponent with this nickname.

2. The Relationship of the Hottentots to the White Race

a) The first contact of the Hottentot with the white man, /nũ-s, occurred at the end of the fifteenth century, in the golden age of the Portuguese. Curiosity and a thirst for knowledge on the explorers' part but also fear on the Hottentots' part were naturally the dominant feelings at the first meeting. So Vasco da Gama's people (12) had to surround the natives whom

12. G. M'Call Theal, History of South Africa, Vol. I-VI, London, 1888-1902.

Hoveve, 17 years old, with his mouth open to show his teeth. The four lower ones have been broken and the upper central incisors filled.

[p. 324]

they discovered in November, 1497, at the foot of a hill in the St. Helena Bay and catch them like wild animals to have any contact with them. The good treatment of the one captured and the rich presents received when released lured others of his tribe to the ship. They also got something and so both sides were pleased.

Distrust, based on the impossibility of understanding each other properly, soon split the recently formed bonds. The soldier, Fernão Veloso, was on his way accompanying the natives to their village, when he suddenly got suspicious of their intentions and hurriedly turned back to the ship. The Hottentots followed him -- as it seems without hostile intentions, because it would have been easy for them to kill him. The men on the ship were mobilized and landed with their weapons and the parties separated with bloody heads, without really knowing what was the reason for the whole affair. Distrust also seems to have been the reason for a skirmish that Saldanha had in 1503 with the Hottentots near Table Mountain by Capetown.

The rash decision to revenge a scuffle between Hottentots and soldiers of the ship with a punitive expedition, in which the soldiers were apparently at fault, sent over sixty Portuguese to their destruction on the first of March, 1510. It seems incomprehensible to us today how the Viceroy of India, Francisco d'Almeida, who was traveling through, could not only tolerate but also personally lead an expedition of revenge and cattlerobbing during which even children were abducted from the peaceful kraal, all for the sake of avenging a trifling matter which had cost no lives, but merely wounded his pride. He and a dozen of his dignitaries were killed by blows from sticks, stones and assagais while doing this.

The successors to the Portuguese at the Cape, the English (see p. 34) had good experiences with the Hottentots. The trade went well (a sheep was traded for a knife, an ox for two knives) [326] and there was no friction. But in the long run the relationships of the whites to the natives have suffered under the Portuguese as well as the English from their sending criminals to the Cape, men who have forfeited their lives or freedom at home but who still seem to be unable to track down Hottentots. Although we know little about the fate of these deported people and almost nothing about their activities, still it only seems likely that they have not inspired the natives with confidence or respect for our race.

At the beginning of the seventeenth century the Dutch entered a badly predisposed country. They did nothing to improve it (59) until Johann van

59. H. C. V. Leibbrandt, Precis of the archives of the Cape of Good Hope, Riebeeck's Journal, part. I-III, Cape Town, 1897.

648

Riebeeck realized that the opening of the natural resources of the country was only possible with the assistance of the natives and systematized the relations of the yellow and white races.

For understanding the time of the first close contact between the Dutch and the Hottentots the diary of van Riebeeck is a most valuable document because it describes not only the facts but also in the short daily phases of development which are precisely noted, he documents the motives and aims of the people involved. Here not only the historian but also a person who watches the meeting of two extremely different human races with psychological interest comes to account. We must be content here with merely a few hints. In the first stage a mutually friendly and obliging 459
manner reigned and peaceful trade was concluded on both sides. Copper and tobacco and also spirits were the best articles for barter. Three 648
pounds of hammered copper and one third of a pound of tobacco was the price of a cow, a pound of flat copper and some tobacco for a sheep, one quarter of a pound of copper wire and some tobacco for a lamb. Game, sometimes elephant teeth and young ostriches were traded cheaply.

In the second stage a decline in the desire for copper brought on a price increase on the part of the Hottentots. After they had enough copper, the Hottentots no longer wanted to sell their cattle, from which they lived. But freshly slaughtered meat was a necessity for satisfactory provisions for the travelers to India and since provisions were the only purpose of the white settlement in South Africa, ownership of cattle was just as much a question of life for the Dutch on the Cape as it was for [327] the Hottentots. And so the first discord appeared and with it the old distrust -- not without reason -- on both sides. The Hottentot could not resist the temptation to take possession of his sold cattle again and stole. What he sells from now on is of inferior quality. He gives the white men hope that the next ones will be better and in the end deceives them.

On the other hand the Dutchman, incensed by this behavior of the Hottentots, have their own crooked designs. He waits for the proper 648
moment to further his own interests brutally and conceals his plans till then. Just as previously in England using criminals as an avantgarde against the Hottentots was justified with the reason that it was "a very merciful deed for these criminals and a way to lead them to God since they were given time for penance and for praying for forgiveness of their sins etc.," in the same way the Dutch-Indian Trading Company received the following recommendation from the officers (July 26, 1649) concerning the erection of a fort on the Cape: not only was it good business but by converting heathen "many souls would be brought to God -- certainly the very best deed for the glorification of the Highest One and for the

spreading of His holy Gospel. In this way your undertaking in India will be blessed again and again." Van Riebeeck also believes that he will attain his goal without offering God shares of stock. He hopes to exploit the Hottentots' blind confidence at the right moment to rob cattle on a large scale and to capture a lot of slaves for India (Entry in the diary for the 13th of December, 1652). For this purpose he suppresses his annoyance, is friendly and considerate, all of which the Hottentots take for weakness. At the same time bitterness increases on their part as the native sees himself pushed out of valuable stretches of pasture by the foreigners.

In the third stage open enmity appears, complicated by the traitorous behavior of individual influential Hottentots who are playing a double game with the Dutch. Theft of cattle and murder here and there seems to eliminate all chance of an agreement but after a while peaceful relations are renewed and barter flourishes again. This unpredictable switch from friendship to enmity characterizes the relationship of the whites [228] to the Hottentots from the beginning and characterizes it up to our day as the relations of the two races moved beyond occasional friction to the stage of a conscious and ever deepening collision of interests.

We do not wish to give a history of the Hottentot wars. He who would write about them, would have to study in detail how the Cape Colony of the British Empire grew from the little stronghold and vegetable garden of the Dutch Indian Company. We are only concerned about becoming acquainted with the people who were in command on the white side in the battles of the following centuries. We must use van Riebeeck's colony as a base. It received reinforcements first of all from Holland and from France after the revoking of the Edict of Nantes. These are the ancestors of the present-day Boers.

b) The Boer has become the cultural pioneer of South Africa. A tough body, a fertility undiminished by the new climate, endurance and a minimum amount of physical and spiritual needs enabled him to found permanent settlements with the few cultural means which he brought from his homeland and to push deeper and deeper into the interior of the country. History depicts him as a brutal egoist. In order to understand the Hottentot's opinion of him, it is necessary to seek out the Boers who live in the remote northern parts of the Cape Colony today. You will still find here strong remnants of the autocratic feelings that became second nature to the Boers in the seventeenth and eighteenth centuries on his lonely frontier post of civilization. He only feels at home there if no white man comes within four miles of his hut, where he himself prescribes the rights and customs for his family and especially for the natives who are in his power. Today he

grudgingly gives in to the law before which the native is a being with 695
human rights. The idea that one has responsibilities to one's neighbors,
when combined with the idea of the common weal, involving some denial
on the part of the individual, is but a vague concept for this family hermit
in northern Little Namaland, either politically, socially or religiously.
Even a formal marriage contract often seems unnecessary to him. That
his children are legally illegitimate does not bother him. That they grow
up unbaptized does no damage to the standing of Christian families among
his own kind. At the end of the nineties an English minister discovered such
paradisical conditions [358] in the area between the mouth of Orange
River and Port Nolloth. Then bearded men were baptized and grandparents
married to make the grandchildren legitimate. The only social instinct
that the Boers still possess is their hospitality.

This lack of political unity degrades the Boers of Namaland in the eyes
of the Hottentots. The hereditary captaincy is the proud expression of a
tribal right to the possession of land as well as of an orderly (according to
his concepts) national life. From this standpoint the Hottentot, aside from
his hate of the intruder, despised and still despises the Boer settler as a
newcomer and masterless person, and points to the Germans in contrast
who, as he does, have a captain and are one nation as he is.

Much stronger than such national feelings are the purely human feel-
ings which have alienated the Boers from the Hottentots for ever. The
Boer has always openly treated the natives with such a scorn for the colored
race making an understanding impossible by its very nature. This scorn is
characteristic of the Caucasian at a low level of racial and national con-
sciousness. Even today the Boer calls the Hottentot a "schepsel," i.e. a
creature in the sense of a being that happens to exist next to him as so
many other mysterious and unnecessary things do in the world. Or he calls
the Hottentot "goel goed," "yellow goods" which one can harness or trade,
as one does cattle. The custom of seizing Hottentot children and rearing
them "goot maak" is less rewarding than formerly when the master still
had complete power over the life and death of his slaves and punished dis-
obedience or running away by shooting them. That the culture penetrating
the country has taken away these ancient rights is the chief reason why
the Boers whom I met in Little Namaland despise the English rule (which
otherwise leaves them as free as can be imagined).

These Boers were strangely disappointed when they discovered that
the Hottentots also have rights in the German territory to which they wished
to migrate. When I became better acquainted with the Boers, I tried to
get an explanation from them, as to what they imagined that their God,
before Whom they knelt three times a day, might think of their concept

of neighbourly love in regard to colored people. I was referred to the Bible. I would not have taken their arguments from the Old Testament [330] seriously, if they had not been presented so seriously and if they actually had not been used in other places as a guide for their activities. In the ninth chapter of Genesis Noah damns Ham's son Canaan and his descendants to slavery. The Boers have extended this curse to all Hamites and include the Hottentot in this category, looking upon him as a born slave. Who is now the lord whom God has placed over them? What the people of Israel were in the old covenant, Christ is in the new. In the seventh chapter of the fifth book of Deuteronomy the extermination of the Canaanites is ordered. So God has placed the Christian Boer as the heir of Israel as lord over life and death of the cursed descendants of Canaan down to the last generation (the natives of South Africa). The Boer clings to this interpretation the more narrow-minded he is and the greater his racial pride is. This kind of gospel is a cover for the more liberal-minded that reveals most clearly what it is supposed to hide: the unbounded egoism of the Boers, that left the Hottentot no alternative than relentlessly to pursue a slow war to the death. Whoever had the upper hand in such a situation acted and still acts where the power of law is inadequate according to this concept.

c) The Hottentot entered a diametrically opposite relationship with another class of white men, the representatives of the Christian missions, which are maintained today in Great Namaland by the representatives of the Rhenish missionary society of Barmen. Whoever reads the older reports of this society can measure the difference between the present day Nama-mission and the one of fifty years ago. At that time service among the Hottentots in this country without any government, where there were many battles among the natives, was a sacrifice of the first rank. Without any government protection the missionary threw himself on the mercy of the people, following the restless tribes on their migrations and sharing hunger and thirst with them. In order to keep in closest touch with the people, the missionary did not even shy away from marriage with a native girl. Gradually the opening up of the land led to the establishment of permanent mission stations. The protection of the government gave new guarantees to life and property and today the mission houses are the best and prettiest buildings in the country thanks to the excellent trade schools of the missionaries. They are places not only of work but also of comfort and, as I would like to emphasize with honest gratitude, show the traveler friendly hospitality. [331] The swing towards

the better in the material conditions of life at the mission has certainly 797
contributed not a little to the solidifying of their prestige among the Hottentots. But even aside from this the Hottentot has a great measure of reverence and (when he does not have to fear shocking pious feelings) trust for the missionary in the knowledge that he has in him the best representative of his spiritual and bodily interest.

Only a blind enemy of the mission would fail to recognize the meaning of this bridge which Christianity has built for the peaceful understanding of two heterogeneous yet interdependent human races and its importance for the cultural development of the country. But it is also as clear as day that the mission will become the curse of the land when it loses sight of the political or economic good of the country in a one-sided pursuit of clerical and hierarchical aims. For the most part this well-being depends on the extent to which the struggle of the various interests of the native and of the invading races can be peacefully regulated in proportion to the economic contributions of the competitors. This is a truth that is often ignored both by the humanistic utopian as well as by the egoistic of power. It is necessary to picture the disasters of the native labor question in the Cape Colony in order to understand how economical it is to be able to combine one's interests with those of the native (even if it is only the despised Hottentot). The first condition is naturally an exact knowledge of the necessities of life and the ideas of the natives. As long as it is only the missionaries (with a few exceptions), who find it worthwhile to establish this contact on the basis of thorough studies, just so long the mission will have a high secular trump in its hand. It has played it successfully during the eighties in the Herero country and in Namaland, by disabling English influence in favor of German. (78)

78. C. v. François, Deutsch-Südwestafrika. Geschichte der Kolonisation bis zum Ausbruch des Krieges mit Witbooi, Berlin, 1899.

How do matters stand in spiritual affairs? Can the mission be satisfied with the successes in the Christianization of the Hottentots?

Older missionaries with whom I spoke gave a negative answer. The work of nearly a century should have ripened other fruit. To what extent a Hottentot is able to accept the spirit of Christianity so that it determines not only what he does not do but also what he does, could best be judged by an unprejudiced missionary. My own [332] rather sad experiences in this area have been confirmed too frequently for me to believe them to

he unfavorable and happenstance judgments which biased my general opinion. Although I generally mixed with those Hottentots who did not belong to the elite of the missions, I also avoided the lowest level which would have readily given me good reason for the most pessimistic judgment. 797

Not the least part of the average Hottentot's judgment of Christianity is that it is an advantageous attribute of the white man. Just as he considers himself better in the white man's jacket, trousers and bright coat than his brother or sister in a skin apron, so he also sees his membership in the Christian church as a social accomplishment in keeping with the rank of modern Hottentot. This view is usually combined with disdain for the old customs of his people, even when they do not come in conflict with the new religion. One might accept this mutilation of the self if it were only the overenthusiasm of energetic resolution to elevate oneself to a new level. But the Hottentot is too lazy and also smart enough to see clearly the contradiction of Christian theory and practice in the social and private life of the white man (cf. folk tale XXVIII), to set himself different ethical ideals than those from the heathen era that at best still serve as the social norms of his own people: loving one's neighbor which for the Hottentot means reciprocal help, respect for age, restraint in regard to the property of others (if only in regard to that of other tribal members), these are all autochthonous commandments that coincide with those of Christianity.

The folk tales and the other imaginings of the Hottentots had perhaps so little in common with Christianity that the two could not be organically joined, as germanic heathen traditions were to Christianity. The moral principles and rules of conduct of the Hottentots that we have learned about are rooted in the tradition of folk customs. The loss of these folk principles along with the complete revolution in the economic basis of their existence since the dominance of the white man has left the Hottentots ethically ruined. Such destruction cannot be repaired with a Bible, catechism, hymnal, attendance at church, Sunday school, holy communion and classes in reading, writing and singing. That attempts have been made to reach such a goal by these methods, would never be held against the individual missionary who has dedicated his life to these people. [808] The harm lies in the system. Only he may bear the name of the Founder, whose whole life was a single great self-sacrifice, who is at least capable of the smallest sacrifice in the service of his fellow man, namely, of work, even though it be only for

himself and his family. In this sense few Hottentots have become Christians. The systematic education of the natives for work has been demanded often enough for economic reasons. But this seems to me to be an unavoidable religious requirement of the Christian mission. Work represents in Namaland, as in every colony, the only possibility that the native has to hold his head economically above the tide of the inrushing cultural stream. And experience has shown further that a primitive people that is economically demoralized is also morally demoralized because it is for sale for any service to the superior race for its own livelihood. Thus the requirement that the native be taught to work does not seem to the missionary a secularization of his duties but only points a way to a firm basis for his religious duties. Moreover the white population is more grateful for a Christian trained for work than for ninety-nine candidates for heaven that know the Bible well but don't want to work.

Whether it would prove successful to appoint a special official for native affairs according to the English model, whether such an official could work together with the mission in the execution of his duties towards a systematic training of the natives for work and towards an organized employment bureau and labor welfare, must be determined by a trial, if possible before the English employers have drawn our best workers away from us across the border. Then we will also see whether the Protestant or the Catholic mission is more vital in this area. In the future this decision may have consequences far beyond the bounds of the mission.

d) The relationship of the Hottentot to his German master. The Hottentot learns our language quickly, at least to understand it. He observes foreigners carefully and has the sense to hide his opinion. In all three points he differs to his advantage from the majority of our people. It cannot be held against the settler and the merchant that they show no interest in the difficult language. That an official can triple his influence over the natives when he masters their language is an old saw, but one would have run into enormous [334] difficulties applying the moral to the Hottentot language if one had ever thought of applying it at all.

There is usually only contempt felt for the Hottentots' language because of its clicking sounds. That can be harmless enough, but a large part of our countrymen are content with finding only the humorous aspects of the Hottentot and that is more serious. If the hundred little upsets are then added, which no one can avoid who has to depend on natives in his work, then all these feelings combine with the outward impression of a ragged, dirty fellow to a general opinion, which is unconcealed scorn.

This scorn may be humorous or bitter depending on the experiences and situation of the individual, but usually there is combined with it our feeling of enormous superiority that seems to make any closer study of the Hottentot unnecessary. We think we can manage him without this knowledge. 648 649

In addition enormous contrasts appear in our dealings with him. A captain, whom on occasion an official invites into his house as a "leader," is offered hospitality by a trader with the words "Will you have a schnapps, old pig?" On the one hand a white man is punished because he ejected a wise-aleck Hottentot bodily, but on the other hand an official in an understandable rage dealt out stripes himself. Punishment in itself is not the bad thing; it is the contradictions in the treatment that are. One may deplore the ruthless methods of the Boers in particular; the consistency, however, with which even the gentler Boer, in complete agreement with his own people, sticks to his severe principles towards the Hottentots, is the heart of that which must be admired, namely, the ability of the Boers to deal with the natives.

Such a uniformity in the treatment of the natives cannot be achieved by ordinances. It must be the spontaneous expression of a consistent appraisal of the native's character and of the situation. Those who know the Hottentot agree that two things are essential to get along well with him. In innumerable cases I have had the experience that a Hottentot expects punishment if he is convinced he deserves it. In his eyes it is a sign of weakness or stupidity if the punishment is remitted or given a sugar-coating. He may [338] thank you touchingly for your indulgent pardon and if he is a Christian wish you the reward of the "Lord Jesus" -- but he who can see behind the facade knows that the Hottentot is amused at this kind of treatment (cf. folk tale XLI); he wants to be treated firmly. The demands of justice should be emphasized in the interest of authority, even when it is not a matter of serious punishments. The harsh and blind scolding of a number of Hottentots by a high official, who could not even speak Dutch with them, was interrupted by a Hottentot (who thought that only his own people could understand him) with a warning to his companions: "Ikgau/ hã gaigye tã kuom." "he is crazy, therefore do not speak." Such situations can occur more often than is good for the strengthening of our prestige, even in the short time that the individual official is allowed to stay in the southwest (cf. the chronicle of the district bureau of Keetmanshoop).

Also the person who is not an official should be aware that his private dealings with the natives in the half-civilised land are not purely private matters. Each individual directly bears a part of the responsibility for the good or the bad relations of the two races. The result of these meetings, in which the individual bears direct responsibility is the sharpest test of the maturity of a people in dealing with other peoples. Here we show up clearly as novices. We fluctuate too much between undisciplined fraternization and bureaucratic overbearing. The middle way is not natural to us yet: the understanding of foreign peculiarities while quietly maintaining our own superiority. Our cousin on the other side of the Channel is more cosmopolitan. 648

In the meantime we must openly confess that the Hottentot knows us better than we do him. Even while aware of his own weakness he never loses interest in the study of the white intruder. Taught for generations and from boyhood up to operate with trickery he only lets the white man see the results of his observations of humans in the rarest cases. We have lost a great deal in not recognizing this situation. In the critical time after the outbreak of the Warmbad unrest, think what was said about war policy around the beer bench in front of the stores in the presence of Hottentot men! Relentlessly, when patriotism had reached its height after the sixth bottle, the refrain was "What can the fellows do?", after some-one had hinted that unbidden listeners were there. And they miss nothing: they comment more thoroughly on such [336] idiotic and thoughtless speeches than on any of the governor's decrees. Whoever thinks he can demand every kind of service from the Hottentot for tobacco and bad gin, ought to have at least as much information about the families of this "trash" in these critical times so that he does not select the man to spy on the leader of a band from a related family.

But we will not give any further examples here. Even without them the conviction that underestimating the Hottentots in the small matters of daily life as well as in the most important was a basic error in our relations with the natives will make headway. We have had to pay for this mistake so dearly with blood that it is the duty of every witness to point it out that it may be avoided in the future.

He who measures the Hottentot as a fighter not exclusively according to the measure of the dragoons or the paragraphs of the Geneva Convention, cannot deny him recognition in more than one point. To be sure, one does not need the eyes of a general to recognize that it was not Hendrik Witbooi who was our chief opponent in the battle with the

Hottentots but his ally, the countryside, that showed waterless deserts, pathless mountains or interminable flatlands between us and the enemy. The enemy vanishes here with his entire outfit. His provisions come from the living cattle that the children drive and the women milk. In remote districts or rocky hollows that only the native herdsman and hunter know they find water and they sleep in open bush-kraals as they usually do when they go out with family and possessions for weeks and months seeking pastures. And so the Ovaherero Hottentot feels himself to be in his own element no matter how badly things are going. We had the task to transplant all at once and efficiently our entire cultural superiority into a country where it would normally take decades for the culture to conquer. In order to mobilize all the resources of modern war here it meant that, long before we could attack the enemy, we had to do battle with nature, which even today places enormous demands on the individual.

The Hottentot is our superior in this battle, not only because he can live on meat and roots, -- experience gives [337] him the edge. Our army is like wild game to the Hottentot, which he hunts with assurance, as he has learned the tricks in former battles. Whereas our soldiers pay the cost of learning in blood again and again, he uses his old methods. He waits in ambush for the enemy at the water hole just as he did for the zebra at the Vlei. He fires at a pawing detachment from the rocky hiding place as he did at a herd of migrating springbok. He stalks a weak patrol as an oryx antelope in the early dawn. He surrounds a supply train the way he surrounds kraws when encircling them to throw the kirri at them.

And when he himself was surrounded, how did it happen that he always escaped again? During the entire war our troops tirelessly covered the battlefield in all directions with patrols, covered the entire country with a net of telegraphs and heliographs at enormous sacrifice and then overcame heretofore insuperable difficulties of time and space with wireless telegraphs. (78) That the Hottentot often surpassed us in pawing

78. L. Schultze, Nachrichtenwesen während der Kämpfe in Deutsch-Südwestafrika ("Tägliche Rundschau," Jahrg. 1908, Nr. 511 u. 513).

information in spite of all this, reminds us most uncomfortably of that which we easily forget from pride in our cultural level: the fact that simple practice of the naked senses of a primitive race plus primitive intellectual experience, sharpened only by everyday things, can be

raised to such perfection that they can compete successfully with a numerically and intellectually far superior power, using the most modern equipment. 648

The strength of the Hottentot in comparison to his enemy, who is trained from youth to work cooperatively and according to regulations, lies in the independence of each individual. When we compare him with the German soldier, we see how many primitive abilities gained by direct contact with nature have been lost by us.

Added to this is the fact that the Hottentot warrior often is a mature man. The youth of our soldiers is very evident to him and he is aware again of a definite superiority in this area. One designation for the German soldier, which has lasted from the times of our former battles with the Hottentots, is "!gaikxpaos //gaĩ-uxaob, i.e. "the little boy (a-xab, boy; -s, dimin.) from the foreign place (//gaĩ), whose dress (the uniform coat that fits snugly across the small of the back) is fastened (!gaĩ) at the rear (uxaob)". But even though he laughs at his opponent here the way a sly old poacher does at [338] at a young game warden, he has still felt the strength of our soldiers sufficiently. He expresses his recognition in the expression "!hani!o/m. !o/m is a so-called "haikop". These animals are harder to handle than the usual oxen because of their lack of horns. They pull their heads out of the noose if they are yoked up in the usual way. They stick their heads through barriers that would be protected against horned animals. One is never certain about them. To the recognition of this readiness to fight, they add, without stretching the metaphor, the striking color of our blond (!hani, yellow) hair to the name.

I have not been able to find out from the Hottentots many details of their battle customs. In order to steel himself to his bloody work, the 726 man who has never killed anyone supposedly drinks the raw blood of a slaughtered animal before he goes into battle. [Picture. Hottentots' War Pipe.]

The battle reports of the troops will give the best information about 726 tactics. Signals are frequently given on a pipe that is carved from the horn of a female springbok. Since this signal pipe, !gâ/b, is blown the same way as a dance pipe, it is also called a reed or blowing horn, !nã/ĩ!nâ/b or "!oa!/ĩ!nâ/b.

It is the job of one of the sub-captains to determine whether a place or water hole which the troop is approaching is occupied by the enemy or not. He rides up spying, while his people conceal themselves around it. Not until he lets out a long drawn-out whistle do they appear. In this way the Hottentots are supposed to have approached the water hole /Aos in the

Hottentot war pipe.

year 1890, in order to attack Kubub on the following morning. A series of short whistles, which [339] must be answered from those lying across the way or on the sides are usually the agreed-upon signal for a general attack. 726 202

The Hottentot also seeks hints from magic in war, when his knowledge fails him and his uncertainty gives him no peace. Under certain conditions an oracle stick, called "go-bo go-bos, gives him peace. It is a piece of wood about as long and thick as a pencil, around which a leather thread is rolled as can be seen in figure a. [Picture. Figures a and b] After the wood has been wrapped thickly in the middle in this way, it is rolled like a whisk on the flat of the hand and the question that needs an answer is asked in time to the rolling. For example: "go-bo go-bo a-maß , kxo-egu go ǂuo-aß?," i.e. "Gobo stick, gobo stick, is it true, have the men shot?" Then the thread is unrolled. If it is still as loose on the stick as before, then the wish that lay in the question has not been fulfilled. It is fulfilled when the thread lies across the wood as figure b shows. 726 737

A ring around the moon, "xoǂgâ-b, (the moon is as though thrown, xo, in, ǂgâ-, the colored ring) is considered, at least that is what a Hottentot warrior told me, a sign that something decisive has occured and the cattle of the conquered have been driven away. Sudden ringing in the ears or an insect flying into one's mouth is a sign of misfortune.

The ability to see in a dream future events or ones occurring far away (//ga-hexab) has probably driven many a leader to take a decisive step even when he is less talented for oracles than old Hendrik Witbooi.

Capitulum V

Intellectual Activity

A. The Language of the Hottentots

From older writings we know that the language of the Hottentots was split into many dialects. They have vanished [340] except for one, as the tribes themselves have who spoke them. Remnants are gathering dust in manuscripts in the Grey library in Capetown.(77) No attempt has yet 177

[p. 339]

shown whether the fragments published by Lichtenstein, Burchell and Wuras of the !Kora dialect, whether the parts of an eastern dialect which Sparrmann, Thunberg and Barrow have heard, and whether the notations of Herbert, Ten Rhine and Witsen of the dialect of the Capeland Hottentots of the seventeenth and the beginning of the eighteenth centuries could be so arranged that they would at least give us a vague picture of the lost languages. The tribes of Great Namaland now form linguistically unified group with the fugitives from the south. Their language is that of the old Namas or Namaqua as older authors write using the former ending of the masculine plural. 197

The language of the Hottentots was the greatest hindrance during the first six months of my journey in getting closer to the spiritual life of the people. In the second and third year it was the most fertile source of my studies. Where war troubles or the unfavorable time of year stopped my zoological studies, I turned to the study of the language. A small work by Theophilus Hahn (78), a concise presentation of the 114

78. Th. Hahn, Die Sprache der Nama, Leipzig, 1870.

language that contains many errors by A. Seidel (79) and especially

79. A. Seidel, Praktische Grammatiken der Hauptsprachen Deutsch-Südwestafrika's, Wien, Pest, Leipzig, (ohne Jahreszahl).

Knenleins Wortschatz (57) gave me a firm start and later a basis for

57. J. G. Knenlein, Vorschatz der Khoi-Khoin, Berlin, 1889.

testing my own results against older ones.

The Hottentot words in the text all stem from the natives. If I have avoided all the information of the whites who know the language, it is not because I underestimated the help that I could have received here, but because I wished to drink exclusively from the source. Therefore I have also avoided natives who could read and write, because they looked at their own language through the glasses of the white man who first gave written signs to these sounds, partly in close connection with the Dutch

language. I was interested in the spoken word of the linguistically pure Hottentot. The difficulties of making oneself understood with illiterates had the advantage that they concentrate all their attention on listening and when I was attempting to repeat what I had heard in a phonetically correct manner they demanded a much stricter accounting than would have been required in any agreement on paper on the basis of conventional signs. In this way I first established the native names for the animals [341] and then for the plants which I gathered. From these studies chose other linguistic stimulations, in the way that a simple example will illustrate. One Hottentot, whom I asked if he had ever seen the large, South African ant-eater, the aardvark,which animal is very difficult to shoot, promised, to my great amazement to bring me one that same evening. He brought a root, because I had not pronounced the Hottentot term for this animal with the accent on the last syllable and with a rising word-tone (/kxûbe-é), but with the accent on the first syllable and with a falling word-tone (/kxu-bee). Such misunderstandings occurred frequently in the course of the first year. They showed me again and again the necessity of never leaving out of consideration the phonetic side of the language and of marking every new word immediately with diacritical signs, since I might have to differentiate it later from a similar sounding one.

The counter check, whether I had used enough signs to differentiate similarly sounding words and had chosen the right ones, was simple. After several days I would pronounce the words I wished to test to a native, reproducing them exactly from the chosen signs and then I saw at once whether he had understood the meaning clearly or not in the sense that the written method wished to convey. I then compared the results of this method with the customary way of writing it and soon came to the conviction that there were not sufficient signs in use to reproduce the sound relationships of the Nama language as was necessary from the phonetic viewpoint and as was desirable in the interest of a clear differentiation of similarly sounding words.

In the stories that follow later I shall give examples of morphology and syntax of the Nama language. I will restrict myself here to giving the results of my investigations of phonology.

1. The Clicks

Clicks are the most noticeable sounds in the Nama language, and learning to differentiate and pronounce them belongs to the first and

unavoidable elementary stage. This has been the stumbling block for many who wished to learn Nama. Once you have learned to distinguish the four clicks by ear, then you [342] can make the job of reproducing them easier by having a native pronounce selected click words slowly and at the same time look as far down his throat as possible without influencing the tone by any interruptions. You will then see and hear that the shape, the placing and the withdrawing of the tongue determine the character of each click.

The click sounds of the Hottentots have been compared to the "inspirata" and the "expirata" of the consonants (78), unjustly in my

78. Th. Hahn, Die Sprache der Nama. Leipzig, 1870.

opinion. The question, whether inspiration or expiration is involved in the formation of the clicks can be tested by anyone pronouncing a click. You must hold your breath and try to click. The sounds come forth effortlessly, powerfully and typically. The same is true for all four sounds, no matter whether they are formed during inspiration or expiration. Breathing, in other words, plays no part here. Rather the formation of clicks is exclusively an effect of the energetic withdrawal of the tongue from the place where it begins the click. In the empty space that is thus formed the air rushes in creating the four different sounds without any physiological assistance. The air also finds its way through the oral cavity but this inrushing is not inspiration. The independence of the diaphragm and the lungs is in my opinion characteristic of making click sounds.

The use of click-like sounds in the language of other peoples than that of the Hottentot - Bushman group of South Africa has not yet been systematically investigated. The dental and cerebral click sounds seem to have been transferred with least modification into the language of several South African Bantu tribes. But their use in word formation is not supposed to correspond to that of the Hottentots. I myself had no opportunity to compare the click sounds of the Zulus, Bantus, etc. with those of the Hottentots.

2. The Musical Modifications of the Nama Sounds

The musical modifications of the Nama sounds are supposedly sufficiently differentiated by three signs. Knenlein's signs are not precisely

defined by the author. Bleek says of them in the preface to "Wortschatz," probably basing his opinion on Th. Hahn or older authors, that they designate the middle, low and high tones." A comparison with the living language shows, however, that pure tonal levels are produced only in a number of cases. In most of the cases the signs are used rather for the designation of such relationships of sounds [364] that are combinations of very different musical elements. The usual three signs do not represent simple sound relationships in most cases but complex ones, reproduce them incompletely, since the sound elements are only partly considered, and the way they are combined not at all, and reproduce them ambiguously, because they reproduce similarly sounding words without consideration for the various sound components.

A. Seidel, who never heard the Nama language himself, in other words proceeds purely theoretically, differentiates the usual three tonal levels as "intonations", but does not see the various tonal levels as of a decisive nature in themselves, but the rising and falling of the tones as most important. This rising and falling of the tone has been now completely amalgamated with the tonal level in the most unfortunate way in that the start of the voice at the middle tonal level has been established as the point of departure. That is completely contradictory to the facts. The assumption that the voice always rises or falls from the middle tonal level when it changes its level is actually false and therefore the whole tonal system built on this assumption collapses.

Clarity cannot be won by abstractly adjusting and assimilating old concepts but only by a renewed study of the living language itself. Therefore, proceeding purely empirically, I wrote down all the phonetic elements that concerned the tonal level and its change, as soon as I heard them turning up repeatedly in a word. A special consideration of the accent later proved to be necessary and required a revision of the designations in that direction. The results of my observations, which were tested often over a period of time in every detail, are the following: the musical character of the sounds is determined in the Nama language not by those isolated modifications of sounds synchronized with a strong accent, but by eight sound modifications, which combine with each other as well as with the ninth factor, the accent, in many, many ways.

The circumstance, that Kroenlein's signs are already in use in two different definitions, of which one is too general, and the other of which contradicts the facts, has determined me not to adopt these signs in my orthography after several unsuccessful attempts to do so. They could only be used if they were redefined. Their use then would not correspond

[text continues on p. 197. -Trans.]

Summary of the Various Positions of the Tongue in the Formation of the Clicks

Name and Sign of the Click	Shape of the Tongue at the Start of the Click	The Starting Position of the Clicking Parts of the Tongue	Position of the Part of the Tongue that is not Clicking During the Stage of the Click	Direction of the Withdrawal of the Clicking Part of the Tongue from the Starting Position
Dental /	Flat and broad	The front end of the tongue is placed against the inner surface of the upper incisors and canines	The lateral edges of the tongue, while the front end starts clicking, are so placed against the inner surfaces, and partly against the chewing surfaces of the side teeth, that you cannot see into the oral cavity.	Far down, right behind the incisors.
Lateral //	Rounded like a bullet, so that the oral cavity is visible on both sides of the tongue, even when the tongue is placed to begin the click	blem of the back of the tongue rests against the palate	The tip of the tongue rests against the front palate, also partly against the inner surface of the upper incisors. The side edges of the tongue lie on the inner surface of the upper molars.	Perpendicularly down, but only so far that the back of the tongue remains considerably above the chewing surfaces of the lower molars.

Summary of the Various Positions of the Tongue in the Formation of the Clicks (Cont'd)

Name and Sign of the Click	Shape of the Tongue at the Start of the Click	The Starting Position of the Clicking Parts of the Tongue	Position of the Part of the Tongue that is not Clicking During the Start of the Click	Direction of the Withdrawal of the Clicking Part of the Tongue from the Starting Position
Cerebral !	Hollow like a basin, and broad	The front end of the tongue lies at some distance from the incisors against the front and middle part of the palate	The lateral edges of the back section of the tongue lie against the inner surfaces of the molars, just touching their chewing surfaces	Downwards and backwards
Palatal ≠	Flat and broad	The tip of the tongue lies closely against the front palate right behind the incisors	The lateral edges of the back section of the tongue lie against the inner surfaces and the chewing surfaces of the molars	Downwards and so far to the rear that the ligament of the tongue is visible between the front edge of the tongue and the incisors

L. Schapera--1933 H-S (1929-1930) 1931 FX15 Hottentot FX15 [345]

so that in Kröhnke's [345] "Wortschatz" and that would lead to misunderstandings. The following nine different musical modifications of the Nama sounds divide into three groups.*

* The terminal technics, which I had created for naming the newly differentiated sound elements of the Nama language, were reviewed by Professor Eduard Sievers in Leipzig and improved when necessary in the interest of a unified nomenclature. (81) I also received

81. E. Sievers, Grundzüge der Phonetik, 5. Aufl., 1901.

decisive assistance in the task of reproducing the phonetic elements in such a way that they did not over-burden the sentence and so that they did not pile up in a muddle when combined. I mention again in this place my heartfelt thanks to Professor Sievers.

α) The initial tone level. By this I mean the level at which the voice regularly starts when pronouncing certain words, compared with the initial level of the voice in other words.

These kinds of initial tone level must be differentiated; the signs which I have chosen for them are included in parentheses.

α) The middle tone is characterised by the fact that the voice does not begin either lower nor higher than on the average. What is meant by the "average tone niveau" of a person and how it varies according to age, sex and individual peculiarities, do not need to be defined in number of vibrations. One becomes so attuned to the organ of one's Hottentot teacher that one immediately notices a deviation of the voice either up or down. The middle tone does not need a sign. It is assumed wherever there is not a sign (if the signs for the tonal level are otherwise complete).

β) The high tone (sign: / after the sound) is characterised by the fact that the voice is higher,

γ) the low tone (sign: \ after the sound) by the fact that the voice is lower than normal.

194

If there is doubt about the type of initial tone level in a word, then a comparison of the questionable word with others made up of the same sounds is decisive. Thus you might doubt whether the word for "green" should be written !am or !a^{h}m, because the voice is so close to the border between the middle and high tone. A comparison with the word !am "to join to each other" which is pronounced obviously deeper down decides for the high tone (combined here with a falling tone extension). But that in this word the voice actually has a middle and not a low tone setting we learn from the designation for "glass bead," the word !a$_{l}$m, because the voice reaches its lowest level in pronouncing this word.

[344] The musical modifications of the Nama sounds stand out most clearly in their variations and in their value for the understanding of the language, when they separate distinctly two words that would otherwise sound alike.* To illustrate this meaning of the three different initial tonal

* The signs used here and in the following text are missing still in some few words which were mentioned in the previous text. The method of writing them that is used in the following list is the correct one.

levels, the following examples are presented: 194 192

1.	/aha-	a: end
	/a/ha-ŋ	a: the north
	°/a/ha-b	a: the taste of blood in the mouth
2.	!a//	a: to test
	!a//	a: to jump
3.	!a/m	a: green (as a verb: to shine around)
	!a/m	a: to join to each other
	!a/ma	a: the glass bead
4.	/a!!	a: to whore
	/a!!!	a: to listen
	(a!?	a: to sprinkle)
5.	/ga^{l}/m	a: to be warm
	/ga^{h}/m	a: two
6.	//ga!	a: to hang bead necklaces around the neck
	//ga^{l}	a: to be thin
	(//ga!	a: to go off to war)

194
192

7. //gx/ox-i
   //gox-b — n the skin sack
   //gox-b — f the hole that collects water in the rocks
8. /gox-b — f the obstruction
   */gx/ox-b — f the berry-like fruit of the Ilex kenea L.f. (Aquifoliaceae)
9. *!gx/ox-b — f name of a species of Rhinogum (Zygophyllaceae).
   !gx/ox-b — f the water bag
10. !gx/ — f to fasten a skin with pegs that is stretched on the ground to dry
    !gx — f to cross something on one's way
    !gx/ — v to make something even by lopping; to lump ankles when walking
11. gx/ — v to prepare sugar beer, to implant
    (347) gx/ — f to be laid
12. gx/ — v to hide oneself
    gx/ — v to become fat
13. /gx/n — f with bushy hair
    /gx/n — v to suck blood
14. /gx/ — v to give another nursing mother to a baby
    /gx/ — v to feel about in the dark
15. //gx- — v to beseech
    //gx- — v to threaten
    (//gx-a — v to become light)
16. /gx/o-b — n mud, the dregs of the sugar beer
    /gx/o-b — f the bed skin
17. /gx/oa-b — f the dregs of a liquid
    */gx/oa-b — v the striped mouse (see p. 187, no. 30)
18. /gx/ — v to push away with the fist
    /gx/ — v to bump into
19. //gx/b — f the father
    //gx/b — v the springbok
    //gx/b — f the tooth
20. //ha/i- — v to flee
    //ha/- — v to scrape hair from a skin
21. !ha/b — f the bone pipe
    !ha/b — v to cut up a fruit

- the strap
- the horn on the flint tinder box
- to be fat
- to knock off the burnt part from something baked in the ashes
- to provocate
- to hold oneself in readiness
- to uncover, lay bare
- to blow out air, kiss (*of* the horned viper)
- the rising up of the snake
- to do something for the first time
- to relax
- to hold back a bowel movement
- to squint
- to milk sheep or goats into the mouth secretly
- to follow tracks
- honey bear
- young
- to produce a dead calf
- to lay back the ears
- little
- to swoken
- to blink
- the beseeching
- hilly or mountain land, the Konso Highlands in the southern Hamar territory
- to bury
- to be coarse
- to make an arc, to go around
- the sled
- to the sword
- to have the bladder too full
- the cooking
- the kidneys

*to shoot out

38. /nu/ho • to grow hair
/nohe- • to scrape
39. !noe- • to become gray
!nu/a- • to run away (thy animals), to awaken
40. !no-/m • slovenliness
!no-/ha • the heel
!no/a-s • stumbling
41. /hua- s to quarrel
/hua/a- s to throw
42. o-a s to seek
o-/a s to increase
oa- s to calf, to lamb, to have young
43. o-se s to vomit milk (of a suckling), as a noun (-s) also: the milk in the stomach of a young, wild calf, just killed.
o-/se • of the predatory animal: running to fetch the buried booty
(ose- s to make free)
[349] 44. !o/m • to push
!o/m s to be without horns (of cattle)
!o/m • to become hard, to pull out a thorn
45. nu/i • thy mother
nuse • the pursuit
46. n/? • to sneeze
n/ s to send
47. uu- • to stalk game
u/ro- s to jump on an unsaddled horse
48. tsabi- • the habit of rolling the eyes around while watching
tsa/bi-s s the black ebony tree

b) Tone extension. By this I understand the difference between the initial tone level and the level of the same vowel or diphtong of a one syllable word., when it has been extended.

Three kinds of tone extension are to be distinguished.

a) The even extension is characterised by the fact that the voice ends at the same level at which it began. This staying the same does not need to be marked by any sign. It is assumed as given if there is no sign.

(1) The rising extension (sign: ↑ after the sound) is characterized by a rising.

(2) The falling extension (sign: ↓ after the sound) by a dropping of the fading voice.

The ear of the white man has to slowly become accustomed to these differences. For the native they are as clear as the rising of the voice for a question is for us or its sinking at the end of a statement. Examples:

1. ǂ • to weep
ǂǂ • to drink
ǂǂ • yes! (modified easily by emotions when the tone is extended.)
2. /ǂ • to wring out
/ǂǂ • to be sharp
3. /ɢ • to be wet
/ɢǂ • to pilfer
4. ɢ/ms • the mouth
ɢ/ms • the roast
ɢ/m • to the right
5. //gu'a • to bake a cake in the pan
(306) //gu'n • to pull in one's head
(//gu'an • verb - the leaving behind of the lamb at a definite place on the part of the mother.)
6. !gu/m • to have gonorrhea
!gu'm • deep
(!gu/m • to bow)
(!gu'm • to kill)
7. /gǁ • to collect cattle of the same color
'/gǁ • not wanting to give away his last bit
(gǁ • to have twins)
8. ɢǁǂ • to be sharp
ɢǁ • to set up a scarecrow for animals
(ɢǁ • to turn aside)
9. //gǁ • the dish that is made from the breastbone of the ostrich
//gǁ • compulsion
10. !gǁ • the long reed mat
!gǁ • following a track

	ǃnī/	• wearing an apron behind
	ǃnī/	• to let someone ride on your shoulders
11.	ǂhxā/m	• chewing different foods at the same time
	ǂhxā/m	• pouring in
12.	ǂhxā/b	• the surface
	ǂhxā/b	• pushing in front of one or shoving
13.	ǂhxā/b	• the seed
	ǂhxā/b	• a black stone (such as is found near Aar in the neighborhood of Kubub, for example.)
14.	ǂhxā/	• pouring out
	ǂhxā/b	• the knapsack
15.	ǃhā/	• to fall on one's elbows (said of the small child that is creeping on hands and knees.)
	ǃhā/	• to mock
16.	ǃhx-/mi	• the mountain
	ǃhx-/mi	• the sail (see page 41)
17.	ǃhx/m	• to be lame, also: to untie oxen from the yoke of the trek rope (to span them in front of another wagon.)
	ǃhx/m	• to swallow something hot
[181] 18.	ǃhx/	• to blow something up
	ǃhx/	• to blow oneself up, to be inflated
19.	ǂhx/	• to leave
	ǂhx/	• to fall
	ǂhx/	• there)
20.	ʔnx/b	• the white blaze across the middle of the forehead and nose
	ǃnx/b	• the lower body
	(ǃnx/b	• a large kind of land turtle
21.	ʔhx/m	• flat and thin
	ǂhx/m	• to whistle
22.	ǃnx/b	• the stone under the cooking pot
	ǃnǂb	• peace (quiet)

33. /û • to make a noise
/ûé • to stop giving milk
34. ûé'ò • the resting
ûé'ò • the buchu powder
35. ûé'ûn • to pull the bark off a tree
ûé'ûn • to take out honey
(ûé'ûn • to intimidate a bird with a throw
• so that it ducks to the ground)
36. ìûʔò • claw, hoof
ìûʔò • forehead
(ìûûʔè • pinon)
37. ìûé'ò • gnaw for pips
ìûé'ò • licking
38. ìnûʔò • distance
ìnûʔò • dust cloud
(ìnûʔò • bush hut, bush shelter)

c) The word-tone. By this I mean the difference in the level of the voice between the first and last syllable of a word. We will not consider three syllable words at all, as no more than two syllables ever have this characteristic difference in level, the third syllable being about the same as one or the other accented syllables. Two kinds of word-tone are to be differentiated.

1. The rising word-tone is characterised by the fact that the voice is higher at the end syllable than at the first syllable.

[302] 2. Oppositely falling word-tone is characterised by the lower level of the voice at the final syllable.

In the rising and falling word-tone you must sometimes differentiate a long and a short interval which are independent of individual variations. The long one amounts to a short third to fourth, the short one only a half tone. Among the following examples are those which show that even this amount of word-tone can make a decisive difference in the meaning.

A special sign for the differences of the word-tone has not been introduced as I did not wish to pack the letters further with diacritical marks. This is readily justified where these differences of the word-tone go hand in hand with those in the position of the accent which has its own sign. But where, as in the following examples, it is a question of the same position of the accent and the same type of word-tone, the following abbreviations are added in parentheses to make clear a difference which is purely one of interval:

1/2, st. ˊmaaa . . . a word-tone rising about 1/2 tone.
3, st. ˊmaaa . . . a word-tone rising about one major third.
1/2, f. ˋmaaa . . . a word-tone sinking (falling) about 1/2 tone.
3, f. ˋmaaa . . . a word-tone sinking (falling) about one major third.

Examples:

1. /ǂgu/ri-b (3, st.) : name of a riverbank grass.
   /ǂgu/ri-ˊ (1/2, st.) : a hail.
2. /ǂgu/a-b (3, st.) : name of a succulent edible plant.
   °/ǂgu/a-b (1/2, st.) : the call of the stirring /hoaxa owl.
3. !gu/re- (3, st.) : to stay behind.
   !gu/re- (1/2, st.) : to roar.
4. !gu/re-b (3, st.) : poison.
   !gu/re-b (1/2, st.) : thunder.
5. /ha/aa- (3, st.) : to be slow.
   /ha/aa- (1/2, st.) : to smell of urine.
6. !ha/re- (3, st.) : to look on.
   !ha/re- (1/2, st.) : to start, to spit hard.
7. /ha/re-b (3, st.) : the vent.
   /ha/re-b (1/2, st.) : the contents of the first stomach of ruminants.
8. /haro-ˊ (3, st.) : name of Cyperus species.
(365) °/haro-ˊ (1/2, st.) : Mesembrianthemum species.
9. /ha/o-b (3, st.) : goat beard.
   /ha/o-b (1/2, st.) : visible breath.
10. /ha/ho- (3, st.) : to paint the face.
    °/ha/ho- (1/2, st.) : to arrange a new-born one.
11. na/ri- (3, st.) : to be thickened.
    na/ri- (1/2, st.) : this morning.
12. !na/ha-b (3, st.) : the navel.
    !na/ha-b (1/2, st.) : rhinoceros.
13. !ny/re-b (3, st.) : tobacco roll.
    !ny/re-ˊ (1/2, st.) : the black ball of manure of the little ruminants.

4) The accent (sign: ˊ after the vowel) should be placed with the vowel modifications as a part of the rhythmic pattern. An amalgamation of the accent sign with the signs of the "tonal level" elements (as Knoechein tried) is not feasible. I consider a sign exclusively used to indicate the accent indispensible for a thorough analysis of the sounds of the Nama language.

In the pronunciation of individual words, in many cases you can only differentiate between syllables that are more or less accented, not between accented and unaccented syllables. Especially when the falling word-tone amounts to one third, the accent usually lies so evenly on the first and last syllable that a differentiation in the accent is not possible. In such cases the sign can be left out.

In general in two syllable words with a rising word-tone the accent lies on the second syllable and with the falling word-tone on the first syllable.

How

e) combinations of the four above-mentioned musical elements determine the phonetic character and thereby usually the meaning of the words, the following examples shall show:

c) combination of differences in initial tone level and tone extension. The combination of high initial tone level and falling tone extension is designated by $\hat{}$, the combination of low initial tone level and rising tone extension is designated with $\check{}$.

1. *ɓɛ́ɛ́* • to burst open
   ɓɛ̂ɛ̂ • to slaughter
2. */ɔ́ʔɔ* • to groan
   /ɔ̌ɔ • to smoke (of the fire)
3. *//ɔ́ʔɔm* • to clean oneself with cow dung
   (364) *//ɛ́ʔɛm* : placing stones in the hole game (see page 314), clapping hands
   //ɛ̌ɛm • to eliminate
   •//ɛ̌ɛm • to cover in order to hide
4. *//ɛ́ɛ́n* : to dwell
   //ɛ̌ɛ́n • to ripen
   //ɔ́ʔɔ • to hold firmly together
5. *ɗɔ́ɔ* • to know
   ɗɔ́ʔɔ • to give a blow
6. *ɗɛ̂ʔ* : to jubilate, make merry
   ɗɛ̂ʔ : to be someone's enemy
7. *gɛ́ɛ́* : to be lost
   gɛ́ʔɛ́ : to be clever, to outwit someone
8. *!gɛ́ʔɛ́* • to burst
   !gɛ́b : the resurrection, the reappearance of the crescent moon

12.	!g̱ɬ̱b	•	poison
11	!g̱ɬ̱b	•	the servant
	ʔg̱ɬ̱b	•	name of an Euphorbia that is probably identical with the one on page 280
9.	!gɛ-ɬ̱ ni	:	this
	!gɛ-ni	•	way [road]
	(!gɛʔ ni-	•	to pass)
10.	ɢ̱ɢ̱ɬ̱	•	to go in
	ɢ̱ɢ̱ɬ̱	•	to be steep
11.	χɔʔm	•	to wipe the dust off
	ʔɔɔ̱m	•	to draw a snare tight
12.	ɢ̱ɢ̱ɬ̱m	•	to mend something broken
	ɢ̱ɢ̱ʔm	•	to jump about
13.	ɢ̱ɢ̱ɬ̱o	•	to cover
	ɢ̱ɢ̱ʔo	•	to ask
14.	/gɛĩɬ̱	•	to be greedy
	/gɛĩʔ	:	to spread out skins for a bed
15.	//gĩɬ̱	•	to strangle
	//gĩʔ	•	to eliminate, excrete
16.	gõɬ̱	•	to refuse
	gõɬ̱	:	to see
17.	!gɛ̱ɬ̱m	•	to be pregnant
[384]	!gɛ̱ɬ̱m	•	the humming of the ostrich
18.	ɢ̱ɢ̱ʔm	•	to dip in
	ɢ̱ɢ̱ʔm	•	to believe
19.	/gĩɬ̱	•	near
	/gĩʔ	•	dirty
20.	!gɛ̱ɬ̱m	:	to bend
	!gɛʔm	•	to kill
	ʔgɛ̱ʔm	:	deep
21.	!gɛuɬ̱	:	to be left over
	!gɛuɬ̱	•	to throw towards
22.	!hĩɬ̱b	:	to winnow out
	!hĩʔb	:	lynx (see page 281)
	!hĩʔb	:	canine tooth of the horse

|92 33. ǂnaiʔ • to smear oneself with something sweet
|99 ᵑǂnaiʔ • to crush the !nara fruit (see p. 309)

34. /nuʔb • the scorpion
/nuʔb • anxiety, choking

35. /nuʔb • the white ants
/nuʔb • the smell of the billy goat

36. //nai • to bore through
//nuʔ • to lack

37. !nai • to flee
!naʔb • the country

38. !niʔ • to tie, combine
!niʔ • to pound cooked meat, to push up and away with the fist
ᵑǃniʔ • to suck marrow from bones (cf. p. 31)

39. /xoaʔm • to urinate
/xoam • to trickle through
ᵑ/xoam • the edible soft parts of sea snails (see p. 31)

40. xoaʔm • to pound fine
xoaʔm • to speak

41. //xoaʔm • to scratch out the remnants baked firmly to the pot
//xoaʔm • to bind up a body

42. /xuiʔ • to tremble
/xuiʔ • to pull out

43. ǂniiʔ • to pour
(306) ǂniiʔ • to be dry

44. ǂnaʔo • to strike fire
ǂnaʔo • to turn around

45. !noʔm • humpbacked
!noʔm • to smoke out bees (see p. 306)

46. ǂnaaʔ • to strike
ǂnaaʔ • to help

[92] 37. /ŋ/m • to breathe
[91] /ŋ'm • to wipe off
38. ŋ/ : to warm oneself
ŋ/ • to pick one's nose
39. ŋ • to come there
ŋ'ŋŋ • ? [phoneme]

β) Differences in the initial tone level and the word-tone:

1. /ŋki- (1/2, st.) : to rain (cf. p. 237 note)
/ŋ'ki- (3, st.) • to scratch the skin for purposes of healing
2. ŋ'ŋm- (1/2, st.) • to scream
ŋ'ŋ/m- (3, st.) • to joke
3. /ŋ'ŋ/i·b (3, st.) • name of a lizard, the Mabuia acutilabris Pts.
/ŋ'ŋ'i·b (1/2, st.) • dancing
4. ŋ'ŋ/ni- (3, st.) : to walk gauze
ŋ'ŋ'ni- (1/2, st.) • to scratch one's closed eye or ear
5. //ŋum·s (1/2, st.) : quartz stone
°//ŋ'ŋ/ru·b (3, st.) : mountain ridge
6. !ha'/mi· (3, st.) • to hunt
!ha'mi· (1/2, st.) • to be insulted
7. !hari·b (3, st.) • fear
!ha'ri·b (1/2, st.) : the backbone
8. //naŋ- (1/2, st.) : to roar, to chew on a bone (said of cattle)
//na/ru· (3, st.) • to impale in rows
9. !na'ru·s (1/2, st.) • the black ebony tree (synonym, see p. 144)
°!na/ru·s (3, st.) • name of a ray (fish)
10. u·'ri (1/2, f.) • to gnaw bones
u·rib (3, f.) : louse

[307] γ) Differences in word-tone and accent.
[04] (Where not specially indicated, the word-tone is 1/2 a tone):

1. a·ku • to fold up
aku·s • the empty ostrich egg

192.	9.	/a-ob	a blood
193		/ao-b	a snake
	8.	/a-re	a to return home
		/ara-	a domed black and white
	4.	/aisa-	a to hate
		/a-ba	a to cut open
	5.	/aisi-	a to sweep dirt
		/a-bi	a to be bored
	6.	/a-ba	a to pioneer
		/aisa-	a to seize someone by surprise
	7.	ga-a	a to be half dry
		gai-	a to praise
	8.	!gai-	a to crack a whip
		?ga-a	a to lie deep
	9.	ga-ri	a to gnaw bones
		gari-b	a the year
	10.	°//gaisa-	a to see sharply and far off
		°//ga-ba	a to step on something by mistake
	11.	//ha-ob	a the wind break of the fire place
		//hao-b	a the rising of a thunderstorm
	12.	!hari-	a to undo stitches
		!ha-ri	a to live in the neighborhood
	13.	/hxa-nob	a the short-step gait of a horse (the Boers' way of riding)
		/hXaro-b	a the calf of the oryx antelope (the accent on p. 275 misprinted)
	14.	/hXa-nun	a name of a kind of kaw (see p. 288)
		°/hXaru-i	a name of a kind of Euphorbia, E. cerviconnis Boiss (see Plate VI)
	15.	/hxa-ba	a to spit water out of one's mouth
		/hxaba-i	a sandal
	16.	//hxa-ob	a driving back
		//hxao-b	a sand of the river bed

[368] 17. //x!xara- ◦ to punish
//x!xa-ra ◦ to be big
112
197 18. !k!a-oab (3, f.) ◦ name of a kind of hare (see p. 283)
!k!aaba- (s, m.) ◦ carrion
19. !k!a-ra ◦ to move
!k!aru- ◦ to shoot through
20. //k!aro-b (3, m.) ◦ the shovel for ashes
*//k!o-nab (1/2, f.) ◦ the honey sack made of iguana skin (see p. 304)
21. /k!aro-b ◦ acidity, acidity
/k!a-nab ◦ grass seed
22. *gk!aro-b ◦ the hot earth around the fire place
gk!a-nab ◦ vein
23. !na/ni- (3, m.) ◦ to carry a child on one's arm
!na-/ni (1/2, f.) ◦ the side; as a verb: to run pigeon-toed
24. ǂna/o-b (3, m.) ◦ honeycomb
*ǂna-/ob (1/2, f.) ◦ a road that is smooth or slightly hilly that runs along a mountain slope
25. !ao- ◦ to stand on tiptoe
!o-ro ◦ to bellow
26. saro- ◦ to catch a sheep or goat by the leg
sa-ra (3, f.) ◦ to pursue
27. s!o-ses ◦ the sun
sore-i ◦ the female sore partner (see p. 318/319)
28. tara-i ◦ the woman
*ti-tas (3, f.) ◦ the brother's duty (especially emphasized by the Hottentots) to love his sister and her children (see p. 303)
29. to-rob ◦ war
toro-b ◦ a fine-grained, red, hard, kind of soil

§ 3Differences in the word-tone, accent and initial tone level (only the third is indicated in the word-tone, otherwise it is assumed to be a 1/3 tone):

1.	/a·rab	(3, f.)	• the annoyance
	/aa·b		• rib
	/a·ʔrab		• the crack
2.	//a·ɛ		• yesterday, tomorrow
[269]	//aʔri·		• to pulverize (in the language of the Namib nomads: ǃoʔʔa)
3.	ǃa·ba		• to climb up
	ǃaa/ba·	(3, st.)	• to scratch
4.	χaa·		• to scrape
	χa·ʔa		• to write
5.	χaro·b		• powdered coals
	χaa/a·	(3, st.)	• to pull out
6.	χa·ba		• to pulverize tobacco
	χa/ba·	(3, st.)	• to drink from [sip]
7.	gaa·		• to be cool
	ga·/ra		• to have German measles
8.	ga/a·	(3, st.)	• bend, bow
	ga·ro		• to dry out, become thin, to be hard
9.	/ga·bi		• to sprinkle
	/ga/bi·s	(3, st.)	• the cup
	(/gabi·		• to be high)
10.	//ga·/a		• to imitate
	//gaa·		• to chew
11.	//ga·mi		• water
	//ga/mi·	(3, st.)	• to bend the head
12.	//ga·nas		• the giraffe acacia, (Cape D. kameelboom)
	//gaʔna·s		• name of a plant that is like a fig tree that grows frequently in the cliffs near Kubub. The inner soft skin of the root is eaten raw.

[262 824]

192
194

//ga·ʔna = to water the cattle singly or in herds

13. //gara·s = the Aloe dichotoma L. (see p. 112)

//ga/ra·s (3, st.) = shoulder blade

//ga·ra = to scratch lines

14. !ga·os = cutting

!ga/o·s (3, st.) = the tree trunk

15. !ga/ra·b = thinness

!ga·rab = the male genitals

16. !ga·ro = to be barren

*!ga/ro, = the hurrying of the thirsty cattle to water or of the mother animal to its young

17. /ga·mi = to have two wives (cf. p. 307)

[360] /gaʔmi· = to close one eye

18. /go·e = to curse

/go/e· = to splint a broken arm

19. /go/re·b = the request

/go·reb = a cut in the skin for bleeding

20. guʔnu = to make a place for oneself by shoving

gu/nu (3, st.) = to spoil, rot

21. /gu·i = one

/gu/i· (3, st.) = to become tired of somebody

22. //ga·ma (3, f.) = to fetch water

*//ga/ma· = to lie close to the fire

23. go/ra·b (3, st.) = name of a kind of crow, the Corvus scapulatus Daud.

*go·ra = to peel skins from field onions

24. !gu/i· (3, st.) = to creep around something

!gu·i = pulsating of a wound

25. !gu·ri = to rub someone with fat

!guʔri· = to be arrogant

26. !gu/bu· (3, st.) = to knock

!gu·bu = to be round

192 27. ǂgu·i = to be much

194 ǂgu/i·s (3, st.) = the nose

28. ha/ra· = to be far

ha ra = to swallow

29. /ha/mi· (3, st.) = to dress warmly

/ha·mi = to make oneself ready

30. //ha·ru = to weep from joyous emotion

//ha/ru· (3, st.) = to creep into

31. !ha·e = to be quick

!ha/e· = to hunt on horseback (see p. 290)

32. !ho·a = to tell a story

!ho/a· = to be crooked

33. !ho/ba·b = turning around

!ho·bab = intestinal worm

34. /hu/ru· (3, st.) = cooking thin meat until dry

/hu·ru = to play

35. !hu/i·b (3, st.) = the bustard (see p. 272)

!hu·ib = the fresh smell of the damp wood of the giraffe acacia

36. !hu·nu = to become wet

[361] !hu/nu· = to suck marrow out of bones (cf. p. 355, no. 28.)

37. ǂkχa·rab (3, f.) = the whale (see p. 37)

ǂkχa/ra·b = testicles

38. !kχo·ab = cartridge belt

!kχo/a·b = ice

39. ǂkχo·a = to soothe

ǂkχo/a·b = the elephant

40. ǂkχu·bi = to make noise

ǂkχu/bi· = to babble (of small children)

41. na·ǂmi = the tongue

naǂmi· = to flicker

na/mi· = to bend around a corner

na/mi·b = the surface, the Namib desert

42. na·ba = to flash [lightning]

na/ba· (3, st.) = to disappear behind something, to go down

192 43. /na‿e· = to put straight
194 /na·eb = the navel
44. //na·e = to indicate
//na‿e· = to sing
45. //nã‿i· (3, st.) = to girdle oneself with straps (Herero)
//nã·‿i = to be stiff
//nã· i = all right
46. !na‿e· = to trot
!naē· = to become warm
!na·ʔe = to be born
47. !na·rab = the Acanthosicyos horrida Welw. (see pp. 146, 197.)
*!na‿ra·b (3, st.) = designation of the Namib bushmen for "white man"
48. /no·ro = to tan a skin
/no‿ro· (3, st.) = to be pale
49. /o‿ro· = to be few
/o·ro = used up, to be old
50. //o·ʔa = not to be able to
//o‿a· (3, st.) = squishing of water in wet shoes
(//o·a = to kiss)
51. !o·a = to meet
!o‿a = to be sad
[362] 52. sa·mi (3, f.) = breasts, udder
saʔmi· = to use the whip
sa·‿mi = to get in the "wrong throat" when swallowing
53. sao· = to mark cattle
sa·o = to follow
54. so·as = barrel
so‿a·s = fissure, scratch
55. to·a = to cease
to‿a· (3, st.) = to tear apart
56. /u‿i·b = brother-in-law
/u·ib = stone
57. !uʔi· = to cut fat from meat

192 !u·i = to become evening

194 58. !u/bu·b = egg

*!u·bu (3, f.) = to turn someone away

59. !ũ·i = to guard

*!ũ/i· (3, st.) = to be seamless or jointless

60. tsa/o· (3, st.) = the raging pawing of the bull or the wildebeest

tsa·ob = ash

61. tsa/ma·b = the tsama gourd (see p. 200)

tsa·mab = the food supply of the ants, "ant food"

62. tso·as = looking for lice

tso/a·s (3, st.) = anus

)Difference in word-tone, accent, initial tone level and tone extension.

//ga·/ni (1/2, f.) = meat

//gani· (1/2, st.) = checked brown and white

194 f) Suspension of sound characteristics is to be observed at times, when the individual word becomes a part of a compound. However, I have not made any systematic notations in this direction, but only noted a few observations.

The accent in a compound is usually shifted from its original position in the individual word. The general designation for cat is /hõ/a·b. In the compounded designation for "field-cat," !ga·ro/hõ·/ab, the accent is clearly shifted to the penultimate syllable. The same is true for !ore b, the basin, and */nu·bi!o·reb, the winnowing basin (p. 201). [363] Usually a change in the word-tone (see the accent, p. 353) is combined with this.

Also the characteristic tone extension of the individual word can disappear in a compound: //hõ/s, the sack, /na·ma//hõ/s, the economy sack (p. 238). Noticeable in a compound is the appearance of a rising tone extension that is lacking in the individual words: /na/m, to love, but /na/m/na/m, to bring to love.

How much the sound characteristics of the individual word change under the musical influence of the sentence structure and under the influence of the emotions, I have not investigated. The initial tone level seems to be to be by far the stablest sound characteristic of a word.

3. Orthography

The spelling which I use for Nama words in this report is closely patterned after the general linguistic alphabet, which Steinthal (80) uses. I 104 194

> 80. H. Steinthal, Linguistik, in G. Neumayer's "Anleitung zu wissenschaftlichen Beobachtungen auf Reisen," 1891.

can therefore restrict myself here to a few remarks to orient the reader and as an explanation for several deviations from Kroenlein's method.

ā indicates the length of a vowel. If the long sign is missing, the vowel is short.

ã indicates nasalization. Individual tendency towards nasalization of vowels, which follow an m (toma, "not," go ma·b, "ox," ma, "to give," etc.) I have observed frequently but I have not considered this in the script.

(a) indicates that the vowel involved is spoken hastily, almost supressed.

y is pronounced as the "j" in the German word Jena.

a/o and analogously all vowels that are separated by a sound sign, are not to be spoken as a dipthong but separately.

aē, aī, and oē etc. are to be spoken with the vowels separated with the accent on the first if no accent sign is given.

ai is to be pronounced as in the German "Kaiser," "Eile," "einerlei," etc. The dipthong ei (as pronounced in the linguistic alphabet) does not exist in the Hottentot language. The linguistic method of writing should definitely be preferred. Where Kroenlein writes ai, in many cases this could be confused with aē.

au is to be pronounced as in the German "Auge," "Buch," etc. The linguistic dipthong ou does not exist in the Hottentot language [364] any more than it does in pure German. Where Kroenlein writes au, there is often a confusion with ao which is very close to it.

ao is to be pronounced with the emphasis on the first vowel and with such a quick transition to the second, that it sounds like a dipthong.

b at the beginning of a word is pronounced like our b, in the middle of a word usually softly like our w, and at the end of a word hard but not quite so hard as our p.

x is pronounced as in the German "lachen," "Bach" etc.

kx corresponds to Kroenlein's kh, that should be "somewhat harder,

but not much" than k. I have always heard this sound as k with a following χ and therefore write it that way.

r is rolled with the tongue, not made with the uvula.

s is pronounced weakly at the end of a word like the German sch in "Busch," "Bresche," but at the beginning of a word like the s in "salz," "Sonne," etc, often sharply as in the French "salon."

ts is pronounced as is German z in "Zahn," "Zunft" etc.

f and l are missing in the Nama language. When met with occasionally they occur in word stems borrowed from the Dutch: gurla·bigis, butterfly; f(a)la·migob, the flamingo, ff·lsib, the vullziekte of the Boers (lues).

[364]

B. Knowledge of Nature

82

What we learned (from our consideration of the sustenance and medicine, handicrafts, animal husbandry and hunting as well as from the portrayal of the land and climate) about the Hottentot's specific knowledge of the three realms of nature was that it derived more or less directly from material exigencies and had always been connected with them. The question now poses itself whether this knowledge also exists independently of the cares of daily life, that is, to what extent it can be regarded as the free expression of intellectual stimuli. It will be shown that despite all the intellectual agility of the Hottentot his knowledge of nature at no time rises to an even rudimentary form of natural science. Only in two fields can we recognize at least the striving for a certain continuation beyond the rudiments or for an organization of the factual data: in the field of biology (which even today is closest to the hunter and cattle owner) and -- almost lost once again to oblivion -- in the field of division of time, whose seasonal changes and deep influence upon animated nature both give the herdsman cause to think.

1. Flora and Fauna

[365] The Hottentot's knowledge of animals and plants will not be discussed here. The zoological and botanical classification of the material I collected must be finished before we can attain a clear picture of the matter. We would gain nothing by simply listing the native names.

82

Likewise, the good anatomical knowledge of the Hottentots can be better portrayed only after the biological basis has been worked out.

2. Astronomy

821
823

From childhood on the Hottentot is accustomed to find his way on his own out on the range. As a child he orients himself by means of close, familiar things like groups of bushes, trees, and rock formations. Later, when he undertakes longer migrations with his family in search of pasturage, he is compelled by the lack of rain in the land to help himself along from one water hole to the next. His migrations thus are composed of treks, of which each one has as its daily goal a relatively nearby spot that is determined by local conditions. Therefore the herder does not need to seek for his journey any points of orientation in the sky except the sun.

a) The starry sky therefore is little known to the Hottentot. It is an open question whether it was always this way or whether also in this field traditions have paled with the general decline of folk character.

α) The sun, so·res, gives the Hottentot, too, his points of orientation for distinguishing the points of the compass: the east is called °soresta//hai·//kχāb, that is, "the side on which the sun rises." The west is °sorestaǂga·//kχāb, "the side on which the sun sets."

I learned a common designation for north and south: °soresχō·!nab; for if one looks in one of these directions, the sun shines upon (!na) one's cheek (χōb). I learned the words !kχa·bagab and /aba·s only as designations for the winds from the south and the north; in other parts (57) of

57. J. G. Kroenlein, Wortschatz der Khoi-Khoin. Berlin, 1889.

the country they may serve also for the designation of the abstract directions. But I consider this to be a later extension of the terms. Close contact with the Hottentots demonstrates how remote they are from all abstract concepts if the senses alone suffice. The sun itself, its rising and setting, the wind which blows from here or from there, the place to which they previously wandered--these are the elements of their geographical knowledge, and they suffice for mutual comprehension.

[366] The moon will be treated in connection with time calculation.

β) Among the stars, /ga'miroti, they are acquainted primarily with the two planets whose propinquity to the sun and regularly varying position in the morning and evening sky makes their observation quite obvious: Mercury and Venus.

The traveler in Namaland who spends the night under the open sky and to whose eyes Mercury is not dimmed by a long twilight as in our latitudes or from whom Mercury is not concealed by the morning fog -- this traveler knows the two precursors of the rising sun and their relation to each other. The following table, which Professor Otto Knopf in Jena kindly set up for me, may serve to orient people less familiar with local conditions. The most striking phenomena which have given rise to the native names for these planets, are indicated by an asterisk:

Venus, called //kʸa·nus, rises 1 1/2 to 3 hours before the sun; it moves (!gũng) ahead (aĩ) of the sun and is therefore also called *aĩ!gũns, the "precursor," the "voorlooper" of the Boers, our morning star. Another designation of Venus is *aogura//hã̃·b, that is, the star at whose rising the men (aogu) run off (//hã̃, -ra particle of progressive action), that is, seek out their own bed so that day will not surprise them in an improper bed of love. This is expressed even more clearly by the synonymous designation ǂhũ·'aogu/ga'mirob (ǂhũ' signifies extramarital intercourse).

Venus, sometimes sooner, sometimes later, is followed by Mercury; Mercury is closest to daybreak (//go·as) and is therefore called "daybreak star", //go·a/ga·'miros, the "dagbreker" of the Boers. Another name for Mercury is *//go·a//kʸãũ·ris; this indicates that this planet comes early in the morning when the udders of the cattle (which are milked in the morning and in the evening) are full again.

The Hottentot, who looks at the eastern sky late in the night so as to break camp before day, pays primary attention to Venus. It is easy for him to overlook little Mercury, which changes its position more frequently with respect to the sun and is therefore often not where expected. This is especially true when Mercury, contrary to the rule, rises before Venus. And he overlooks Mercury all the more carelessly the later Venus itself appears because then it becomes less necessary to wait for the straggler (since they still believe that Mercury follows Venus) and less possible to determine its appearance in the breaking dawn. One must take these conditions into consideration in order to excuse the natives in their contradictions which can be easily figured out by astronomy and the lack of clarity among the whites about these questions.

821 Number of Hours and Minutes which at 25° Southern Latitude

The Hottentots do not observe that Mercury also appears as an evening star since this planet is of significance to them only as a harbinger of day. 821

Venus, however, is not to be overlooked even in the evening (!u·ib); it is recognized by the Hottentots as being identical with the morning star. Because it never tarries long in the sky as the evening star but, as it were, hastens away (!kʗo·e), it has received the name °!u·i!kʗo·eb, that is, "the fleet one of the evening."

Jupiter is likewise known to the Hottentots. They occasionally identify it with Venus since they say that this star, in the course [368] of the weeks, wanders through the skies like the moon. But regardless of how the relations of the two planets to each other may be interpreted by the individual, in every case the Hottentot sees Jupiter, in contrast to Venus, "in the middle" (//a egub) of the sky and of the night as well as in the east and in the west. In accordance with this conception he calls Jupiter the "middle star," °//a egu/ga/mirob.

γ) Orion is the most striking constellation in the fixed star heavens of the Southern Hemisphere as well as the Northern. Of these stars the Hottentot, ignoring those of first magnitude, includes only the six which correspond to the belt and the sword according to our fantasy. He calls this group !go·regu, that is, the zebras: the stars δ, ε and ζ represent to his eyes three zebras in flight, at the middle one of which the hunter, ι, shoots his arrow, γβ and C.

I heard the Pleiades, because of their closely clustered stars, called °/hũ/seti (/hũ/ - "to assemble"). More widespread is another name which shows more than mere dialect difference from the first: /kʗhũ/seti. The Pleiades become visible in the middle of June for an observer at the 25th degree Southern Latitude, thus in the first half of the cold season. I heard a native of the upper Auob territory call the Pleiades °ǂao·/g/amiroti, that is, "frost stars," because at the time when they become visible the nights can already be so cold that there is frost early in the morning. For the Bushmen of the above-mentioned district the appearance of the Pleiades is supposed to be the sign for setting out into the tsam a fields.

The glitter of the Milky Way and the Magellanic Clouds reminds the Hottentots of the weak glow of the ashes dying away in their hearth or campfires. Hence, they call the Milk Way °tsaob, that is, "the ash" (with a masculine ending corresponding to its long slender shape); the two luminous clouds on the other hand are called °tsaora (with a feminine ending in the dual corresponding to their lumpy form and small size). The Magellanic Clouds are also called "the two testicles of the lion," ʗamʗkʗ a/rakʗa.

821

Of the individual fixed stars I heard only Sirius mentioned by Hottentots: it was called ǃna·/m/ga/mirob, and sometimes also ǃna/mǃna/ms, that is, "side star." I could not determine the significance of this word with any certainty, and only a supposition can perhaps be justified: "The Hottentot, as we have seen earlier (p. 61), calls the east wind ai·ǂo·ab, because it comes from "in front." Hence, if the east, as the point where the sun rises, is the front of the world for him, then north and [369] south would be the sides. From this conception it would be comprehensible that Sirius, the brightest star of the Northern sky of the Southern Hemisphere, is regarded as the "side star." Its partner in the southern skies would be Canopus.

b) The time division of the Hottentots is based upon the change of the seasons, of the phases of the moon, and of the daily position of the sun. 805

α) They have, to be sure, the concept "year," guri·b, which refers to the period encompassing the seasonal changes, but they do not calculate according to years in our sense. I got the impression that they recall the age of their cattle according to calf and lamb periods. Their own age is of no interest to them, and if they perchance want to date something further back, then they use well-known local events (the outbreak of cattle plague, hostilities with neighboring tribes or with the whites, immigrations, etc.) as sufficiently general points of reference, from which they can then date a specific moment by figuring in the birth or size of the children in the family at that time.

β) The change of the seasons, ga·magu, determines the division of the whole year. They distinguish the following seasons:

1. An early spring. When with increasing warmth (ǃo·ba, vb.; also said of the early sun that warms the eastern sides of the rocks and bushes after a cold night) and independent of the rainfall the trees and bushes begin budding and, in good years, wintery early rains or early spring rains (cf. Climate, p. 154 ff.) revitalize the meadows, the blossoming time, ǃkχã///aẽb, or spring, ǃaba b, has come. It begins as early as August and ends in October.

2. The season that the Hottentot calls //kχũ·nab (in the Bergdamara dialect ǂoreb, that is, "the sun time") comprises the first half of a hot period, during which the so-called "little" rainy season occurs if the year is good. If these rains do not come or if they are sparse, as is usually the case, then the land remains extensively barren, without growth of grass and plants. This period of drouth, like the drouth itself, is called /kχuru·b. The //kχũ·nab of the Hottentots extends from October through

December and thus corresponds astronomically to the spring of the Southern Hemisphere. 805

3. The season upon whose abundance the welfare of the Hottentots primarily depends is called //ha‿o· b (3, st.); we can call it the grazing season (since the word is also used in the same concrete sense as tūb, "pasture"). It comprises the so-called "big" [370] rainy period of the year and the time immediately following, during which the fodder plants retain their greenness. It falls, generously estimating, between the months of January and April, hence into the southern summer and the beginning of fall.

4. The winter of the Hottentots, sao· b, comprises the cold season from May to August and therefore includes the last two-thirds of the fall and the first half of winter by astronomical calculation.

γ) A more detailed organization of the year is based upon the observation of the phases of the moon. When, after the new moon, the crescent again appears (≠kχ̣ani·, vb.) in the western sky, they consider the month //kχ̣ãb begun. For the Hottentot the phases of the moon are symbols of his own development and passing away (cf. Folk tale XXX): the crescent which is just appearing and still scarcely recognizable is called °≠kχ̣a‿m//kχ̣ãb, ≠kχ̣a‿m with the meaning "unripe." The word is also used to designate a fruit which is prematurely born. [821]

The narrow glittering crescent in which the moon, as it were, comes alive (that is the original meaning of !gã), is called °!gã· go//kχ̣ãb.

The first two quarters have two names that are common to both of them. The first is °gai· //kχ̣ãgai· ra//kχ̣ãb, "the moon that becomes big or old (gai)." The other name is °gã‿ai· ra//kχ̣ãb, "the moon that becomes clever (gã‿ai)."

Thus, they cause the moon to increase in age and wisdom until it ripens into the full moon, °gai//kχ̣ãb.

In the last quarters only the narrow crescent is characterized as °//ōra//kχ̣ãb, "the dying (//ō, -ra, participle of progressive action) moon."

Proportionately as our twelve months and the dates of the Christian festivals gain prominence, the Hottentots gradually forget the time reckoning of their ancestors. It is definitely established that they gave names to the individual lunations of the year in close connection to the change of the seasons. In Kroenlein's "Wortschatz" (57) Hottentot

57. J. G. Kroenlein, Wortschatz der Khoi-Khoin, Berlin, 1889.

designations can be found for nine of our months. I did not include the name for September because it is a word belonging to the Bergdamara dialect. Kroenlein's Hottentot February corresponds to the January of my calculations. Our calculations show considerable deviation only in the interpretation of the name for July, which I must requisition for October.

Of the four names of months that are new here, I have used the one listed under VII, because of its clear astronomical reference, as the reliable point of departure for a comparison of the Hottentot months with ours. [371] The Hottentot months, which were surely based upon naive observation of the moon phases and hence the time of a synodical month (29 days, 12 hours, 44 minutes), can naturally be equated only approximately with the months of our calendar. The etymology of the names, which contain references to the meteorological character of the season, yields a valuable checking system as to whether or not the attempt to make such an equation is justified in the given case.

The placing of the months that have no such etymological reference to their position in the year was based solely upon native tradition: that is, in this case upon the information of an old woman whom I found to be reliable. After many unsuccessful attempts to cull any useful information from the unclear calendar conception of the natives of my acquaintance, I finally succeeded unexpectedly in finding the forgotten month names in the vivid memory of a 60 to 70 year old Hottentot woman. Without any hesitation or faltering she repeated twelve names to me in a constantly consistent sequence. When asked where she got this knowledge, she referred to her childhood. The possibility cannot be excluded that this duodecimal system of the months and their order had already been influenced by notions of the whites. Therefore, it has perhaps already become too late to penetrate here into the original ideas of the people. Then the following scheme may at least be preserved as the last attainable remnant of that which has been lost. -- The twelve months of the Hottentots and the parallel months of our calendar are thus the following:

I. ǂkχo-esao//kχãb (or ǂkχo-esaos): "the moon that follows the ǂkχo-e-bush." This important grazing bush, a variety of Salsola (see p. 80), is supposed to have its main blossoming in the spring. Therefore, the first month of the southern summer follows (sao) it . . . . . January

805 II. ᵓga/ma· /aēb . . . . . February

III. ᵓ!kχai tsã/b: "when it begins (tsã/ = tsoa/, intransitive vb.) to get cold (!kχai)." The name designates a lunation in the transitional period from summer to fall. According to the accepted order it would correspond to our . . . . . March

IV. ≠goro /nũ·ᵓ/seb: Older Hottentots, consistently and independently of one another, assured me that this referred to the [372] month of increasing cold when one sits so close to the fire that one's legs (/nũᵓ/-) get blisters (≠go·ro) . . . . . April

V. ≠nĩ·ᵓ/ //kχãsa, "the black month." In the southern winter, the drouth period, the black branches of the bushes that have shed their foliage give the landscape its characteristic aspect (57) . . May

57. Ibid.

VI. /hai· //kχãsa . . . . . June

VII. ᵓ/kχũ·ᵓ//kχãsa, that is, "the month of the Pleiades." For an observer at 25° Southern Latitude the Pleiades become visible in the second half of June. As it was mentioned earlier (see p. 368), the appearance of the Pleiades is of significance for the wanderings of the natives who are seeking tsam·a. Hence, it is understandable that they name the lunation from the month of June to July after this constellation . . . . July

VIII. hõa/ri·b . . . . . August

IX. !ho/a·≠ga·eb, the month "when the leaves (≠ga·e-) are crooked (crinkled by winter) (!ho/a·)." (57). . . . . September

57. Ibid.

X. gai kχa·ni . . . . . October

XI. ᵓ/gõ·a!kχa ni . . . . . November

XII. /hõ·/≠ga·eb. When the fresh, young verdure

805

sprouts from the old withered grass roots after the first plentiful rain, then the grass meadow (≠ga·eb, "leaves") seems to be checked (/hõ/, with a black and white checked marking) (see p. 265) . . December

[177] δ) The Hottentot became familiar with the division of time into weeks only as a day laborer in the service of the whites: he had to get used to paydays and holidays. His calendar for this purpose is a thin piece of wood, about 10 centimeters long and 2 centimeters wide, into which seven holes have been burned. A thong is attached to one end, and the loose end of the thong is inserted successively through one of the holes, each of which designates a certain day of the week. The women like to tie the calendar wood to their necklaces by means of the upper end of the thong; the men like to wear it on their hats along with a fluttering ostrich feather. The primitive calendar is called bē·kgye hais, the "week wood" (borrowed from Dutch week).

[373] ε) The smallest unit of time measurement of the Hottentots is the day, tsēs, and the night, tsũ·χub. They indicate the length of a journey by days and nights. //a·ri means both "tomorrow" and "yesterday."

The other distinctions they make do not refer to lengths of time but only to times of day. In this connection the many words for the time between day and night is striking, whereas in the day itself only noon, tsĕ!gã/b, is emphasized. This becomes understandable if one considers that the sun, with negligible exceptions, is visible all year long from early in the morning until evening. The Hottentot knows how to express specific hours as well as duration of time, with certainty and comprehensibly, by reference to the position of the sun.

Special designations are used only for the time at the beginning and at the end of the day.

1. °//go·a!a·roam is the dawn.

2. °!u·itsũ·χubab is the dusk.

3. The bright time of day shortly before sunrise is called °kχai·//go·agab since this period of daybreak (//go·ab) is usually the most bitingly cold (!kχai).

4. The period of brightness immediately following sunset is called °/a·ba/ho·bab, that is "the red twilight."

805

5. In some areas the period of the first perceptible diminishing of light after sunset is designated as "little children's twilight," *ǂkχa·ǃm!gõa/hobob, in accordance with the belief that most children, /gõ·an are born at this time.

6. The */u·iab of the Hottentots corresponds to our afternoon.

7. Their //go·agab can be equated approximately with out forenoon.

8. A distinction is made between evening, !u·ib, and late evening, !o·es, which extends long past sunset.

9. They call the hour of midnight *tsũ·χub!gã·ǃb, the "back of the night."

C. Rudiments of Art

53

We saw that the beginnings of sculptural art progress no further than boys' games (see p. 311 f.). But the pleasure in reproduction, in the fantasyful representation of enduring impressions of memory, is equally vivid for old and young Hottentots. Their joy in and capacity for imitation is expressed in pantomime, their musical feeling in reed blowing and singing, [374] and more delicate erotic matters in their dances. Only in a few cases do we find the beginnings of these art forms clearly defined; generally they are just as mixed as the incitements which form their basis. Thus they cannot be divided among our Muses, but can only be organized in a series ranging from the simple to the complicated. [Musical bow. 1/8 natural size.]

1. The Musical Pantomime

533
534

Whereas on a childish level (see "Children's Games," p. 315) we saw certain fantasy concepts being aroused by rhythmical sounds, musical tones appear for the first time in the musical pantomime of the Hottentots.

For this purpose they use as a musical instrument a wooden bow, kχãǃb, preferably cut from the thorn tree, and strung with a string made of the back sinews of the goat (or, better, from sheep gut). The women are the performing artists. They sit on the ground when they play. The upper end of the bow rests against the left shoulder

1: Schultze--174A N-5 (1903-1905) 1907 FX13 Hottentot FX13
Nama

534

Musical bow. 1/8 natural size.

[p. 374]

and the lower end is propped against a skin-covered bowl that serves as a sounding board. It is held in place with the right foot which is inserted between the bow and the string. The player uses her right hand to strike the string with a wooden stick -- if the women sitting beside her do not do this -- and with her left hand she plucks like a violin player. They also use their chins in plucking, in that they rest their heads, halfway back, for a moment against the upper end of the string. Generally several of the women sitting around beat in time upon the string with wooden sticks. 533 534

I myself saw no other string instrument beside the bow among the Hottentots. I encountered the gora with the quill (66) only among the

66. Th. Hahn. Die Nama-Hottentotten. Ein Beitrag zur südatrikanischen Ethnographie (Globus, Bd. XII, 1867).

Bechuans. To be sure, Hottentots spoke of a guitar-like instrument that they make in imitation of European models; they call it ramgyib or !gũ·ǂtsib (from !gũ = "to cover," and in this case: to span the sounding board with a skin. See also the footnote to Folk tale XLV.). [Plate XV. A Topnaar Hottentot.]

[375] The main characteristic of the action which is supposed to be depicted in the musical pantomime lies musically in the rhythm. In hunting scenes it expresses the various gaits of the horse and the wild animals: the tracking of the hartebeest, the first chase at a gallop, the flight of the shot animal and its defeat -- all of this is reproduced by the rhythm of the wooden sticks. The spurring of the hunting horse, the death blow and the death rattle of the dying animal is expressed with gestures and inarticulated sounds. The monotonous intervals that are plucked on the string are only accompaniment. 533 535

Similarly portrayed are the rolling of a wagon, the yoking of the oxen, the unhitching of a lame or feeble animal, the snapping of the whip, and so forth.

They are very fond of imitating the practices of wild animals. I saw a woman imitate a baboon with great animation and devotion to her rôle: how it picks up insects from the ground, how it bends over the waterhole to drink, jealously wards off the thirsty animals pressing after him, how it casually trots, how it becomes frightened upon scenting danger and flees when surprised.

A Topnaar Hottentot.

1; Schultze--175A N-5 (1903-1905) 1907 FX13 Hottentot FX13
Nama

142

In all these entertainments the music remains in the background even though the strings and wooden sticks are constantly in action. 533 535

2. The Reed-dance Song

The tones become melodies only in the song of the reed dance. Here the ancient musical instruments of the Hottentots, the reed pipes, ǂā·ti, come into their own. [Fig. Reed Pipes made of root bark with a tuning rod (b). 1/6 natural size.] The pipes, as their name indicates, are generally cut from reeds; but in dry stretches where there is no reed growth they are made from the roots of Acacia horrida Willd. . The root segment that is cut in the shape of a rod is either debarked completely by tearing off the bark (a), or it is slit lengthwise and the bark is peeled from the wood. The root that has been slit lengthwise is then firmly wrapped with a piece of bark in a spiral as though with a band (c). The pipe produced in this way is closed at one end and filled up with milk so that it will not dry. The pipes are tuned by adjusting the firm grass plug which closes the pipe end. After use, the pipe is again filled with milk. 533 534

[376] A complete reed pipe orchestra comprises at least nine musicians, each one with his own specially tuned reed or reed passage. Just as we distinguish the first and the second violin, the Hottentot distinguishes the first through the ninth reed pipe; only he does not count them, but names them individually. He makes the following distinctions: [Figure -- Reed pipe scale.]

1. ǂkxa·riǂā·ti, that is "the little reeds," all tuned the same, with four to six placed side by side in each hand.

2. ǃnona·gu, the triplets, or collectively called ǃnona·b, the trey, tuned the same and held in one hand.

3. ǃnani·gu, the sextuplets, or called collectively ǃnani·b, the "sixer," held in one hand and tuned the same.

4. ǃ//hũ·ǀirob, or //hũ·ǀirokxa, accordingly as the blower holds only one or two in his hand.

5. ai·ās, "who (-s) cries (ā, here with the meaning: "to make a lamenting noise") in advance (ai)." Only one man in the whole orchestra has this pipe whereas with the further exception of number 6 all other reed voices can be filled doubly or triply. This reed gives the note by which all the other reeds are tuned. Among the others the first to tune in is

[p. 375]

534

Reed pipe scale.

[p. 376]

6. the reed pipe, which is called ǃã!gã́s, that is "who cries afterwards (ǃgã́s, 'back')." After this the other pipes tune up: 533 534

7. ǂgo/ma·s "the cow."

8. ǃa·rob, finally

9. ǂ//hũ/i·b, the reed with the lowest note.

The tuning rod, ǂ//kχa·ehaib, with which the grass or bast plug [377] inside the pipe is adjusted or "chased back" (//kχaē) as it were in order to adjust the pitch completes the instrumental equipment.

The reeds are held between the thumb and the other four extended fingers in such a way that the ends which are blown lie on a level with the upper horizontal edge of the index finger. A complete reed scale or phrase comprises about two octaves. Only in one case did I have the opportunity to check the pitch of the individual reeds in a complete scale that had just been tuned up. The results yielded the distribution of tones that are represented in the preceding figure.

The music of each reed piper consists of individually enunciated tones that harmonize with one or several rhythmically identical tones of the other pipers. These reed tones give the beat for the dancers and singers who carry the melody. Many reed songs have no text. (Whether they never had one or whether it has simply been forgotten cannot be determined.) In the simplest case the subject is indicated by gestures and the melody is sung with a very few sounds.

The dance steps of the men are a sort of low hopping executed simultaneously with both legs, the knees slightly bent and the feet placed one in front of the other. In this manner the dancer slowly and jerkily moves forward, bent over, the head bowed to his breast and his lips on the pipe. The women chassé forwards with small and often extremely delicate steps, with the rear slightly protruding, undulating their hips, gently clapping their hands together before their faces, and singing in a loud voice, sometimes with an expression of great excitement. The number of dancers is not fixed. 533 535

The Hottentots' pleasure in the dance is typified by a little story in which they make fun of themselves: at a watering place they had ambushed several Bergdamaras. When the Kaffirs saw that they were in a trap, they began to execute a dance. Dancing, they retreated farther and farther, and, when the watching Hottentots finally recalled their murder plans, had escaped.

Every reed-dance song has a special theme. Thus, for example, in the following example the arrival of the bull at the water hole is illustrated. As the malevolent ponderous animal slowly wanders to

the water hole, grazing alone in the pasture after the rutting time, muttering to himself, moving his head from side to side -- this is the way the Hottentot pictures him, accompanied by the reed tones (or by an accordion or a harmonica), he sings with a few simple sounds for the dance of the grazing bull: 533 535

[378] The Song of the Grazing Bull

[Translator's note: four musical bars omitted.]

The following reed dance song accompanies a lively pantomimic imitation of shoeing horses and is therefore called the song of horse shoeing, ǂnaũǂais.

The man who represents the horse has a thong in his mouth and by means of this he is held fast, as though on a rein, by a man standing before him. To another man, standing behind him, he extends a foot to be shoed. A fourth plays the part of the bellows: he lies flat on his stomach, extends his lower legs into the air and lets them be moved alternately backward and forward from the knee, in time with the music, by a fifth man who stands behind him. Before him stands the smith with a stone in his hand as a hammer and waits for the iron to get hot. All the others, including the reed blowers, dance around this group in a circle and sing a wordless but rhythmically, unmistakable imitation of the blows of the hammer: [Translator's note: six bars of music omitted.]

In other dance songs, in place of the pantomime, we find that the situation which is being sung about is indicated by a cue word. Thus, one Hottentot, who occasionally crept into the cattle kraal of a neighboring village at night in order to milk goat's milk into his mouth, expressed in a song his joy about the fact that he had never been caught. He sang its single words, B(e)ridaise, b(e)ridaise, "you goat milk, you goat milk" to a melody that was just as unpretentious but that his friends liked to request for the dance: [Translator's note: six bars of music have been omitted.]

[379] On the same low level there is a song for which the following event is the basis. The singer had beaten his oxen guard with a sjambok because the guard had let a valuable animal run away on the trip. The punishment was so severe that the mistreated man lodged a complaint against his master with Captain Paul Frederik in Bethanie. The latter sent one of his men on horse after the guilty man and had him seized. The only words, which recur like a refrain in the otherwise unarticulated song, refer to the color of the above-mentioned horse, which had a white stripe on its forehead and white feet and therefore had the Boer

name witvoet. The circle of friends knew, when they heard this word, 533
what the song was all about. The melody goes: 535

Song of The White-footed Horse

[Translator's note: eleven bars of music omitted.]

Whereas the previously-mentioned dance melodies lack a complete text, in the following song it is at least loosely attached as a point of reference. In the brothers' war for the rule over the Bethanie Hottentots, Paul Frederik had occupied the most important water spots of the territory and Cornelius, caught in a tight spot, finally had to ask his brother for water. The text* of the song that concerns this war between

* In all the following texts and their explanations, with few exceptions (for example where it is a question of newly mentioned words), I have neglected to add the signs for the musical modifications of the Nama sounds (see p. 342 ff.). In the detailed analysis of the subsequently following folk tale texts the purely phonetic consideration is dispensable for the comprehension of the plot and hence makes it possible to save much space in printing. A theoretical reason for a simplified orthography of the text has been mentioned above (p. 363).

brothers, a program for the music as it were, goes:

"Ti !gãtse, //nāti gõse !gaĩ ẽta //gami āre!"
!abuti ãtsa //gui ẽts //gami ā
"/guita tite."
"My brother, be good, be a friend and let me drink some water!"
"Put down your weapons and then drink water."
"I will not put them down."

[380] The relevant dance melody goes: [Translator's note: five bars of music omitted.]

In the Song of Kaukaussib text and melody are just as loosely connected as in this war song. Kaukaussib is a watering place in Namib, located on the southernmost of the three routes which can be taken by oxcart traffic between Angra Pequena and the hinterland. The road by way of Kaukaussib is the most difficult, and the carts often remain stuck in the sand for days. A Hottentot with the nickname ǂnau-bas (e)nǂnā-/b,

that is "he who plays for his own dance," selected as a text the simple 533
words: !Gaokχa·osetse, hã·ta ǂo·are "Kaukaussib, let me get out!" 535
The constantly repeated melody to this text goes: [Translator's note: five bars of music omitted.]

The text is more closely connected to the melody in the Hyena Song. This song portrays the hyena as it creeps around the cattle kraal at night and is discovered. The pantomimic presentation of this theme with its reed music, its song and dance, is very amusing: the men group themselves in a semi-circle, and opposite them the girls do likewise. The circle formed in this way with its two opposite openings (where the men's row meets the girls' row) represents a cattle kraal and the girls represent the cattle. To the accompaniment of the singing and the sounds of the reed music of all the people standing in the circle, one of the men steps out of the row and, with deeply bent knees, creeps into the kraal, moving past the row of girls with the gestures of a bloodthirsty hyena. After a while three other men step out of the row and pretend to ride up to the same opening of the kraal where the hyena had entered. With gestures and poses they tie up their horses, discover the tracks of the hyena and follow them until they suddenly notice the animal. Then they hurry back to the horses and take up pursuit. Meanwhile the hyena has left the kraal, but is caught outside it and killed. During this pantomime, to the rhythm [381] of the reed pipers, the following words are sung incessantly as a warning to the cattle-hungry predatory animal: [Translator's note: four bars of music and one line of Hottentot text omitted.]

"Hyena (the nickname will be discussed later), this (i.e., the cattle of this kraal) is man's property!"

3. Songs Without Dance and Pantomime

533

At an early date I became acquainted with the Hottentot's pleasure in music by itself (dissociated from dance and pantomime). It was on the evening of a hard working day for our Hottentots; since early morning they had been dragging spars for the construction of sea signals to the top of the steep coastal cliffs, and now, long after the evening meal was past, they were still squatting around their fire. In the tents of the white men it had already become quiet and even the Cameroon sailors were asleep in their sailcloth berths. Then, from the miserable

brush stockade of the Hottentot camp into which the cold winter sky shines starry clear, there resounds pure and serious a many-voiced song. A young fellow is standing erect amidst the ragged sitting older figures and, unconcerned about the smoke of the flickering fire that irritates his eyes, leads the chorus with a loud voice. An older man repeated the text in a short rapid sentence to the singers; it was a Dutch chorale that had been translated by a missionary into their language. For a long time I listened to the song of the "degenerate mob" until they crept shivering under their covers, closely pressed together, their naked feet extended close to the glowing ashes.

In their own songs the text does not always have a set word sequence and in choral singing the singers often improvise their own motifs, which they repeat again and again, with slight variations and after variably long or short pauses, until the text has come to an end. In doing so, however, they know how to weave their motif into the voice texture of the others without dissonance.

Most songs (perhaps all of them) have a definite event at their basis. Thus, years ago, a white carrier [382] unyoked his team at the house of the brother of old /E·ris and went to bed. A group of Hottentots, as is common, appeared in order to beg and to trade. In doing so they stole some of the provisions of the sleeping trader. The Witbooi Hottentot, who intervened to protect the white man's property, was shot down by the white man in an outburst of rage under the mistaken assumption that he was the inciter of the theft. The fate of the slain man lives on in family tradition and the women sing: "!Uri lendetse, /hai daos ai go !gabi ǂoatse, gai χũẽ dĩtsĩ, /aoba dĩtsĩ! tariẽ kχa nĩ nẽ kχoĩ /aoba !eream?"

"You white cloth (probably a reference to the hat veil or the scarf of the traveler), you who have ridden out on a wicked (literally "pale-colored, worthless") path, you have done a misdeed (intransitive preterite participle, literally "you have done a great thing"), you have spilled blood! Alas, who shall avenge the blood of that man? (literally "answer for").

After a short prelude on the bow the voices begin with the following motif:

[Translator's note: eight bars of music omitted.]

A love song of the simplest conceivable sort goes: [Translator's note: four bars of music and one line of text omitted.]

The lamenting text says: "I will never get you!"

In Lüderitz Bay and around Keetmanshoop half-grown boys and young men, when they wanted to make fun of girls, used to sing: 533

[Translator's note: four bars of music and text omitted.]

The teasing is implicit in the ambiguity of the text. The words in themselves, "you, my cheek (χõse)," are straightforward. But not [383] χõs is intended, but χũs, that is, a possession, a "thing" (of any sort) and here specifically: the most preciously guarded possession of the virgin body which the boys boldly call their own.

4. The Dance Without Accompaniment 535

Dances without musical accompaniment came to my attention only once. It was a nocturnal dance with the name ʔtsũ.χu tsa.ǂbe --- da.ǂba tsa.ǂbe. These at the same time are the words that the dancers constantly repeat in time with their steps. The dance is performed by young and old, even by the oldest people of both sexes. Three people take part in it: two who approach each other in a hostile manner and a third who tries to separate the quarrelers by dancing between them every time they approach each other.

The step itself is simple: the right foot is scraped forward and then again half backwards in short paces. Immediately after every such scraping motion the left foot, stamping with the whole sole, is brought forward; at the same time the body sinks into a slight knee bend. The movement goes along slowly and jerkily, but it is not ponderous and it is even graceful when a young body executes it lithely. The movement of the right foot accompanies the words tsũ.χa- and da.ǂba-; the stamping of the left foot occurs on the first syllable of the word lying between them, tsaǂbe.

D. Beginnings of a Literature

1. Point of Origin 538 825

Outside of the narrow circle of his daily needs, and second to his interest in his own kind, the animal world is the favorite playground of the Hottentot's phantasy. He comes into close contact with domestic animals from the very first day of his employment as a herd boy. Left

538
825

to himself day in and day out, from early in the morning until evening, and dependent in his watchman's duties and for his amusement exclusively upon his observation of nature, he soon becomes acquainted with every bird call and he gets to know the habits of wild game and predatory animals as well as the hiding places of all the little animals that spice his scanty meals. All of this comes to him at an age when a childish desire for knowledge and games makes him receptive to everything around him. Later the hunt is his preceptor in natural history. The Hottentot never lacks leisure time in which these impressions can develop, and thus he spins out what he has seen and [384] heard and interprets it in human terms. In its most modest form this takes place when he thinks that he hears words * in animal voices.

*Syllables that are to be sustained are marked with a musical hold. An accent mark is added where the rhythm is especially noticeable in imitation of the animal voice.

A. Animal Voices

Thus a wild dove (Stictoenas phaeonotus Gray, ǂnabu·s), probably from the time when it was hunted with thorn-tipped arrows, calls to the man: "/Hai kχoëtse·, /hai /huru·, !gaba //kχūb gom !kχaĩ χūba o!" "You good-for-nothing (literally "pale") man, you are playing a good-for-nothing game, the gaba thorn is a poisonous (forbidden) thing!"

A lark, *!hurīẽ. b by name (I cannot determine whether it is a Calandrella cinerea (Gm.) or a Clothilauda semitorquata A. Sm.), has a zig-zagged flight that rises and falls, and at the peak of its zig-zag it makes a clattering sound with its wings and produces an extended rising tone. In this call the Hottentot hears the words Om·dīre!, that is "fix up the hut!", which is an admonition to the women to tighten the rush mats of the hut, for this bird call is supposed to be heard especially [821] when a storm is approaching; I heard it in all sorts of weather.

The Hottentot finds an admonition to negligent parents in the cry of the !kχu·ririseb bird (which seems to belong to a species of Pycnonotus): "/Gu·rub ǂkχa·rib, /gu·ri //goë·, hũ·diros /gu·ri //goë·!" "The Gurub lies alone, the Hudiros lies alone!"

The Hottentots call the black corn crow, the Corvus capensis Licht., *//hõ·rab, which is derived from //hõ.ra, "to scratch around the ground

538
825

in order to find scraps." In its screeching voice the Hottentot sometimes hears the rejoicing of a happy hunter: "χu·rigye go /a·os gye, hõ.gye go ≠hã·eĩ gye!" "We (gye, suffix of the first person plural masculine) have drawn (χuri)* blood (/aos), we have got (hõ) a springbok (≠hãeĩ, neut. sing.)."

* The native hunter ordinarily pours the blood from the body cavity of the freshly killed beast into its eviscerated stomach and carries it home. [224]

The Hottentot also hears dialogues of the birds. Thus, according to him, the white-breasted crow, go/ra·b (3, st.) the Corvus scapulatus Daud., which is not very choosy in selecting its food, calls to the above-mentioned corn crow: "//Hõ.rab, //hõ·rab, /kχĩ·ẽ·kχ(u)m χau·sa !kχã !ã·gu!" "Raven, raven, come and let us both pick apart (literally, "stab," !kχã, and "separate, !ã.) excrement together."

But the addressed crow remains with its own preference and answers: "Go/ra·b, go/ra·b, kχi· ẽ·kχ(u)m !ha·nsa !kχã· !ã·gu!" "Come let us pick apart field bulbs with each other."

The cooing of the turtle dove (≠na/i·s) has its own story. The Hottentots relate that the turtle dove was once a notorious cattle thief. She once wanted to borrow an ax to chop up the bones of a stolen calf from the sand grouse, Pteroclurus namaqua (Gmel.), !haus, with which she lived. But the honest grouse refused her. Ever since the dove has cursed it with the words *: "!hau·s !ga·rrrase, !hau·s

*Here it is especially clear how the choice of the words, their sequence and accentuation, aim at an imitation of the animal voice.

It seems to me that certain observations from the primitive stages of an incipient literature (such as the Hottentots represent) are not without value in determining how man originally came to give his speeches certain rhythms when he wants to free them from oppressive monotony and use them for freer creations of the phantasy. It is no hypothesis but an ascertainment of the actual state of affairs that, in the Nama language, the childish joy in imitating certain animal voices with words represents one way to rhythmical development.

538
825

> Another way can be derived from the pleasure that the Hottentot, as probably every people does, experiences when he refines the movements of his body and makes them the expression of his emotions. Thus, the natural movements of the body, which are rhythmical in themselves, have become dance motions. And since among the Hottentots we encounter dance and music and accompanying song texts in close relation, a second source of conscious rhythmization of language appears here of its own accord.

!ga·rrrase, !ōba /kχu·bi te, ĩ·ta tsaũ·ba !na·n !ā·, ta·naba ǂhũ.i si!" "You filthy beast (!garab is the penis, used as a curse word), lend (/kχubi) me (te) the ax (!ōba); let (ĩ) me (-ta) chop up (!nan!ã) the calf (tsaũba)." "I will split (ǂhũi) your (si) head (tanaba)."

It follows that anybody who understands the language of the animals can also take part in their conversation by means of cries.

B. Cries

The name of a woodpecker (probably the Dendropicus picus cardinalis Gmel.), tĩ·tĩ·ses, imitates the sustained call of the bird. The Hottentots of my party always interpreted this as an erotic enticement and mockingly pass it along to an imagined Bushman by crying: "!nuru//kχum gaitse, nẽ gye tĩtĩses si χaiba ra ãba!" "You old Nurukum (proper name), this woodpecker is calling for you to copulate with her!"

[386] As among us, children discuss the animals with which they play. Thus, they try to make the *//kχaobas lizard lie still by singing to it: [Translator's note: two bars of music omitted.] "han - sib //nao - se, ǂãb t(u)mi //goe re." "Hey, you, Hansib's (fictitious proper name) grandmother, why don't you sit down!" (Literally, "Lie down like an arrow.")

533
857

A dung beetle, that the children spear in order to hear the humming of its flapping wings, is lured with the words: [Translator's note: four bars of music omitted.] "//nao - ba, //nao - ba o /aru ai ǂnũ - te." "Naobas-beetle, oh, why don't you sit down on the manure!"

533
857

The children try to enchant the chameleon with the words: "!no·mtsi !no-meba, a·ma !nu·rubas õ·ab !" "Humpy old hunchback, child of grandmother (*amas) Nurubas!"

533
539x

The baboon is honored by an especially exhaustive address. In a deep wadi near the Orange River we heard the apes calling on the surrounding cliffs. To the first one that became visible one of my Hottentots called the following greeting which is widespread among the people*:

*Cf. Bleek's translations of animal songs from the manuscripts of the Grey Library in Capetown.

"herẽ·tse, hẽ·retse!
/hu·mi /ha·rutse,
//a·retse, //a·re /kχã·baĩtse,
!na·ohe gye //ga·ns //(e)ĩ /na·os(e)n !
≠nabu· !nani·b ai gye mã·tse
/nabu· a·maĩtse !
tsoa·ba gye ≠gaẽ·s !"

"For heaven's sake!* You are gleaming with fat!**

*Actually something like: "Good God!" from heere, the Dutch designation for "lord" with the Hottentot vocative ending of the masc. sing.

** The blades of the /hu·ʔmi/haru·s rush (see p. 229) glisten like fat; a hide that glitters like this is supposed to be the ornament of the young baboon. The opposite address which I also heard goes: "/no·ro /kχo·nibeise"; /kχo-nibeb is an edible underground bulb with a pale exterior.

"Old Lefty*! You are loaded down, you are loaded down with

*The use of the left hand is considered a sign of dexterity.

[826]

your own flesh*! Hey you, standing up there on the dove's cliff** 533 539x

*As a characteristic of the dragging, forward-jerking movement of the baboon.

**The steep declivity of the Table Mountains is a favorite resort of the wild doves (see p. 384).

"you dove-mouthed fellow!* You who drag your anus behind you!"

*In ridicule of the baboon's long snout which, in the eyes of the Hottentots, sticks out like a beak.

2. Folk Tales of the Hottentots

*Aibe-gam-//aë-!gã̀s-χũna. 538

Just as they call the horizon of the open sea the "back of the water," *//gami!gã̀b, likewise they call the remote past, which is as far away as that horizon, the "back of time," *//aë!gã̀s. In those days there were still no people, but sun and moon inhabited the earth, and fire was alive; all animals had manlike forms and felt and acted like people. Within the frame of this general conception the Hottentots' imagination reduces all his observations of the animal world and the experiences of his own life to folk tales, which have endured for generations without being written down. In the evening they squat in a circle around the fire of the hut or of the camp in the field, and each person gets a turn to tell his story. Probably it was from no feeling of superstition but simply from the very mood of those happy hours that the precept of allowing these legendary figures to come to life only around the evening fire developed. Anybody who talks about them in the day time might well conjure up the things (χũ·na) of the past (aibe-gam)*

*I was not able to determine the etymology of the word *gam. It is used before aibe and ǂgũro, "formerly," in the sense of a demon. particle.

and thereby bring about irremediable confusion. Only after sundown

does one hear the command !ho·are, "tell a story!"

Although the travelers of the eighteenth century already recognized the Hottentots' love of folk tales, until now only four stories were known in the language of the Hottentots themselves; they were published by Theophilus Hahn (78) according to notes made by

78. Th. Hahn. Die Sprache der Nama. Leipzig, 1870.

G. Kroenlein and the Bastard J. de Bries. The rest that has been published on this subject is made up of translations and plot synopses in European languages. George Grey, the governor of the Cape Colony, had the curator of his library, W. H. J. Bleek, send a circular to the missionaries of South Africa with the request to send him everything that might be considered the beginnings of a literature of the [388] natives. Bleek published the results--unfortunately only translations-- although among the 40 stories of his collection 24 had already been copied down in the original by Kroenlein (unfortunately never published). A direct comparison of Bleek's translations with Kroenlein's original text is possible only in the story of the moon myth by means of Th. Hahn's publication of the original. In place of the title, which literally should be "The Moon and the Louse and the Hare," Bleek puts "The Origin of Death," and he suppresses the indecent louse (which also defiles the following text) by speaking instead only of a "little animal." One would pass over such minor details if one prudery did not lead to another and, finally, if it did not produce a result which is absolutely incongruous with the Hottentot's manner of expressing himself. How must a censorship which is so touchy about minor things proceed when the people really reveals itself without a figleaf? Since I am not acquainted with Kroenlein's manuscript, I must keep simply to a comparison of the style and content of my texts with those of Bleek. The translator considered it necessary to make "omissions and changes without which the fables would have appeared too naked in European eyes in order to make these Hottentot fables accessible to a larger public," and he believes that he is not violating the spirit of the fables in doing so. The texts that are published here give the answer: their form of expression reveals the bluntness of a primitive people in which none of the senses is neglected; here, where everything has a sanctuary and no part of the body is objectionable. And specifically little psychological traits in which are to be found the

driving motives for the judgments and actions of the folk tale figures are often bound to the most vivid and forceful expressions. The crude figure of speech of the old female elephant (Folk tale LVIII) characterizes in a word the rough conception of family life that the young wife (in the figure of a fly) wants to escape. The lion's address to the animals (Folk tale LVII) and his unreasonable demands are a striking illustration of the absurdity of an undignified and only apparent authority.

In judging the intellectual level of the people the form of presentation seems to me to count just as much as the content, especially in the beginning stages of an unwritten literature. It will be seen that the Hottentot never anticipates and depicts a character or a situation in his story in advance with an abstract adjective that reveals everything. Never did one of the Hottentots who told me their stories speak [389] of "a simple old hyena," as Bleek does, and never does an animal act "out of malice," etc. Rather, the Hottentot develops a situation, lets us eavesdrop on the conversations of the animals and lets them act before our eyes so that they themselves may show what their feelings are.

It is not astonishing that animals play a main role in the stories of a pastoral and hunting people. But one may not speak of "fables" simply because of this fact. The moral teachings that people have sought and believed to find in the animal legends of the Hottentots by analogy with superficially related indigenous works of art is in the majority of cases nothing more than the expression of an non-contemplative emotion, and by no means a moralizing one: thus we find hatred toward the oppressor and not praise of brotherly love (Folk tale LIX); ridicule of the presumptuousness of a weakling and not praise of self-knowledge and modesty (Folk tale LVII); malicious joy in the bad luck of an old deceiver and not abhorrence at lies (Folk tale XLII). After all, in other connections stealth and deception celebrate triumphs! Wherever more tender emotions play a part, like sibling love (Folk tale LVIII), a mother's grief (LI), the loyalty of friends (Folk tale XXVI)--here the portrayal, in its naivété, stands far above any sermonizing ulterior motive and in erotic matters the imagination with its sometimes bizarre digressions (Folk tale XLIX) leaves absolutely no place for the moralist.

Therefore when Bleek says of the animal stories of the Hottentots: "Children as well as adults who have retained their simple nature and whose taste has not been ruined by the poison of overstimulating reading will always take pleasure in the nicely expressed moral precepts

that they get in any good fable; and the more profound literary connoisseur will likewise be delighted by these first innocent flights of the awakening human phantasy. To people such as these the Hottentot fables that are offered here will surely be welcome," etc., etc, I only see three possibilities of explanation. Either the translation is wrong; or the manuscripts contain only a selection of such tales which satisfy certain prerequisites of Christian moral teaching; or the Hottentot, cunning observer of human nature that he is, edited his stories in advance in usum Delphini, knowing well to whom he was telling them. However that may be, Bleek's reports about the stories do not show me the Hottentot as I have become acquainted with him; for this reason and because I had direct access to the source I took no further consideration of them in matters of detail. [390] On the other hand the translations of the missionary J. Olpp (88, reveal throughout

88. J. Olpp, Aus dem Sagenschatz der Nama-Khoi-Khoin (Mitteilungen der geographischen Gesellschaft für Thüringen zu Jena, Bd. VI, 1887).

an understanding and fidelity that can only be produced by intimate acquaintance with the people themselves.

Of the stories that are to be related here the autochthonous origin can surely be questioned in two cases: Folk tale XLVIII, in the course of its action, recalls a Wolof legend that Boilat published and Bleek translated. In this story the jackal of the Hottentots is represented by an elephant, the snake by a hyena, the porcupine by an ox, and the stone by a pit; but the rôles of each individual are, in meaning, the same in both cases. Furthermore, the story of the little traders (XII) corresponds in numerous details to a story of the Hereros that J. Rath copied down in the original language and Bleek again translated from the manuscript. I have no way of determining which people here had priority.

As for the others, I can only reproduce faithfully what I have heard from the mouths of the Hottentots and I must let others answer the question whether or not the folk tales printed here reveal any similarities to the folk tale cycles of other peoples and, if so, which ones. The exact proof of borrowings, if this should turn out to be the case, seems to me to be no less interesting as an insight into the dark pre-history of the Hottentot race than a confirmation of the originality of the stories would be.

Proceeding from the conviction that it is extremely important, 538
in order to understand the intellectual activity, specifically of a peo- 128
ple of low cultural niveau, to comprehend the manner of their conceptualization and the rules by which they combine concepts in the form of images and judgments, I have added to each text an exegesis explaining vocabulary and grammar; this should enable the reader to check the translation word for word. For these texts are to be considered as documents of the Hottentot mind that require deciphering. Anyone who wishes first to read through a tale in coherent German will soon get used to following the German text as a unit and skipping over the explanations that are printed in italics and set in parentheses.

In a purely linguistic connection the following remarks must be made about the texts:

The jackal as well as the baboon are frequently portrayed in the [522]
stories as having a speech defect, and by this alone they produce a comical effect upon the Hottentot listener. Either these animals are caused [391] (if they are being stamped as comical figures) to pronounce no clicks, and instead mutilate the words in question with irregularly unarticulated sounds; or else they are made to repeat one and the same click throughout entire sentences, whether in the right place or not. I always had such intentionally perverted passages repeated to me in correct Nama, and I reproduce them here in this form.

In order to avoid repetition in the text analyses (wherever this is 538
possible without detracting from clarity), the following points are 128
mentioned here in advance once and for all: 193

a) In Hottentot the subject is frequently indicated only by the personal suffixes of the third person (see for example Folk tale XVI). Wherever it turned out to be unclear or clumsy to use a corresponding pronoun as a substitute, I generally simply repeated in the translation the noun of the preceding sentence. The personal suffixes of the third person are in the nominative:

	Singular	Dual	Plural
Masculine	-b, -i (after m and n)	-kʔa	-gu
euphonic	-ba, -a		-ga
Feminine	-s	-ra	-ti
euphonic	-sa		-te
Neuter	-r	-ra (♂ + ♀)	-n
euphonic	-e		-na

538 b) The most common auxiliary verbs, also called verbal particles,
128 are:
193 i used very generally.
a and gye, when they stand alone designate the present.
go and gye gye designate recent and more distant past.
nĩ designates the future.
ra (euphonic ta) designates a progressive action.
hã designates a condition.

c) Direct discourse is frequently introduced in Hottentot only by tsĩ with the personal suffix of the speaker added. At the end of the speech there are the words ti go mĩ, that is "so said he" (she or it, etc.). In translation these words are frequently more comprehensible if they are placed at the beginning and often I have used the substantive, not simply the pronoun, as subject.

d) The common conjunctions o and tsĩ I have translated according to context as: "and, now, then, thereupon," etc.

[392] Whenever the Hottentot lists a number of objects or persons (even though there are only two), he always adds at the end, to sum it up, the conjunction tsĩ with the personal suffix of the listed persons in the dual or plural and in the masculine, feminine or neuter. Thus: /gĩrib tsĩ χami tsĩ ǂhĩras tsĩna, that is: "the jackal and the lion and the hyena and they." I have not reproduced this summing-up particle in the translation.

e) I propose to designate a peculiarity of the Hottentot narrative style as the "narrative passive." Instead of saying: tsĩs gye go ǂnã, that is "and she danced," the Hottentot, in the context of the story, likes to say: tsĩ gye go ǂnãhe (-he, passive ending), that is "dancing was done," [Translator's note: "und es wurde getanzt": English has no equivalent for this impersonal passive.] whereby the subject of the preceding sentence is imagined personally with all definiteness although it is not indicated in the passive sentence itself by any suffix.

If the subject of the sentence is a substantive, then in the narrative passive construction it is frequently (but not always!) followed by the word χa. In this case one can regard χa as the preposition "of" and might accordingly translate the sentence: /gõati χa i gye gye sarihe, literally as: "by the girls it was gone walking" [Von den Mädchen wurde spazieren gegangen]. But whenever this χa can be

dropped and is replaced by a demonstrative personal suffix, this formal adjustment of the German to Hottentot (for lack of anything better) is not possible. 539 128 193

I have translated all constructions of the narrative passive as active clauses with a definite subject.

f) The words of the translation that were added for better understanding or in order to avoid unnecessary roughness in the translation, although no word in the Hottentot text corresponds to them are set in brackets [ ].

The folk tales of the Hottentots can be grouped in five classes:

a) Adventures in the Wilderness 538

In the remote interior of the land lives, in the folk tale world, a fabulous beast that the Hottentots call ǂaitgã/mũ·ǂxab, because its eyes (mũ·ti) are not in its face but on the back (!gã/b) of its feet (ǂaiti). The being is thought of in a manlike shape, walking upright, and hence with eyes directed towards the sky. If it wants to see what is happening on the ground, it must lie down on all fours: on its extended arms in front and on its knees in the rear. [393] Then it raises one knee and bends it as far as it can until the back of the foot with its eye is looking backward horizontally. These fabulous beasts live together harmoniously and hunt down human beings, whom they take for zebras, in order to tear them apart with their finger-long sharp teeth that mesh like those of a predatory animal. Thus they are also called ǂkxoe-oren (kxoeb "man," ǂo-re "to run up and devour the buried prey"). The man-eating female has in addition the special name /gaũ·/bes. In the adventures with the Aigamucha people (Folk tales I to VI) the Hottentot does not adhere in detail so strictly to the above-mentioned characteristics that he ascribes to these man-eaters; generally he has them appear so manlike that they can deceive their prey as to their true character until escape seems impossible. The discovery of the foot-eyes of the Aigamuchab is the achievement of the jackal (Folk tale VI).

The manifold Experiences While Wandering (Folk tales VII to XII) are comprehensible without commentary.

Only a few Hunting Adventures (Folk tales XIII and XIV) that deserve to be considered as folk tales reached my ears. The one hunting adventure (Folk tale XIV) is tied to the name of /gu-rikxoeseb,

538

that "Unique Man," (66) who was the first of his kind to inhabit the earth.

66. Th. Hahn, Die Nama-Hottentotten. Ein Beitrag zur südafrikanischen. Ethnographie. (Globus, Bd. XII, 1867.)

Among the Hottentots I ran into another conception of the /gu·rikχoĕseb, that perhaps arose later: he was described to me as a hunter who lived alone in the wilderness with his wife and his dogs; in accordance with this one would simply call him a person who has settled off by himself and in short the "hermit." Accordingly the word /gu·rikχoĕseb would then be formed in analogy to the word /gu·riseb, a designation for the springbok ram that has been expelled from the herd and lives alone.

[394] [Text omitted]

Translation of I

The Girls Who Take a Walk to the Village of the Aigamucha Woman

531[x]

Girls (/g̃oasi "daughters) went walking (sari narr. pass.) to the (//ga) kraal of the Aigamucha woman; and when they got there (si, with the personal suff. of the subj.) one (/gui) of them ("a person," kχoi's, fem.) is pregnant (!gom); this one is addressed (mĩ "to say") like this by (χa) the Aigamucha woman: "Come (/kχĩ), let yourself (literally: "and ẽ [imperative], I -ta, manage you -si") be massaged!" (!guri, cf. Care of the Skin, pp. 207 and 215). And she is massaged. Then her (ã, root of the poss. pron., -sa personal suff. of the possessor) front apron (!gaẽb) was bound together (!gai "to bind," //ase "to unite") with (/kχa) the front apron of the former (//(e)ĩs, personal pron.), and the others (expressed here only by the personal suff.) went home (//aru, vb.).

The one (nau, literally: "other") girl, however, was held back (!kχõ "to catch," maĩ "to place") and told (gai) to lie down (//goẽ).

X539 and she lay down. Then [her] coccyx (/ama, "tip," ǂare- "of the buttocks") is cut off (!gao//nã) and the fat is roasted out (aira)."

"All of the following is expressed in the form of the narrative passive. One might consider it a use of the true passive if the forms ǂnã/he and bẽhe did not make it clear that the former is intended. In translation these clauses are reproduced in the active with a definite subject.

Then the woman put (ǂnũi) the little pieces of fat (gaub "fat," -ro, [395] dimin.) individually (/gui /guibe) into (!na) tortoise shells (/gabiti) and poured (ǂnã) the drippings (//nuina, neut. pl.) over them (ai) and put (maĩ) them, one after the other (saogu), on (am !na) the path (daob) that her sons (indicated by the suff. of the 3rd pers. pl., -gu) had to come (nĩ, verbal particle of the fut.) Then she danced (ǂnã) and [sang]: "Whoever (-ba, suff. of the 3rd pers. sing. masc.) stays (hã) at home (!haĩs, "kraal," ai "in"), [makes] nevertheless (ᵡabe) a finding-of-food!" (ǂũba hõs). Thus (tumi) she danced away (bẽ). But when the woman had gone away, [the girl] takes (ũ) a stone (/uiba) and puts (//gui) it where (-ba) she had lain and runs away.

Then [the sons] came where the tortoise shells were standing (mã), emptied (abu) them and hastened (!kᵡoẽ) up. And the woman comes towards (ais ai) [them]. But the stone, so (ti) she thinks (ǂaĩ), is the girl, and when she saw (mũ) the sons* coming along

*Expressed by the suff. -gu. The personal suff. of the subj., -s, is attached to this personal suff. of the obj. Without this heaping up of suffices it would have to be expressed this way: !goaᵡas go kᵡoẽgu.

(!goaᵡa), she covers (!gũ !gã) [it even more]. And they came. Then she said to the one: "Take the ax (!õaa) and (ẽ, with the suff. of the 2nd pers. sing. masc. -ts) air (/hui) the covers (ǂnamte) there (//nã) and chop up (//hã) the thing (ᵡũẽ, neut. sing.) that is lying there (//nãba)! The Two Women Who Were Taken Along by Aigamuchab

And it happened this way (hĩhe "was done"): Two (/gam) women (kxoẽra) had gotten lost (!kxoẽ "to hurry," /ari "to lose"). And they came (/kxĩ) to (ai) the place (!kxaib) where Aigamuchab refused (//hã, ta = ra) cattle food (//ũna, neut. pl.).* Then they

[283 929]

"The smooth, shiny, yellowish, innermost layer of fibers of the bark of the thorn tree, which tastes sweet, is sucked and then twisted into twine.

[called]: "Man, [you] who (-ẽ, suff. of the 3rd pers. sing. neut.) are hammering (!gõ!gõ) there (nẽba), take (õ) us* to the (//ga) kraal! (//gaũs, p. 232).

"Literally: "one," kxoẽẽ = "person" in the neut. sing., corresponding to our impersonal "one." This indefinite manner of expression is preferred to the personal pron. of the 1st pers. if the request is made to a stranger. In this form I heard women ask strange Hottentots for tobacco.

A 539 Then Aigamuchab looked (gõ) up and says: "Let (ha) me (-ta) show (//gau) you (si) the kraal." And they went. But the fat (gausa) woman remains (hã) behind (kχaus ai); in this fashion (//na tumi) the two go away (bẽ), go [farther and farther], but the one (nau) woman turns around (oa).

Thus, the man [Aigamuchab] sees (mã), when (o-) he looks back, only a (/gui) single (/guisa) woman. Then he asks (tĩ), and the [397] woman [answers]: "I know not (ũta), she stayed behind." But he [cursed]: "Come on (hã ĩ), you (-sa) child (õas) of the great (gaib) dirt-scum-penis! (!garab, penis, cf. p. 320). A pack of twins (/gẽ/gõab "twin"; χũba, contemptuous for "thing") is supposed to go along with each other (sao "to follow"; -gu, reciprocal particle), isn't it (gom--o)?"

Then they came (sĩ) to the doba) kraal of the Aigamuchab.

> "Here the gen. particle di receives the fem. personal suff. because it follows the substantive which it governs.

And when (o) he got there, he said: "What? (tarẽ) the thing will never (huga "ever"; toma "not") taste good! (//kχoa). Cut [her] (!gao) throat (tomi) off! (-χa). Let (ẽ "and," imperative) us (-gye) [at least] lap up (!hum) the soup (surosa) [from it]." Thus he spoke.

Thereupon they (-gu) seized (!kχõ) her (si), cut off her throat. And when she befouls (χau) herself (s(e)n), they cry, "Grab (χaba) the fat from the anus!" (tsoa//nuiba}, euphemistic term for excrement) and they ate (õ) it up (toa, "to end").

But he looked for the tracks; (mã "stood," ai "on," ǂaib "her foot") and he comes along, finds the track (daoba), follows it (!kχõ) and catches up with the woman (sao "to follow," sĩ "to arrive," //are "to come together"). Then the woman produced a foul (nau "sofa") stench (/õ, vb.), [as though] she would spontaneously decompose ("nora) if (?) he caught her. But he says: "[You] stink sweetly, (ǂkχun) you (-s in /guis) will just fit (ǂgã) into (!na) my (ti) pot (sũs), that's (kχoma) the way it smells (tsã "to taste")!"

And he hastily (!kχoẽ, vb.) looks for (õa) the pot. Then the woman gets up (kχaĩ) and runs away" home (//aru "to return home").

> "The fut. ending nĩ in !kχoẽ-nĩ indicates that she expects to be pursued.

X 539 And while the woman was running away, he comes (/kχĩ) dragging (!kχara) the pot, comes up (hã), looks in disappointedly (//kχui "to miss") and called: "Sweet stinky, where (maba) did you go?" (ĩ). Thus (tumi) [it happened].

The Aigamucha People and the Hottentots

To (aĩ) Aigamuchaib's kraal (//gaũs) people (kχoĩn) had come (/kχĩ), and (tsĩ) an Aigamucha girl (-sa, personal suff. of the fem. sing.) was slaughtered (≠ãhe) in their honor (-ba, verbal particle, emphasizing in this case the connection with the ind. obj.). But when (o) the time (//aĉba) had come (/oa) when they were supposed to be called (≠gaihe) [to the meal], [400] they take (ũ) their own° (//(e)ĩ, root of the

°Because they do not trust the hospitality.

*539 personal pron.; -n, personal suff. of the 3rd pers. pl. neut.; di, gen. particle) meat (//gana) [that they had brought along themselves], and when they were called, they go (si) there with (/kχa) their own meat. When they (expressed by -ba, a verbal particle in the objective case) had been served (hora-he), they ate (≠ũ) also (tsĩ) their own meat and put (ũ) the meat of the Aigamucha girl into (!na) the covers (≠namti). Then they gave back (//kχai "to turn, return," //nã "to leave") the dishes (!oreti) and go home (//aru).

And when the next (nau = /nĩ) morning (//goas) came (//goa), a ram (baiba) is caught (*!kχõhe) [by Aigamuchab] and buried* (//kχõhe)

*As bait for the people that the man-eater wants to catch.

in a hole (ãb). After (tsĩ, verbal particle of the past participle) the sheep (gũba) was buried completely (toa "to cease"), a dog (ariba) is tied (double vb.: !gai "to tie" maĩ "to put"), and then they go away (!gũng with a pass. ending). But the others (the humans) dig (kχao) up (≠ui) the sheep. Then the dog breaks (double vb.: ≠gai "to pull"; !gao "to cut") the strap (!haũba) and runs away (!kχoë) and [howls]: "The one (-ba, full personal suff. of the 3rd pers. sing. masc.) with the bushy (/gom) back of the head (!noros) is being taken!" (u---he, sustained long in imitation of the howling of the dog). Then the Aigamucha men (-gu = ga, masc. pl.) came again (oa, vb.) with (/kχa) assagai's (gõagu). But the others seize the weapons (!abuti). Then the former were afraid (!ao) and go back (oa).

[401] [Text omitted]

Translation of V

The Woman for Whose Child a Dog is Substituted

A woman (kχoës) bore (ora, narr. pass.) a son (/gõaba), but the other women (tarate) did not (toma) grant (*≠aĩba) [him] to the woman and took (ũ) the son, went away (si) and laid (//gui) [him]

1539 on the shore (am !gã, "along"; //gaĩni, "the water"); but near the woman they laid down (-ba, an objectivizing verbal particle) a dog (ariba). Then an Aigamucha woman found (hõ) the [exposed boy] (bi "him") and took him and comes (sĩ) home (//aru, vb.) with* him

*The verbal relation of certain post-positive prepositions as well as preceding prepositions is seen clearly here where the word ũ is used as a preposition and needs only a copulative link in order to be a verb.

And during the time that (hĩ̃a) he stays (hã̃) with (/kχ̃a) her (//e(ĩ̃)s, personal pron.), he becomes big (gai).

Then, when (o) she had gone away (!gũ̃ng) [one day], he went to (//ga) a Boer place (//gaũs, "kraal") and seeks (õ̃a) advice* (/abe).

*How he could free himself from his foster mother.

Thereupon water and chena thorns* and a mountain stone (!humi) --

*The little prickly fruits of Tribulus terrester L. (Zygophyllaceae).

all these things (tsĩ̃ "and"; -na, personal suff. of the neut. pl.) -- were given to him by (χ̃a) the Boers as well as two(/gam) horses (hãĩkχ̃a, dual masc.). Then he rode (!gabi) away. And toward evening (!ui a) she comes (/kχ̃ĩ) and when, having arrived (hã̃ go, abbreviated participial construction), she calls (≠gai) him, it is (i gye a) quiet (!nõsa). Then she followed the trail (mã̃ "stood"; ai "on"; ≠ai "the foot"; that is to say, "of the fleeing one") and was about (sĩ̃ "to come") to catch (sao "to go along behind"; //are "to come together") him and called him, "Little Kaffir (kafferki, borrowed from Cape Dutch), [402] my (ti) child (õ̃a)!" Thereupon he answered (oõ̃): "Mama!" and let the water flow out (//nã̃ and χ̃ũ̃ "to abandon"). [--The water becomes a lake.--] Then she swam (tsã̃) and swam

*539 through (ǂoa "to go out") while (hĩ a) he (-b) ran away (bē), and again (//kχaba) she was about to catch him and called him: "Little Kaffir, my child!" and he answered: "Mama!" and let the stone (!huma) euphonious for -mi) fall. [--The stone becomes a mountain.--] And while she stands there (//nā) on (ai, with the personal suff. of the subj.) the mountain, he hastened away. Then she was again about to catch him while he (-b, in //gaũsab) approaches (/gũ, ta = ra) the kraal [of the humans]. And she called him: "Little Kaffir, my child!" and he answered: "Mama!" and dropped the chena thorns. And while she (-s, after //nāba there") stands there to pull out (!ora) the thorns from herself (-s(e)n, refl. particle), he hastened away and came to the kraal.

Then the men (expressed by the personal suff. masc. pl. -gu) immediately (ai "at the"; //aēb "time"; //nā "there") set out and come along (hā, vb.) to lie in wait (//goē am) for her (si, suff.) along the edge (am !na) of the path (daob). Then she came and they shot her (/noa!an) her dead.

The Girl Who Marries into the Bush-Jumpers

A girl (/gõas "daughter") had married (!game, narr. pass.) into (!na) the people (!haos) of the bush (hai) jumpers* (uri, vb.) and

*A legendary people that do not walk between the bushes but leap over them effortlessly with high bounds.

moved away (//ã "the moving of a girl from her parents' house into the home of the husband); and the two of them (-ra, suff. of the

*539 3rd pers. dual masc. - fem.) came (sĩ) to the(ai) kraal (//gaũs) of the husband (kχoĩb).

And when (tsĩ in hãtsĩti, participial construction) she (-s in tsĩs) is (hã "to remain") [there] a few days (tsẽti), the bush jumper women (indicated by -ti in hãtsĩti) were fetching water (//gama, vb.) one day (/gui tsẽ). Then they jumped [over] the bushes and came to draw (χuri) [water]. Then, when (o) they had drawn (tsĩ, particle of the pret. participle) enough (toa "to stop") and turned back (oa), they again (//kχaba) start jumping (≠goaχa, vb.) and come (hã) humping up and say (mĩ, with objectifying particle -ba) to the husband: "For the sake of your (sa, stem of the personal pron. 2nd pers. used as poss. pron. when the di of the gen. particle is omitted) wife (taras) to whom you (sãtsa, full form of the [405] personal pron. 2nd pers. masc.) are married; because of (!ama) her (//(e)ĩs, personal pron. of the 3rd pers. sing. fem.) you will (-ts, suff. of the 2nd pers. sing. masc., nĩ verbal particle of the fut.; the two words have been contracted to tsĩ) yet perish!" * (//õ). So they said.

"Because she cannot jump and he, since he
belongs with her, could easily be caught
in the event of pursuit.

Then he caught (!kχõ) her (si) and her (ã, the root of the poss. pron. becomes the full poss. pron. when the personal suff. of the possessor is added) two (-kχa, suff. of the masc. dual) bones of the lower leg (!hai "to hurry," ≠kχõb "bones") he cut (≠ã) out (≠ui), and he gave (mã) her two giraffe (!naĩb) hides (kχõra, fem. dual) and chena thorns (a collective form with the suff. of the masc. sing.)--all these things (tsĩ "and," -na suff. of the neut. pl.). Then her daughter carried (tani) the two hides and she carried the thorns. And they walked and walked until sunset (sore≠gã). Then they made a stop (sĩ "to arrive") and slept (//om). When morning (//goasa) breaks (//goa), they see a lion (χama) approaching (!goaχa). Then they let (//nã) one giraffe hide fall (χu "to let lie") and went. And when the lion had eaten (õ) it up, he again set out after (!gõa !gũng) [them]. And they saw him (-bi, suff.) coming and again dropped a giraffe hide and went on. Then they ran on, but when he had devoured it (tsĩ, particle of the pret. participle), he came on. But they saw

x539 him coming again and dropped the chena thorns and walked on. And while (hĩ'a) he stands (mã) there (//nãba, with the personal suff. of the subj.) pulling (!ora, with the refl. particle s(e)n) the thorns from himself, they come to a cliff (/uib) and say: "You (-tse) stone (/ui-) of my (ti) ancestors (//naoǂan), a great (gai) mob (!gũs) is on the march (!goaǂa) behind me (!gã te); therefore (ǂuigye) open (!ã) your flanks (?) to me (te, -ba), won't you?" (re). Thereupon the cliff opened itself (//kǂoba ams(e)n) and they went (ĩ) [through]. Then the lion came along behind (kǂaos ai) and said: "You stone of my ancestors, a great mob is on the march behind me; therefore open your flanks for me won't you? Then the cliff opened only (/gui "single") a very little bit (≠kǂari "small," -ro, dimin. ending, -se, adverbial ending) and as soon as (*tumis ai) [the lion] just enters (literally: [406] nĩ "is on the point of," */gui ti gõ "to look like one thing," that is, in a line drawn with the cliff opening) with (/kǂa) his neck (!aos), it closes (≠gan ams(e)n). Then his (ãba) head (tanas) hopped (!ai) alone (/guri) and there it died.

And the woman came home (//aru, vb.). Then a calf (tsaũba) was slaughtered (≠ã) for her (expressed by the objectifying particle -ba) and [its] two lower leg bones were inserted (≠gã) [into her]. Then she [calmly] sat down (≠nũ), and when she was healed (≠uru) she was allowed (gai) to run (!kǂoẽ) to (//ga) the calves. But then one leg (/nũb) broke (*tson) down. Then they let her sit quietly again and she sat down. Thereafter she was allowed to run again. This time she did not break down and was healthy (≠gau).

The Girls Who Went Into the Gara Berries

Girls went (!gũng, narr. pass.) for (//ga) gara berries (neut. pl.), and they came (si) to the place and picked (hare). But all (hoate = -ti) the others (*nauti) picked sour (/kǂuru) berries (-ba, collective suff. of the masc. sing.) and only one (/gui) of the girls picked good (!gaĩ) berries. And when (o) it became (!ui) evening, they went home, and while (hĩ'a) the sun (sores) sets (≠gã, ta after s, is euphonious for ra)

×539 they say: "Let (hã) us (-se, suff. of the 1st pers. fem. pl. in the dat. acc. case) taste (tsã tsã) the berries, let's (o), and they tasted the berries. All their (di, gen. particle) berries are (a, present particle) sour. Then they say to the one (-sa, personal suff. in hãsa) who had (u "to take," hã, particle that expresses a condition) sweet (ǂkχon) berries there (//nã): "Your (sa, stem of the personal pron. of the 2nd pers. used as a poss. pron. with the omission of the gen. particle di) berries are not good. So (χuigye) turn back (oa) and (ẽ, with the personal suff. of the subj.) go (sĩ) and pick where (-ba in hareba) we (sise, personal pron. of the 1st pers. fem. pl. exclusive) picked!"

Then she turned around and went picking. Excrement (χausa) had had been excreted* for (-ba, objectifying verbal particle) her, and

*In order to make it easier for her to find her way back.

when [408] she* came up (hã) where the others had stopped (ĩ "to

*Expressed by the fem. personal suff. -s in tsĩs and hãs. The -s in bas ("where") picks up the subject again in accordance with the repetition of the predicate in the protasis.

go," hã "to remain") she called (ǂgai). Then the excrement answered (oẽ): "Here!" ("he, general answer of anyone who is called to); thus (tumi) it answers, but despite this (χabe) she sees (mũ) no one (kχoẽẽ "person," neut. sing.; toma "not") and goes past (!gũng ĩ). Then she came to the place where (literally: "while" hĩa) the hare (!õas) was sitting (*ǂnõa) in order to draw (χuri) water, and she said: "Draw (!kχã) for me." (te, intensified by the objectifying -ba). Whereupon the hare: "[this] tortoise shell cup (/gabi) "the back shell of the tortoise") [is] my (ti) grandfather's (//naob) and my own (tita, personal pron. meaning "I." The genitive relation is expressed here simply by adding the thing possessed to the possessor.) Solely (/gui, with the suff. of the 1st pers. masc. - fem. dual -m) for the two of us (tsĩ "and," with the above-mentioned suff.)." Thus he spoke. Then she seized (ũ "to take," /hana "to rob") the cup from him (-si, fem. suff. referring to õas) and drank (ã).

X539 But the hare hastened (!kχoe) to the lion * and said: "My

*"Big Back," gai !gãb; see folk tale names of the animals.

grandfather, if (o) I (-ta, suff.) tell (mĩ ba) you (-tsi, suff. of the 2nd pers. masc. sing. in the dat. - acc.) what (χũe) I (tita, personal pron.) have seen, I wager (ga, concessive particle) you will (-ts, suff. of the 2nd pers. masc. sing.; nĩ, verbal particle of the fut.; both contracted to tsĩ) make (guru, with the objectifying particle -ba) me (-te, suff.) a front apron (//gam !gaeb) and a back apron (//gan !gus), both." Thereupon the former said: "I will make [them] for you." Whereupon [the hare]: "While I am saying that the tortoise shell cup is that of my grandfather and my own and belongs to us two alone, the cup was seized [from me]." Then [the lion] hurried off and caught up (hã "to come," sao "to go along behind," //are "to come together") with the girl (expressed by the personal suff. -si). And they chased each other in a circle (!kχoe and //hame) around a tree (haisa). Then the lion fell (//nã) and she threw herself (literally: "seated herself" ǂnũ) on (ai) him (-bi, suff.). But he cried: "Get off (kχaĩ) me, please." (-re). And she got off him and again they chased each other in a circle. Then the girl (kχoesa "person" fem.) fell and he threw himself upon her. But she cried: "Get off me, please." But he said: "Today (//goas "the morning") is no day for getting up as a reciprocal (-gu, reciprocal particle, -be, adverbial particle) favor [409] and killed her. Then he pulled off (//hau //na) her skin (kχõba), crawled (ǂgã "to go into") into (!na) the skin and ate (o) the girl and finished eating (toa "to cease") and went.

And he came to the kraal (//gaũs) of the girl; at the time when (hĩa) the cows (gomati) were being (pass. ending he with the personal suff. of the subj.) milked (/ao) he came there. And he drank up (!kχabe) all the milk (daiẽ, neut. sing.) that was set before him (maĩ). Then the people say: "My! (kχa) the girl never (huga "ever," toma "not") drinks like that (ti) after all (gomo)!" Then the sleeping (//om) time (//aẽba, not //aiba as on p. 407) came. And when (o)

*539 he (-b after //goē "to lie down") lay down, the younger little sister (literally: "the young" ǂkχam, "little daughter" /gõaros) lay down there (//nãba) near (/gũse, adv.) to (doba) him (//(e)ĩb, personal pronoun). Then he feels about (tsã) for the navel (sunisa) of the little girl [in order to insert his claws here and kill her], but the little girl shoves (ǂhã) his (ã, root of the poss. pron., -ba, personal suff. of the possessor) arm (//õab) away (bē), and afterwards (ēga) she gets up (kχaĩ mã) and asks (tẽ) her mother (//gũs): "Why (tarel !ama) in the world (gum---o) isn't this my sister?" (*ausi, personal suff. attached to the negative particle; for more information see p. 301). Thus she asked. Whereupon the mother: "Tomorrow (//ari) I will see about it, but (*hũ gye) lie down here (nēba) [with me]."

And the sun rose (//hai "to go up") high (/gabi), but then (//goasi) he was still lying asleep (expressed passively). Then the people uncovered (/hui "to uncover," /kχãb "body") [him], and when (o with the personal suff. of the subj. in the apodosis) they looked (gõ), it is a lion. Then they heaped (//gabo) firewood (/aēna, neut. pl.; not /aina) on (*!gã) him and set [it] on fire (!kχã and ǂhubi). And the heart (ǂgaosa) of the [slain] girl leaped (uri) high out of it (ǂoa). Then they took it and put (ǂgã) it in a gourd (abas). Then they poured (//ai) the milk of a young mother cow* into it. Then it became again that (//nã, demon. pron.)

* //kχaob "lamb," not a calf or a kid; but with a following attributive (cow or goat) it is used to designate any mother cattle as long as its young still has no horns.

girl; it came to life (ũitsaba).

The Girl Who Was Always Caught By the Brothers With the Noose

The sister (!gãsasa) was always being caught (ǂhao, the

[539] particles gye and re indicate a frequent practice and at the same time the past) by (ǂa) the boys (aǂagu) with /kǂa) thongs (!haũgu) by the leg. Then she ran away (double vb.: !gũng and bē) and she went (≠gã) into (!na) a Buiver tree (//garas, Aloe dichotoma L.; see p. 112) and made (dĩ) the rock-rabbit (!aũsa) her maid servant (!gã) and every (hoa) day (tsēti) the boys [come] there (//nã) under (ᵑ!gao) the quiver tree; yes, there (//nãba) they come (hã) to drive up (double vb.: ≠nau "to hit," maĩ "to place") [the cattle], and yet (ǂabe, with the personal suff. of the subj.) they do not (/ũ) know that (!kǂaiẽ) someone (kǂoẽ̃ĩ "person," neut. sing.) is hidden (≠gana, vb.) inside.

Then one (/gui) of the boys was watching (!ũĩ) [the cattle] with the son (õab) of the mountain Kaffir woman (damas) of his mother (//gũs, di gen. particle). And the two of them (-kǂa, personal suff. masc. dual) went under the quiver tree to lie down (//goẽ). And
[233] when (o) the cattle (/goan, neut. pl.) ran away (!gũng; during the hot noon hours the cattle are driven together into the shadow of a tree), he sent ("allowed" gai, "to go") the little mountain Kaffir (damaroba) out to chase [them] back (//kǂai). And he went to turn them back, and while (hĩ̃a) he [411] comes back (oa "to turn around," /goaǂa "to arrive"), fire (/aẽs) smoke (/ana) becomes [visible], and while he comes he says: "Master (*/hon-kǂoẽtse, vocative), [don't] you (-tsa, suff. of the 2nd pers. sing. masc.) see (mũ) smoke (neut. sing. in the sense of some undetermined sort) rising (≠oa) from (ǂu) this (nẽ) quiver tree?" Then he looked there (gõ, vb.) and said: "You are lying!" (≠numi). But the little Kaffir said: "The smoke is rising into the air." Whereupon the former: "You are lying; in just a minute (/ãse) I will hit (≠nau) you (tsi, personal suff.)."

And on the next (nau) morning (//goaga, "early at sunrise," in contrast to //goab "early before sunrise") the two of them come /kǂĩ) again (//kǂaba). Then they both saw the smoke, come up, and [the boy] said: "In just a minute I'll chop down (double vb.: //hã "to chop," !gao "to cut") the tree (hais) for us; open!" (//kǂoba am). Then they opened [for them] and the two went in. And the one (the young Hottentot in contrast to the Kaffir) married (!game) the girl.

Then they went away. And when (o) they came to (doba) a mountain (!homi), they said to (//ga) the rock-rabbit [in order to

x539 get rid of him]: "Come, let (ẽ, imperative) me (ta) lift you (si) up" (double vb.: ũ "to seize," !aba "to climb up"). Then they put him on (ai) a ledge (/uib) and deserted him ("to go and leave"). Ever since that day (tsẽs) rock-rabbits live (literally: "is a remaining": hã, vb. substantivized by the personal suff. -sa) on ledges.

The Giraffe Tree That Killed People

A giraffe tree (//ganas, with the old demon. particle -i) had [already] killed (!gam, narr. pass.) [many] people (kχoĩna, neut. pl.). Then two men (-kχa, personal suff. masc. dual) rode (!gabi) there and unsaddled (sĩ "came," *ore !gã "to saddle") there (//naba). And the one (/gui) man slept (//om), but the other (/gui, with personal suff.) stayed (hã) awake (≠kχai gari, "to be about to do something"), and lying (//goẽ, with the ending of the pret. participle) on (≠ama) his back (!gãs) he watched (gõ) [the branches]. Then the giraffe tree stirred (gon). And the man (expressed by the personal suff. -b) took (ũ) a thorn (//kχũba) and stabbed (!kχã) it. Then the tree quivered (≠gõ "to turn aside). But the man had hung his cartridge belt (!kχoasa) on (ai "at") the giraffe tree. • Now he takes down

• ≠gã "to insert," maĩ "to place." hã expresses the completed condition; in German, if the subject is to be retained, the sentence can be expressed only by the past perfect.

(ũ //na) the belt, but the tree seizes (*!kχõ) him (bi, personal suff.) by the cartridge belt and grasps the belt.

Then the two saddled up (*gai !gã) and rode off. But although (χabe) they hastened away (bẽ, with the personal suff. of the subj.), the giraffe tree stayed close by (/gũse) and while (hĩa) it becomes

x539 this (//nāti, with the personal suff. of the subj.; the narrator raises his arm as high as he can) big (gai) it comes (hã) over their (ã, root of the poss. pron. with the personal suff. of the possessor) heads (≠am!nab, masc. sing.) and hurls itself (//goẽ) upon them. And the tree killed the one that had watched it (mũ, go, particle of the pret. with the personal suff. of the subj.) there (//nã), along with (/kχa) his horse, but the other one got away (!kχoẽ "to hurry," dã "to overtake someone," or generally: to be faster; si is the obj. of the double vb., and a personal suff. referring to //ganas). Then the tree went back (oa, vb.).

Then again (//kχaba) two carts (gunira, dual fem.) came /kχĩ), and the men (-gu, personal suff.) unhitched (//hũ !ao) there. [413] Now as soon as (/gui, literally "one with") one [of the wagons] had finished (toa "to cease," with the personal suff.) unhitching (-tsĩ, particle of the pret. participle after hĩ, "to do"), the men shared (//hã) meat (//ganẽ, neut. sing.) under the giraffe tree. Then they saw blood (/aoba) and left the meat behind (//nãχu) and cried: "Come, drive the oxen (gomaga) up (ũ "to take") and (ẽ, imperative) let us (-gye) hitch up." (≠gaẽ /ao). Then they hitched up and drove away (!nari). But the giraffe tree grew big, and when it was exactly (*/gui ti gõ, "to look like one thing") over their heads, it fell (//nã) upon them. And it killed carts and oxen and men, completely (toa "to finish").

The Two Brothers Who Found a Piece of Coal

Two brothers (kχoẽb "person," !gãb "brother," -gu here is probably a reciprocal particle, -kχa, suff. of the masc. dual) had gone out (!gũng, narr. pass.). Then they found (hõ) a piece of coal (≠nomsa "charcoal") and the older (gaiba "big") shattered (≠nau "to hit," !ã "to spread") the coal with (/kχa) his sjambok[4] (!nabab). Then the two went on.

[4] [Dutch for "driving quirt." - Analyst]

X539 But when (o) the sun (sores) set (ǂgã), the coal (expressed by the fem. suff. -s in os) started burning (kχau) and rose (!aba) high [414] (/gabise), and when it was close (/gũ, vb.) to the two (kχã, suff. in the dat.-acc. with the suff. of the subj.), it called: "I (tita), fiery one (/aẽs, "fire," !na "in," -ta suff. of the 1st pers. sing.), fireborn (õas "child," /aẽ !nas designates the mother), make a double catch (*/gama ǂharu "to kill two beasts with one shot), the two children of one (/gui) man!" (aoba). Then the younger (ǂkχama "young") reached (ũ) for his knife (gõaba) and stood up (mã̃), and the charcoal came (/kχĩ) and the two of them (-ra, suff. of the dual masc.-fem.) fought (!kχam). But when he was defeated (dã̃ "to step"), he jumped (sĩ "went," ǂgã̃ "to go under") into the water (//gami), and they kept on fighting. But when the morning (//goas) came (//goa), the coal went out (/ari).

Now when it was extinguished that one came to (doba) his brother (here in short: "person"), who (hĩ̃a "while") was lying there (//goẽ, with the personal suff.) full of fear (!ao, vb.) and asked him: "Why (tareĩ !ama = tareẽ !aroma, with the suff. of the addressed and pers. sing. masc.) do you not (toma) help (hui) me (te, suff.)?" But he answered (kχum "to speak") nothing ("not something"). Then they went home (//aru, vb.) and got there.

But when they had come home, the fire flared up at night (tsũ̃χuba) and set the kraal (//gaũsa) on fire (ǂhubi, vb.).

[Text omitted]

[415] Translation of XII

The Two Brothers Who Chase the Calves into the Field

Two (/gam) boy brothers (aχa-!gã̃gukχa) chase (!kχaĩ̃) calves into the field. There they find (hõ) the goas plant, and while they are (hã̃ "to remain," and an auxiliary vb. expressing condition) there (//nã̃) with (/kχa) the goas plant, they met (hõ) a woman (tarasa). And the woman gave (mã̃) them (kχã̃, dat.-acc. of the 3rd pers. masc. dual) an awl (ǂorosa, old-fashioned designation for ǂum//naos, "sewing point") and takes (ũ) the goas plant. Then the two went on.

x 539

And they come (ǂî) to (doba) a man (aob) -- the man who is pulling (!um) a thorn out of himself (-s(e)n, refl. verbal particle) with his member (/aob, actually: "what one conceals," /oa, that is "penis"). Then the two say: (expressed here only by the auxiliary vb. gye) "We (sikx(u)m, exclusive form of the 1st pers. dual masc.) have here (double vb.: u "to take," hã̄ "to remain") an awl, whereas father* pulls a thorn out of himself with his member." And they

*Formed from the Dutch oud "old" and the Hottentot dadab "father."

gave the man the awl, and the man gave them a walking stick (//kxaibas(e)n, haib old-fashioned pronunciation; now usually //gaĩbas(e)n haib).

Then the two of them came to boys who were beating (//hum) honey (danisa) [from a tree stump] with a stone. And the boys asked (ǂgan) the two for the stick. And they gave the stick and received (mã̄ "to give," he, pass. ending) honey. Then they went on.

Then they came to guinea hens (/kxĩnati) that were eating (ǂî) field onions (!hana) there ("ba, demon. particle of place) and said: [416] "We have honey while you (-so, suff. of the 2nd pers. pl. fem.) are eating field onions." Thereupon the former reply: "Now give us (-se, dat. -acc. of the 1st pers. fem. pl.) [some] then (//nai), won't you?" (-re). Then the two of them gave to them (ti) and went on. But the guinea hens had given them feathers (!amga).

Then the two came to boys who were feathering (//guiri) arrows with sheep (gĩ) hair (/ũb) and [said]: "We have feathers, and yet (ǂabe) you (-go) are feathering the arrows with sheep hair?" Thereupon they say: "Well then, give us (gye, suff. of the 1st pers. pl. masc.) [some]." Then the two went on, but the boys had given them milk (daisa, neut. pl.).

Then they came to a mother dog (//oti "to bear," aris "bitch") -- to one who was eating excrement (ǂaub) and they said: "We have milk whereas you are eating excrement." Whereupon the bitch: "Then give me (-te) some!" Then the two gave to her (ti). But when (e in ekxa) the time (//aĩba) had come (/oa, "was full") when they had to (nĩ, verbal particle of the fut.) go away, then

[539] they think (ǂnĭ): what (ǂgŭĕ) will be given the two [of us]? and [say]: "We had gotten milk from (ǂa) the boys [and have given it to you; now] kindly (re) give us [something in return]."

"Here the story ends. It is regarded as obvious that the boys come out empty-handed.

[417] Translation of XIII

The Man Who Is Killed by Lightning

A man (kxoēb) went hunting (!au, narr. pass.) after (tsĭ, particle of the pret. participle after ŭ "to take," narr. pass.) he had taken his bow (kxăsa); and while he was in the (!na, with the personal suff. of the subj.) field (!garob), a storm (/namuba) rose (//hao) and it rained. Then he situated himself (sĭ "to go," mā "to stand") under ("!gao) a giraffe tree (//ganas), and the storm killed (ǂnau, narr. pass. [him].

Then on the next ("nau) day (tsē) the jackal came (/kxĭ, narr. pass.) and said: "I will drive ("ǂna/m, "to go to turn") the giraffes (!naĭte, fem. pl.) there (//nā) [to you]" and hastened (!kxoē) away and turned [the giraffes] and arrives with (ŭ) [them] and [calls]: "[Shoot] the one in front! (o, interjection; ei! hereupon the jackal points at the one running in front, gau "giraffe" with the personal suff.); the one running behind (nao, vb.) [shoot!] the one following then! the one following this (//(e)ĭa, personal pron. of the 2nd pers.) same one " (//kxăsa)! the one following behind this one itself (ǂĕu,

"The jackal cannot count. His hasty and clumsy way of expression is intentional comedy.

with personal suff.)!" Meanwhile (hĭa, with the personal suff. of the subj.) the giraffes all (toa "to end") ran past (ĭ, vb.).

539 "As truly (ao = "because," introducing the oath, with the personal suff. of the subj. in the apodosis) as our (sakx'(u)m, personal pron. of the 1st pers. masc. dual inclusive form, used in the sense of the poss. pron. when the gen. particle is omitted) two (-ra, suff. of the dual fem.) sisters (!gā-) [live], I will go (tī) and chase back (//kx'ai) [the giraffes] just this (nē) one time (nās)!" Thus he said and hurried away and turned the giraffes, and when he came up with them he said: "Shoot the one running in front! The one running behind! Shoot the one following! The one following that one! [418] Shoot the one that now follows this one itself!" Meanwhile the giraffes all ran past.

Then the jackal cut (!gao, narr. pass.) a long (ga'xu) rod (indicated only by the suff. -ba) from the au bush (Grewia flava D.C.) and said: "Why ("taē, abbreviated from taregē "what") do you (-ti) not (toma) want (ǂgao) to shoot (//kx'aū, -ba, objectifying verbal particle) the giraffes?" and struck (ǂnau, narr. pass.) him. But the rod (baiba) slipped (ī, "to go past") behind (!gābe) the man and along (ū) the giraffe tree and struck him in (ai) the groin (ǂoab). * "My (ti) little brother (!gāb; -ro dimin.; -tse suff. of

* The jackal believes that he is being struck by the very man whom he wished to punish; he quickly pretends to be sorry and shys: (see above).

the 3rd pers. sing. masc. vocative), I will not (tite, verbal particle of the fut. negative) do (dī) it again (//kx'abe)." Thus he said and ran away ("!kxoē-nī, narr. pass.). And when (o) he had climbed down (//gōe, narr. pass.) behind a mountain precipice ("!gōab), he sat down (ǂnū) and looked at (gō, narr. pass.) the weals made by the rod (literally: daoba "the way that the rod had laid" //goē) and said: "You dirt-scum (!haī'b) genital (ǂnūis "vulva") child (ōaba), you have indeed (ga) struck me (te, personal suff. with the personal suff. of the subj.) painfully (tsū tsū, vb.)." Then he passed the man from behind (literally: "at his" ābe, "back" !gāb) and lay down and watched [him].

But when that one did not move (gon), he saw (mū, narr. pass.) that (!kxoāē) he was dead (//ō, vb. with the personal suff. of the

539 subj.). Now he came (/kχ͡ǂī, narr. pass.) up and seized (ǂ!kχ͡ǂō) the bow (with the personal suff. of the subj.), cut (!kχ͡ǂai and !gao) the joints (where the stockings, -- ǂuni break off --, of the bones come together, //aē) of the hand (!omi) and took (ũ, narr. pass.) the bow and went (!gũng, narr. pass.).

[419] Translation of XIV

The Hermit and the Lion

The hermit said to (//ga) his wife (taras), while (hī̃a) they were playing (//am) the hole game (//hũsa, see p. 314) with each other (-gu, reciprocal form): "If (o, with the personal suff. of the subj. in the apodosis, -s, 2nd pers. fem. sing.) the baboon should (ga, potential particle) come (/kχ͡ǂī), then you must (nī̃, fut. particle) pretend to be asleep" (ǂ//om//oms(e)n).

And when (o) the baboon came, she pretended to be asleep; but the man (aoba) took (ũ, pret. participle) the male (acre) dogs and went (!gũng). Then the baboon (expressed by the suff. -b) was bitten (nã̃) by (χ͡ǂa) the female (tarereti) dogs, and [only] when (o, with the personal suff. of the subj. in the apodosis) he became faint (ǂkχ͡ǂabu, vb.) did the woman get up (kχ͡aī̃, vb.) and ward off the dogs (literally: "forbid" !kχ͡aī̃, "for" -ba "him" bi). Then when he had received (pret. participle) milk (daiē), he went over (li) where the men were playing the hole game.

Then [the lion said]: "What has happened (dī) to you (tsi)?" and he answered: "The bitches bit me (te, suff.)." Whereupon the lion: "Tomorrow (//ari, with the suff. of the dual masc.) the two of us will (nī̃, fut.) take a nice little walk * to the Vlei (!kχ͡ubis)."

* ǂũ-!kχ͡oē, literally: "to run to pasture."
I also heard this same designation when childres

539

ran off to play and tumble about. In these extremely harmless words the lion clothes his intention of revenge.

And when it was still dark (!kχaē) over (aí) the land (!hûb), the lion went away; and while he climbed (!aba, hã̄ "to come to") up a tree (hais) that stood (mã̄) in(!na) the water (//gams), [420] the hermit came. But the dogs, when they went to drink (ã̄), saw (mũ̄) the shadow (somsa) in the water, and each (hoaba) dog that comes down (//gõaχa) growls (literally: "becomes angry," //aíχa) and stands.

But he (//(e)ĩb), the hermit, drank. Then [the lion] leaped (urí) down (//gõnaχa, down), but he jumped out of the way (ǂgõ), and the dogs bit [the lion] to death (nã̄!an).

b) The Bergdamara or the Mountain Kaffirs

538
539
539

The Hottentot, as we saw earlier (p. 323), has no high opinion of the Bergdamara. This is also expressed in the short folk tale in which he makes fun of the baboon-like appearance of his black servants (Folk tale XV).

There is only one characteristic that he ascribes to them without reservation: the precocious independence and fearlessness of the Bergdamara child that is celebrated in the war story in Folk tale XVI and in the lion encounters of Folk tales XVII and XVIII.

On the other hand, the Hottentot, with his strong sense of family discipline, is struck by the lack of parental authority and filial respect among the Bergdamara. Anyone who hears stories XIX and XX from the mouth of a Hottentot sees clearly that here only a satire on the degenerated family relationships is intended. Likewise the dirty joke in XXII has the same intention.

[Text omitted]

Translation of XV

X539 The Mountain Kaffir Who Imitates (//gai) the Barking of the Baboons

When (hĩa) the baboons (/nẽragu) were eating (ǂũ) rushes (ǂũna, neut. pl.), a shit-Kaffir (Bergdamara, p. 323) and a (/gui) man (kxoĩb "person," masc.) came (kxĩ, narr. pass.) along, the two of them (tsĩkxa), and the baboons fled (ǃkxoe-nĩ). Then the man said [to the mountain Kaffir]: "Try (tsã) once, won't you (re, optative particle), [Plate XVI. Bergdamara.] [421] to bark (ǃhao) like (kxtumi) the baboons there (//nã)." And he barked. Then the mountain Kaffirs (expressed by the suff. of the 3rd pers. neut. pl. -n after tsĩ) became (gai) baboons.

[Text and six lines of music omitted]

[422] [Translation of XVI]

The Mountain Kaffirs and the Hottentots

The mountain Kaffirs (-n, euphonious -na, personal suff. of the 3rd pers. pl. neut., including here men, women, and children) live (//an with the pass. ending) lonely (/guri). Then (o with the personal suff. of the pl. masc., gu = ga, since it is only a question of fighting men) the Hottentots (namaga) went (/gũng) to (//ga) the Kaffir kraal (//gaũ) to kill (ǃgam) the Kaffirs. And on (ai) the day (tsẽs) [on which] they (//(e)ĩgu) intend (nĩ, verbal particle of the fut.) to arrive (ti), the Kaffirs leave a little Kaffir behind (ǃgoro) [as a guard] and (tsĩ) look for field onions (ǃhani, "field onions," -re gives the word a verbal character). And while (hĩa) the little Kaffir stays (hã) there alone (ǃguib), the Hottentots (expressed by the -gu in tsĩgu) come (/kxĩ).

Then some (/nĩga) say: "Let (hã) us (-gye) kill the Kaffir." So they say. Thereupon the others (/nĩga): "Oh (ao), what (tareb) will (uĩ) such a (-s, personal suff. of the neut. sing. in the sense

[539] of an undetermined sort) Kaffir do (!oa) with his anus in the onion skins?" • Whereupon the others: "Let us -- [for] the Kaffir will

> "Serob "skin," -ǂa, adj. ending, tsoab "anus," he, pass. ending. The little fellow is sitting at the hearth fire and picking leftover scraps from the garbage.

blab (!hoa) -- Kill the Kaffir!" Thereupon the first ones say: "The little Kaffir [is] young (ǂkxam); [he] will tell nothing (tite, verbal particle of the fut. negative)." Then they ceased (/ũ, go verbal particle of the pret.) and got busy making (dĩ) an enclosure (//kxuib, "an ambush hut for wild animals," //goẽ "to lie") and lay down.

But while they are lying down, the Kaffirs came, came while they are lying asleep (//ǂm). And the little Kaffir continues (ra, verbal suffix of progressive action) to pick up (nabo) onions and [sings]:

> "Let's kill him," so said some.
> "What will he do, he with his anus in the onion skins?" So said the others.
> "The Kaffir will blab." So said some.
> "We'll just look at the Kaffir!" So said the others.
> "The Kaffir is big." So said some.
> "The Kaffir is dumb." So said the others.

Then the mother (//gũsa) [asks]: "What (taẽ, abbreviation of tareẽ) is the little fellow (daoroba in Kaffir dialect instead of damaroba) saying there like that (ti)?" But he keeps on picking up [onions]. Then his mother tossed (/ai, -ba stresses the relation to the obj.) onions to him (bĩ); now he told, and the mother told it to the other (ǂnau) Kaffirs. And some (women, children, old folks: -n, neut.) immediately ("at the time then") went away (bẽ), while the other (/nĩ) men (ǂaoregu "young men," in contrast to aogu) stay (hã̃) there. But (//nãgu) the latter go [then to the enclosure] and start a fire (double vb.: /kxã and ǂnubi). And they set fire to all (hã̃, see footnote on p. 424) rifles (from !aba, "to pop") and to

[539] all the cartridges (from //hã, "to stuff"), and they shot off (!hui). Then all the Hottentots died (///õ "to pass away," toa, "to come to an end").

[Text omitted]

[424] Translation of XVII

The Little Mountain Kaffir Who Climbs up to the Game Hoard of the Lion

The little Kaffir was looking for firewood (/aēb. The suff. -re takes the place of the gender ending and gives the word a verbal character) with !kxa) his mother (//gũs), and the two of them (-ra, dual masc.-fem.) came (hõ) upon the game hoard* of the lion

[224] [251]

*) !naosa, from !nao "to load." In order to protect the slain game from hyenas and jackals, the hunter sometimes hangs it on a tree, as the lion has done in this case.

(gai!gãb, ("Big Back," folk tale name of the lion.) Then the little Kaffir climbed* up (ai) the tree (hais) and threw (ao) [some of the

*) ≠oa. The verbal particle *!gã indicates a special goal of the action, as for example !aba!gã "to climb up" (on a wagon in order to bring down a recalcitrant person) in contrast to !aba "to climb up," when the wagon is ready to drive off.

booty] down (//na) to his mother; he threw down little (-ro, dimin. particle) pieces of meat (//gani "meat," -na, ending of the neut. pl.).

But when the time (//aēba) had come (/oa) when they were supposed (nĩ verbal particle of the fut.) to go (!gũng), she told (gai)

[539] him (bi) to climb down (//gõaχa, the older form is //gonaχa, p. 420 above). But he does not (toma) want (≠gao) to climb down. Then she says: "The lion is coming (/kχī) right away*, climb down!"

*) //gā "almost" "immediately"; for example, ≠nauhe //gāts go: "you were almost hit."

But the little Kaffir does not want to climb down. Then [she entices him like this]: "Come along (/kχī), come (hã) and steal (!nari) something nice* for your father (saob)." But he refused (≠kχa).

*) *χuiχa is obviously the old form for the present-day χũχa "rich." Compare tsui//goab and tsũ//goab. Here, too, the Hottentot is making fun of the degenerated morals of the Bergdamara.

Then she went.

Now while the little Kaffir stays there (hã), the lion comes and says: "Is that (ẽ, interrogative particle) a hunting booty for children (/gõa-)?" and calls (≠gai) all the hyenas (≠hĩra), all the jackals /gĩri-), all the silver jackals (!kχama-), all the Otocyon megalotis (Desmar.) (//ã-) together* (hao) and chases them up the tree (gai

*) hã-, a particle expressing the fact that many things belong together; for instance, Naochomab (David Christian) and his people: ≠naoχoma hãgu.

"to order;" !aba "to climb up"). But they cannot (//oa) climb up.

Then, when (o) the hyena climbed up, the jackal lit (kχau) a fire (/aĕsa).* And the hyena got up (sĩ, with the personal suff.) [425]

*So that it could not come back, but had to climb up.

X539 to the little Kaffir [and] got (hõ) [him] and said: "Why, he is beginning (tsoa tsoa, gum "why"), [to get nice and fat!"] Then the little Kaffir bit (nã) it (si), and it fell (//nã) down (//gonaχa) into (!na) the fire. Then they ran away (kχoẽ "to go," nĩ fut. particle, expressing the anticipation of pursuit).

[Text omitted]

Translation of XVIII

The Lion (χami) and the Little Shit (χau-) Kaffir

When (o) the people (kχoĩn) were going (doẽ) on their wanderings, the little Kaffir refused (ǂkχã, narr. pass.) to go along although (χabe) his mother (//gũsa) seized (ũ, ta after the s is euphonious for ra) him (bi). Then (o with the personal suff. of the subj.) they left him there (literally: "he was let off," χuhe "to drag").

And when the sun (sores) had set (ǂgã), he assembles (sã) old (/oro) hides (lχõna, neut. pl.) and piles them up (double vb.: !nao "to pack," maĩ "to place") and lights (!kχã) a fire (/aẽsa). And while (hĩa with personal suff.) he roasts (am; ta = ra) the hides, the lion (gai!gãba) comes (/kχĩ) and bares his teeth (*//gã) at him (bi). Then the little Kaffir* [said]: "No, no! (hm'm, [426] pro-

*Who in his fearless naivete thinks that the
fang baring of the lion is a flattering grin.

nounced without articulation, an interjection of refusal), so (ti) you think you are going (nĩ, verbal particle of the fut.) to get a taste (tsã)?" (ǂaĩhe, "is thought"), and again (//kχaba) threw (ao) a piece of hide (-ro dimin., ẽ = ĩ personal suff. of the neut. sing.) into (ǂgã) [the fire]. And when the lion bared his teeth again (expressed adjectivally), he said: "You (-ts, masc.) will not (tite, verbal particle of the fut. negative) get a taste! Whoever (tariẽ) you (expressed here by the 2nd pers. pl. -go, with the dimin. -ro; the Hottentot would say tariẽtsa etc.) are, who (replaced by the conjunction o) are laughing (aĩ "to laugh"; -ba stresses the

X539 connection with the obj.) at me, I (-ta) will not laugh."

Then the lion scratched (χora) him, and blood (/aob) came out (ǂbaχa), and he licked (tsā) the blood there (//nā). Then the little Kaffir grabbed (ū) a glowing stick (literally: "fire mouth," a piece of wood that is glowing at one end) and set fire (ǂhubi) to the lion. And it died (//ō) in the fire. Then the little Kaffir ate (ō) it (//(e)ī ba) up. And while he eats it, he grows (//kχara). Then his (ã, root of the poss. pron. with the personal suff. of the possessor -ba, masc. sing.) people came (/kχī) along and he goes to (doba) his mother.

The Little Mountain Kaffir and His Mother

(//õa "to bear," gu verbal reciprocal particle ra dual masc.-fem.)

The little Kaffir had gone (!gũng, narr. pass.) with (/kxa) his mother (//gũs) to dig (kxao) [field onions]. Then they met (hõ) a hyena (≠hĩrasa) and the woman (tarasa) stuck the hyena, which lay (//goẽ) sleeping (//om), firmly into (//kxam) (!na) the net (/ũib, see the description on p. 243; the click is misprinted there); and carried (tani) [it] away.

While they were walking (!gũngra go) the little Kaffir [asked]: "Mother! (aise) may (ga, verbal particle of the potential) the anus*

*tsoasa: the anus and the end of the rectum of a freshly killed animal is turned inside out and roasted in the coals.

be mine (ti, with the personal suff. of the subj.)" "[That] is [not

X539 for children, but] for (di, gen. particle) fathers,"* [the mother

*) saob "father." The suffix χan does not express, like the plural endings, a number of similar things, but the similarity of several things: saoχan refers to all who have the position of a father; //naoχan to all ancestors, etc.

answers]. Whereupon he (-b): "Then may the feet (!ũtĩ) [of the hyena] be mine (tite - titi)?" And she answered: "[They] are for fathers." Whereupon he: "In just a moment (/ǂse) I (-ta) will (nĩ) cut off (!gao) this (hẽ) stick (haiba) here and clean out [the hyena's] anus!"* And continued: "Mother, may the liver (aĩsa) be mine?"

*) /nuru. The boy knows that the hyena is not dead, as his mother mistakenly believes, and he now seeks to obtain something by threats. The words hĩ, χũ, and χũis -- the latter two corresponding to our "thing umbob" -- are put into the Kaffir's mouth to show his clumsiness in expression. A Hottentot would never speak that way.

But she replied: "It is for fathers."

Then the little Kaffir cut off a stick and cleaned out [the hyena's] thing, its anus. Then it woke up (ǂkχai) and bit (nã) the Kaffir woman (damasa) between the shoulders (ai "in," //hu "hole, depression," //ai "to come together": the depression where the shoulders meet). And the Kaffir woman [called to the hyena in her fear]: "You there (hẽ, here intentionally garbled from nẽ, demon. pron.; ẽ suffix of the neut. sing. 3rd pers.), just (re) wait (//nam) until I (-ta) get you (si) loose (ǂhĩ)!"

The Mountain Kaffirs Who Turn into Crows

539 The Kaffirs had become (gai, pass.) crows, and after (-tsĩ, particle of the pret. participle, after //gã "to tie around") they had put on white (!uri) cloths (!kχaiga) (corresponding to the white neck marking of the bird), they arrived (/kχĩ, narr. pass.) with (/kχa) bows (kχãti) and everything (-n, personal suff. neut. pl.).

Then the little Hottentot girl (/gõas "child," -ro dimin.) says: "Oh (ao), what sort of (ǂtarebe) crows are those that are not at all (toma with the suff. of the subj., neut. pl.) like (kχoma "like," ĩ "to seem") the crows of our (sĩda, pron. of the 1st pers. neut. pl. exclusive, used as a poss. pron. with the omission of the gen. particle) country (!hũb)?" But the mother (//gũsa) says: "But (χabe) crows come here (nẽ, demon. root) every (hoa) day (tsẽte), after all (gum . . . o)."

And while (hĩa) the Kaffirs (expressed by the suff. of the 3rd pers. pl. masc. -gu) were sitting there) (ǂnũ), the sun (soresa) went down (ǂgã, vb.), and the people (kχoẽna, neut. pl.; the Hottentots are intended) slept (//om). But the Kaffirs came and killed (!gam) them.

[Text omitted]

[430] Translation of XXII

The Man Who Went for a Walk (sari) to the Kaffir Kraal

A man came (/kχĩ, narr. pass.) into (ai) the kraal (//gaũs) of the shit Kaffirs (χau- daman, neut. pl.), and he got (ǂau "to present," pass.) a dish of mice (duruna, neut.; favorite dish of the Bergdamara) and got hani-onions; thus he was treated (was done to him, hĩhe). But although (χabe) the people were ready for sleep (//om toa), he nevertheless remained seated (ǂnõa).

X539 Then the Kaffir woman (expressed by the suff. -s) asked: "Hey, you (nẽ, demon., -tse, special form of the suff. for the 2nd pers. masc. sing.), why (tarẽẽ, with the suff. of the pers. addressed) are you still sitting after (tsĩ, ending of the pret. participle) I (tita) have given you field onions, after all (o), and mice (neut. sing.), and have treated you so well?" And he answered: "Well (gum . . . o), I have desires (literally: "I am on the lookout" /gona, -si adj. ending) for (_a, with the personal suff. of the subj.) that which becomes flat (/hãhe, pass., -i suff. of the neut. sing.) when one sits (/nũsi, adj.)."

Then she called (/gai) her daughter and said: "Take (ũ) this man (aoba); and (ẽ) you (-ts, addressed to the man), don't (tã) stick (/gã and ũ) the whole (*horaga = hoaraga) thing (_ũẽ, neut. sing.) in; she is a young (/k am) little (-ro, dimin.) Kaffir girl." But he stuck the whole thing in. Then the girl cried (ã) and the old (gai "big," with the suff. of the relative substantive because it is placed after the noun) Kaffir woman said: "I (-ta) told you (sãtsa), didn't I (gum . . . o): young is the Kaffir girl, don't go in (ao "to throw") with the whole thing!" Thus she spoke (pret. participle) and took the girl.

[431] c) From Family Life and Pastoral Life

538 X539 Folk tale XXIII is in praise of married love. Folk tale XXIV, exceptional in its strictly moralizing form, gives us a view of the duties of the children in the house. Folk tale XXV is perhaps only a fragment.

The legend of the rejected boy whom in the one case (Folk tale XXVI) the bull assists and in the other case (Folk tale XXVII) the cow, and the two folk tales about the stupid fellow (XXVIII and XXIX) are taken from pastoral life.

X539 The People Who Go in Search of Rushes

A man (kχoẽb) had taken (!game, narr. pass.) a wife. And the man along with his brother (kχoẽ !gãgukχa) and the wife, the three

X539 of them (tsĩ "and," with the personal suff. of the neut. pl.) looked for (õa narr. pass.) rushes (/haruna), so that (ga) the couple (kχoẽra, "people," dual masc.-fem.) might (nĩ) sew (ǂom) [house mats] for themselves (-ba, objectifying particle), [and they went out] with (/kχa) two (-kχa, suff. of the dual masc.) pack oxen (/garu). And near (doba) the water (//gams) they unsaddled (ǂore "to loosen," !gãb "the back"). Then the two men went (/gũng) along to cut (!gao) rushes, but the woman went to the water to wash (//ã) herself (sen, refl. particle). And when she was busy (sĩ) washing herself, a frog woman (//gũtse-gũbeǂa) came out (!goaχa, vb.) and put on (ana, vb.) the clothes (sarana, neut. pl.) of the (di, gen. particle) woman. Then she said: "Frog, put down (ǂnũi, vb.) the clothes." But the frog said: "No (hm'm), sister (ǂausis, cf. "The Family," p. 301, I (ta suffix) am (hĩ) only (/guisa) trying [them] on." (ana "to put on," tsã "to taste"). And when (tsĩ, particle of the pret. participle after toa "to cease") the woman had finished washing, she said: "Give (mã) me (te, suff.) the clothes, frog." But it ran away (!kχoẽ- nĩ) and goes there (sĩ) where (-ba) the men unsaddled. But the woman was ashamed (tao) and went (ǂgã) into (!na) the bushes (hais). And the man (expressed by the suff. -b) took the frog woman as his wife in the belief (ǂaĩ, "to think," in the pret. participle form) that it was his (//(e)ĩb, personal pron. of the 3rd pers. sing. masc., di, gen. particle) wife (tarasa).

But when (o) the people (expressed by -n, the suff. of the neut. pl.) went (ta, euphonic for ra) for the rushes, the former (-s in tsĩs, that is, his real wife) comes (/kχĩ) and cleans (!anu !anu) the hut (omsa), washes the dishes (χabana, neut. pl.) and pulverizes (χon) buchu (sãẽ, neut. sing.) and makes butter (//nubu, vb.) [in the] calabash (abasa) and pours out (ǂnã, -ba objectifying particle) some milk (daiẽ, neut. sing.) for the [old] woman (the mother of her husband, who is pictured as blind) and goes. Then one (/gui) day (tsẽ) the old woman said to her big (gaib) son (/gõab): "Hide yourself (go into) in this (nẽ) [433] rush mat (/harub) and (ẽ, with the suff. of the 2nd pers. sing. masc.) lie (//goẽ) in it (ǂgana) and watch (ǂan "to know") what person (kχoeẽ) is going about (hã "to be, to remain") here (nẽba). And while (hĩa is used to introduce, like the conjunction o, the protasis as well as the apodosis and has here the personal suff. of the subj. in the apodosis) he was lying there she came. And she

*539 got busy (hã) sitting down (ǂnũ) and takes the calabash, and while she churns (ta - ra), he spit (ǂara) on (ai) her (si, suff. [to make himself noticed]. Then she ran away (//hai- nĩ) and he caught (!kχõ) her, but she said: "Go to the frog woman, you who (sats, masc. personal pron.) have married (in the pret. participle) the frog woman and left me in the lurch." (//nã χu). But he caught her and wants (sĩ, begins to) to take her to the hut and wants to embrace her.

Meanwhile the frog woman [and the man's brother] came up, the two of them. Then the frog woman said: "Help me down."*

*She is sitting on the riding ox and demands
the courtesy of being assisted in getting down.

(ũ //na). But nobody speaks (!hoa) to (ũ) her. Then he took the hippopotamus whip (!nababa) and came forth (ǂoaχa, vb.) and struck (ǂnau) her. Then she leaped (uri) down (//gona) from (χu) the riding ox and [cried]: "I (-ta) am a frog. I paddle (*ǂnãtsabu) in the water." Thus she cried and jumped down (//gõa, vb.) to the water. But when the man had found (hõ) his (ã, root of the poss. pron.; -ba, personal suff. of the possessor) wife, he married his wife [again].

[434] Translation of XXIV

The Girl Who Curses the Kaffir

A girl (/gõas, with the old demon. suff. -i) said to a mountain Kaffir (damab), when (o) he came (hã) to sit down (ǂnũ) before (ai) the door (ams) of the hut (oms, fem.): "Like (kχoma) the calf (tsaũb), that stands (mã) in front of (ais, "face") the hut (omi, masc.) of my mother (ais), so disproportionately long (*ǂnama) is your penis." (χãba) (*ũ, vituperative particle). And takes (ũ) ashes (tsaoba) from (ǂui) [the hearth] bestrews (tsoro, narr. pass.) him with (/kχa) ashes.

539 Then the older (gai, "big," adj. with the personal suff. because it follows the substantive) girls say: "Consider (≠an "to know," nĩ, fut. particle) that he is an adult." (kχoēē "big person," neut. sing. with the personal suff. of the pers. addressed, -s fem.). But he replied: "Never mind (//nãχu, [435] "to desist"), she speaks this way out of (!ama) foolishness (gãb = gãsesib), so (χuigye) [let her go]."

And early (//goaga) the next (ǂnau) morning the girls (expressed by -ti, the suff. of the 3rd pers. pl. fem.) went (!gũng) swimming (tsã). But when they had undressed (≠gaĩ ǂχui) themselves (sen, refl. particle) and had gone down (//gõa) into (!na) the water (//gams), the Kaffir (expressed by the personal suff. -b in ob at the beginning of the sentence) took (ũ) their (ã, root of the poss. pron. with the personal suff. of the possessors -ti) clothes (sarana) away. And only (/gui, with the personal suff. of the obj.) when they came out (≠oaχa), did they see (mũ) the Kaffir. Then they came (hã) up and said: "My grandfather (ti //naob, respectful form of address), give (nã) me (te, suff.) my hemmed* (//gam, an attribute of the back apron which

* The back apron is occasionally decorated with chains of beads.

is decorated with chains of beads; cf. p. 408) back apron (!gũs) and my front apron (!gaēb), all of that." And he gave it to them (ti, suff.), but to the one (-sa, personal suff.) who had cursed (/goē, with the personal suff. of the subj.) him (//(e)ĩba, pron.), he said: "First (aibe) run and (ẽ, with the personal suff.) pick (sĩ "go," !ora "to pick," with the objectifying particle -ba) me some thorns (//kχũga) near the giraffe tree (//ganab) that stands (mã) over there (//nã)!" Then she ran and picked and came (/kχĩ) back with them (ũ). But the Kaffir grabbed (!kχõ) her (si, suff.) and stuck (≠kχom) [her limbs so firmly together that she could not move] with the thorns. Then he lifted (ao "to throw," ǃaba "to climb up") her up into the giraffe tree and went away.

Then her people (ãsa kχoĩn) came (doē) past (ĩ), and first the two grandparents (//naosa = nao-, ro personal suff.) come by. Then the girl called: "My grandparents there (ǂnau, demon. root, -ro suff. of the 2nd pers. dual masc.-fem.), look (gum - - - - o, interjection), the root (ǂnomab) of the giraffe tree holds me firmly fastened,"*

* maĩ "to place," ǂtan-tan-tan- "to hold

K539

someone fast against his will." I heard this strange word also in the following connection: a messenger who kept someone waiting a long time was received with the words: "tareē tan-tan-tan maĩ tsi hã̄ i?" The same expression was used to a pair of dogs that was inextricably entangled in copulation.

But the grandparents answered: "I had told you (sa, suff.), girl: please (re, optative particle) pour (ǂuri, with the objectifying particle -ba) out some water (neut. sing.) for me, [and you did not listen.]" Thus they said and went away.

[436] Then the two servants (!gã̄ra) of her di gen. particle) mother (//gũ̄s) come by, and the girl called: "You servants of my mother who are coming along (garu) there, look, the root of the giraffe tree holds me firmly fastened." But they answered: "Didn't I tell you, girl: milk the after-milk (/gubi, vb. with objectifying particle) for me, let (ẽ "and," imperative) me (-ta, suff.) pour water in (ǂnã̄; see p. 258), [and you did not do it?]" They said it (-tsĩ, particle of the pret. participle) and went.

Then the parents (//gũ̄ra) came along, and the girl called: "Venerable parents (aboǂaro, dual masc.-fem.) who are coming along there, look, the root of the giraffe tree holds me firmly fastened." But they answered: "Didn't I tell you, girl: straighten up (*!haibe, vb.) the hut for me, [and you did not obey]?" They said it and went away.

Then the sisters came by, and the girl called: "You (-so, suff. of of the 2nd pers. pl. fem.) children of my father (dãdab) who are coming along there, look, the root of the giraffe tree holds me firmly fastened." But they answered: "We (seg(o)m = sig(o)m, pron. of the 1st pers. fem. pl. in the exclusive form) told you, girl: know that he is an adult." They said it and went.

Then her two (-kǂa, suff. of the 3rd pers. dual masc.) brothers came, and she called: "My brothers (-kǂo, suff. of the 2nd pers. dual masc., !gã̄- = !gãsa-) who are coming along there, look, the root of the giraffe tree holds me firmly fastened." Then they hurried (!kǂoẽ) up and came there and lifted her (//(e)ĩs, pron. of the 3rd pers. sing. fem., di, gen. particle) calf* (tsãũba) up, and the calf

*The brothers, out of a feeling of shame,

*539

do not help their sister themselves because she is naked. Hence also the assistance of the bitch.

(expressed by the personal suff. -b in tsĩb) brought the girl down (ũ //nã, vb.). But the brothers sat down (pret. participle) behind (ai "in," !gãb "the back") the tree (hais), and a bitch (arisa) pulled the thorns out (!ora) of her. And when (o, with the personal suff. of the subj. in the apodosis, -n, neut. pl.) the thorns had been pulled out of her completely (tao "to cease," in the pass., referring to the girl, as the suffix -s indicates), they went away.

[438] Translation of XXVI

The Boy Who Lives With His Sister

A boy (ǂǁab) lived (hã́ "to remain," narr. pass.) with (/kǁa) his sister (!gãsasa). And when (o) they (-ra, suff. of the 3rd pers. dual masc.-fem., attached to the obj.) milk (ao) the cows (gomate), she (-s, personal suff. after tsĩ at the beginning of the sentence) hits (ǂnau) him (bi, personal suff.) there (//nã) with the stick (hais) with (ũ) which she chases away (ǂnau !oa) the calves (tsaũna) [from the cows]. And when she gives (mã, ta = ra) him milk (daiẽ), he (-b in tsĩb) only gets a little (ǂkǁari) sip of milk (-ro, dimin.) poured out (ǂnã, -ba objectifying particle), and water (//gama) is used to fill up the rest (/oa), and he lies (//goẽ) outside (!auga) on (ai) the ashes (tsaos).

[439] Then one (/gui) day (tsẽ) the bull (//gõba) said: "to (doba, with the suff. of the 2nd pers. masc. sing.) me (tita, pron.) you must (nĩ, fut. particle) come (/kǁĩ) when you are watching (!ũi, ga particle of the potential) the calves; let (ẽ "and," imperative) me (expressed emphatically by the suff. and the pron.) give you (tsi, suff.) nourishment (ǂũ)." And the boy, when he was watching the calves, went (sĩ) to the bull. And the bull told (gai) him to go (ǂgã) into (!na) one of his feet (!ũa, sing.). He went in there and found (ũ "to take") nourishment (ǂũna, neut. pl.) and a pot (sũis), all of that (tsĩ and -na, suff. of the neut. pl.). Then he came out (ǂoraǁa, not ǂoaǁa) to cook (saĩ); and when he had finished (toa "to cease," with the personal suff.) cooking, he cleaned (!anu !anu) the pot and went with it [into the foot of the bull] and came out (ǂoaǁa, vb.) and went home (//aru, vb.) after (-tsĩ, particle of the pret. participle after ũ) he had assembled (literally: "taken") the calves.

But one day the sister said to her daughter (ǂ/gõasisa = /gõas): "You (-s, suff. of the 2nd pers. sing. fem. after !gũng "to go") must go along once with this (nẽ) boy, then (ẽ, with the personal suff.) watch (gõ) what (tarets, with the personal suff. of the subj.) he eats." (ǂũ, ta = ra, !kǁaiẽ, particle of indirect question). And the two

x539 went and got there just when (hĩ'a) the bull was standing in the shade (!haũ, "the shade-seeking of cattle during the hot hours of the day." mã "to stand") under (ǃgao) a giraffe tree (//ganas). Then the boy lit (kχ'au) a fire (/aẽsa) and went [into the bull's foot] and got nourishment and came out to cook; and when he had finished cooking, he cleaned the pot and went in with it and came back out again. Then the two went home. And when the daughter got there, she told (mĩ'ba) her mother (//gũsa): "He goes into the bull and he brings out (ǂũi) a pot and nourishment -- all of that (hã, copulative vb. in enumerations; see the footnote on p. 424), and when he has cooked (participial construction) he eats."

Then when the cattle (gomana, neut. pl.) had come [from the fields], the bull stood behind (kχ'ao ǃgã̃) the hut. Then the sister said, while the bull was listening (//nau, with the personal suff.): "You (-ta, suff. of the addressed pers. in the 2nd pers. masc.) kill (ǂnoa ǃan) this bull." Thus she said to (//ga) her (ã̃, root of the poss. pronoun, -a personal suff. of the possessor) husband (aob). Then the bull said to the boy: "Your (sa, stem of the 2nd pers. of the personal pron., [440] used in the sense of the poss. pron. with the omission of the gen. particle) sister said: "I am supposed (hã̃ "to let") to be shot," he told (ǃhoa) the boy; "Therefore, (hũgye) we (-kχ'um, suff. of the 1st pers. masc. dual) shall (nĩ', fut.) to flee (bẽ) this evening (nẽ ǃoẽ)." And in the night (tsũ'χuba) the two of them (-kχ'a, suff. of the dual masc.) fled.

But the bull goes (ǃkχ'ã̃) bulls to death. And then the boy takes the oxtails (/hã̃'te, fem.) there (//nã̃), and with the oxtails he bought (//ama) a wagon (gunisa), bought oxen, thus he did (hĩ'). Then he sold (//amaχ'u) the bull, and with the profit (literally: "With the things, wares," χ'ãna "of the" di "bull") he obtained (ũ) wares for selling. Then the bull came back (//kχ'abe) to him (//(e)ĩ'b, pron.), and they went away and sold to the people.

Then the sister also came (hã̃) in order to buy. But he demanded (ǂgan) a very (-gai "large," -se adverbial ending) high (/gabise) [price]. Thereupon she asked: "Why (tarets ǃama) do you demand, when I buy, at (gõee) such a (//nĩ'ti) height?" But he answered: "What (χ'ũna) you (sas, pron.) had done (dĩ') to me, I have not (toena) forgotten (/uru) indeed (gum - - - o)." Then she knew (ǂan) that (ǃkχ'aiĩ') it was (literally: "is," a) the brother.

X539

The Boy Who is Left With Strangers

A woman (taras), when (o) she moved away (doē, narr. pam.), left her boy (axaba) behind (!goro, narr. pam.) with [strange] people (hxoña, neut. pl.) and left (//nāxu, narr. pass.) a cow (gomaas) so that (ga) it might (mī, fut. particle) suckle (ā "to drink," dai "to suck"; -si gives the double vb. a causative sense) the boy with milk.

But the people buried (//han, "to put leather in damp soil in order to soften it." !gā "on, i.e. to throw dirt on [him]") the boy in (!na) a hole (āb), and when (o) they slaughter (ǂā) cattle (/goana, with the personal suff. of the subj. -n, neut. pl.), they throw (taoro "to pour") the manure from the guts (/haraba) upon (ai) his (āb) head (tamab). Then the cow roars (ā): "My Hoab (!hōab, name of the child, -se, suff. of the 2nd pers. masc. sing. corresponding to a vocative ending), I am after all (gumo) the cow of your mother (saos) with the small (ǂkxari) breast (sami). My Hoab, your mother tells (mī) me, [I am supposed to suckle you]." Thus she roars.

Then the people went away and left (xu) him there after (-tsī, particle of the pret. participle after ū "to take") they had taken away the cow. But the cow hurried (!kxoē) back (oa "to turn around") and came up (hā, vb.), dug (xoro) him out (ǂui), and they went away.

And the two brothers (!gākxa, dual) of the (di, gen. particle) boy just happened (hā, with the personal suff. of the subj.) to be guarding (!ūi) the cattle (/goana), and the younger one had gone to drive back (//kxaē) [the goats]. Then he saw (mī) the boy (hi, personal suff. "him"), and when he came back he told (mī "to say," -ba objectifying particle) his brother: "I met (hā "to find") a ghost (//gaūba)." [442] Then the other said: "Come (/kxī), let (o) us (-kxaim, suff. of the 2nd pers. masc. dual) go then (//nai); let me see (gō) the ghost there (//nā)."

And the two went and got there. Then the cow sang (//nai): "My Hoab, behold, I am the cow of your mother with the small breast. My Hoab, your mother tells me that I am supposed to suckle you." Now they knew (ǂhan) what was what and recognized (mū "to see,"

X539 ǂâ "to explain clearly") the cow and took the boy and gave him milk (daiß, neut. sing.) and set (ǂnūi) him on a billy goat (b(i)rib) and went home (//aru, vb.) with (ū) him.

[443] Translation of XXVIII

The Two Brothers

Two brothers (kxoēb "human being," ǃgāb "brother," -gu reciprocal particle expressing their relationship, -kxa dual masc.) were watching over (ǃūi, narr. pass.) the cattle (/goana, neut. pl.) once upon a time (gyere). Then the elder (gaiba, "the big one"), while (hĩa) the cattle stayed (hã) with (/kya) the younger one (/kyami, "the young one"), [went] to look for (ũa) food (ũina, neut. pl.). And while he was (ǃgoakxa) on the way with the bowl (ǃoes) full (/oa) of food, he saw (mu) his (ã, root of the poss. pron., -ha personal suff. of the possessor) shadow (aoms) and said: "What (tas, abbreviated from taras) are you (-tas, suff.) looking for" and gave (mã) [the shadow] a (/gui) piece of meat (//gans, neut. sing.) and went (ǃgũng).

And once again (//kxaba) he turned around ("he moved himself" gun, "backwards" kxaoǃgã). Then he saw [his shadow] again and said: "Hey you, (nã, demon. particle, -tas suff. of the 2nd pers. masc. sing. vocative), that is not (toms) my (ti) food." He spoke,

"That is: "Therefore I cannot actually give you any of it."

gave it again a piece of meat and went.

And once again he turned around and called: "For the sake of (ǂnã) food which is not mine you are persistently running after (sao "to follow," mã "to stand") me (te, suff.). Take (ū) the bowl and everything [444] (hoas "completely") and go away (oa)!" So he said, gave it (hi, suff.) the bowl and went.

*539 Then he came (ǂĕ) back and [the brother] said: "Where (maba) is the food?" And he answered: "To this person here (literally: "who is sitting there," ǂnõa) I (-ta suff.) have given everything (toa "to end")." Then the other said: "You (ta...taa, pron.) idiot (gare, adj.), why (gum...o), it is your (sa) shadow, that is all (ǂabe)." He spoke and went.

And while he was gone (/kǂai), the other cut (!gao) open (-ǂa) the throats (domi) of all the cattle. Then the other came (/kai) back and asked (tẽ): "Why (tarei "!gao) did you cut the throats of the cattle?" But he answered: "Since (0, with the personal suff. of the subj. in the apodosis) they did not want (ǂgao) to stand still (literally: "to sit"), I cut their throats; oh (o), I was tired (taau) [and did not want to run any farther]!" Whereupon the other: "That is a fine thing you have done (literally: "you are doing a great thing there"). Therefore ("huigye) get up (kxaĩ) and (ẽ, imperative) let us both (-kǂaum) run away (!kǂoẽ and bẽ, verbs)."

So they went and came to the kraal (//gaũs) of the Boers. There he saw fat (//mĩẽ, neut. sing.) standing in (!na) a container (ǂabas) and put (ǂgẽ) his hand (!oma, euphonious masc. ending) in; but the container did not want to let it happen (ĩ) that it could come out again (ǂoaǂa). Then he broke (ǂnau) it (ti, suff. of the 3rd pers. sing. fem.) in two, (!ã vb.) on (ai) a stone (/uis). Then the two of them went.

And they came to a tree (haisa, literally: "a tree was seized"), to a broad one (ǂhabãsa). Then they saw men coming (!goaǂa) [the kind] who kill (!gam) people and take people's money (marĩa, neut. pl.). Then they climbed (!aba) up the tree. But the others came up, came into the shadow (here masc.) of the (di, gen. particle) tree, deathly (//õ, vb.) thirsty ("//gã, vb., -ti, adj. ending), and lay down ("came up" hã, "to lie down" //goẽ).

Then the young one (indicated by the suff. -b) urinated (/kǂam) on them; but they said: "The Lord" (!kũib) has given us (gye, suff.

* That is, God. The narrator has come into contact with Christianity. Here he is clearly making fun of the conception that all happenings, even the revolting, are the ordinance of a benevolent god. Also, the technique of putting pious words into

A539

the thieves' mouths as well as their foolish
fear under the mask of piety is biting satire.

of the 1st pers. pl. masc.) water (//gamē, neut. sing.)," and drank (ā). Then [445] in turn he defecated (ǂxau); but they said: "The Lord has given us food," and ate (ǂū).

Thereupon they take out (ǂui) their money, pour (ǂnūi "to set") it on hides (ǂgoati) and count (!gōa) it. Then the young one threw (ao) down (//nā, "to fall") a stick (!naosa); but they cried: "The Lord is falling (!kǂom) upon us," left their money behind (ǂu, vb.) and ran away (!kǂoē-uī). Now the two of them climbed down (//gōaǂa, vb.), took the money and went.

Now the older one was told (gai, "to command") by (ǂa) a Boer to go and carry away a calabash (ababa). "Three (!noma) pieces of money (fem. pl.) I (-ta) will give you (tsi)," was said to him, and he went off with it (ū).

And as he was going, he said [to himself]: "If (o) I ever (ga, with potential force) get (hō) sons (/gōab, -ro dimin.) I intend to name (mmi "thus") one (/guiba) the "firstborn" (ǂgūro, "the first") and to give him a piece of money, and to give the second one (gam //(e)ība) the second piece of money, and to give the third one the third piece; and if a fourth one (haga //(e)ib) should come, then like this -- the narrator makes a violent motion of repulsion -- I will chase (ǂnoa "to throw away," ǂgō "to shoo off") him to the Devil with this calabash." Thus [he spoke].

Then the calabash shattered (!kǂōa), but he was captured (!kǂō) by the Boers.

[Text omitted]

[446] Translation of XXIX

The Two Brothers Who Were Tending the Cattle

Two brothers were tending (!ūi, narr. pass.) the cattle (/goana) of white men (/hūn, neut. pl.). And one day (/gui tsē) when (o) the goats (biriti, fem.) groaned (/gaē), the older one (gaiba, "big")

537 said (in the pret. participle): "They are predicting death (ǂ/goǂa, vb.) for me (tita)," and cut (!gaoǂa) their throats (domi). But the younger one (ǂkxama) said: "Oh (ǀ), they (-ti, personal suff.) have eaten (!ũ "to graze") themselves full (//ã); for that reason indeed (gum---o) the goats talk that way!" But while (hĩa) he spoke thus, (ti, with the personal suff. of the subj.), the other had already (toa, narr. pass.) with the throat-cutting. Then they took (ũ) the meat (//gama) and went away (!gũng).

And they came (ti) to (doba) Boers. But these poured (taoro) out (ǂu) rice and ordered (gai) the two of them (-kxã, suff. in the dat.-acc.) to pick it up (aĩ kxaĩ). But while (hĩa has the personal suff. of the subj. in the apodosis) they were picking it up, white (!uri) crows (gorate) came (/kxã) and helped (hui) them pick it up, and the sack (//hõas) became full (toa "to become finished"). - - - - - - - -

Here the narrator stopped and, without any evident connection with the preceding, continued:

Then the father (ĩba) of the girl (kxoǂ'a) whom the snake (/aoh) had taken as a wife (!game) said: "Run and (ẽ, with the personal suff. of the 2nd pers. masc. sing.) go to the kraal (//gaũs) of the snake in order to fetch (ũba) me (te, suff.) my (ti) child (õasa)."

And he got there at the time when the snake was gone (/kxai) and questioned (tẽ) [the girl]. She said: "He [that is, the snake] will (nĩ) come right away (/ãe)." Then he asked her: "Where (maba, with the personal suff.) does his (//(e)ĩb, personal pron., di gen. particle) strength (/gaisa) sit (ǂũĩ)?" "In (ai) the forehead (!ũs) sits (ǂũõa) his (ĩ, originally a vb.: "to belong"; now a poss. ending) strength," answered the girl.

[447] And when the snake came (hã, with the personal suff.) he transformed himself (gai, vb.) into an ant (ǂgoberu-b) and climbed (doẽ, "to wander," !aba "to climb up") upon his forehead and sucked (/gom) out (ǂui) his (ã, root of the poss. pron., -he personal suff. of the possessor) strength, took (pret. participle) the girl and went home (//aru).

d) Haintsibeb Myths

538 Hai-tsiai-bens is the Hottentot name for the group of folk tales
TNC about a hero of former times, to whom, just a few decades

538 ago (66), they still erected grave mounds in remote districts (cf.
776

66. Th. Hahn. Die Nama-Hottentotten. Ein Beitrag zur südafrikanischen Ethnographie (Globus, Bd. XII, 1867).

"burial customs," p. 317) in the form of stone heaps upon which a passerby placed a stone or twig in the hope that he might be rewarded by finding a good path and water.

If the hypothesis should be confirmed that the Hottentots at a later date transplanted Haitsiaibeb to the sky as the moon (78), then the

78. Th. Hahn. Die Sprache der Nama. Leipzig, 1870.

moon myth (Folk tale XXX) would also have to be included in this group. The text that I heard narrated deviates from the one published by Th. Hahn in that the louse that is caught by the hare in his story is missing in mine.

Attempts have been made to interpret a legendary figure that the Hottentot calls tsũ//goab as an expression of an idea of God; Kroenlein (57) translates this supposed Hottentot god-concept as "the

57. J. G. Kroenlein. Wortschatz der Khoi-Khoin. Berlin, 1889.

one who is difficult (tsũ-/) to entreat (//goa)." According to my conviction such a derivation is linguistically inadmissible. For the first word stem, as I have convinced myself again and again, is not tsũ-/, but rather tsũ-ʔ, as it occurs in tsuʔi-"to wound." Older authors have indeed heard and written down not tsũ//goab, but tsuiʔgoab. Since in the formation of compound words the accent that was characteristic of the single word is frequently lost in favor of the new word accent (see p. 362), it cannot be determined whether the second root of our word is //goa-"to entreat" or //go-as "knee." But according to all that is known about the meaning of tsũ-ʔ, the latter interpretation is by far the most probable. I believe that in this point the missionary Kroenlein was a bad influence on the linguist Kroenlein, and on the basis of my

538
776 own text I concur with Th. Hahn's derivation, according to which ǂgoab signifies something like "wounded knee": the designation for a hero who is wounded in the knee in battle. It is quite another question whether this hero, as is suspected, is identical with the above-mentioned Haitsiaibeb.

In view of the great veneration that is paid to ancestors, it is understandable that the Hottentot swears by the name of "Wounded Knee": "tsũ-ʔ//goa-ao !" [448] I have also often heard the exclamation of astonishment corresponding to our "my God!": "tsũ-ʔ//goatse !"

In Folk tale XXXI there figures as an enemy of mankind a being that the Hottentots designated to me as "ǂgã-ʔǂgori-b because he is supposed at one time to have hurled (ǂgori-) people head over heels abruptly ("ǂgãʔ, vb.) down into a pit, until the jackal stopped his actions. The monster then arises from death and boasts of his immortality. But I suspect that the text published by Bleek (in which Haitsiaibeb figures as the savior and the immortal) is the older one and I therefore heard only vague memories of the now almost forgotten group of tales about Haitsiaibeb.

In tales I heard the "Hurler" himself called only "!U-ǂriseb's father." I ran into his proper name, however, once in a figure of speech by which a Hottentot was protesting about a hard jostling: "ǂgãʔǂgoribits ga goma a ǂhaǂmrihe !" "May you be knocked down by the Hurler!" (the final i in ǂgoribits is equivalent to ǁa "by, "-ts "you," ga is a potential particle, goma makes the curse a sort of commission to the monster, a is a present particle, "ǂhaǂm "to knock down," -ri means as much as "against" in "to bump against," he pass. particle).

[Text omitted]

X539

Translation of XXX

The Moon and the Hare

The moon (//kx̃ãb) sent (ĩ, probably in the narr. pass. see p. 392; ǁa demon. particle, i auxiliary vb.; verbal particle of the

[539] pret.) the hare (!õasa fem.) away: "Announce (mĩ "to speak," -ba stresses a relation to the obj.: "to report") to mankind (kxoʃna, neut. pl) that they should do (ẽ "and," imperative, with the personal suff. of the subj. -n, neut. pl.) just as (kxomi) I (ĩta) do (hĩ, -ra verbal particle of progressive action), pass away (//õ) [and] reappear (!gã)." Thus (tumi) the hare was commissioned (sĩhe, here probably a true pass.).

And (0, with the fem. personal suff.) the hare [said]: "As my (ti) grandfather (//naob, respectful term for the moon) does (ta euphonious for ra), so [you, too] pass away and reappear (imperative). That is my commission (goma, interjection). When (0) he, however (tsĩ with personal suff.) spoke (mĩ) thus, then the boys [cried]: "What (tarẽ) are you (-s in tis) saying (ta euphonious for ra) there (ti "so, thus")?" Then said the hare (indicated by the s in os): "Just as I do--thus goes my commission--so [you, too] shall die goggle-eyed."

"The hare, therefore, intimidated by the boys who interrupt him, proclaims just the opposite of what the moon had ordered him: As the moon sets, so people were to die.

Then he goes home (//aru, vb.) and comes (sĩ) [to the moon]. And the moon questioned (tẽ) him (si, personal suff.); he, however, remained silent ("speaks" kxom "not" toma), well knowing (ǂan, tsĩ verbal particle of the pret. participle) that (!kxaiẽ) he had (go, verbal particle of the pret.) lied (ǂhumi, with the personal suff. of the subj.). Then the moon shattered (ǂnau "to beat," ǂari "to burst") his mouth (ams)."

[525]

"Ever since hares have had a "harelip" on their upper lip.

[Text omitted]

[450] Translation of XXXI

Uriseb's Father

Uriseb's father (ĩb) digs (kxao, narr. pass.) a pit (ãba) and has

x539 (gai, narr. pass.) the people (kǂoēna) look for (-re is added to the stem to make the vb.) firewood (/aēba) and throws (ao) them down (//nā) into (!na) the pit and sets (!kǂā) them on fire (ǂhubi "to ignite," narr. pass.). And when (0) a person comes (/kǂī), he chases (!kǂoē) after (ū) "with" him (expressed by the personal suff. of the 3rd pers. neut. sing. -ī) round about (//namibe, vb.) the pit and shoves (ǂhā) him down into (ǂgā "to stick into") the pit.

But one day (gui tsē) the jackal came, after (tsī, particle of the pret. participle) he had smeared (ǂkǂau) himself (-sen, refl. particle) with fat (//nuiba) and had made himself wet (/ã /ã); and the two of them (-kǂa, suff. of the dual masc.) chased around in a circle. Then that one pushed the jackal, but slipped down (ǂkǂanu) and fell (//nā) down (//gona) [himself] and burned up (kǂau). Then the jackal went home (//aru, vb.).

But the other dies (//ō) and comes to life again (!gã) and eats (ǂũ) from the Nais bush and [sings]: "Bury (//kǂō) me (te, suff.), won't you (re), me, Uriseb's father (here without a personal suff.). Bury me in big (gai, with the personal suff. of the related substantive because it is post positive) nais bushes." "I (-ta, suff.), Uriseb's father, have died, [but although] dead, I am alive."

e) Animal Tales

538 825 776 The belief that certain people have the capacity of transforming themselves, while they are asleep, into animals and, as such, to wander about unrecognized and to observe things that otherwise would be concealed from them, is encountered not infrequently.

The legendary being that the Hottentots call //gaũa·b also possesses this capacity to assume any desired animal and human shape. They imagine this being in human shape as a skeleton covered with skin and with feet as long as an arm. "As quickly as a flame flickers up from the glowing ashes and then dies out," -- this is how fast, as a boy told me, the being steps into a hut at night and steals a child. It hastens with him into a cave that it has dug in loose soil and rides upon its prey until it has suffocated in the dust. By day the //gaũa·b can also assume animal form. [451] Such a klipspringer, jackal or

538 whatever else it may be, does not flee, for it is invulnerable. The
825 being appears to people in human shape only at a distance since he
776 would be recognized by his facial expressions despite all disguise.

538 The emphasis of the Hottentot animal tales, however, does not
825 lie in these arbitrary fantasies that are only loosely connected with the animal world, but rather in the animal characterizations, which are executed with sharp individual characteristics, and in the transferral of the characteristics to human types. Because the Hottentot reveals himself in these animal portrayals as a sensitive observer of himself--because, in the manner in which he brings the stories to an end, he gives clear expression to his moral evaluation of individual types--because here, finally, he does not need to disguise himself because of anxiety or utilitarian considerations--for all these reasons I regard these tales as the purest reflection of his inner self.

Among the animals behind whose words and deeds the Hottentot conceals himself the jackal claims a predominant position. Excelling all others in cleverness, he plays his deliberate game with the strongest as well as the weakest. The hyena, his opposite, is the symbol of stupidity; with the hyena he can allow himself any old joke (Folk tales XXXII and XXXIII) and even deceit (XXXIV), insofar as the transgression does not offend the feelings of piety that are conceded even to a stupid person (XXXV).

The guile of the jackal is crowned with success especially in cases when it is linked with personal courage (XXXVI) or where it skillfully exploits the cowardice of the opponent (Folk tales XXXVII and XXXVIII), in these cases the hated leopard or the more harmless baboon. When the narrow-mindedness of the opponent is combined with avarice, as in the adventure of the jackal with the Boers (XXXIX), the sly fox is allowed to escape from the noose successfully at the last moment. When half measures are applied in indecision (XL) or in mildness that is badly out of place (as is told of the missionary in Folk tale XLI), the jackal is even allowed to get away with deceit, murder and theft. But every once in a while they do not begrudge the old rascal a good beating when he approaches the "dwarf" impertinently and conceitedly (Folk tale XLII) or when he is all too domineering with the flamingo family (Folk tale XLII).

The jackal has the Hottentot's unlimited sympathy when, as the underdog, he is clever enough to get out of the clutches of the stronger

538 one (the lion) [452] (Folk tales XLIV and XLV); and even more so
825 in cases when he is taking vengeance for injustices that he has suffered personally (XLVI); and most of all in cases when he breaks the tyranny of the strong simultaneously as an avenger and benefactor of all weak people (XLVII).

The jackal's slyness is regarded from the humorous side when, as both referee and liberator, he teaches the serpent and the porcupine a lesson (XLVIII).

The jackal appears as a Don Juan with varying luck: successfully in the salacious Folk tale XLIX and as the cheated lover in Folk tale L, where he falls in love with the sun.

Next to the jackal the lion is most sharply characterized and humanized in the tales. Everywhere hate or ridicule are showered upon him. He is hated because of his brutality, which makes him the murderer of his own children from the marriage with the ostrich (LI) and because of his violence, which makes it unpleasant even for the peaceful baboon to be his neighbor (LII). In consequence, his punishment overtakes him all the more easily, the more he considers himself superior to the others: even the little aro-lizard leads him around by the nose (LIII). And at the same time he is so lecherous that he does not hesitate to feign illness in order to rape his masseuse (LIV).

He is ridiculously conceited about his power and considers himself invincible. He has to be taught better by the ostrich (LV) and even by the little steinbok (LVI). The silver jackal pays him back so well for his arrogance that his sham authority finally loses all its glory (LVII).

The theme of the triumph of guile and skill of the weak over the crude superior strength of the stronger is constantly repeated in Hottentot tales in ever-new variations and animal portraits. One of the best tales, one that gives us deep insight into the emotional life of the Hottentots in its most varied aspects is LVIII, which deals with the fly and the elephant. Furthermore, the story telling how the "dwarf" frees himself from the tyranny of the elephant is, despite all anthropomorphization of conditions, still kept close to the animal's manner of living (LIX).

As in the preceding stories the fly and the "dwarf" in the two following tales, a bird about the size of a black-bird, called

538 gã·/tsi/ha·mabes, plays the part of the weaker party. However, it
825 is superior in battle because of its cleverness. The bird, which appears in the shape of a young lively girl, frees itself and its family from the plague [453] of the python (LX); in another story its attentiveness and guile rescues the girls from murder by the honey badger and his companions, who go dancing with them to the growling reed music of the dorbeetle (LXI).

A simple ruse (similar indeed to the one used by our hedgehog with the hare) aids the tortoise to victory in the race with the ostrich (LXII). Even the giant antelope, the eland, must pay with his life for his arrogance to the tortoise (LXIII). In Folk tale LXIV (as in the Bergdamara adventures) the motif recurs that an important decision or change is placed in the hands of the weak.

In conclusion I offer four tales that, in part crudely naive and in part with a somewhat greater supply of fantasy, are to be interpreted simply as an illustration of certain peculiarities in the external appearance or in the natural history of certain animals (zebra, iguana, baboon, etc.; Folk tales LXV through LXVIII).

136 In order to avoid explanations in the translations, I take this op-
538 portunity to present a list, briefly and generally in simplified spelling, of the animals that figure in the legends. (Those that are only mentioned incidentally and that do not play an active part themselves are given in parentheses.) In the index at the end of the book one can ascertain in which tales the individual animals appear:

1. Elephas africanus (Blumenb.), the elephant, ǂkxaob.
2. Giraffa capensis (Lesson), the giraffe, !naǂb.
(3.) Procavia (Hyrax) capensis (Pall.), the rock-rabbit, !aũb.
4. Taurotragus oryx (Pall.), the eland, !kxans.
(5.) Antodorcas euchore Zimmerm., the springbok, //gũb.
Folk tale name, ǂhãeb.
6. Rhaphiceros campestris (Thumberg), the steinbok, !aris.
(7.) Ovis aries L. platyura, fat-tailed sheep, gub.
8. Bos taurus L., domestic cow, gomab.
9. Equus zebra L., the zebra, !goreb.
(10.) Equus caballus L., the horse, hãb.
11. Felis leo L., the lion, ami. Folk tale name: gai!gãba, that is, "Big back."
12. Felis pardus L., the leopard, /garub.

136
538

13. Canus mesomelas Schrbr., the jackal, /gīrib. Addressed by the hyena in the tales as "my brother Pale," ti !gã /haisetse because of his yellow fur. In the tales the jackal child has the proper name ũsgyeb.

[454] 14. Hyaena brunnea Thunberg, the brown hyena, ǂhĩras (specifically *ǂnũbe ǂhĩras), also called "my sister Pointed Run," ti !gã ǂgõbese, by the jackal in the tales because of its posture in running.

15. Vulpes chama (A. Smith), the silver jackal, !kχamab, hunters' name: *ǂgaihetoma·b (see p. 283); puzzling folk tale name: *hoagye-!gã·hãkχoĩ sõab, that is "the son (õab) of the sister (!gãs, kχois, "woman") of all (hoa) [mankind] (gye and hã, verbal particle)."

16. Felis caffra Desm., the wildcat, /hõab.

17. Mellivora ratel (Sparrm), the honey badger, /harebab.

18. Cynictis penicillata (G. Cuv.), [Mierkatze], the "dwarf" /ẽb (specifically: *!uri/ẽb).

(19.) Canis familiaris L., the house dog, arib.

20. Hystrix africae-australis (Peters), the porcupine, !noab.

21. Lepus, the hare (see p. 285), !õas.

22. Papio porcarius (Boddaert), the baboon, /nẽrab.

23. Struthio australis L., the ostrich, /amib. Puzzling folk tale names: hubais and hĩngatu·bus. Proper name of the ostrich child in the tales: batsibab.

24. Saxicola pileata (Gm.), Kochlar, *gãtsin/hamabes.

(25.) Numida spec., guinea hen, /kχinas.

26. Phoenicopterus, the flamingo, fala-migob (a borrowed name that is also applied, as it seems, to a heron of the interior).

27. Gallus domesticus Boiss, domestic chicken, hũnors (borrowed).

28. Corvus scapulatus Daud., white crow, gorab or !uri gorab.

29. Python sebae, python, *gai/aob. The rudiments of the rear [825] extremities of this animal are regarded by the Hottentots as testicles, and hence they call the python also *go/ma-ǂkχa·raseb, that is "the one with the oxen testicles." I heard old people call the python *!ga·/nigyen!gũ/b because the animal squeezes its prey to death (!ga/ni) and because his "testicles" are attached in the rear like an apron (!gũ/b).

136
53%

30. Psammophis notostictus, sand snake, sanugyeõ aseb.

31. Varanus spec.[1], iguana, !no/na b, *//nareb in the Bergdamara dialect.

[455] 32. Agama spec. (A. atra Daud. or A. planiceps Peters). Aro lizard, !aro b.

33. A Lacertidae, related to a Scapteira, /gabestau b.

34. Pelomedusa glaeata (Schoepff), a tortoise that lives in slimy water and therefore smells bad. The general term for tortoise is //kχuri· b.

35. Batrachia anura of various species, insofar as they can be included within the general term "frog," //gũ·/tsi//gũ·/bes. [Fig. --Canis mesomelas Schrbr., the jackal called /gĩ·rib.]

36. Muscidae of various sorts, insofar as they may be included within the general term "fly," /gĩna·s.

37. Orthoptera of various sorts, insofar as they may be included within the general term "grasshopper," *≠nã≠!au/s; because of their hopping movements the grasshoppers are compared to a girl who dances (≠nã≠) and rages (*!au/).

[456] 38. Orthoptera from the families of the Hetrodidae and Stenopelmatidae; to the latter belongs the type of Maxentius called /kχu·nitsi//kχu·meb, that is "glutton belly."

39. Coprophage Lamellicornier from the group Scarabaeinae, types of "dorbeetles." The dorbeetle is called χau·tsi//ga·≠mabeb because of its burrowing movements in dung: he nestles up to the dung (χaub) exactly as one lies down at night (*//ga≠ma·) close to the fire. The buzzing sound of his wings is compared in the tales to the bass of the reed pipes. In folk tales the dung beetle appears under the name ≠anagye≠gaieb.

(40.) Formicidae, ants, ≠goberu·gu.

The Jackal and the Hyena Who Take Away the Ants' Two Cows

The hyena and the jackal were tending (!ũí, narr. pass.) the cattle (/goana, neut. pl.). And they came (sī) to (doba) thorn trees (//kχũti) and looked for haira resin for themselves (hare). Then the hyena said: "Brother Pale, look (gō) after the cattle, won't you (re)." Then the jackal looks and says: "They are lying (//goë) together in the shade" (!haũ, vb.: the assembling of the cattle seeking shade in the hot hours of the day). Thus he said, although (χabe) the cattle had run away (bẽ, with the personal suff. of the neut. pl.) and continued*: "Sister Pointed Run, did you (-s fem. personal suff., after

*This dialogue (cf. Folk tale XXXV), in which two scoundrels, each with the same mischief in mind, cautiously sound each other out without, however, admitting their designs openly at first, is characteristic of the crafty character of the Hottentot.

[157]

≠aĩ "to think") have in mind what I had in mind?" And the hyena answered: "I had it in mind." Whereupon the jackal: "Let (hã) us (-m, derived from im, the suff. of the 1st pers. dual masc.-fem.) then seek (õa) the cattle and (ẽ) go away to slaughter (≠ã) * together (-gu)."

*) ≠agu also has the meaning "to slaughter a roast for a wedding." The word is to be understood in this sense here also; the hyena's subsequent request for copulation is linked to it. In the legends the jackal always appears as a man and the hyena, with few exceptions (for instance in XXXIV where it figures as a stupid bridegroom) as a woman.

539 Then the two of them went and found a white (!uri) and a black (ǂnũ) cow. Then the jackal said: "The white one is mine" (ti, stem of the 1st pers. of the personal pron., -sa adj. ending), and the hyena said: "The black one is mine"; then they slaughtered. Now the jackal put (ǂnũi, narr. pass.) the hyena under (!gũ, "to cover") the damp (/ã̃) hides (kχõ̃ra, fem. dual), cooked (saĩ̃ narr. pass.)

*After he had persuaded her that she was sick and must therefore subject herself to the customary wrapping in hides (see the chapter on "Medicine," p. 223).

[the meat out] and poured (tsoro, narr. pass.), after (tsĩ̃, verbal particle of the pret. participle after χorohe) he had dug (χoro, narr. pass.) a hole (ãb), the pieces of fat (gauga, masc. pl.) into (!na) the [458] hole [in order to conceal them]. Then he gives (mã̃, narr. pass.) the hyena two little lean (/hai "pale, juiceless") pieces of meat (//gani "meat," -ro dimin., -ra dual fem.) and urine (/ũb). Then she said: "My Brother Pale, of (χa "from, of") what (*taĕĩ = tareĕ) does the fat (//nũiĕ, neut. sing.) taste (tsã̃) this way?" (//nãti). Whereupon the jackal: "Oh (kχa) my sister, I (-ta) do not (toma) understand (//naũ̃ "to hear," !ã "to explain clearly") what is wrong with the fat."

Now the jackal saw the ants (ǂgoberugu) coming up* and slipped

*In connection with the jackal and the hyena's cattle theft the Hottentots have introduced the figure of an Orthoptera that they call: /kχu·nitsi//kχu·meb; when the ants noticed the theft, they assembled all able-bodied men for the pursuit. But the grasshopper [Fig. -- Maxcentius Stal spec., aff. pinguis Wlk. ♀ (Stenopelmetidae). 9/10ths natural size.] replied: "nẽta ra hã̃ tsĩ̃ /gõ̃an doba //hao dain χa ra ã̃!" "I will stay here and drink with my children the milk of the flower-time." (The time of the best

Maxentius Stal spec., aff. pinguis Wlk. ♀

[p. 458]

459

grazing). In the punishment for this she grew so tremendously fat that, as "glutton belly" (*/kǂuni "to drink immoderately," //kǂums "belly"), right to the present day she can only crawl laboriously in the sand (see illustration) or climb up the thorn tree.

(sĩ "to go," ≠gã "to go into") in the hole. Then they came and saw the hides of the two cows and beat (≠nau) the hyena (si, suff.) with (/kǂa) sticks (haiti). Then she cried: "Brother Pale, To beat my body (/kǂã) does me (te, suff.) no good (!gaĩ, [459] vb.), but you can (ga, particle of the potential, -ts masc. suff.) fertilize (ǂaẽ, carry out copulation) my body, indeed (o, interjection) I like that." Then she bit (nã) a hole (//hũsa) through (//hũ "to make a hole through") [the hides] and saw now that (!kǂaiẽ) it was (literally: "are" a) the ants and ran away (//hai-nĩ).

But the jackal scratched himself (!hari "to undo something," -sen refl. particle) on the rasenki bush (*≠aros), and when (o) the hyena hurried by (ĩ, vb. with personal suff.), he called (≠gai) her and she came. Whereupon the jackal: "Yes (gum - - - o), I (tita, pron.) too (tsĩ "and," with the personal suff. of the neut. pl.) have been beaten." So he said after (-tsĩ, particle of the pret. participle after mũ "eyes") he had rubbed (≠ǂoro) his eyes with saliva (≠ãba).*

*In order to simulate tears.

Then the two of them (//(e)ĩra, pron. of the 3rd pers. dual masc.-fem.) went and ran (hõ) across horses (hãna, neut. pl.). And the jackal tied up (*≠nũi !ao, "to set the neck") the young (≠kǂam) horse with a thong (!haũb) while it lay there (//goẽ) and slept (//om, with the rare suff. of the 3rd pers. masc. sing. -mi) and packed (!gaĩ "to tie," ≠nũi "to set") the hyena on it. But he himself (//(e)ĩba, personal pron.) caught (!kǂõ) the big (gai) horse and said to the hyena: "You (sasa, pron.) ride (!gabi) to a place (ũ "along") where no people (kǂoĩn, neut. pl.) are (in Hottentot the relative sentence is expressed substantively by /kǂaĩa "nothing," with the attached suff. of the 3rd pers. masc. sing. -ba). Let (ẽ) (-ta, suff. and tita pron.)

[539] ride where people are." (Likewise substantively expressed by attaching the personal suff. to the vb. hã̄ "to be"). Thus he spoke and ran away. But the hyena was deposited (literally: "came" sī̄, "with" ū̄, "jumped" uri, "has been" -he, pass.) by (ǂa) the young horse in the horse kraal (!harab). Then she was caught and beaten and chased away ("told" gaihe, "to go").

When the Hyena Got Married

The hyena had wooed (ǂgan, in the narr. past, like the following pred.) a girl (/gõasa), and when (o) he had completed (toa) the wooing successfully, he sought (õa) cows (gomate) in order to (nĩ, fut. particle with the personal suff. of the obj.) slaughter them for the wedding (literally: "cows that he, for the wedding slaughtering, ǃgũna, would take" ũ). And while (hĩa, with the personal suff. of the subj. in the apodosis -kxa, dual masc.) he came along with (/kxa) the cows, he met the jackal (literally: "the two met together" /hao). "Where (ma/ĩ, with the personal suff. of the addressed 2nd pers. masc.) are you (-ti) wandering (garu) with (ũ) the cattle?" (neut. pl.) [asked the jackal]. "For ("ǃgao, with the personal suff. of the subj. -ta, "I") my (ã, root of the poss. pron., -ta personal suff. of the possessor, -b personal suff. of possession) wedding (ǃgameb) [to fix up everything], indeed (gumo), for that reason I am wandering with the cows," he replied. Then the jackal asked (tẽ) thus (tumi): "And will they all (hoa) six (ǃnani, with the personal suff.) be slaughtered?" and he answered (ǃeream): "Yes." (a). Whereupon the jackal: "I will go (ǃgũng) [along] and eat some of (ǂa) the wedding-slaughter cattle." ("to come" si, "to eat" õ). Then the two of them went.

And near (/gũne) the kraal (//gãũs) they went to sleep (//om), and when morning (//goas) came (//goa), the jackal stuck (mai) a [little peg of] wood (haisa) between (//aĕgu) his [462] toenails"

"In order to pretend that he had stepped on a thorn and was now lame.

(//goro, the suff. is missing) and said: "Well (gum - - - o), now ("nĕairisa) I cannot (//oa, vb.) walk," and continued: "The living (ũitsaba) shall (nĩ) carry pickaback (aba) that which (-ĕ, personal suff. neut. sing.) is (hã) dead (//õ) !" Then the hyena said: "Come (hã), hop on." "

"The jackal has the hyena carry him pickaback.

x531 Whereupon the jackal: "Oh (ǒ), if only (kxa) I could (re, optative particle) make (di) [myself] some stirrups ("dā "to step," ǂnui "to set," connected to the substantive by the personal suff., here the neut. pl. -n, ǂa, demon. particle with the personal suff. of the subj.)." And the other replied: "Well, then make yourself some." (//nai). And [after a while] the jackal said: "Oh, if only I could make myself some reins (!haũn)." -- "Well, then make yourself some," the other replied. And the jackal asked further: "Oh, if only I could make myself a whip (!nabaf, neut. sing.)." --"Then make yourself one," the other replied. Then the two of them went.

And they arrived. But when (ǒ) they arrived, the jackal beat (/ham), the hyena (expressed by the personal suff. -bi) on both sides (/kxãikxa, dual). Then he [the hyena] fled (!kxoē bē), and while he hastened away, the jackal leaped (ui) off and said [to the hyena's bride]: "Did you (-s, suff. of the 2nd pers. sing.) see (mũ) that you (saa, pron.) were just about (ra, particle of progressive action) to marry my father's (dãbab, di gen. particle) horse (hãi), which (expressed temporally by hĩa) had run away in (!na) the pasture (//hoab)?"

And the jackal married the girl.

[466] Translation of XXXVII

The Jackal Who Taught the Leopard's Children

The jackal was teaching (//kx̃a̋ //kx̃a̋, narr. pass. If one wishes to assume that this is a case of the true passive, then ǂa must be interpreted as a post positive "by.") the leopard's children (ǂoana, neut. pl.). But when (o) they (-n in ǂhen) had been brought (hã̋ "to come," ǂhe "to be taken") [to him], he cut the throat of one (/gui-) of the little children (ro dimin., -s pers. suff. in the neut. sing.). (The following forms have merged to a verb with the ending of the narr. pass.: !gao "to cut," ǂa "through," ǂomi "throat")

Then the leopard came (/kx̃ã̋) and asked (tsĩ̋): "How (xaiti) are you (-isa, suff.) teaching the children (/gǂoana)?" Thus (tumi) he asked. But the jackal said: "No, uncle," the children are learning

"The form Ohn is borrowed from Cape Dutch. The jackal regards the leopard's question as a sign of distrust and counters it.

("to teach," with the refl. particle -sen) very (gaise) well (!gaĩ̋se)." Then [the leopard] went [467] home (//aru, vb.), and when he had gone home, the jackal once again (//kx̃aha) cut one of their throats.

And the leopard came again and said: "I have come to see the children." So he said. But the jackal replied: "No (hm'm), now (ǂnõ̋ xirias) they will not (tire, verbal particle of the fut. negative) come out (ǂnax̃a)!" Then the leopard asked: "Why (taref !ama) shouldn't they come out?" But he [answers]: "The children are learning very well, don't (tĩ̋ • toma) disturb (ǂhani) [them]."

Then he believed (ǂgom) [it] and went home. Then when he came back again, in the meantime (hĩ̋a) all (hoa, -ro dimin., -s pers. suff. of the neut. pl.) of the children had been eaten up; only a single child (/guiro? /guiǂ) was left (hã̋). And [again] the leopard said: "I [want] to see (gõ̋) the children!" Then the jackal showed (//gau, narr. pass.) the single one; but the other thinks (ǂaĩ̋, ti "so") [that it is] all of them and went home. And when he had gone home, the jackal ate up the single one that was left (!gau hã̋).

[53] And the leopard came once again but when [the jackal] saw him coming (!goaxa), he said to his mate]: "When (o, with the pers. suff. of the subj., -s, in the apodosis) the leopard indeed (ga, verbal particle of the potential) comes, you must (nī) pinch (//kxā) a child." Then let me ("let" ī, "so that I" -ta) ask: 'For what (taeē = taree "what?" -ha objectifying verbal particle) is the child yelling (ā)?' And (ē, with suff.) then you say: 'It is yelling for leopard meat' (//gaaē, neut. sing.)." And the leopard came, and when she pinched the child, the child yelled. Then the jackal asked: "What is the child yelling for?" And she answered: "It is yelling for leopard meat."

Then the leopard ran away (//hai-nī) and went (aī) to urge (//kxau) the baboon (/nīraba) [to go with him], and the two of them (-kxa, suff. of the dual masc.) arrived. But the morning sun casts dark shadows (literally: "the early shadow" //gaa somi, "makes" dī, "shadows"). "Don't you (-kxo, suff. of the 2nd pers. dual masc.) see (mī) the six (!naani) leopard skins (kxôgu) lying there (//nā)?" [the jackal said]. Then the leopard fled, ran away (hī), while the baboon cries (nī, ti "thus," with the pers. suff. of the subj.): "Wait! Wait!" (//aam).

[Text omitted]

[468] Translation of XXXVIII

The Jackal and the Baboon

The jackal and the baboon were debtor and creditor. ("ux(u)tegu, narr. pass., "stand in a relation of debt to each other." The context reveals how this is to be interpreted in detail.) But when (o) the baboon came (/kxī) to seek out (ōa) the debtor (ux(u)teba), the jackal (expressed by the -b after o at the beginning of the sentence) sat down (ām, narr. pass.) in front of (ams aī) the hut (oms) and made a big (gai) knife (gōaba) sharp ("/ōxisama vb., narr. pass., /ī "to be sharp," -xi adjective-forming ending, am "mouth, blade of an ax, knife, etc."). Meanwhile the baboon appeared and came (hī) up to dam (/kxai) the debtor. Then the jackal said: "We (-kxam, suff. of the 1st pers. masc. dual) don't know each other." (/ī "not to know," -ku refl. particle)

539

Then the baboon (I heard the term /nēraba only from old people; the younger ones all say /nēraba) was afraid (!ao) and went (!gūng) away and came (nī) to (doba) the wildcat (/hōab) and said: "The jackal there (nē, demon, root) whets a knife when (o) I ask about the debt." [449] Whereupon the cat: "He is only pretending (ǂhumi "to lie") that (//au). The High Supreme Dung Chief! (literally: "the unique turd," ǂgum /guisa). That is just like him! (ī "to be like," -b pers. suff.). So (ǂūigye) come on, let (ē) us go." So she said, and the two of them went and got there. But again (//kxaba) the baboon was not prepared for the sight ("had not" toma "provided" mū "himself" -sen, refl. particle, "for this," with the objectifying particle -ba) and ran away (//hai-nī).

Then the cat called (ǂgai) to him again: "The jackal is lying; he will do (dī) nothing (ǂnē "something," tite particle of the fut. negative) to you (tsi, suff.); so come, let's tie our tails (ǂarekxa, dual masc.) together." (//are "to unite," !gai "to bind"). So she said and they came there. But the jackal leaped (ǂham) at both of them (kxā, suff., in the dat. acc. case) with the knife.

Then the baboon fled while (hīa) the cat cried (mī, ta ǂra, ti "thus," with the pers. suff. of the subj.) "wait!" (//nam). And when (o) she wanted to hold onto ("!kxōbasen) herself to (ai) the bushes (haiti), he pulled (!hum) her out (ǂui) along with the bushes. Then finally the baboon stopped (/ū, vb.) running, and the cat said: "Come, let's go back (oa), the jackal is pretending, believe (ǂgum) me, won't you!" (e, with the suff. of the 2nd pers. masc. sing.) But the baboon refused (ǂkxā) and did not go back."

[225]

"Here, too, the Hottentot sets up a causal relationship between the tale and the animal--one which is so well known to the natives that the narrator no longer stresses it: when the two animals unknotted their tails again after their wild flight, it turned out that the baboon's tail was bent. As punishment for his cowardice it has remained that way ever since; see the illustration on p. 288.

[470] Translation of XXXIX

The Jackal Who Sells a Horse to the Boers

The jackal sold (//amaχ̣u, narr. pass.) to (doba) the Boers (bũrgu) a horse (hãiba) and first (aibe) stuck (ǂgã) money (marina, neut. pl.) into (!na) the anus (tsoas) of the (di, gen. particle) horse and brought (ĩ "to come," ã "to take," narr. pass.) it and said (mĩ, narr. pass.): "Now ("nẽ sirisa) will (nĩ) I (-ta, suff.) get (hẽ) money there (//nẽ) from (χ̣u) the horse." And when (o) the horse excreted (as), he held his hand underneath (χ̣aba, narr. pass.), and the horse excreted money.

But when (o) the two (-kχ̣a, suff. of the masc. dual) Boers spoke (!hoa) about the price (/gausa) of the horse, the jackal said: "I will not (toma) set (ǂnĩ) a price because (ao) I am not selling the horse. [471] But any (hoa, with the suff. of the neut. sing.) man (aoĩ, neut. sing.) who wanted (ga, verbal particle of the potential) to buy (//ama) [it], would give (mẽ) me (ta, suff.) a wagon (gunisa) with (/kχ̣a) the oxen (gunisagu) that go with it (//(o)ĩs, pers. pron. of the 3rd pers. sing. fem., used in the sense of the possesive pron. with the gen. particle omitted)."

Then the Boer gave him (hi, suff.) a wagon with oxen. And the jackal hitched up ("ǂgaẽ !ao) and said: "Boer! The horse waits (hã) three (!nani) days (tsĩ!), then it excretes [money]." Thus the jackal said and drove (!nari) off.

But the two Boers waited (!aũ), when (di) the three days had passed (ĩ), until (//gu) the fourth (haga //(o)ĩ) day, but the horse excreted no money and excreted only (/gui with suff.) grass (/gãĩ). Then the two of them saddled ("!gaĩ!gã) up and chased (!kχ̣aẽ) after (!gum) [the jackal]. And they came (ĩ) to a kraal (//gaũ), to one that lay ("ǂnãa, with pers. suff.) on (am !na) the way (daob), and asked (tã): "Where (mabe, with the pers. suff. of the subj.) is the wagon that came by here (nẽbe)?" "Day before yesterday (ai tẽ) it went by," so it was said (mĩ "to say").

Then they rode (!gaĩ) along and came again to a kraal and asked: "Where is the wagon that came past here?" To this the people (-n pers. suff. of the 3rd pers. pl. neut.) said: "Yesterday (//aĩ) it came

539

by." Then they rode along and came along to a kraal and asked: "Where is the wagon that came past here?" To this the people replied: "Today ("this" nē, "day" tsēb) it came past."

Then they rode along; and when (hĭa) the jackal had been [home for a long time], they came and cried: "Uncle Fox (borrowed from Cape Dutch), I will shoot (ǂnoa) your (-tsi, suff.) head (!ūs) in!"

To which the other: "For (ai) what sort of a (mã) crime (/habiŧ, neut. sing.) are you (-tsa, suff.) going to shoot my head in?" So he asked.

Whereupon the Boer: "You (sats, personal pron. of the 2nd pers. masc. sing.) told me, didn't you (gum--o), that the horse, that excreted no money, would excrete money!"

But the jackal said: "No (hm'm), once and for all (!hoa horaē) do not (tĭ ǂ toma) talk this way (//nāti) with (ū) me! My (ti) older (gaib "big") brother (!gāb) does business (//ama "to buy," -gu reciprocal particle) with both of you." (sago, pron. of the 2nd pers. pl. masc.)

[472] Then the Boers (literally: "the two others" ǂnaukŧa asked: "Where is he?" And the jackal said: "He lives (//an) [farther] down (//goma) there (nāba)." Then the two of them rode off and went to shoot (ǂnoa !an) the jackal who was not guilty.

[Translator's note: In the Hottentot text of Legend XL the following remarks are inserted in German by the author:]

This questioning of the jackal is now repeated two or three times by the narrator in order to make it impressive. Then there follows:

Question and answer as before. Then he demands the same thing of the jackal. Thereupon:

Question, answer and demand as before. Then:

Urgent repetition of the questioning. Then again:

Translation of XL

The Jackal Who Licks Out the People's Pot

The jackal (/gĭrib) came (/kxĭ) from (ǂu) his (//(e)ĭ b, personal pron. of the 3rd pers. sing. masc., used as a poss. pron. before the following substantive) kraal (//gaũs) to (!na) the hut (oms) of men (ǂnoũ) and [473] (tsĭ) came (hã) in (ǂgã, vb.) and licked out (tom)

×539

the fat-pot (//gubusa) of the people. But the people came back while (hĩa) the jackal was still (hã̄ "to remain") at (doba) the hut. Then the man (aoba) of the hut asked (tẽ): "Of which (mã̄) district (!ãb) are you the jackal?" (-tsa personal suff. of the 2nd pers. sing. masc., nominative)* Then the

[193]

*The word ǂumi "so," which is frequently attached to direct discourse, has merely the function of summing up, in contrast to the conjunction goma, which has an imperative sense. "Mã̄ !ab gǂritsa goma" would mean: "Where do you come from? Answer! That's my command."

jackal answered (!eream): "I (-ta) [am] the jackal from the arobush district. [The fruit] of the aro tree (-na, ending of the neut. pl.) I eat (ǂũa). from the hari bush I eat, from the au bush I eat, yes indeed (gumo)!"*

[137]

*The ǂa·ros bush is Zizyphus mucronatus Willd. (Rhamnaceae). ǂhari·s is Royena pallens Thbg. (Ebenaceae). ǂaũ/s is Grewia flava D.C. (Tiliaceae). The jackal lives indeed from the berrylike fruit of these bushes, among other things.

Repteition. Then:

Thereupon the man said (mĩ): "let (ẽ, imperative particle) me (-ta) see (gõ) you (-tsi) excrete (ǂau)." Thus (ti) he says. Then the jackal excreted aroberries. And the man asked again:

Repetition of the question and demand.

And the jackal excreted hari berries. Then the man asked:

Repetition of the question and demand.

And the jackal excreted au berries and [again] the man asked: "Of what place are you the jackal?" And the jackal answered: "I am the jackal of the aro district. I eat aro berries, I eat hari berries, I eat au berries, yes indeed!"

Repetition. Then:

And the man said: "Let me see you excrete." Then the jackal excretes fat, and the man caught (!kõ) him (bi). But the jackal cried: "My (ti) grandfather (//naob), hold me differently." (!kõ "to seize," umu "to turn around," !gã̄ "backwards"). And the man seized him differently. Then

the jackal got away (ũi) and says: "Yes (mo = gumu), that's the kind of guy I am." (Literally: "such" //nã, "a child" /gõa- "I resemble" ĩ).

[475] Translation of LI

The Jackal and the Porcupine Who Both Dig Water for the Teacher (Missionary)

The jackal and the porcupine (!noab), the two of them (tsĩ "and," ǂkya personal suff. of the dual masc.) were digging (ǂora, narr. pass.) water (//gamsa), and when the time (//aẽb) came (/oa) when they were supposed (nĩ) to go home (//aru), the jackal got himself (-sen, refl. particle) all wet (/hari) in the (!na) mud (ǂgoab) and told (gai, narr. pass.) the porcupine to wash (//ã). Then when (o) the two of them arrive (sĩ), a small(ǂkxari) dish (!ores, -ro dimin.) is poured out (hora "to take cooked food out of the cooking pot") for the porcupine and the jackal's portion is put into a wash basin.*

*Because the jackal, who has traces of work on his body, is considered to be the diligent worker, and the porcupine the lazy one.

But one (/gui) day (tsẽ), when (o) the two of them had gone (!gũng) to work (sĩsen), the teacher (//kxã//kxã "to teach," aob "man," the missionary") went [after them] without (toma "not," "hãse, adv. formed from hã "to be, to remain") their seeing (mũ) it. And they got there. Then the porcupine climbed (//gõa) down [into the water hole], but the jackal lay (//goẽ) down and slept (//om). And when (o, with the personal suff. of the subj. in the apodosis) it was time to go home, the porcupine came out (ǂoaya, vb.) and woke (ǂkxãi-ǂkxãi) the jackal. But all (hoana, neut. pl.) this the teacher observed (ǂnõa "to sit," mũ "to see") there (//nã). Then [the jackal] told the porcupine to wash, but he himself (//(e)ĩba, personal pron.) got all wet in the mud. And the two of them got there. [This time] the porcupine was served in the big (gai) bowl, and the jackal got his in the porcupine's little dish. Then [the jackal] said: "You (-ts, suff.) have misunderstood (//naũ "to hear," sã "to do something

X539

incorrectly"): you were told to give (mã) me (tita, personal pron. [the big bowl]." The [476] porcupine, however, replied: "The teacher"

"This is probably one of the few cases in which the old form of the suff. of the 3rd pers. sing. masc. -bi has been preserved. The i has been lost and, otherwise, in the Nama language, is retained only in the masculine nouns in which there is an m in place of the b: //gami ǂami, etc. (cf. Th. Hahn (78), p. 62). Th. Hahn, Die Sprache der Nama. Leipzig 1870.

gave me the bowl."

Then the two of them went to work, and whey they came to the (doba) water the jackal said: "Hey there! (ŧsĩ "and," -go suff. of the 2nd pers. pl. masc.; ŧsĩgo is a careless form of address much like nētse), let (hã) us (-kx̃um, suff. of the 1st pers. pl. masc.) bathe (//ãsen)! Let (ẽ) us put on (!gai) white (!uri) cloths (!kx̃aikx̃a, dual masc.) in front (ai) and jump (uri) into this (nẽ) water." Then first (ai "to be first") he tied [the cloth on] the porcupine, and when (ŧsĩ, particle of the pret. participle after toa "to cease") he had finished tying it, he took (ũ) a stone (/uiba) and [said]: "Porcupine, I jumped so (ǂũgye) jump!" So he said and threw (ao) the stone down (//nã "to fall," in the narr. pass.). -- The porcupine jumps in, assuming that the jackal had jumped ahead of him, and drowns. --

Then the jackal [rejoices]: "The porcupine has drowned (ǂ//gam //õ)!

"The following is to be interpreted as high-spirited nonsense.

The calves (ŧsãĩn) have sucked (dai) milk. The wagons (ǂuniti) have driven (!nari) by themselves (sen, refl. particle). The huts (omgu) are set (ǂnubi) on fire." So he cried and fled (!kx̃oẽ "to hasten," hẽ "to go away," in the narr. pass.).

But the lion (ǂama, euphonious for -mi) was lying in wait (ǂ//goẽ ami) for him. Then [the jackal] came (/kx̃i, narr. pass.) [to his hut] and cried"

"The jackal suspects that the lion is lying in wait for him. He speculates on the lion's

539

simplemindedness by calling loudly and then, in a feigned monologue, makes his approach contingent upon an answer, by which the lion then indeed betrays himself.

"My house!" (Borrowed from Cape Dutch). But it is (i, gye, a) quiet (!nõsa). Then he said: "I (-ta, suff.) will keep quiet (!hoa "to speak," tite "particle of the fut. negative); that (nēē, demon. pron. in the neut. sing.) is something (ǂũĩ "thing," neut. sing.), that my (ti) hut (oms) does not answer (oē). I will just call (ǂgai) this one (/guisa) [more] time (!nãs)." So said and called again. Then the lion cried: "Yes (hē)!" [Whereupon the jackal:] "Have you ever heard or seen (literally: "Do you hear" //naũ "and see, since" o "you were born" !naē), that (!kxtaiē) a hut answers?" So he said and ran away (//hai-nĩ).

[477] But the teacher was putting up (maĩ, narr. pass.) lime twigs (ǂnēba "lime") in his garden (!hanab), and the jackal came in, and while he is coming in (ǂgã garu), he caught himself (!kxõbosen) in the bird lime and is held by (ǂa) the bird lime.* Then the jackal said: "What (taeē • tareē)

"In the dark the jackal believes that he is being held by a person, and he tries to outwit this person by exchanging rôles: he pretends to be the one who is doing the holding and questioning.

are you (-tsa, suff.) doing (dĩ) in the garden? Let me (te, suff.) loose (//nã "to let," ǂu "to desist"), you (-tse, suff. of the 2nd pers. sing. masc., vocative), let me (-ta) go (!gũng)!" So he said, but was not freed nevertheless (ǂabe, with the personal suff. of the subj.). Then he continued: "Just wait (//nam), comrade (aob is the familiar form of address of two coevals who have grown up together; see page 315), let me go (ǂxra) to [illegible] (ǂgai), I will come right back (/ase), so [let me go]!" But he was not released; meanwhile (hĩa, with personal suff.) the morning (//goasa) came (//goa). Then the teacher came and steps up (ha) to take him out (ũ //nã) [of the lime twigs], and takes (goes to take) him to the kraal and asked (tẽ) him how (mati) he should (nĩ, !kxtaiē particle of indirect discourse) kill (!gam) him. But he said: "Slaughter (ãĩ) a fat (gauna) wether (gũba) and (ẽ, with the suff. of the 2nd pers. sing. masc.) give me the fat drippings (//nati-ba) to drink (ã "to drink"; si gives the vb. a causative force: "to give to drink") and pack (!gaĩ) the fat (gauna) on me and rub

x539

(/ã /ã "to make wet") my tail (≠areba) with fat (≠hoau) and seek (õa) here (nẽba, with suff.) a man (kxoẽba) out (≠ui), of whom you know (≠an, tumi "so") that he is (the fut. particle ni here corresponds to our "in all probability") strong (/gaisa), and let him (-b in ẽb) wrap (tami) [my] tail in [his] hand (!umi) and hurl (≠ẽ "to throw down"; ≠an "to beat") me on (ai) the rock basin (!haos, see p. 162) that is lying (≠hõa) there (//nã)." So he said.

And the teacher, just as (kxumi) the jackal had said, sought out a strong man and ordered him to hurl [the jackal] to the ground. And he hurled. ---The greased tail slips from his hands. --Then the jackal stood (mã) on (≠ama) both (-ra, suff. of the dual fem.) feet (≠aira) and said: "Here the boy is (/gõab, [478] "son"), yes indeed!" and ran away. But the men saddled ("!gaẽ "to pack on," !gãb "back") horses (hãga, masc. pl.) and chased after [him]. But the jackal went down (//goa, narr. pass. and pret. participle) into a wadi (!ãb) and picked (ũ, in the same construction as //gõa) flowers (blomga, masc. plural, borrowed from Cape Dutch) and went toward (!oa; narr. pass.) the men. Then the men cried: "That's the jackal!" But he said: "Which (mã) jackal? Don't you (-go, suff.) see that (!kxaiẽ) I come from (ǂû) the flower land (!hub)?" Then they believed (≠gom) [it] and sought [farther] and found no one ("not").

But he came [home and lived on (hã "to remain") just as he had lived formerly (hũga).

[Text omitted]

[479] Translation of XLI

The "Dwarf" [Cynictis penicillata (G.Cuv.)] and the Jackal

With the jackal and the dwarf it happened (dĩhe "was made") like this: When (o. The o at the beginning of the sentence is a copulative verb.) the jackal (-i, an old and rarely used demon. suff.) had found (hõ, narr. pass.) a snake (/aob), he went to the dwarf and said: "Dwarf, reveal (mĩ "to say," -ha objectifying verbal particle) to me (te, suff.), won't you (go), in (ũ "with") what way (gaus) you (sama, pron., strengthened by the suff. of the 2nd pers. masc. sing. -si = se) kill (!gam) snakes (neut. pl.)."

[480] Then the dwarf went (!gung) with him (bi, suff.) and showed ("went" ĩ, "to show" //gau) him the neck vertebra." And when (hĩa)

"According to legend the dwarf sticks his head through the atlas, //goresa, of an ox or a horse,

x539

> attacks the snake and, at the moment when it strikes, twists it head in such a way that the snake bites the bone. When it has lost its poison in this way, it is bitten to death by the dwarf.

the vertebra (expressed by the personal suff. –s after ǂkoχã, "to refuse." Ta euphonious for ra.) did not want [to let itself be put on], he pressed (//gaĩ) [it] in (ǂgã "to stick in") and killed the snake. And when (o) he had finished (toa "to cease," with personal suff.) killing the snake, [he tried] to slip off (ǂui "out," ũ "to take") the joint, but (χabe, with the personal suff. of the subj.) it did not (toma) come loose (ǂoaχa "to come out").

Then the jackal said: "Comrade (aob, see p. 315), roast (am) you (–tse, suff.) the snake there (nẽba), for (χuigye) I (ta, suff.) am going (ĩ) [off for a minute]".* And while (hĩa, with the personal suff. of the

> *The jackal is ashamed of the constricting position that he has gotten into through his own meddling; he tries secretly to remove the vertebra and to deceive the dwarf, who catches him in his desperate exertions.

subj.) he stands there (mã, preterite participle) with his head bent forward (ᵐǂubi, a vb. that designates this position) and beats (ᵐǂnoa !gã) [against the joint with his fists], the dwarf unexpectedly (/kxĩ "to appear," hã "to come") leaps up behind (ᵐ!gãba ũ) him and gives him a shove (tsa /kxa). Then he leaped (uri) up (kxaĩ "to get up," narr. pass.) startled (!huri, ᵐhãse, adverb expressing a condition) and said: "Well (ᵐaẽ, interjection), you (–ts) have (ũ "to take"), I suppose (ga, verbal particle of the potential), still (ᵐnoǂoba, perhaps borrowed from Cape Dutch and assimilated) childish pranks (//ore "to make fun of," ǂũna with the personal suff. of the addressed pers. or things, di gen. particle, ǂkxamsis "youth") in your head."

But the dwarf replied: "You are dying (//õ), so (hũgye) I would like (re, optative particle) to help (hui) you (tsi, suff.)."

Whereupon the jackal: "You (sa---go) idiots (gãre, adj.) think (ǂai) so! (ti, with the personal suff. of the one pers. addressed). If (o) I only wanted to (ǂgao), then I could (nĩ, future) indeed (gam---o) remove this vertebra thing (neut. sing.) after all (χabe)." So he said and continued: "Go and (ẽ) see (sĩ "go," gõ "to see") whether (!kxaiẽ) the snake isn't done (//an, vb. ĵ)."

x539

[481] And when the dwarf had gone, he jumped into (!na) the water (//gams) and tried (tsã, narr. pass.) to remove (≠gai) [the vertebra]. But when it did not come loose (≠oaxa, see above. i "to go"), he ran away.

And he came to (ai) the kraal (//gaũs) of the hyena and said: "See (gum---o, "yes"), the dwarf told (gai, "to cause") me to put my head (tanas) into the vertebra (expressed just the other way around in Hottentot), and now the vertebra won't come loose." But while he talked this way, the dwarf came and said: "Jackal, do not (tĩ = toma) lie (≠humi) that way (//nãĩ)." Then he got up and went away.

And he came to (doba) the kraal of the silver jackal and said: "Uncle, please remove (//nã, vb. with the objectifying particle -ba) from me (te, suff., with the suff. of the 3rd pers. neut. sing. -ẽ = ĩ in //goreĩ, which as it were substantivizes the construction) this (nẽ) vertebra thing with (ũ) which the dwarf has deceived (gã) me!" But while he spoke thus, the dwarf came and said: "Jackal, don't lie like that." But he replied*:

> "In order to cut off any further explanation
> that might make him look rediculous.

"Oh my (o and kxa, interjections), our (ã, root of the poss. pron., with the personal suff. of the possessors, here in the dual masc.) affairs (xũna) there ("nauba = //nãba, with the personal suff. of the neut. pl.) are in a mess (/garu "to be out of joint." -sa adj. ending, -se adverbial ending), so look after the affairs, won't you?"

So he said and went to (//ga) the kraal of the porcupine and said: "Uncle Ijzervark (Cape Dutch name for the !naob), please remove this vertebra from me, with which (expressed adjectivally by the ending -sa after the pred.) the dwarf (-i, old demon. suffix) duped me." Then the porcupine broke (!xõa) the vertebre with (/kxa) his vise (//kxamtas).

Thereupon the jackal said [to himself]: "Hey, that dirt-scum penis guy!" (!haĩ "the sour scum of a dirty milk calabash." !garab "the penis").

> "The dwarf is mean, who proved him a liar
> everywhere. In revenge he lures him into a
> trap and incites the snake against him.

What do you suppose I could do to him?" (ga "for/that" /abeã "plan" neut. sing., "could I" ga, "for" -ba, "him" bi, "find" hõ). And the two of

*539

them went along and came to a thick (/gom) thorn tree (//kx̃ũs-) bush. Then the jackal said: "Climb (!aba) [482] after (!g̃a) the guinea hen (/kx̃inasa) that is sitting there (//nã)." And the dwarf climbed up. But when it had climbed up, the jackal said to the snake: "Climb up behind the dwarf who is sitting there, grandfather (//naob, respectful form of address)." Then the snake climbed up, but the dwarf jumped down.

Then the jackal said: "Hey (//nai), look at (literally: "hear" !g̃a) this son of a dirt-scum vagina!"* And the snake climbed down (//g̃oax̃a)

*The jackal curses the snake, who had let the dwarf slip away, half audibly but still loud enough so that it can hear. /nũis "the vagina." ũaba "child."

and called: "Jackal!" And the jackal answered: "My grandfather!" But the snake said: "Have you ever heard and seen (mũ, in the present tense in Hottentot) that (!kx̃aiẽ) such a child (/g̃oaĩ, neut. sing.) as this (nẽ) curses (/goẽ) old age (aoẽ, "a man." The snake is masc. here.)?" So he said and hit (/nau) him. [Fig. -- Bitis cornuta L.]

Then he ran away (!kx̃oẽ-nĩ). But the dwarf caught (*!kx̃õ) him, and the snake came and struck him. And he ran away [again] and came to the lion and said: "Grandfather, don't let the snake who is coming (!goax̃a) strike me!" He said it and ran away.

And when he had just lain (//goẽ) down to sleep (//om), the snake came [after him] following (/kx̃a "with") his (ãb) tracks and woke (/kx̃ai /kx̃ai "went to wake") him and asked: "Where (maba x̃u) do you come from?"

But he replied: "I am seeking (ũa) the cattle (gomana, neut. pl.) that ran away yesterday evening (//an !oẽ)." Thereupon the serpent: "Don't lie!" And the jackal said: "I am not lying, grandfather."

Then the snake said: "Uncover (/hui) your belly (//kx̃um), let (ẽ) me see." And he uncovered his belly. Then the snake saw [483] the weals of the hippopotamus whip (!nabaga, masc. pl.) with which he himself had beaten him, and beat him again (//kx̃aba) and chased him away ("told him to go away").

*539
[484] (hais), and was sitting (ǂnõas) on the eggs (!ubugu, masc.). Then he said, "Hen, my (ti) sister (!gā, without suff.), please (re, optative particle) throw (ao) one (/gui) of those little things (ǂũba, masc. sing., -ro dimin.) down (//nā, with the objectifying particle -ba) to me (te, suff.), won't you (ǂabe)?" But she replied: "I (-ta, suff.) won't (tite, particle of the fut. negative) do (hĩ) it." Then he said: "If (o) I (tita, pron.) wanted to (ǂgao, ga, particle of the potential), I could (nĩ, fut. particle) climb (ǂoa) up the tree." And he continued: "I will climb up the tree immediately (/ãse)! So (ǂũigye) throw one down!" Then she threw down an egg, and he said: "If you had not (toma, with the personal suff. of the pers. addressed) thrown it down, I would have climbed up." He said it (-tsĩ, particle of the pret. participle) and went away (!gũng).

Then on the next (ǂnau) day (tsē) he came along just when (hĩa) the hen was on the ground (!hũũb) and caught (ǂ!kxõ) her (si, suff.). Then she said: "Wait (//nam), first (aibe) let (ē) me (-ta, suff.) pray" (ǂ/gore)."

[727] "Baptized Hottentots occasionally allowed the white men whom they captured in war time to pray before they shot them.

But when he let (//nãũ) her (the suff. of the subj. -b, is attached to the suff. of the 3rd pers. fem. sing.) loose, she flew (fĩĩ, borrowed from Cape Dutch) up (!aba, "to climb up"). Then he said: "This (nē) day you may (ga) mark (ǂan "to know")!" And went away.

And he came where (-ba, demon. particle of place) the flamingo (borrowed from Cape Dutch) was catching fish (//aũna, neut. pl.), and asked: "When the North Wind (/abas) blows (!gom, ta ǂ re), how (mati) do you seat (ǂnũ) yourselves?" (-go, suff. of the 2nd pers. masc. pl.). And the other replied: "I sit like this (nēti)." -- The narrator turns to the South. -- Whereupon the jackal: "When the Southeast Wind (ǂaore ǂoab) blows, how do you sit?" And the other replied: "I sit like this." -- The narrator turns to the Northwest. -- Whereupon the jackal: "When the sea wind (huriǂoab) blows, how do you sit?" And the other replied: "I sit like this." -- The narrator turns to the Northeast. -- Whereupon the jackal: "And when the South wind (!kõãbagab) blows, how do you sit?" And the other replied: "I sit like this!"" Then there was a thud (ǂ//ae, onomatopoetic

"The narrator puts his head under his arm, just as the flamingo puts its head under its wing.

*539

for the sound [485] that the ax makes when the jackal chops off the flamingo's head).

Then the jackal went away with (ũ) the head (indicated by bi), and when he came to the hen he said: "Have you (-s, personal suffix after mũ "to see") seen that !kxaiẽ) I have killed (!gam) your (sa) husband (aoba)? Throw down the eggs!" But she said: "I won't do it!" Whereupon he: "In just a moment I will fly into the tree! Don't you see that I flew after (!gon, adv.) your husband and killed him?" Then she threw down three (!nona) eggs. But he gobbled (habu) up the eggs and said: "Throw down some more (noxoba, probably borrowed from Cape Dutch and assimilated)!" But she said: "I won't do it." Whereupon the jackal: "In just a moment I am going to climb up to (!gã) you." But she replied: "Go ahead (o, interjection) and try (tsã) it (ti "so"), let (ẽ) me see." Now he tried to climb up, but he did not get up.

Then she [cursed] him: "Never (/nĩ "another of the same sort," tsẽ "day," tite particle of the fut. negative) shall you (-ts) find (hõ) your fortune (!gaĩ !gãẽ, neut. sing.) on the earth! And may you (-tsi, rare form of the suff. of the 2nd pers. masc. sing.) eat (≠ũ) the vermin (≠unina, neut. pl.) that men (kxoi'n, neut. pl.) squash (dã, tsautsau "to make soft") with their feet; we (-da, suff. of the 1st pers. neut. pl., and sida, pron. of the 1st pers. neut. pl. exclusive) will remain (hã) with men and eat food (≠una, neut. pl.)!" -- In this way the chickens became domestic animals and the jackal became omnivorous. --

The Lion and the Jackal

The lion and the jackal, the two of them, had gone (!ao, masc. pass.) hunting, and the jackal shot with his bow (//hxāō, vb.) fat (gaus) giraffes (!nafte). But the lion shot a skinny (ǂgabeas) giraffe; and the giraffes and the giraffes that the jackal had shot he took (ŋ), and he gave (mā) the jackal the skinny giraffe that he (//(e)ī) himself had killed. Then he gave him (ti, suff.) fat (gaoga, masc. pl.) and told (gai) him to call (ǂgai) the lioness (taraxa "wife").

But when (ŋ) the jackal came there (ai), he gave the fat to his (//(e)ī, pron. of the 3rd pers. sing. masc. used as a pron. with the omission of the gen. particle) children (oaxa, neut. pl.) and gave the lion children the lungs (ǂhe) and said to the lioness: "Your husband (aoǂ) wants [me] to say (gama, an adverb that indicates that that which he says is a commission) to you: "Stay (hā) at home with (/hgu) the children (/gaes)." Then he took his (the root ā is supplemented to become a pron. pron. by attaching the personal suff. of the possessor) wife and his children, all of them, and went (!gūng) and came [to the lion]. Then the lion said: "Whose (maka, with the personal suff. of the subj.) is the mistress (//naoxa, literally: "grandmother," a term of respect)?" And he answered: "Sir, my (ti) mistress does not wish (tire, fut. negative) to go (with personal suff.), so (tsoxū)

"339

the refused (/hoǂ) and remained." Then the lion went [himself]

But the jackal dragged (ǂâa "to climb up," ǂ "to take") all (hoa) the meat (//goa) up into (a) the giraffe tree and left (//nâǂa) the skinny giraffe behind. Then he roasted (aiza) out the fat and roasted a round quartz stone (//gurusa) into (!ua) the grease (//nuib). Now the lion came (/hoǂ) and cried, and the jackal answered (oē). [Then the lion cried:] "Pull me (te, suff.) up (!aba "to climb up," ǂ, see above)!" Then a thong [496] (!haoba) was let down (ǂ//naǂ) to him (-ba, in the predicate, objectifying particle), and he was drawn up ("/aoua); but just when (hîa) he arrived (ǂî, ta + ra) [above], the thong was cut (!kaai and !gao) and he plunged down." Then the jackal

> "ǂî signifies: a) the pressing of nursing cattle against the udder; b) to drop, with the refl. ending -sen: to plunge down.

said [to his mate]: "Give me a newly (/kas) prepared thong, -- [and whispered]: "give me an old thong!"

But when the lion could not manage (//ua "to be unable," ǂoaxa "to come forth"), the jackal said: "Sir, open (kaiba) your jaws (an !naaǂ and ǂî, with the suff. of the 2nd pers. masc. sing.) catch ("hâi) this (ni) piece of fat (aeus, sing.) neatly (ǂaxa)! And be sure that it does not (nâ + toma) fall (ǂoa "to set," ǂ "to happen") on the ground (!hîb), for (ǂnigye) if (o, ga particle of the preterital) it falls, it will go to pieces (/aa)!" Then the [lion] opened his jaws, and the fat [with the red hot quartz stone in it] fell right down (ǂî, vb.) into his mouth.

Then the jackal cried: "Sir, [run] to (//ge) the water! (//gaua) To the water!" But he did not get there (doba) to the water, but died (//ô). (Literally: "while he did not get there, he died.") -- The stone plunged through his intestines and tore open his anus. For that reason -- this is what the Hottentot told me whom I asked for further details--every lion, when it has killed an animal, first gulps down a piece of hide in order to close up the hole that the glowing stone made.

The Lion, the Husband of the White Crow

The lion had married the white crow; she had made (guru, with an indication of the ind. obj. by means of -ba) wings (//gaboga) for him (bi, personal suff.) and he flies (borrowed). Then when (o) he flies (ta euphonic for ra), she hangs up (!gaß "to bind," mai "to put") the bones (ǂkoboe, fem.) [of the slain prey]. But he cannot endure (/gara) that people (kxoßna, neut. pl.) walk about (!gũng), kills (!gam) everyone (koaß, neut. sing.) that he sees (mũ, with the personal suff. of the subject; ta : ra, with the personal suff. of the obj.). That is the way (ti) he does (hĩ) it.

Then one (/gui) day (tse) the jackal came (/kxi) and said [to the crow]: "Give ("au "to present") me (te, personal suff.) water (//gami)!" But she replied: "I (-ta, personal suff.) cannot (//oa, vb.) go away (bẽ) from (ǂu) the hut (omas), indeed (gum---o)." Whereupon the jackal: "I (tita) sit

"Because she has to keep a check on the bones that
are hung up! For if the bones fall to the ground,
then the lion also plunges to the earth.

(ǂnõa) here (nõba), and no dog (arib, neut. sing.) shall (tite, particle of the fut. negative) approach; so ("nũgye) go (ũ) and draw (ǂgurĩ) [water]." Then she went.

But the jackal took (ũ) the bones down (//nà, vb., in the pret. participle) and beat them to pieces (ǂnoa "to throw," /am /am, "to shatter"). Then the crow (expressed by the personal suff. -s in tsĩs) came and asked: "Who (tarib) has done (di) such a thing (/gaub)?" But the other answered: "When the other answered: "When (o, with the personal suff. of the subj. in the apodosis, -n neut. pl.) I slept (//om) here (nẽba, with the personal suff. of the subj.) a bit (-so, dimin.), dogs came in (ǂgã, vb.)."

Then when the sun (sores) went down, the two of them (-ra, personal suff. of the dual masc.-fem.) lay down to sleep. But the jackal took [491] (ũ, narr. pass.) the cover (ǂnamsa) of the di, gen. particle) white crow and gave (mĩ) the white crow his (//(e)ĩb, personal pron.) cover.

And the lion, while (hĩa) he approached (!goexa) from afar (!nũse, adv. with the personal suff. of the subj.), cried: "Mother (aise)! Lift (tsi)

X537

me up, won't you (re)!" " Then he came up and saw a strange (/hxaxs)

"The narrator bellows the word ton in a deep extended bass, imitating a distant lion's roar.

blanket. Then he stabbed (!kxū) the white crow dead (!an). But the jackal sprang (uri) forth (ǂara) and cried: "May (re, optative particle) we (-gye) poor (/gū) people [now be able to] walk peacefully (//gue "to lie") about (ai) the earth (!hūb)!"

[Text omitted]

[493] Translation of XLVIII

The Snake That a Stone Rolled Over While It Was Sunning Itself

A snake that was rolled over (ǂnū "to sit," ai "on") by a stone (/uiri - /ui ga) while (hī) it lay there (//gue) sunning itself (literally: "attaching" ǂnaobe "itself" -sen, "to the sun" sawe; -ī is an adjective forming particle), calls to all (haan) people (kxoēn, neut. pl.) who pass by (ǂ: "Help (ǂ "to take") me (te, personal suff.) get up (kxaī ai), won't you (probably borrowed; re optative particle)?"

Then one day the porcupine came (/hxī), and the snake cried: "Please help me to get up." Then the porcupine helped it up and went (!gūng) with (ǂ) it (hi, suff.) to (//ga) the water (//gams). But when (o, with the personal suff. of the subj. in the apodosis, -hi) the two of them had come (ǂ) to (doba) the water, the snake coiled (tami) around the porcupine (expressed by the suff. hi), and when its head (tanas) comes to (!na) his throat (damī), she said: "I'll eat (ǂ) you (hi, personal suff.)!" Then the porcupine said: "Hey (kka) we (-kxam, suff. of the 1st pers. dual masc.) are on our way (gare, vb.), after all (gum---o), to a big (gai) kraal (//gaūb)!""

"Supply: "Let us settle our matter there."

And the two of them came to the kraal of the ani lizard. But it said": "The men (aogu) have already (tun "to be through") hurried away

"The following answers are supposed to typify cowardly refusal to play the part of a judge.

1539

(!gūng and !hie) and have deserted (ǂan) me! [I must quickly follow them!]" It spoke and went away.

Then they came to the kraal of the gabemaub lizard. But it tied (!gaā "to bind," !hyāb "body") its blanket (ǂhamma) up and ran away.

Then they came to the kraal of the jackal. But he tied up his blanket and said: "What (tarē, with the suff. of the addressed 2nd pers. dual masc.) are you seeking (oā) here (gua'a "to arrive")? I am just (ra, progressive action) leaving, I am just leaving! Come quickly and (ē, with imperative force) let me (-ra) hear (//naī)." Then the two of them came, and the porcupine said: "Oh (ō at the end of the sentence), this one (nē) here (kx'aēb, "man"), from whom after all (gum---o) [494] I rolled off the mane, wants to eat me." Whereupon the jackal: "Come! Run! Let me see (gō)!"

Then they got there and the jackal said: "Lie down (ǂhūī "to sit down"), let me see!" Then the snake lay down in (ai) two (/gam) coils (!hamra, dual fem., formed from !ham "to return"). Then the jackal asked (ta): "Was she lying (ǂhūe) like that (nēti)?" And the porcupine said: "No!" Then she lay down the right way (ǂxāse).

But the jackal put (ǂhūī) the snake on her and said: "Even (ǂaise) always (gom) when we(-da, suff. of the 1st pers. neut. pl.) go past here (ta), the snake may continue to say: 'Please help me up, [We will leave it lying there!]" And he said further: "If (o) something (ǂūī) bad (tsūbe, "wrong") happens to you (gare), only (/gui) then do you think of me (tita)!" (Literally: "is there a thinking-of-me," ǂhna fem.). He said and whipped (ǂhaī) the porcupine.

The Jackal Who Carried the Sun Pickaback

And it happened like this (hîhe "was done"): they went wandering (ǂoē), and with (/hǂa) the jackal the people went [497] (hǂoǂo, neut. pl.) away (hē, vb.); however (ǂâse), he remained (hã, narr. pass.) behind (hǂâse ai) and came (hã) where (-ha) the sun* (sore) was sitting (ǂhãe).

*Conceived in the shape of a beautiful girl.

and said: "Come, let (ã, with imperative force) me (-xa) carry you (ǂî, fem.) on my back." (ǂîa "to carry a child in a skin on one's back.") But she refused (ǂhǂî). Nevertheless (ǂâse) he said: "Come let me carry you on my back." Then he picked her up, and the two of them (-re, dual masc.-fem.) went (!gãe).

And while (hîã, with the personal suff. of the subj.) they are going (gare), he was no longer able to bear the load" (hay "to bring," //oa "not to

"He now tries, with all sorts of stratagems, to free himself from the load of the sun, but is continually rejected with ironic words.

be able"). Then he said: "Climb off; let me shoot (ǂhae) three (tã) giraffes (!oaǂe + ǂî, fem. pl.)." But she said: "Always (hoge), even when (hîa "while") I (-xa) was being carried pickaback, people have shot giraffes with me (ǂî "to take," he pass. ending)." And the two of them went. Then he said: "Climb down, there (sâe, demons. pass., neut. pl.) stand (mã) some springbok (//gãna, neut. pl.)." But she said: "Always, even when I was being carried pickaback, people have seen (mã) springbok with me." And the two of them went on (//hǂaîa). And when the man (nuhe, the jackal in human form) could no longer stand it, he said: "There stand some oxen (!goreo + -ti), so (ǂaigye), climb down, let me shoot." But she [replied]: "Always, even when I was being carried pickaback, people have, after all (goreo), shot oxen with me." Whereupon the man: "In just a moment (/îse) I will (tã) rape (ǂ.ai "to complete copulation") you with the

A539

penis (ǂkâi) that is located on (/kxâb "body," ai "at") my back (!gâb)." But she said: "I have always been used to copulating with a penis which is situated on the back."

Then he hurried (!kxŏe) with (ǂî "to take," used here as a prep.) her (ni) and went (hî) into (!na) the water (//gamu). "Splash" ("//ubu) said [the water], but he was not (tsama) helped (hâi). Then he came up (ǂoa, vb.) out of (ǂî) the water and dug (ǂoro) a root ("!numaha "a root stock that runs horizontally") and slipped (//haru) there (//nî) under the root, and [498] while the sun got stuck ("ǂhoa) by her skin (kxŏb), he crept through (!kxŏaru, vb.) on the other ("nau) side (/kxâib) and goes home (//aru).

Then he met (gî "to come," hŏ "to get") the two (-ra, dual fem.) sun sheep and slaughtered (ǂî) one and took the fat (gauna) and went and came [home]. Then the children (/goâna, neut. pl.) [cried]: "Father (ǂâb, abbreviated from ǂîǂab) is carrying (tani) meat" (//gana)!" Thus (tsami)

> "The children thought that the hideless back of the old jackal, which had been scraped bloody, was prey that he carried on his back.

they hurried toward (!oa, vb.) [him]. Then the man became angry (//aiǂa) and comes (/xǂî), while he is expiring (//ô, ta euphonious for ra) of thirst ("//gâi "thirsty"), and demands (ǂgan) water. Then his wife (tarasa) gave (tsî) [some water] to him, and while he takes [it] (double vb.: !kxô "to take," !oa "to meet," ta : ra.), [the water] dries (ǂnâ) up." Then the

> "According to legend, the sun lets two sheep that are untouchable grass on the earth. Whoever commits the sin of touching them dies of thirst because all water dries up before his very lips.

wife knew (ǂhoa) that (!kxaib) he had slaughtered a sun sheep and said: "We have (-nî, demon. pron., da-nî; ǂîǂab let pers. pl. neut.) go past the two sun sheep that you slaughtered there every (hoa) day (tsâte ? ti)." (Double vb.: !gung and ["to go," /kxâb "side"). So she said and asked (hî) whether (!kxaib) he had taken the fat. And he said: "I have!" Whereupon she: "Go, put (ǂnî) it away." Then he went to put it away, but he keeps a small (ǂkxari) piece of fat (-ro, dimin.) and comes. Then

539

the wife poured out (ǂnã, ba, objectifying particle) [some water] for him, and again (//xgaba) the water dried up. Then she said: "Go, put it all (boragase) away." Whereupon he: "I am keeping a little bit (ǂǁãb "thing," ro, dimin., i, suff. of the neut. sing.) in order (ga) to anoint (sobo, ni verbal particle of the fut.) my eyes (mũte + ti)." But the wife said: "As long as (gõse) you (-ta, suff. of the 2nd pers. masc. sing.) keep the fat (ãuna, neut. pl.) there (//nã), you will not (tite, particle of the fut. negative) drink (ǂ) water and (uĩ, with the rarely used full form of the suff. of the 2nd pers. masc. sing.: ti) die of thirst." Then he went to put all of it away and came and drank water.

The Baboon and the Lion

The baboon and the lion, the two of them, live (//as) together (//aesha "united"). And (ǂî) when (o, after !gûng) the baboon takes (ũ) the musical bow (kxâbe, see page 376) and goes (!gûng, verbal particle of the present), the lion creeps (/kxûri, expressed passively) behind the baboon. But he sees (mîn) that (!kxâsi) he is being followed (ta euphonious for ra) and [sings]: "I see (mîn, -se verbal particle) the one (-ha) who follows (//haba) me (-ra), a person (kxûĕ-). I (tita) [see the] creeper. [I] with eyes everywhere (taoba "to look around distrustfully," -ǂa a particle denoting a high degree, mîb "eye," -sa adj. ending) [see] the creeper!" In this way (tsamî) he plays on the bow (!gaba "to strike").

But the lion (indicated by the suff. -b in ob) believes (ǂaî, ti "so"), when (ǂî) he is being (sa : ra) looked at (ǂîbe, with suff.), [that he sees the baboon's] back-of-the-head (!aoxa) and creeps on, although he is seen. But when the baboon looks away (!aru/Tû), the other ducks down (//gaĕ "to lie down"), and when he is seen, he creeps on. And he came all the way up (doubles vb.: hâ "to come," toa "to cease") and jumped (ǂhaxa). Then the baboon quickly (!aubase) slipped away (ǂgû) toward the overhanging cliff ("corner") and the lion fell (//nâ) down (//gama) from (ǂâ) the cliff (here with a full masc. ending) and perished (//ûi).

Then the baboon, after (taî, verbal particle of the pret. participle) he had climbed down (//gîna), cut (ǂû) out (ǂhâ) the liver (a!ûsa) and roasted (axa) it and went (di) to (ni) the kraal (//gama) with (/kxâ) the liver and gave (mâ) the [family] mother (//gusa) the lion (ǂkami) liver.

K539

Then she asked (tẽ): "Why (tarexa) does the liver stuff (-ẽ, neut. sing., with a contemptuous connotation) taste (//kxoa) like that (hĩ)?" Thereupon [504] the baboon told (gai) his (ã, root of the poss. pron. connected with the personal suff., -b, of the possessor) children (/gõan) and his wife (taras) to climb (ǂoa) up (//ga) the cliff. And they climbed up. Then, when (o) they had climbed up, he answered (!eream) the lioness while (o, "when") he meanwhile (hĩa) remained (!gau) alone (/guri) at (doba) the hut (oms): "Over there" (//nã, with the personal suff. of the

"As he speaks the baboon points sarcastically toward the lion's hut.

subject) the liver acquires (hã) such a taste (kxoma "so," nã "to taste")." Thus he answered her (ti).

[Fig. --Papio porcarius (Boddaert.) an old male.]

Then she came out (ǂoexa), but he runs away (!kxoẽ, ni, verbal particle of the fut. expresses anticipation of being chased) and climbs up (double vb.: ti and ǂoa). And (o) she comes (ti) there and sees that (!kxaiti) her (ã) son (/goaib) is dead (//ẽ). Then she became afraid (!ao) and she cries: "You (ti) stay (hã) forever (!ari "completely") on (ai) the mountains (!hungu)!" [Ever since] this (ne) day (tsĩs) the baboon remains (hã with an adjectival genuitive ending -ti) on the mountains.

[The baboons now live in peace and sing:]

"When (o in the last measure, with the suff. -kye: "we") we pick up (naha) tree resin ("/nuruna, favorite food of the baboon) and are sitting (ǂoe) [comfortably], then kindly leave us in peace!" (Literally: "Then may we sit, please," -re).

[1504]

Papio procarius (Boddaert.) an old male.

*539

bones (//xx‡gu) on a cord" (ŋ̃ŋ̃ana, vb. in the narr. pass.) and lies down

"The lizard is making itself a rattle to
frighten the lion.

(tí "goes," //gaē "to lie down") beside (!na "on, next to") the path (daob), and when (o) the lion comes (kx'i) with the personal suff., ta : ra) he [the lizard] slips (ǂgã, narr. pass.) between (!na "in") [the lion's] legs (/nũgu). Then he [the lion] throws (ao) the meat (//ganga, masc. pl.) away (‡u "to abandon") and flees (!kxoē-ni).

But the lizard takes (ŋ) the meat, and when (o) he comes (tí, ta : ra) [home], he says (mí, with the objectifying particle -ha) to his wife (tarasa): "Order (ē) the children (/gõan, neut. pl.) not (tã : toma) to play (/hurus) with (//are "to come together") the lion children." So he says.

But one (/gui) day (tē) when the lion had gone away (!gũng), the children ran away and played together. Then they got into a quarrel (!kxam, vb.) and the lizard children cried: "Hey, how nicely (!gãise) our father (ǂkhi) frightens (!aoi ao) your father (taoha) with the bones and takes (ŋ) the meat away (/hana "to rob," narr. pass., with personal suff.) [from him]."

But the lion, frightened (-tí, verbal particle of the pret.) [by the old ape lizard], again (//kxaba) came (/kx'i) without (õe) meat. Then the children said: "Uncle Trust God (Cape Dutch name for the !arob-lizard), indeed (gum---o), does (‡aba) frighten father and takes the meat away (‡u) from father."

Then the lion went to the (//ge) kraal (//gõas) of the lizard and got there and asked (ũ) like this (tama): "Are you (sasa, pron. of the 2nd pers. masc. sing.) making (di) me (tita, pron. with the personal suff. of the 2nd pers. masc. sing. : -ti) your village idiot?" (//are "to make a fool of," kxoē "person," neut. sing.).

But the lizard said: "Why (tare) !ama) does Uncle ask such things?" (/gaē, "way," neut. sing.).

Whereupon the lion: "Why, your (se) children said that you frighten me and take the meat away; that is what (ti) your children said."

But the lizard said: "Since (o) I (demon. root ni with the personal suff. of the 1st pers. sing.) lie down hungry (!ãi) when the sun (aoxa) sets (ǂgã)--how in the world (literally: "ai ai, "which" mã, "time" //aēb) do I know (ǂhi) about something like that?" (‡ãsa "things," neut. pl.).

[307] Then the lion went. But the lizard said to the lizard wife: "Didn't I tell you (sase, pron. of the 2nd pers. fem. sing.), the children

*539

[should] not (tā) play together?" and put (ǂgā) the children in the rogue's sack." Then he went to the lion's kraal, got there and said to the lion:

[WS] ' /hõa gaos, a little sack made of leather in which small stolen items are concealed (cf. page 235).

"Because (xūi ao) the misbehavior of this pack of children (literally: "the manner that resembles I this child thing,") now (ui sirisa) is bringing strife between us (literally: "drags" ǂgaē, "the two of us" sakxum, "together" //are, vb.), look (gum---o "yes"), for that reason I have (the pret. is expressed here by toa "to be finished") killed (ǂnãa !ao) my (ti, stem of the poss. of the 1st pers. sing., used as a poss. pron. with the omission of the gen. particle) children." So he said.

Then the lion killed (!gam) his (ē, root of the poss. pron.; with the personal suff. of the possessor it forms the full poss. pron.) children so that not (tamaae, adv.) even (tī, with the personal suff. of the neut. pl. referring to /gaos) a single (/gui) little one (-ro dimin.) was left (!gae).

[Fig. --A member of the Lacertidae that is called /gabemaa-b (S. a.) and is related to the Scapteira. 1/6 natural size.]

But the aro lizard went home (//are, vb.) and when he climbed up (ai) a mountain ridge (!naũi) and saw (mĩ) a gabemaab lizard," he dumped

"This variety is reputed to be a favorite food of the aro lizard.

(taare) the children out (ǂui). When a noise (ǂkurukis) arose (ǂãi "to sit, to take place") there, the lion cried: "Give (ao) me some of (ǂa) the thing, won't you (re), with (ti) which you (-re, suff.) have made (ǂgaoǂgaa) your children come to life." But he did not see the aro lizard again.

[611]

Rhaphiceros campestris (Thunberg). Steenbok ♀

X539

page 454), the "dwarfs" (/ēn), the wolves (/gîs), the cats (/hõan)-- all of them -- and said": "Which rogue (literally: "which" tsi, "child of a

"To be understood as a provocation to be allowed to commit a murder without punishment.

genital" tsoas õa, "genital" tsoab = penis) will (nĩ, fut.) stab (!kock) me (tita, pron.) in the anus (tsoaba) with (/kxĩ) a hot (/gamas) iron (/uris)?"

And when (o) they (-gu, suff.) had recovered from their fear ("ceased" toa, "to be afraid" !ao), the jackal said: "I (ta, suff.) first (aibe) want to go (ĩ) to call the child of the sister (!gã, without a suff., kxoĩs "human being," fem.) of all (hoa) [men]." He spoke and stuck ("went" !gũng, "to

"This refers to the silver jackal, who best repeesents his species.

stick" ǂgĩ) the iron into (!na) the fire (/aĩs) of (di, postpositive gen. particle with the personal suff. of the governing substantive) the bellows (soasoab) and set out on his way. And when he came to call him, the other said: "Why (taeõ = taroõ) are you calling me?" He spoke (mĩ, pret. participle) and went

Then they arrived, and the lion said: "What rascal will burn (dao) my anus for me (tita, suff.), also a rascal?" However (ǁabe, with suff.) the silver jackal kept quiet (kxom, "spoke," toma "not"), took (ũ) out (ǂui, pret. participle) his little bone pipe (!hafb, -ro dimin.), struck fire (ǂnan, vb.) on the tinderbox (dorosa) and smoked (ǂgaõ) and said: "Whether I do it or not (literally: "I will do" dĩ, "it in vain" //ause), I (nẽ, demon. root [514] with the personal suff.) will be caught (!kxõ) nevertheless. After all (gum---o), there is only a single (/gui /guis) day of death." Then he put out (/ari, narr.

"That is: "After all, I cannot be tormented to death for a long time." Or: "After all, I have got to die sometime." tsĩs "day," //õ "to die," substantivized by the personal suffix of the neuter singular.

pass.) his bone pipe and put it away (ǂgã, narr. pass.).

Now when the lion was lying (//goõ) there like that (//nãti), the silver jackal (-i, old demon. suff.) asked: "Isn't the iron warm?" And the jackal

539

answered: "It has become warm (the suff. of the addressed 2nd pers. is attached to the particle of the pret., go), you child of my good [female] comrade (ǂaa, "coeval"; cf. page 318)." And it was hot, and it looks (i. vb.) like (kxoma) blood (/aob). Then the lion asked again: "What rogue wants to burn my anus?" But the silver jackal answered: "This (ti---ta) "I" rogue will burn your anus." He said it and burned his anus.

Then they chased (saru) each other (-ga, reciprocal particle). Then the lion comes (hã) up, but the jackal dodges (ǂgõ) and brushes (/hore) him in the eyes (mĩ, the suff. is omitted before the postposition) [with his bushy tail]. But while the two are carrying on like this (hĩ), the lion became limp (saas). Then the silver jackal leaped (uri) with (ĩ, the verbal origin of the postposition is expressed in the attached ending of the narr. pers.) him over a young (ǂkxam) hakjes thorn (!noõba), but the lion jumped too, and they kept on chasing. Then the silver jackal leaped with him over a large (gai) hakjes thorn but there (//nãba) the lion got stuck (hã !ari, "to remain behind alone") and the silver jackal came home (//aru, vb.) alone (!guri).

[515] [Text omitted]

[516] Translation of LVIII

The Fly That Marries the Elephant

The fly (/gĩnas) had been married (!gamaiba) to the elephant (ǂkxoaiba) and had moved (//ã) to (//ga) the elephant kraal (//gaũ), and there (//nãba, with the full and rarely used suff. of the 3rd pers. sing. fem.) she bore (hõ) a daughter (/gõasa). Then (o, with the personal suff. of the subj. -kxa, dual masc.) her two brothers (!gãmakxa) asked (sẽ) of (doba) their mother (//gĩsa): "Were we (sikxama, personal pron. of the first pers. dual masc. exclusive) then (ga) not (toma, with the personal suff. of the subj.) born (//axa) along with (/kxa) a sister (!gãsa,tarere fem.)?" So they ask. Whereupon (o) the mother: "You (kxo, dual masc.) possess (double vb.: ã "to take," hã "to remain") a sister" says the mother, "but (gabe, with the personal suff. of the subj.) she is not here (nẽba); she has married into (!ns) a bad (//aixa) tribe (!haos)," she says. Thereupon the two of them

reply: "We will (ǂnĩ, verbal particle of the fut.) go (ǃgõũ) to (//ge) the bad people there (//nâ)." "But you will be killed (ǃgamhe)," says the [mother]. But they both went.

And toward evening (ǃui "to become evening," vb.; a verbal particle expressing a condition; here both are connected to form an adv.) they got (ũ) there just when (ǂâ) the little elephant children (-se, dimin. particle) and the daughter of their (ã poss. root with the personal suff. of the possessor, -kʻĕa) sister are throwing (ǂnaxa "to strike"; see "Children's Games," page 313) the ana sticks (//xraga). And while they are throwing the sticks, the two of them (o, with personal suff., introducing the apodosis) went (hã) into (ǂgã, vb.) the bushes. Now [the children] throw--then (o with the masc. personal suff. of the subj.) the stick of the daughter (di, [517] gen. particle) of their sister, who (-s in ǂnaxas) had thrown, came (ũ) to rest (//gũ) [where] the two (//(e)ĩkxa, personal pron., 3rd pers. dual masc.) were sitting (ǂnãĩa, ha indicates the relation to an obj.--here the fly's child). And when she came to take (ũ) the stick, she is called (ǂgaihe) [by them] and cuddled (xnahe; actually: "made faithful by the smell," //xnah, like a puppy, see page 260). And when she had picked up (double vb.: ũ "to take" and tsa "to cease") the stick, she goes [to the elephant children] and says: "You (nadu, 2nd pers. neut. pl.) who eat (ǂã) mud" (ǂgoah), go to (//ge) the mud! Let (ũ, "and," with imperative

> "The belief, widespread among the Hottentots that the elephant feeds upon mud can probably be traced to the fact that these animal rooted up the bed of the Vlei completely whenever they came down to the water in herds, as they used to do. Then they not only drank muddy water, but they carried away so much mud on their feet that in the course of time the water hold became deeper and deeper, as though it had been progressively eaten up.

force) me (-ta), who (tita) drinks (a) milk (daiß, neut. sing.), go to the milk." Then the little elephants hurried (ǃkxoã) to the mud, and the little fly hurried to the milk. And when (o) she got there, she says: "Mother (aise), get up (kxaĩ) and (ũ) come (ǂĩ) give (mã) me (te) milk!" So she says. (The woman is not sitting in her own hut, but in a neighboring one.) But the mother does not get up, and the [little one] weeps: (ã). Then the mother gets up and goes there and goes to pour (ǂnã, -ha a verbal particle emphasizing the obj.) milk

539

for her (ti). Whereupon [the little one]: "Mother, I have seen something (xûi): go there, won't you (-re), and see." So she says.

Then she took a thong (!hauba) and went and saw (actually: "came to see") the two of them (-kxâ, suff. of the 3rd pers. dual masc. in the dat.-acc.). Then she plucked (taurg) grass (/gûba) and wrapped (//guiam) the two of them, their two dogs (aribka), everything (hm) together (/xâa) in the grass. Then she brought (double vb.: ê "to go," ĝ "to take") the two of them to the hut (omi), and in the hut she built (om) a separate hut (/gui "alone," hã "to remain") and said (gai) the two of them to lie down. Then they lay down and warmed the dogs (mî "to say," -ba emphasizes the relation to the obj.): "You should (ni) not (ti) drink (ĝ) like that" (tumi)." So

> "Here the narrator imitates the lapping noise of drinking dogs.

they said. But the [other] asked the old elephant mother: "When (ni) I [518] once upon a time (!kare) married here (ubba), was a hare (!gara) kneed (//gaaa adj., here used substantivally //gaaa(-b)) wether (gûb) slaughtered (ubba) for me" (ta, -ba see above)?" Whereupon [the old woman] said: "You

[535 576]

> "It is a Hottentot custom for the mother-in-law to slaughter a head of cattle when she receives the young wife who moves into her husband's kraal. The daughter-in-law then does the same. If this festive slaughter is omitted by well-situated families, then that is a breach of good form, an unfriendly gesture toward the young wife.

wife (tzaaa) of my (ti) son," why (tarra, with the personal suff. of the subj.)

> "The crude conception of the family life which causes the young wife so much suffering is characterized by the words of the old elephant; she does not speak of her son as the man whom she bore (ãaib) but whom she conceived in copulation (aã "to complete coitus").

do you suddenly (tsûã, "one day") speak of things (xûna) that you (-s in hugas) never (huga, "ever," toma "not") mention?" But the other replied: "I (-ta)

§531

simply am asking (ka). " Then [the old woman] said: "Nothing was slaughtered for [you]," and slaughtered her (ni) a wether. Then [the young wife] combed (mi) it, and when it is done (//ka), she ladles it (ki) out (ghi) into (!ae) the wooden dish (!ai) [ready] for the two waiting (//gai "to lie," -!a objectifying particle) men and places (mai) it before the waiting men.

And the time (//aiha) when the elephant is accustomed to arrive (/hi), literally: "the coming time of the elephant," di gen. particle) is at hand (/ae). Then [the fly] wants the two men: "When he, having arrived (hi "to come," mi verbal particle of the pret. participle), beholds (!gai, literally: "comes to behold"), then hold your nostrils (ngui) shut." (Double vb.: "!khi, "to grasp, ngua "to cover") so she says. Then she grinds up (!kui) bucho powder" (hai, neut. sing.). Then [the old woman] says: "What (tsoe) sort

> "The fragrant powder is supposed to conceal the smell of the heathen which the old elephant mother (who is conceived as being blind) could scent. The fact that the old elephant was not acquainted with the scent of bucho, the national perfume of the Hottentots, is a further illustration of how alien the young wife (here seen as a fly) has remained in the elephant's family.

of smells (//amaxa, neut. pl.) that I have never sniffed (!kxaihe) am I getting (hâ) to sniff today (ni "on this," mâi "day," neut. sing.)?" (ti, interrogative particle). But [the fly] replied: "Do you (mâi, 2nd pers. neut. pl.) think (ghi, ti "so"), because I married [into your tribe], I should not (tite, verbal particle of the fut. negative) make (di) bucho powder for myself (-ma, refl. ending)?" And then it got dark (!kxai).

Then the [elephant] came, and while (hîa) he came (!gaexa, with the masc. personal suff. -hi) he talked (kXoro) [in order to make himself noticed] [§18] Then [the fly] said [to the child]: "Go out (ghe) and (ki) report to your

> "The loving peter familias leads in the fields all day long and comes to the hut only in the evening; however, he does not go in, but only has the child report that everything is in order: "We are doing nothing!" That is: "Nothing has happened."

father (nuuba)." So she said. Then the little fly went out and reported: "We (-da, suff. of the 1st pers. neut. pl.) are doing nothing (ǂxûî "something," tama "not")." So she said. Then he comes up and comes to lie down beside (ǂâb "cheek," ri "at") the hut. Then he belched, then he got up (ǂxaĩ). Then he went off.

But then (ai "at," //hêba "the time," //nâ "then") they (-n, suff. of 3rd pers. neut. pl.) tore (//xxoabe) down the hut and packed it on a draught ox (!garoǂ) and tied up (!gai maĩ) an old (gaixa) sheep (gîsi) and a blind (ǂî) goat (hôsi) and a blind cow (gomaĩ)* and went on their way (hê, vb.).

"All the rest of the cattle they drive along
as they go.

But the elephant pursued (!gaũ !gon) them. But they had told (gai) the daughter to sit (ǂnâ) backwards (ǂxaoe, "in back," /ǂxâb "body," !oa "in that direction") on the draught ox: she [sees him] and cries: "Yes (gumi), he is coming! (!gaũǂa, expressed passively) [broad as] a wide-branched (//nuuǂaĩ) giraffe tree (//gaoaĩ, neut. sing.), [heavy as] someone who can (-ǂa, adj. ending) trample shut (tsom) a well (tsaub). He is coming, truly!" she cries. And now they heaved (double vb.: *//gau "to make a kraal out of branches," ǂgau "to cover") the way (daoba) and lay in wait (*//gaũ, an) for him (hî).

But at the time when he was going away, [the old mother elephant] said: "My son (ǂaise, vocative masc.), in case (o and gu) you (sîn, masc.) are killed, [as a sign of your death] my rear end (ǂxaeo aiba) will tremble (gum)!" So she says. And while he is being ambushed, he comes and cries: "I will jump (/gau) [over that], I will jump over it." (i, auxiliary vb.). Then they threw (//haĩ, expressed passively) the two assagais (gũoakǂa) and the two dogs bite (tsî) him to death (!aa, in the sense of "killed," in contrast to //û "died"). And the tiger said: "If you kill the child-maker (//ora "to procreate," aub "man"), then cut (!gao) off (*ǂxaĩ, "to cut something open on the surface, as up") his genitals (/oa aiba)." And when the two of them [538] had killed him, they cut off [the genitals] and journeyed (doĩ) home (//aru, "to go home").

[559]

Translation of LIX

The Elephant Who Made Servants Of All Sorts Of Beings

The elephant had made servants of four-legged (haga /nūhē) beasts of prey (‖/gurusa, neut. pl., collective term for all sorts of vicious animals), and every morning (literally: "on which?" mā, -- "on every" haasa, "morning" ‖/goeb) they (-a in tāa, suff. of the 3rd pers. neut. pl.) are urinated on" (/kXam, ai "on").

[560]

"So that they may make a good catch--
a curious superstition.

But the white (!ui with euphonious n) "dwarf" (/Ei), who (-ba, suff. in somatba) does not (tama) dig (kXao) a knapsack (//hēba) full (/oa) [of field onions], is drenched over and ove. again (ǂūnga) with urine (/ūba); the others (ǂnuna, neut. pl.) are only (/gui [821] "single") urinated on a little bit (/kXai "little," -ro dimin. particle, -se adverbial ending); then they go (!gung) digging. And the others dig their knapsacks full, but the white dwarf comes (/kXi) with (/kXa) refuse (gǂa "thing," -ro dimin. particle & personal suff. of the neut. sing.) which sits (ǂnūa) there (//nā) in the back (kXaos ai) [of the almost empty sack]. Then they come (hā) along to hand over (mā) [the field onions], and when (-tā, pret. participle) they have finished (tna "to cease") handing over they go. Then when (g) dawn breaks (//gna), they come and take (k) the knapsacks and go after (o at the end of the sentence) they (-a in toahen) are through being urinated on (ta after a is euphonious for ra, verbal particle of progressive action).

Then one (/gui) day (tā) the white dwarf found (hā) a way out (/abas): he dug (kXoro) holes (ǂga, masc. pl.) and comes back with very (gai "big," -se adverbial ending) little onions. But when he had finished digging the holes and the time (//aēba, the next morning is meant) had come (/oa) when they were supposed (ni, verbal particle of the fut.) to go, he goes (ui) to sit down (ǂnū) on (ai) a hill (!homi "mountain," -ro dimin.), after (tā, particle of the pret. participle) he had taken an amagai (gōaba), and cried (ǂgai): "You (-ta, suff. of the 2nd pers. masc. sing.) will not (tite, particle of the fut. negative) urinate on me (-ta, suff.) today (nā/tā)!" So he cried.

539

Then [the elephant] started (/nuhe) after (//ga "toward") the dwarf, but the dwarf escaped (//hai, ai̯ particle of the fut., uniting with the vb. to form one concept, expresses here the anticipation of pursuit). Then he set out after (!kxoe "to run," !gun "behind") him (-hi suff.), but [the dwarf] went (ǂgū vb.) into (!na) a hole. Then the elephant went there and peered (ǂai) into the hole, and after (ui̯, particle of the pret. participle) he had peered in, he trampled (ǂā) so that (ga) a cave-in (!kxoesi) might take place--from above (ǂam) he trampled into the hole. But the dwarf leaped (ui) out (ǂara) and slipped ("went to go into") into another (/xgara) hole. Then the other again (//xgaba) came there (//nāba) and he was stabbed (!kxā) in the heart (ǂgaoe) by (ga) the dwarf. ---Ever since the dwarfs have lived unharmed in holes in the ground. But their sides have remained whitish-yellow from the daily morning ablution. ---

The Girls Who Visit the Kraal of the Python

The girls (/gūsetî) went for a visit (sari, narr. pass.) and Gaoninghamabes (see the bottom of page 452 and page 454, number 24) ran after (tao, vb.) her (a) sister (!gāsa), but the girls (expressed by the personal suff. ti) chase her (ti, suff.) back (!hai daba). Then she sat down (ǂāū), and when (o) the others go on (hē) she hastens (!kxoē) after them (!goe) and catches up with them ("comes there"), but they chase her back again (//kxaba). And while (hĭ̄a, with the personal suff. of the subj. in the apodosis) she is carrying on (hĭ̄) like this (//ui̯ demon., ti "so," -s personal suff. of the subj. in the protasis), they wandered away (hē) from (ǂa) the kraal (//gāsa). Then they relented (/ū) and the little one comes along.

Then they come [to the kraal of the snake] and milked (/ao, narr. pass.) milk (daisa, neut. pl.) for themselves (-ba, objectifying verbal particle). But Gaoninghamabes' cow (gomasa) was tied (!hau̯, "the rear legs are tied together with a thong") for her (-ba, see above) in front of (arra ai) the hole ("ǂāb) [in which] the python (gai "big") snake (/aob) sat (ǂnāe), and the hole was covered (ǂnūi "to set," ai "on") with (/kxa) cow manure (/horoe). Then she was told (gai) to milk (daru) the milk into her mouth, and she grasped (*!kxō) the udder (sama) of the cow (di, gen. particle)--then the cow manure moved (gan). Then

539

the squeezed (//hgā) the udder of the cow and the cow made a leap (ui, vi.). Then she says: "Grandmother" (ti //nau), the cow is not used to me (ti

"The respectful form of address for the wife and accomplice of the python; the snake is thought of as a male being.

"not to know") and went to the hut. Then fat (//nuiti) was given (mā) to them, and they rubbed themselves (ui-hoxa). But Gaminghamabes [534]

539

"The Hottentots, when they wish to sleep especially well, rub themselves with grease in the evening. The massage accompanying this has indeed a soporific effect. The little girl wishes to remain awake and therefore refuses the service.

does not (tama) want (ǂgao. hā expresses here the persistence of the little girl) to rub herself. Then it got dark (!kxĀā, vb.). Now she took out (ā ǂhi) a little (-ro, dimin.) cutting iron (ǂnamib, "a sharpened piece of tin") and sharpened (nau /am) pieces of wood (haiǃa euphonious for -ti). Then the woman asked (ne): "Why (taeē abbreviated from tare) are you (-a) sharpening pieces of wood?" But the girl says: "Tomorrow (//ari) I (-ta, suff.) want (uī) to break off (nu) gums onions" (ǂgūnuna, neuter

"An edible species of Babiana (Iridaceae).

plural) with (ā) hard (garo) stalks (haiti)."

And when they slept (//om), she went to the hut of the grasshopper (ǂnāǃaus) and asked at (ai, with the personal suff. of the subj.) what (mā) time (//aēiǃ the [python] would come out (!kxaiē, particle of indirect discourse). Then the grasshopper said: "At midnight [Fig. --Idothoea sudereuni Stal. ♀ (Oedipodide) from Kubub. Natural size.] (nuǃūrī gaiǃ) probably (ge, potential), if (o) a cool (gara) breeze (ǂnab "wind," -ro dimin.) is blowing (!goni), he comes." Thereupon Gaminghamabes went to lie down, lit (kxau) a fire (/aēas) in order to heat up (//kxūa//kxūa) the earth all around, and a broom (//kxoros) and the pieces of wood and a hard (garoxa) bodkin (ǂgoas) -- all of this (uī "and," -se neut. pl.)

she makes ready (ǂ "to take") and lies down [just inside] the entrance (ǃnaa "mouth") to the hut.

And the cool breeze was blowing, and she got up (ŋa-ǂaĩ and mã) and sat down (ǂam). Then the snake (expressed by the personal suff. -b, acc. bi, which is attached to ǂaĩ just as succinctly as the girl, as the subj. or, respectively, obj. is designated by the following -s and si) came, and Gaunǂhamabes stabbed (ǃkũi) it and the snake struck at Gaunǂhamabes, but she warded (//kxae) him off with the knifebedikin and stabbed him and covered (ǂaeb) him with hot earth (ǂhgaurib) and killed (ǃgaes) him. Then she laid the animal (bi, see above) [539] on the place (ǃkxaib) where (the entire relative sentence here, just as usual, precedes the related substantive without a relative pronoun) it sits down after (si, particle of the past participle after tsa "to cease") it has finished killing people. Then the wife (//gâi "to awaken," doubled: "to wail") the girls (kxoêtn "people," fem. pl.), and they went away, and while (hã, with the personal suff. of the subj. in the epodosis) they were going away the morning (//gaeas) came. (//gos).

But the others (the people in the kraal of the snake, expressed by the suff. of the 3rd pers. neut. pl. -se) were milking the cows and the sun (tsaeas) went up high (double vb.: //hai and /gâi). Then [the wife of the slain snake] said to the mad snake (mangyoneeb, see page 454, number 30): "Go wake up your (sa, stem of the personal pron. of the 2nd pers. sing. fem., used as a poss. pron. with the omission of the gen. particle di) grandfather (//naeib). The girl who has eyes everywhere (literally: "turns" doba "and looks" gâi) was there, and for that reason (tsuigye) [I am worried]," she said. Then the other one went to wake and said": "My grandfather

> "The snake called mangyoneeb is portrayed as a comical figure: its stupidity is revealed by the fact that it regards the distorted eyes of the slain python as an expression of bad humor. In her the Hottentot also ridicules the inferior grief of a parasite who mourns for his benefactor only because his own good times are now at an end.

looks (//ui) at me (te) askance!" Then the wife herself (aitsoma) came up and saw that the snake [lay] dead (//ã) and said: "Your grandfather has

been killed by (ǂa) the girls who slept here (nâhe) yesterday evening (//an !oē)." Whereupon the sand snake: "My grandfather, who always gives me (indicated by the objectifying particle -ba, which here is extended into a bowl) only (/guise "single," referring to ǂhoaǂe "beans") beans with much fat (gaub "fat," -ǁa, expressing the quantity, /hoaǂb "body")!" So it howled (ǂ).

But when the [grasshopper] heard (//nâũ, with the personal suff. of the subj.) that, [it said]: "If it were only true (ama), that he lies on the ground! (Literally: "that her back" !gõb, "is deep" !gaǃna). If it were only true, that he is lying on the ground!" Thus she speaks in rhythm, just as the butter calabash rolls (literally: "thus she churns," //nuise). Then the snake's wife asked (ti): "Grasshopper, what (ǃnâti : tarets) are you saying there?" (ti, with the personal suff. of the addressed 2nd pers. fem.). But she [answered]: "For a worthy (/gari) man standing there (mã) alone (/guise, adv.) [606] a head of cattle (literally: "a thing," masc.) is indeed (gum---a) slaughtered (ǂâi/hoaǂ) as a death sacrifice, I said."

"The ambiguity of these words -- grief for the deceased or joyful anticipation of the funeral feast -- is an intentional insult.

But when the girls got home (//aru, vb.), and at the same time the reed dance (ǂâi) was being blown (ǂaã), they hung (ǂgã and maĩ "to set") up the buchu sacks (ǃgaute, fem. pl., see the bottom of page 340) and went (ǃgũng) to the reed dance. The Girls Who Went to the Honey-Eater, to the Dwarf and to the Anagyregaieb Beetle to Dance the Reed Dance with Them

The girls (/gūsi), when (ǂē) the men (kxuǂgu "people," masc. pl.) took (ǂē) the reed pipes (ǂēse, fem. pl.) and [807] went away (!gūng, ŋ is a particle of the present tense here), had gone also in order (nī, fut. particle, ge, potential particle) to play with them (ǂa-ns, nasr. pass.). Then the others blew (ǂxai) [on the reeds]. But the dung beetle blew: "Today (nī nī) they will spatter themselves (-sen, refl. particle) with their blood (/au)."

> ' sani, verb, means: a) the rapid headshaking of cattle and horses; b) the similar movement of the hand when one is sprinkling water. Hence: "to spatter."

But Gaxinghamabes understood it well (//nau "to hear," !ā "to spread, to explain") and took the [other] girls [with her] and hurried away (hē, vb.). Then they went (ǂē) into (!na) an aardvark (/kxuhe) cave (ǂhi), they went in (ǂgē, verb) and closed (ǂgao "to cover," an "mouth") the opening with (/haxa) a spider web (/nūi !kxami). But when the honey-eater looks [in] (gē, ta euphonious for ra), they open (//kxaba an). Then the honey-eater cries: "There (//nā) they sit (ǂnā). There they sit, the children (ǂasi) of the great (gai, with the suff. of the relative substantive because it follows the noun) dirt-scum crust (!haiba) genitals (!garagu)."

[Fig.--An ǂanagyregaieb beetle (see page 456, number 39).

Then the others ("nanga) look in, but the girls close [the cave again immediately] with the spider web. Then the others cry: "Oh (kxa), you (sasa) are lying (ǂhumi) indeed (gum---o)." -- "By God! ("for the sake of" ao, "my" ti, "lord" !kxūb) the girls are sitting there," the honey-eater answers. But the others said: "You stay (hā) here, and (ē, with the personal suff. of the subj.) we (tigye, pron. of the 1st pers. masc. pl. in the exclusive form) will go!" (With imperative force). And they went [to the water].

Then the tortoise called (/gaā) [all] tortoises together (/hao "to assemble") and told (gā) them to line up (tsā) one behind the other (sangu). Then the two of them joined and hurried off together (//are, vb.).

But as soon as (ǂtsami ai) they were just beginning (tsoense, nā fut. particle), the tortoise (-b, personal suff. after tā) let the ostrich (hā, suff., "him") run alone (//nā "to let, "xa "to leave"). Then the ostrich called: "Tortoise!" And the one [standing nearest to him] answered: "Here!" (hā, a general careless cry of answer). Then the ostrich thought (sha, with the particle of the pret. participle tā, ū "so") that it was already (ǂnuǂaba) nearby (/gâse) and hurried on. And when (u) he was exhausted ("came to the point" ai, "that he was finished" tsa, vb.) again (//kxǂaba), he called: "Tortoise!" And the one [standing nearest to him] answered: "Here!"

Then he stopped (/ū, pret. participle) and came (/kxā) to (doba) the tortoise [that stood closest to him]. And the two of them went home (//aru, vb.). But (ǂâbe, with the personal suff. of the subject) he thought that it was truly (/guib, "single") the other (ǂnau) tortoise.

[XIII] [Text omitted]

3.539 Translation of LXIII

The Tortoise and the Eland Antelopes

And it happened (ŋ̀ŋ̀ne, "was made") [like this]: The tortoise (masc.) had gone (//gxoma, masc. pass.) to the water and while (ŋ̀ŋ̀e) he sits there (ŋ̀ŋ̀ne) and weeps, (ǂxaŋ̀) eland antelopes (fem.) come (/hŋ̀, masc. pass.) and say: "Tortoise, pour (!kXaka, vb.) some for me (te, suff.)." Nowever (ǂaka, with personal suff.) he kept quiet (!hae "to speak," tama "not," hã expresses duration).

Then they said: "In just a moment (/hae) I (te, suff.) will (ŋ̀ã swallow you (te, suff.)."

But she replied: "Just (ŋ̀) try (tsã) to do (dã) it, let (ã, "and," with imperative force) me see (tsã)."

Then they said: "You (ge, suff. of the 2nd pers. masc. pl.) look (!) like (khama) little things (-ne, dimin.) that ought (ŋ̀ã, fut.) to be swallowed (-he, pass. ending), and yet you are defiant (//ã)?"

[XIII] Whereupon the tortoise: "Who (tsĩ) is mopping (ǂxa) you (se, suff. of the 2nd pers. pl. fem.) then (kXa)? Whoever wants (ǂgae) to try (ge, verbal particle of the potential, with the personal suff. of the fem. sing.) to swallow [me], can swallow any time (hoan), after all (ŋ̀)." Thus the tortoise spoke.

Then one (/gxãe) [of the elands] swallowed him (hi, masc. suff.) down. But the [tortoise] spread his legs (ŋ̀ã//kXaa) and: "Grr -- handy legs! (//gxãe, neut. sing.) -- choked!" -- Tortoise! -- choked!" the

> ʔ!k aã, imitating the choked condition of animal suffocating from the tortoise, the narrator intentionally falsely pronounces: //k aã.

eland said and died (//ã). Then the tortoise cut (ŋ̀ã) out (ŋ̀ã) the stomach fat (/hoaha) and hung it up (xaa, vb.) and went home (//aru, vb.). But the sisters (!gãaxo - -ti) avoid (!aaa, "to be clean." The objectifying particle -ha gives it the force: "to be clean with regard to someone," that is "to avoid someone who is unclean") him because of (ǂa) his (ãb) armpit

*531

sweat (/hoaib). Then he came (di) to the kraal (//gãũ) and they saw that (!kxaiß) he had (ǂ "to take, "ha "to remain") stomach fat and they said: "Today (ui tai) we (se, suff. of the 1st pers. pl. fem.) will fix up (di) your (ti, masc. suff.) armpits (gam, collective sing.) [with buchu powder] ."

"The sisters, up until now, have neglected their brother, the tortoise; they have neglected to prepare powder for him (woman's work) and now, at the sight of the rich booty, they try to endear themselves.

But he said: "It has been a long time (huga, adv.) since you (se, suff. of the 2nd pers. fem. pl.) have fixed up my armpits."

And they replied: "Today we will powder your armpits." Then he gave (mĩ) them fat (gauna, neut. pl.) and they went (!gũũ) off together (expressed by the suff. of the 3rd pers. neut. pl.) to cut up the eland.

[Text omitted]

[531] Translation of LXIV

The Giraffe Who Marries a Fly

A giraffe (!naiǂa) married (!gaume, narr. pass.) a male fly (/gĩnaiba). and the two of them (-ra, suff. of the dual fem.) moved (doß) to (//ga) the kraal (//gaũ) of the man (kxoëb) and came (di) there. And when (a) she longed (//kxaore) for her (a, stem of the poss. pron., -sa personal suff. of the possessor, -s personal suff. of the subj.) relatives (kxoǂa "people," neut. pl.), she told (mĩ, with objectifying particle ba) her husband and went (!gũũ) to visit them with (/kxa) her child (/gõas "daughter"). And the two of them set out on their way and came to (doba) the kraal of the jackal (/gĩriß). And she gave (mĩ) the child some fat (gauna) from (xu) her caul"

"This self-sacrificing motherly love of the giraffe reminds one of the classical legend of the pelican that nursed its young with its own blood.

(/haub is the very fatty omentum majus). Then the jackal saw (mĩ) [how fat she was], and when the giraffe went out (ǂae, with personal suff.) he stuck (maĩ) thorns (//kʼĩ̃ga) into (!na) the bed (kʼĩ̃anib). Then she came in (ǂgĩ̃ʼĩ̃a) and lay down (ǂaĩ̃). Then the thorns stuck (!kʼĩ̃i) her (ĩ, suff.) and she said: "The thorns that stuck me, the child of man (kʼĩ̃ab, with the suff. of the 1st pers. sing.), do not (!nona) taste (tsĩ̃) like (kʼĩ̃oma) the thorns (neut. pl.) of my fathers (ǂhaib, -ǂxa See page 428, footnote)." So she said and died.

Then the jackal (expressed by the suff. -ĩ̃) cut (ǂã) her up. But the little (-ro dimin.) fly flew (ǂĩ, borrowed from Cape Dutch) and seated herself on a giraffe tree (//gaxa). And the other, after (tsĩ̃, particle of the pret. participle, after tsa "to cease") he had finished slaughtering, [532] laid (//gui) the pieces of meat (//ganga, masc. pl., euphonious form) on the giraffe tree (a customary way of protecting meat from scavengers, see page 424). Then the little fly took (ũ, pret. participle) the smallest rib (ǂ gaoi gao/xraxa) and flew and came with it (ũ) to the father (//gũĩ). But he put (ǂgĩ̃) the rib in a calabash (ǂhas) [with milk] and [the little girl] told (!hoe, with objectifying verbal particle) him (hĩ, suff.). Then he was afraid (!aq) of the jackal and did not go there. But the giraffe became alive (ũirasha) again (//kʼĩ̃aba)."

"The miraculous power of reviviscence of milk also brings about a happy end in Folk-tale VIII, page 409.

The Jackal Who Roasts the Iguana

The jackal (/gĩrib) had hunted (!auhe, narr. pass.) [and] caught (hõ, again pass.) the iguana (!nonaba) and (tsĩ̃) came (/kxʼĩ̃, pass.) home (//aru "to come home") at the time when (hĩ̃a) the people (kxoʼĩ̃n) were blowing (ǂaĩ̃, -ta = ra, altered euphonically after the n of the preceding word) the reed dance (ǂhaa). And he put (//gui, narr. pass.) [it] in (!na)

*539

the fire (/aēs) under the ashes ("ga'n "to cover with ashes") and went (!gũng, narr. pass.) over (//ga) to the reed dance.

But just as (hîa) he comes ("to come" sĩ, "to stand" mã) [and] blows, the iguana (!gon) who (-ba after go, particle of the pret.) had been put under the ashes came after him and said: "Yes (gumo), [533] because (ao) the other one (/nĩ, the jackal is meant) has left* his treasure, then (-tsĩ,

? !gũng "to go," ǂnũi "to put down," to put down and go = to leave, also to put away. I have not been able to find out the meaning of ǂgũsa; nor can I vouch for the correctness of the clicking sound since I neglected to check it. /gũsa !gũng ǂnũi seems to be a set idiom with the meaning: to leave behind something valuable that one is unwilling to give someone else. Thus the jackal left his roast, the iguana, in the ashes. In the same sense a newly-wed guide who was in a hurry to get home said to me: " ǂgũsa !gũng ǂnũi tsĩta go !gũng ǁui aota gye !haise ra oa ǂgao." That is: "Because (ǁuf) I (-ta) went (!gũng go, particle of the pret.), having (tsĩ, pret. participle) left something valuable behind, so (ao) I wish (ǂgao) to turn back (oa) rapidly (!haise)."

pret. participle) he (//(e)ĩ, the leguan himself is meant) takes (hora, "to take the cooked food out of the pot or the fire") himself (-sen, refl. ending of the vb.) out of the fire."

And the jackal heard (//naũ) it and comes up (hã), seizes (!kǂõ) him (bi) and takes him along (double vb.: "to go -- to seize," !gung-ũ) and places him again (//kǂaba) in the fire under the ashes. Then he runs again to the reed dance and goes again to blow the reeds.

Then the iguana comes again and says: "Yes, because the other one has put away his treasure secretly, it takes itself out of the fire."

--The legend is an attempt to illustrate the tenacity of the iguana to give an explanation for its crustlike skin (which looks as though it were baked on). --

The Baboon and the Honey Badger

The baboon (-i, see page 476, footnote; χa see footnote page 487) once had taken out (sam, narr. pass.) honey (danisa), and the honey badger had collected (ũ "to take") haira resin (neut. pl.), and the two of them met (!oa, -gu reciprocal particle). Then the baboon said: "You (-tse) let (ha) me (-ta) have a taste (tsãtsã)," and the honey badger said: "First (aibe) let me taste yours."* Then the baboon gave (mã) him (bi, suff.)

* ʔ sa, root of the personal pron. of the 2nd pers., used in a poss. sense by supplying a gen. particle and substantivized by attaching the suff. of the 3rd pers. neut. sing. Grammatically complete, but not existing in practice, the concept "yours" would be: sa di χũũ

a very (ǂkχarí) little (-ro, dimin.) honey, and he took a taste. Then the baboon said: "I would like (-re, optative particle) to taste yours," and the honey badger gave him some. Then they hit (ǂnau) each other with (/kχa) the sacks (//hõti) until (tumi, "so") they spit* (/kχũi; !nãã "to be

*Because that which they had just tasted seemed so good to them that they no longer wanted to keep their old food.

bright, to lie open"). And the baboon spit out (ǂui) the honey and the honey badger the haira resin, and the baboon took the haira sack and the honey badger the honey sack, and then the two of them went.

Since then (tsĕs "by day") the honey badger eats (ǂũ, substantivized by the fem. personal suff. -sa, but felt nevertheless still to be a pred., as the verbal particles ra and, euphonically, ba show) honey and the baboon haira resin.

[535] Translation of LXVII

The Two Zebra Mares and the Baboon

With the zebra mares (-ra, personal suff. of the fem. dual) and the baboon it happened (hĩhe, "was made") like this: The zebra mares come to the water (//gama, verb. narr. pass.). But the baboon makes iron (//urite, fem. pl. = -ti) hot (/gam/gam, verb. narr. pass.) and comes forth (/kχĩ, narr. pass.) when (o) he sees (mũ) the zebras approaching (!goaχa, narr. pass.) and cries: "After all (χabe) the water expanse with the grassy edge (/gariχa "rich in plants," amî "mouth, opening") is mine (ti) indeed (gum---o)." Then the two of them turn back (oa) and come [again] on the next (ǂnau) day (tsẽ). But the baboon comes (sĩ) along with (/kχa) the irons when he sees them approaching (two personal suffixes are attached to the vb.: -ra shows, so to speak, the subj. of the vb. and -b the subj. of the sentence) and cries: "Hey, the expanse of water with the grassy edge belongs to me." Then the two of them turned back.

And the young (ǂkχamsa) [zebra] foaled (õa "to bear") a colt (masc.), and they all (expressed by the suff. of the neut. pl. -n) came again (//kχaba) early (//goaga) the next morning. But the other cried: "Hey, the expanse of water with the grassy edge belongs to me." Then they went back. And they waited (hã̃) until (gôse) the colt should become (nĩ, fut. particle) big (gais, the s is probably an abbreviated form of the adj. ending sa), and when (o, with the personal suff. of the subj. in the apodosis [on) the colt had become big they went to the water. Then the baboon came down (//gõaχa) with the iron, and when they appeared he cried: "Hey, the expanse of water with the grassy edge belongs to me."

[536] But they remained standing (mã̃) and the little (-ro, dimin.) zebra stallion (-ba, masc.) trotted (!naẽ) down (*//gonaχa is probably the older form of //gõaχa, with transformation of the n into a nasal sound), and the two mares followed (tao) the little stallion: he came (ǂã̃) up and drank (ã̃). Then the baboon burned (dao) him (bi, suff.) here (nẽba).*

*The narrator points to the processus ulnaris humeri of his arm.

But he seized (ǃkx̣õ) the baboon and placed (ǂnũi) him firmly (//gaĩ "to press") on (ai) the irons. Since that day the rear end (kx̣aoais) of the baboon is roasted (//an "to be done," -sa adj. ending, -sa fem. personal suff. substantivizing the word; cf. page 539) and (tsĩ has here in the genitive case the suff. of the substantive governed by the subj., not the personal suff. of the subj.) the elbows (ǃumiti) of the zebra are scorched (daũ "to burn").

[Papio porcarius (Boddaert) from the rear, demonstrating the posterior welts.]

---In this way the Hottentots' phantasy explains the origin of the posterior welts (see the illustration) and of the so-called "chestnuts," those bare callosities to be found on the inner surface of the carpus of the zebra.--

[Text omitted]

[537] Translation of LXVIII

The Jackal Who Keeps Leopards and Lions as Cattle

The jackal had made (dĩ, narr. pass.) cattle (/goa, without suff.) of the leopards and lions, all of them (tsĩ "and," -na personal suff. of the neut. pl.), and his (ã, stem of the poss. pron., -ba personal suff. of the poss.) child ("/gõaseb = /gõab) guards (ǃũi) the cattle (neut. pl.). Then, when (c) it was milking (daru, with personal suff., ta euphonious for ra) [milk from one of the animals] into its mouth, it was clawed (ǂkora) half dead (gã "to be lost," the reduplication gives the vb. causative force) by (/kx̣a) its claws (//gorogu), and when it came (/kx̣ĩ, with personal suff., ta = ra) [home] the jackal asks (tẽ):* "What (taref) have you gotten (ǂgã) into (ǃna,

*Although he knows well that he is guilty. He himself is very careful not to come into contact with his dangerous cattle.

with the personal suff. of the 2nd pers. sing. masc. -ts "you")?" [538] So (tsami) he asks, and the child answers: "The goats (birigu) have scratched me (ts, suff.)." But only (/guiba) the child continues (ra) to milk (/ao) the goats (fem. pl.).

[536]

Papio procarius (Boddaert) from the rear, demonstrating the posterior welts.

X 539

But one (/gui) day (tsĕ), when it (-b in /aob) had gone (!gũng) to milk, it was seized (ǃkxõ) by (ǂa) the lion. Then the father (//guba) called (ǂgai) it, and it answered (oĕ): "Father" (dada). But the wife (tarasa) [of the jackal] was worried (ǃhuma !na) and said: "Usgyeb's (folk tale name of the jackal child) father (ĩb) should (nĩ) kindly (go) see (gõ) about Usgyeb." Then the jackal went (ǂoaxa) out (ǂu) of the hut (omsa), but he went along (i, "to go past") behind (!gãba) the kraal (!haras) and called [for the child only]. And this (nĕ) time (!nãsa) the child answered only very weakly (ǂkxari, "small," -ro dim. -se adv. ending). Then the wife went out and called the husband (aoba) while (hĩa) he is standing (mã) behind (ai "in" !gãb "back") the kraal. And he came (/kxĩ) and the two of them (-ra, suff. of the masc.-fem. dual) went in. Then the lion leaps (ǂham) at them (-ra), but the two of them leaped (uri) on (ai) the wall of the kraal, and the child slipped out of the kraal in back (!noros "the back of the head").

Meanwhile (hĩa, with the personal suff. of the subj.) Hottentots (naman) came and asked (ǂgan) for food (ǂuĕ, neut. sing.). Then the jackal said: "Usgyeb, come out and (ĕ, with imperative force and with the personal suff. of the 2nd pers. sing. masc.) show (//gau) this man a wether (gũĕ, neut. sing.) and may he (-b) take (ũ) [it]." And the child told him (bi, suff.) [where to look]; then it became quiet" (!nõ). And again (//kxaba) two (/gam) men

"The man is ripped to pieces by the wild animals
in the kraal.

(kxoĕkxa, "people," masc. dual) came and asked: "Where (maba, with the personal suff. of the subj.) is (hã) the man whom we sent (sĩ) here (nĕba)?" So they asked, but the jackal said: "Some time ago (/nai), indeed (gum---o), I told (gai) the man there (//nãba) to catch a wether." Then the two went into the kraal.

But the jackal went out [of the hut] and stood (sĩ "went," mã "to stand") in the dark (!kxaĕb). And when the two men had gone in, the lions and leopards, all of them, sprang out on all sides (/kxãgu, ĩ "to be like," kxumi "so"). [539] Then the jackal said: "Far across (ǂgoro am) the lands (!hũgu)!" And they hastened (!kxoĕ) away (bĕ, vb.).

Then the jackal opened (//kxoba am) the kraal in order (ga) to slaughter (ǂã) the little (-ro dimin.) lions and the little leopards, all of them (nĩ with the personal suff. of the obj., 3rd pers. neut. pl. -na, and with the personal suff.

x539

of the subj. -b) completely (toa "to end"), and he caught a little one. But they scratched (/kχau) his body (/kχãb). Then he stopped (/ũ) and fled (!kχoẽ-nĩ) to (ai, postpositive, !aba "to climb up") a mountain (!homs). And all (hã, see footnote, page 424) the leopards and all the lions came to look for (oã) their young, and each one (literally: "which?" mã: "all" hoaẽ, neuter singular) took (ũ) his (//(e)ĩr) child (õa) and went.

So they did (hĩ). Since that day the leopard and the lion are at home (hãsa, substantivized hã "to remain") in every land.

3) Riddles, /urogu

524

Along with folk tales riddles form a good part of the evening entertainment of the Hottentots; they are posed by the old and young of both sexes.

The simplest riddles refer to the immediate surroundings of the audience (I-V): any object that is visible to all -- an article of clothing, a tree, a rock, an implement, etc. -- is defined according to shape or color or according to its relation to man and given as a riddle. (VI-XIII)

Other riddles have as their object not immediate sensory impressions but sense recollections, and hence they make more demands on the imagination than the above-mentioned ones.

Riddles like those given in Numbers XIV-XXV appeal to the capacity of combining more or less abstract concepts.

From a linguistic point of view the personal suffices are noteworthy: by means of these the entire interrogative sentence of the riddle is substantivized. Generally the suffixes of the 3rd pers. neut. sing. (-ẽ or -ĩ) or pl. (-na or -n) are used for this purpose. They are added to one or more words which, as a result of their meaning or their position in the sentence, [540] are stressed in some way. This characteristic might be correctly but clumsily expressed in translation by introducing every question with the words: "What is it that . . . etc.?"

In other cases the interrogative sentence of the riddle receives the personal suffix that, in gender and number, fits the substantive expected in the answer.

If the answer is expressed by a verb, then it is substantivized by means of the suffix of the 3rd pers. sing. fem. (-s or -sa).

524

I have heard the Hottentots pose the following riddles:

[Translator's note: In the case of each riddle the Hottentot text will be tacitly omitted without indication.]

I

What (tarεε), so it is said (goma), is this: On the edge (am !gã) of a red (/aba) valley furrow (!garib is the slope of the dry wadi bottom toward the trench in which the water runs) stand (mã) white (!uri) things? (-na, personal suff. of the neut. pl.). -- The teeth.

II

On (ai, with the personal suff. of the subj) a black (≠nũ) mountain (!homs) stand (mã) black sheep (gũte = gũti, fem. pl.)? -- Head lice.

III

On (ai, with the personal suff. of the subj.) something round (!gubu) stands (mã) grass (/gãna, neut. pl.), and people (kχoεna) pick (tsuru) the grass? -- The head [that is being clipped].

IV

What is (-he, pass. ending) counted (!gõa) and not (toma) counted to a finish (toa "to finish")? -- Grains of sand (!hũb, "soil").

[541]

V

What do you see (mũ), although (χabe) it may (ga, potential) be dark (!kχaε), it may be far (!nũ) and it may be near (/gũ). (tsĩna, neut. pl. summarizing all the cases once again). -- Fire.

524

VI

What is black (ǂnũ) checked (/hõ)? -- The zebra (_goreb) and the porcupine (!noab), one (/guib) of (di) the two (tsĩkχa).

VII

What is marked (//gani) yellow (!huni) brown? -- The kudu.

VIII

What is a little (-ro, dimin.) pale (/hai), and when (o) you (-ts, suff.) see (mũ, ga particle of the potential) it from (χu) afar (!nũse, adv., -ba, demon. particle of place) red? (/aba) -- The gemsbok.

IX

What is spotted?-- the skunk.

X

What is red (/aba) with a white (!uri) belly? (!nãba, °-ĩ adj. ending) -- The steinbok.

XI

[822] What is blue (ǂhoa) with a crooked (!hoa) belly? (!nãba, °-ĩ adj. ending) -- The coffee bean. [Older Hottentots have still not adopted the 'f', sound but the younger ones quite generally say koffi. The color designation is peculiar.]

524

XII

What has (ũ "to take," hã̃ "to remain") a big (gaí) light (!nãba)? -- The mirror, because it is blinding if one plays with it in the sun. Mirror = the thing (χũs, fem.) in which one (-n, personal suff. of the neut. pl.) views (gõ) one's face.

XIII

What is this: a round (!gubu) thing (χũ̃ũ̃, neut. sing.), and next to it (//nãba) sits (ǂnõa) a round thing, and in (!na) the thing there (//nã) sits a box (dorosa). Then again (//kχaba) comes something black (ǂnũ), then comes something that looks (ĩ) like (kχoma) grass (/gãĩ, neut. sing.), then comes a round thing, and when (o) the thing falls (//nãĩ, ga, particle of the potential) on (aí) a person (kχoẽĩ), this person will not (tite, particle of the fut. negative) become alive (ǂgau) again? -- The bullet (/urib is metal in general) [in the cartridge].

The parts enumerated in the question are, in the same sequence as above, and with the customary designation in parentheses, the following: a) the metal back surface of the cartridge (kχaoaib "the seat"), mentioned twice in order to complicate the solution; b) the priming (ǂais "metal bead"); c) the powder (χurub "coal"); d) the wad (!abis is the nest of a species of Aegithalus, built of a fleecy plant substance); e) the bullet.

[543] XIV

What do you (-ts, suffix) make full (//ã//ã, vb.) and then let (gaí) go hungry (!ã̃) again (//kχaba)? -- The gun (!abu "to pop, to puff"), [which is loaded and then, after the shot, put aside empty.]

XV

What is this: when (o) you (-ts, suff.) see (mũ̃, ga particle of the potential) it, it seems (ĩ, vb., kχoma "like") to be very (tsĩ̃) easy (//ause "for nothing," that is "without effort") to catch (!kχõ), and yet (χabe) you will never (tite, particle of the fut. negative, tã̃ = toma "not," tsĩ̃ "day") catch it? -- The shadow.

524

XVI

Who does not (toma) help (kχam) him who (-ba, personal suff.) walks along (garu) without her (/guri "alone")? -- The sun: [it points out snakes and poisonous creatures on the traveler's way, but at night he must rely upon himself.

XVII

What is this: when (tsĩ, particle of the pret. participle with the personal suff. -ts "you," masc.) you have gone away (!gũng) without (ose, adv.) it (//(e)ĩr), your way is not (toma) pleasant (!gaĩse)? -- Fire [making equipment] [the tinder box].

XVIII

What is made (dĩ, pass.) by (χa) man (kχoĕr, neut. sing.) although (χabe) it also (//kχadi) comes (/kχĩ) by itself (aitsoma)? [544] -- Water. [Digging wells almost always is called "making water" even by the whites in South Africa. That which "comes by itself," is rain.]

XIX

What (tareĕ) makes a long (!nũ "far") way (daoba) short? (/gũ "to be close"; doubled: "to make near") -- the horse, [because it is fast].

XX

What makes a short way long? The trek oxen, the riding oxen, [because they are slow].

524

XXI

What does not (toma, with personal suff.) catch up (sao "to follow," //are "to come together") with itself (-gu) although (χabe) one hastens along (!kχoē) behind (!gon) the other (-gu, reciprocal particle, with the suff. of the 3rd pers. neut. pl. -n in !gongun)? -- Wagon wheels (/nūb, masc.: "leg," -s, fem.: "wheel").

XXII

What is very small (ǂkχari, -ro dimin.) and yet (°!anaga) brings (hō "to come," ū "with") only (/gui "single," neut. pl.) things (χūn) that are bigger (!nā "to tower over, to excel")? -- Money.

XXIII

What is troublesome (tsū) to (-sa, gerundive ending) do (dī), but (°!anaga) pleasant (!gaī) to sit (ǂnū) in front of (°!ã, postpositive)? -- Work (sīsen, vb.) and its pay (marīē "money," hō "to receive").

[Plate XVII -- An old Bondelzwart Hottentot man; an old Topnaar Hottentot woman.]

[545] XXIV

What is this: When (o, with the personal suffix of the subj. in the apodosis, -tsa "you") it has gone (bē) away, you have heart pangs (tsū, vb., ǂgaoba "heart"); then you forget (/uru) it, but (χabe, with the personal suff. of the subj.) when you think of it (ǂnī), you get heart pangs? -- A deceased person (//ō "to die," χu "to leave," he pass. ending, -s the personal suff. which substantivizes the infinitive).

XXV

What is this: when (o) you (-tsa, personal suff.) see (mũ) it from (ǂu) afar (ǃnũ, -se adverbial ending, -bē demon. particle); it is blue (ǂhoa), and white (ǃuri) things (ǂũn, neut. pl.) are (hã̄) on it (ai, with pass. ending and personal suff.), but when you (-ts) have come (hã̄) up close (/gũ), it is transparent (ǃanu "clean, clear")? -- The sea.

E) Concluding Remarks

177

The Hottentots' Relation to Invading Culture

How does it happen that a people like the Hottentots, which has given clear evidence of an intelligence that has long been recognized and that is outstanding among the aborigines of South Africa, melts away like wax on a hot plate before the invasion of culture? The process of this dissolution up to the present date has been recorded in descriptions of peace and war (75, 73, 82)*. Here we are interested solely in the principle of the matter.

*75. C.V. François, Deutsch-Südwestafrika. Geschichte der Kolonisation bis zum Ausbruch des Krieges mit Witbooi. Berlin, 1899.

73. H.V. François, Nama und Damara, Deutsch-Südwestafrika. Magdeburg (ohne Jahrangabe).

82. K. Schwabe, Mit Schwert und Pflug in Deutsch-Südwestafrika. Berlin, 1899.

The first contact of a Hottentot tribe with culture took place in a generally friendly manner; all travelers of the past praise the hospitality of the people and the protection which the chieftains gave them against the attacks of individuals. The Hottentot expected and, at first, also found his advantage: the trader brought him clothes and blankets, so that he himself now no longer needed to tan them laboriously from hides and to sew them with sinew thread; the trader brought him household implements which spared him the necessity of making pottery [546] and carving wood. In

addition there were luxuries: in part ones that had been highly valued for years, like alcohol, now in a new concentrated form; and in part new ones such as tobacco and coffee, which became so popular that they now can scarcely be dispensed with. But the factor that above all others caused the Hottentot to react peacefully to invading culture was the realization that with its help he could multiply his own power in a hitherto unknown fashion: exchanging the bow for the rifle suddenly made him master of all living things and equal in battle to his enemies.

The mission, which sold weapons on a large scale, as well as the German government, which permitted traders to deal in weapons after the protectorate in the north had been seized, gave the Hottentots still further guarantees which likewise brought him willingly closer to culture: the Hottentot soon realized that in the missionary he had a friend upon whom he could depend absolutely in all cases. The government, for its part, made treaties of protection with the chieftains, who were all the more agreeable to these since they did not curtail their own power, at least temporarily.

The Hottentot also expected advantages from the white settler--from the land sales and from the taxes that he levied upon the settler and from the annexations he occasionally undertook of land which the white man had brought under cultivation by hard toil.

In Great Namaland certain regions still lay fallow in which the white man, without taking anything from the native, could settle; but in the course of time it inevitably reached a point when the Hottentot saw himself being hemmed in, whereas formerly he had had at his disposal meadow and water in proportion to his power. Through his chieftains he would probably have had the power to definite advantageously his own spheres of interest and those of the alien race, but he did not have the ability even before he began to feel himself being hemmed in.

The chieftains looked out only for their own interests and they proved themselves very clearly to be what they are: selfish tyrants, not representatives of tribal interests--unless the interests of the tribe coincided with their own. So it was not possible for the white government, which in the meantime had established itself and which was filled with the genuine desire to give everyone his just due, to do anything but limit the autocracy of the chieftains. That has been the main cause of all our Hottentot wars. Temporarily [547] the tyrannical desires of the apparently tame rulers, who decked themselves out with the names of the apostles, prophets and patriarchs, could be appeased with money and liberally dispensed alcohol

licenses; but those who were preferred in this way, despite all tokens of esteem that were occasionally rendered to them, felt themselves oppressed by the white men, yet at the same time they saw--and this was the ominous factor--that their power over their own people was not broken. That kept their ambition alive and nourished their longing for the full freedom they had enjoyed before. We can be indulgent in our judgment of the fact that this urge finally outweighed any consideration that we might be superior to them in battle--especially since our own predictions in this point were very shortsighted.

We must search elsewhere for the reasons why the mass of the people were ruined by culture rather than were won over to it. In this connection it is necessary to start with the basic revolution in living conditions that was connected, as far as the Hottentots were concerned, with the invasion of culture in South Africa. Let us disregard for the moment cattle breeding and consider the hunting grounds of the Hottentot homeland within their wide former boundaries: around the middle of the seventeenth century, and even only a hundred years ago in many cases, Western South Africa was one of the richest game lands of the earth. Today, south of the Orange River, no Hottentot can make a living any longer by hunting. When it occurred to the Cape Government to protect game, it was far too late to take into consideration the question of the welfare of the natives. The sportsman's concern that he would soon not be able to fish--the half economic and half Lucullian consideration that wild game is, after all, the best part of the South African fare--finally, the consciousness that it is a cultural people's duty to preserve for posterity certain animals such as, among the big game of South Africa, the elephant, the rhinoceros and the giraffe represent: these were the reasons for the measures protecting at least the remainder of the wild game.

One of the most fruitful hunting methods of the Hottentot was ambushing at the water hole. It is quite clear that this place was devaluated as far as hunting was concerned by the Boer who settled here, or the cattle herder who watered his white master's cattle here, or the waggoner who unyoked here. Where this is repeated in progressively more and more places it becomes just as apparent to the native as the increasing disappearance of game along the railroad lines and in the vicinity of the stations. One should at least be conscious of the fact that, for almost every step of progress (gratifying to us) in the colonization of the land, the native [548] is correspondingly harmed as far as his old way of life is concerned.

177

More ominous than the captains' ruining of the hunting grounds was the unsystematic auctioning of pasture lands to farm-land speculators, who would stoop to anything. The Hottentot even gave up his cattle in the most frivolous fashion for guns, alcohol, tobacco and other articles to which he had become accustomed.

Often with the laudable intention of preparing him for culture the Hottentot was instilled with certain needs in clothing and ways of living without seeing to it that he satisfies these needs in a way that does not ruin him economically. For the Hottentot by himself does not see--or if he sees it does not want to accept the rational conclusion--that there remain for him only two ways of living under white domination. Either: to keep up with the new competition in the exploitation of the natural resources of the land, that is to learn to manage rationally according to European concepts in order to keep himself economically independent. Or: to bow before the competition and to earn his bread in the service of the white man.

Only a small number of the Hottentots have taken the first way, and only a few of them have managed prosperously. A second part have taken the latter way and have hired themselves out as cattlekeepers, wagon drivers, servant boys or servant girls in the white houses and farms. Here at least he has no worries about food and, in general--even if his master occasionally treats him harshly--feels content when he finds a form of justice that does not degrade him because of the superiority of his master. In this point the Hottentot, despite his superficially often unlimited devotion, is painfully sensitive.

The girls and young women also enter into a relation of dependence to the white men at their own expense. The young Hottentot woman finds a carefree life in intimate intercourse with the white man. Her vanity is generally satisfied in every respect, her sensuality is an important factor, and she is often quite proud of bearing a white child.

For the average Hottentot, whose joys and worries change from day to day, who does not think about providing either for his children after his death or for his own old age, bondage in the service of the white man would be the easiest way of getting through life if, on the one hand, the results of sexual degeneration did not drag him down, [549] and if, on the other hand, he could be trained permanently to regular work; but up until now the latter has never been systematically undertaken either by clerical or mundane forces.

Thus a large number of the Hottentots, as in past centuries, even today feel far better when, in the hard battle for existence, they must win their livelihood from frugal nature, and is hindered in their movement by no limits other than those of nature herself--in this situation they feel much better than at the trough of the white man. A settled way of life does not appeal to them, whose nomadic impulses could probably be broken only by education over a period of generations. They do not wish, as is demanded in the service of the white man, to be bound to the day and the hour; they would preferably undergo the hardships of wanderings and sacrifices of months spent in the wilderness, than allow themselves to be yoked to regular work. The most willing followers of the discontented chieftains are made up of such people.

When then, at any occasion, the signal for a revolt is given, there awakens among hundreds of others the old desire for adventure, the hope for rich booty and victory celebrations, such as live in the memories of all from the endless battles of past decades. Then, too, a way is opened for each individual to take personal revenge for injuries suffered years ago; at times like this, finally, drowning out all detailed questions of right or wrong in present or past, there sounds the cry which I have heard so often and always with the same naivété and logical irrefutability: "The land was ours; we wish to be the masters in it again!" It is the old refrain, and the end of it in this case, too, is simply that one more human race disappears from the face of the earth.

dankbar gewidmet

Vorwort.

Als ich zu Anfang des Jahres 1903 von der Kolonialabteilung des Auswärtigen Amts den Auftrag erhielt, die wissenschaftlichen und wirtschaftlichen Grundlagen der Fischerei an der Westküste Südafrika's zu untersuchen, wandte ich mich an die Königlich-Preußische Akademie der Wissenschaften zu Berlin mit der Bitte, für eine Ausdehnung meiner Studien auf das Innere des Kontinents mir die Mittel zu gewähren. DEM KURATORIUM DER HUMBOLDT-STIFTUNG FÜR NATURFORSCHUNG UND REISEN, das diese Mittel bewilligte, übergebe ich heute mit ehrerbietigem Dank für das rückhaltlos mir erwiesene Vertrauen einen Bericht über die ersten Ergebnisse meiner Forschungen.

Der Gesichtspunkt, der mich auf meinen Wanderungen leitete, war, in der südlichsten Provinz des äthiopischen Faunengebiets der Erde die Verteilung der Tierwelt, innerhalb ihrer Grenzen und verglichen mit Nachbarfaunen, einem kausalen Verständnis näher zu bringen: sie zurückzuführen soweit als möglich auf die Wirkungen der Klimate und des Untergrundes nach Bodenart und Reliefbildung der Landschaft, sie zu begreifen im Zwang des Abhängigkeitsverhältnisses der einzelnen Glieder wie sie heute nebeneinander leben, endlich sie abzuleiten aus der Vorgeschichte, deren Daseinsbedingungen und -Kämpfe in ihren Wirkungen auf die Verteilung der überlebenden Arten versteckt, aber erschließbar bis in die Gegenwart reichen.

Die Aufgabe, die aus dieser Stellung des Ziels erwuchs, forderte zunächst, aus den weniger bekannten oder den undurchforschten Gebieten das nötige Tatsachenmaterial in systematischen Sammlungen und Beobachtungsreihen beizubringen. Die regenarmen Landschaften des westlichen und zentralen Südafrika wurden so mein Forschungsgebiet (siehe die Karte am Schluß). Je verwickelter sich hier im Laufe der Untersuchungen die Aufgabe erwies, die Daseinsbedingungen der Tier- und Pflanzenwelt in

[pv]

1: Schultze FX13 Hottentot

ihren bestimmenden Kräften und Wechselwirkungen zu ergründen, desto lohnender erschien gleichzeitig ihre Lösung. Denn immer deutlicher trat hervor, wie die spezielle Fragestellung, wenn gründlich gefaßt, auf dem direkten Wege zum Verständnis der Gesamtnatur des Landes liegt; wie weiter dieselben Faktoren, die den Tierfamilien Verbreitungsgrenzen ziehen und Florenreiche abteilen, auch den Menschenrassen ihrer Gebiete wirtschaftlich und politisch den Stempel aufdrücken, die Individuen körperlich charakteristisch ausgestalten helfen und ihrer geistigen Entwickelung eine Richtung geben, die unmittelbar von den Vorgängen in der umgebenden Natur, als der vornehmsten Schule ihres Verstandes und der frischesten Quelle ihrer Phantasie, noch heute täglich von neuem bestimmt wird. In diesem Zusammenhange war ich bestrebt, die Lebensbedingungen und die Lebensart der aussterbenden Ureinwohner meines Hauptarbeitsgebiets, der Hottentotten, als einen integrierenden Bestandteil der Naturgeschichte des Landes kennen zu lernen; deshalb blieb ich in der Wahl meiner Begleiter auch außerhalb des Groß-Namalandes in ständiger Fühlung mit dem Volk.

Die praktische Durchführung der wissenschaftlichen und der eingangs genannten wirtschaftlichen Pläne ging im ersten Jahre, 1903, glatt von statten. Das ist in erster Linie dem unbegrenzten Entgegenkommen der Kolonialabteilung des Auswärtigen Amtes zu verdanken, die mich mit weitgehenden Empfehlungen an alle Behörden des Schutzgebiets entließ; der Gouverneur, damals Herr Oberst Leutwein, und sein Stellvertreter, Herr Regierungsrat Tecklenburg, förderten ihrerseits mein Unternehmen nach Kräften. Den Behörden im Mutterland und in der Kolonie spreche ich hier noch einmal meinen wärmsten Dank aus! Angra Pequena, die Lüderitzbucht, wurde Anfang April mein erstes Standquartier. Von hier aus beteiligte ich mich an den Küsten-Rekognoszierungsfahrten S.M.S. „Wolf", an Bord dessen ich die beste Kameradschaft fand, und wandte mich dann den Inseln und der Küste südlich und nördlich der Swakopmündung zu. Anfang September verließ ich Swakopmund zu einer zweimonatlichen Reise durch das südliche Hererogebiet über das Komashochland nach Windhuk, zu dem doppelten Zweck, einerseits über die Durchführbarkeit eines Fischhandels-Projekts an erster Stelle mich zu informieren, andererseits die Vorarbeiten für eine längere Expedition weiter ins Innere zu beenden. Der Rest des ersten Jahres war dem Abschluß der Küstenstudien, der Januar und Februar 1904 einem vergleichenden Studium der englischen Fischerei am Kap der guten Hoffnung gewidmet, durch das deutsche Generalkonsulat in Kapstadt, damals

1: Schultze FX13 Hottentot

mit Herrn von Lindequist, später mit Herrn von Jacobs an der Spitze, in dankenswertester Weise gefördert; über die Ergebnisse habe ich an anderer Stelle Bericht erstattet[15]).

Inzwischen hatten die Unruhen im Bondelzwartlande, die auch in Angra Pequena zur Erklärung des Kriegszustandes geführt und uns wenige Weiße zur Verteidigung organisiert hatten, das Signal zum Aufstand der Herero gegeben. Der nun folgende Krieg vereitelte hart die bis in alle Einzelheiten vorbereitete Expedition durch das Hereroland und die mittlere Kalahari zum Ngamisee; die Etappenstationen, die ich im Hinblick auf diese und andere Marschpläne im Lande angelegt hatte, wurden verlorene Posten. Ich hoffte, wenigstens im südlichen Namalande meine Arbeiten fortsetzen zu können, kehrte im März 1904 nach Lüderitzbucht zurück und wandte mich nach Kubub, meinem zweiten Standquartier. Die Wahl bewährte sich; aber im Mai sah ich mich auch hier jeder Bewegungsfähigkeit beraubt: Von einem großen Teil meines Gepäcks abgeschnitten und der Hilfe des Gouvernements, die jetzt drängenderen Aufgaben sich zuwandte, notwendigerweise entblößt, mußte ich mir — wollte ich nicht viertelverrichteter Sache nach Europa zurückkehren — in der Richtung des vorgesetzten Ziels ein neues Arbeitsfeld suchen. Ich fand es jenseits des Oranje im Klein-Namalande und bearbeitete es bis Ende August des zweiten Reisejahres. Dann kehrte ich, die im Hererolande zurückgelassene Ausrüstung endgültig verloren gebend, nach Kapstadt zurück, um von dort, neu ausgerüstet und von Herrn F. Hirschhorn in Kimberley in liberalster Weise unterstützt, über Mafeking in die zentrale Kalahari, zu der mir der Weg von Westen verlegt war, von Osten her vorzugehen. Von Mitte Oktober bis Anfang Februar, also in der kleinen Regenzeit, durchwanderte ich in den Richtungen, die die Karte zeigt, die Kalahari, westwärts bis Lehututu vordringend.

Hatte ich auf diesen und den vorher genannten Wegen die westliche Randzone und die östliche Hälfte des zentralen Hochplateaus mit dem großen Sandfeld im Innern an charakteristischen Punkten kennen gelernt, so fehlte doch noch eine Verknüpfung der Beobachtungen vom Westen und Osten. Ich bewerkstelligte sie, nach abermaligem Aufenthalt an der Südwest-Küste (speziell im Umkreis der Walfischbai) mit einigen Schwierigkeiten im dritten Reisejahr, 1905. Daß ich überhaupt im aufrührerischen Groß-Namalande mich bewegen konnte, verdanke ich zunächst dem Etappenkommando in Lüderitzbucht, das mich kriegsmäßig bewaffnete, verproviantierte und vorzüglich beritten der Truppe mich anschließen ließ. In Keetmanshoop fand

1: Schultze FX13 Hottentot

ich in Sr. Exzellenz Herrn Generalleutnant von Trotha einen starken Helfer, der, selbst Naturforscher, mit der Angliederung des friedlicheren Fachgenossen als Kriegsberichterstatter an das Hauptquartier meine Studien ausgiebig förderte. Nach Abschluß der letzten größeren Umgehungsbewegung gegen Hendrik Witbooi, an der ich auf diese Weise teilnehmen durfte, ebnete mir der Anschluß an eine kleine nach dem Osten abgehende Truppenabteilung unter Herrn Major von Estorff den Weg nach Rietfontein (September-Oktober 1905) und setzte mich so in den Stand, die Kalahari doch noch von Westen her, wenn auch vier Breitengrade südlicher und anderthalb Jahre später als ursprünglich geplant war, zu erreichen. Von einer Schilderung persönlicher Erlebnisse sehe ich ab.

Die Resultate nur, die sich trotz aller Wechselfälle und zum kleinen Teil auch aus ihnen selbst gewinnen ließen, sind hier am Platz. Sie folgen in diesem Band mit Ausnahme derer, die auf speziell zoologischem Gebiete liegen. Den Fachgenossen, besonders denen am Kgl. zoologischen Museum in Berlin, bin ich für die Bestimmung vieler der Tiere, die in diesem Bericht genannt sind, Herrn Prof. Dr. G. Volkens in Berlin für die unermüdliche Hilfe, den mitgebrachten Pflanzen zu den besten Bearbeitern zu verhelfen, zu großem Dank verpflichtet. Die Resultate der detaillierten Sammlungsbearbeitung, in die sich ebenfalls zahlreiche Fachgenossen mit mir teilen, hat die Medizinisch-Naturwissenschaftliche Gesellschaft zu Jena beschlossen, in ihren Denkschriften zu veröffentlichen. Die Mitarbeiterschaft ist geregelt, die Bearbeitung im Gang.

XII. Kapitel.

Die Hottentotten.

Die Holländer des 17. Jahrhunderts gaben den Ureinwohnern, die sie am Kap der guten Hoffnung vorfanden, ihrer merkwürdig glucksenden Sprache wegen den Namen „Hottentots". Wie Autoren der damaligen Zeit berichten, war das in Holland ein Schimpfwort für Stotterer, und dieser Spottname ist dem Volke geblieben.

Soweit die Geschichte zurückreicht, haben sich die Hottentotten nie zu einer Nation geeint, schon die ältesten holländischen Ansiedler am Kap

berichten von Kämpfen der Stämme untereinander. Dazu kam, mit dem 17. Jahrhundert beginnend, die Einengung der Hottentottenstämme durch die weiße Rasse von Süden her und im 19. Jahrhundert die Invasionen der Banturassen von Norden. In dem Maße, als die Hottentotten somit auf immer engeres Gebiet gedrängt und damit die Kämpfe um Weidegründe und Wasserstellen immer erbitterter geführt wurden, beschleunigten sich die Prozesse, die seit alters die gelbhäutigen Nomadenstämme Südafrikas durcheinander gewürfelt haben: Aus- und Einwanderungen über weite Gebiete hinweg, Zersprengtwerden verwandter und Vereinigungen verschiedenartiger Elemente unter neuem Führer zu neuer Stammesgemeinschaft. Die Stämme, die während dieser Kämpfe untergingen, wollen wir hier nicht aufzählen; die Quellen ihrer ältesten Geschichte fließen trübe. Die besten Urkunden aus dem letztvergangenen Jahrhundert sind die Berichte ihrer Missionare[43]).

Was sich im Gebiet der heutigen Kapkolonie von der alten Hottentottenbevölkerung erhalten hat, können wir übergehen; es sind verschwindende Reste, körperlich verbastardet, geistig ihrem Volkstum in Sitte und Sprache entfremdet: die Korana und Griqua und einzeln über die Farmen der Buren zerstreute Tagelöhnerfamilien. Nur nördlich des Oranjeflusses hat sich bis heute eine Anzahl Hottentottenstämme stark und verhältnismäßig rein erhalten, verbrüdert mit den Stämmen oder Horden, die vor der nachdrängenden Kultur über den Großfluß geflüchtet waren. Beide, Ureinwohner und Flüchtlinge, waren bis zum Anfang der 80er Jahre die unbestrittenen Herren des Groß-Namalandes. Jetzt hat auch sie ihr Schicksal erreicht. Die Stämme, die vor dem letzten Auflehnungsversuch noch beachtenswerte politische Faktoren waren, werden jetzt nur noch dem Namen nach eine Zeitlang unterschieden werden. Denn mit den Kapitänschaften (der stärksten und hoffentlich nun endgültig beseitigten Friedensgefahr) fällt, wie die Geschichte gelehrt hat, auch die Stammesunterscheidung. Von den Hottentottenstämmen nördlich des Oranje, mit denen wir um die Mitte des 19. Jahrhunderts zuerst näher bekannt wurden, sind fünf schon vor unserem bewaffneten Eingreifen in die Wirren des Namalandes im Kriege der Eingeborenen untereinander aufgerieben worden. Ihr ehemaliges Verbreitungsgebiet (im Jahre 1852) ist auf der Karte punktiert angegeben, für die Grenzen der übrigen Stämme (mit geschlossenen Linien eingetragen) ist das Jahr 1890 zugrunde gelegt (siehe Karten-Erklärung). Wie es mit ihrer Kopfzahl, ihren Kapitänen und Wohnsitzen stehen wird, wenn das Land wieder zur Ruhe gekommen ist, läßt sich zurzeit noch nicht übersehen. Hier mögen wenigstens die Namen der Stämme folgen:

a) *Naṁa-n* nennt der Hottentott diejenigen Stämme, die seit alters her im heutigen Groß-Namalande ansässig sind. Das sind

1. Die *ǂAo-ǂnin* oder *ǀGo-ǂmen*, zuweilen auch ihrer Naragründe wegen von den Nachbarn *°ǀNa-ranin* genannt, die Topnaars der Buren.

2. Die *ǀKχa-ragai-kχoĩn*, abgekürzt *ǀKχa-r(a)kχoĩn*, die Franamanschen Hottentotten oder nach ihrem Kapitän auch Simon Kopper-Leute genannt.

3. Die *ǂHa-bobe-n* oder Velschoendragers.

4. Die *ǀGa-miṅũ-ǂn* oder Bondelzwarts.

5. Die *ǂKχau-igõa-n* oder Zwartbooïs, jetzt, mit Ausnahme Versprengter, außerhalb des Namalandes, im nördlichen Kaokoveld angesiedelt.

Dazu kommen, heute versprengt, aber in der Erinnerung der Eingeborenen noch immer als alte Stammesgemeinschaften lebendig:

6. Die *ǂKχau-ben* oder die Rooi Natie.

7. Die *ǀKχa-roǀõ-an* oder die Tsaibochen Hottentotten von Keetmanshoop.

8. Die *ǂOgain* oder Grootdooden.

b) *°Gũiṅũn* ist eine Bezeichnung für diejenigen Hottentottenstämme, die von der Wende des 18. und 19. Jahrhunderts ab aus dem Gebiet der heutigen Kapkolonie nach Groß-Namaland einwanderten. Hierher gehören, gewöhnlich Orlam genannt.

9. Die *ǀA-main* oder Bethanier-Hottentotten.

10. Die *ǀHai-ǁkχau-an* oder Bersaba-Hottentotten.

11. Die *ǁKχo-besin* oder Witbooïs.

12. Die *Gai-ǁkχau-an* oder Amraal-Hottentotten von Gobabis.

Dazu kommt, seit 1889 aufgerieben, einst aber unter Jonkers und Jan Afrikaners Führung der gefürchtetste aller Orlamstämme, der Stamm der

13. *ǂAi-χaũa-en* oder der Afrikaaner.

Diese 13 Namen werden bald die einzigen Überbleibsel der alten Stammesgliederung der Hottentotten sein. Ehe der politischen Vernichtung ebenso unaufhaltsam die Vernichtung des Volkstums in Sprache, Vorstellungen und Sitten folgt, sollte alles in Sicherheit gebracht werden, was wenigstens für den Ethnologen zu retten ist. Bei meinem Bestreben, dieser Pflicht eines jeden wissenschaftlichen Reisenden, so gut als es die Hauptaufgabe im speziellen Arbeitsgebiet zuließ, nach Kräften nachzukommen, machte ich es mir zur Regel, nur das aufzuzeichnen, was ich in direktem persönlichen Verkehr mit den Eingeborenen sah und ermittelte. Nur im Kapitel „Geburtshilfe" war ich genötigt, auf die Erfahrungen einer landesansässigen weißen Frau zurückzugreifen. Klar darüber, daß die Erfahrungen eines ein-

seinen nur lückenhaft sein können, ziehe ich es doch vor, das Bild vom Hottentotten nur wie es mir selbst sich bot zu geben und nicht, auch wo die Lücken empfindlich sind, mit fremdem Stift weiter auszuführen, weil ich mir auf diesem Gebiete mit seinem weiten Spielraum für individuelle Auffassungen eine Kritik nur zutraue, wo ich selbst an Ort und Stelle meine Aufmerksamkeit hinwenden konnte.

Eine Zusammenstellung des ethnologisch Wissenswertesten über die Hottentotten, soweit es in der Literatur bis 1872 enthalten war, hat G. Fritsch[84]) gegeben. Seit den vorausgehenden Arbeiten Theophilus Hahns[85]) sind aber keine zusammenhängenden originalen Untersuchungen über das Volksleben der Hottentotten im Namaland angestellt worden. Auf die Darstellung Ratzels[86]) sei hier nur hingewiesen. Es kann hier nicht meine Aufgabe sein, Probleme der vergleichenden Ethnologie der südafrikanischen Völker im Anschluß an die Fachliteratur zu behandeln. Ich habe hier nur über meine eigenen Beobachtungen zu berichten, allein in sich verarbeitet, vielfach auch nur als Tatbestand mitgeteilt, Berufeneren zu weiterer Verwertung.

Über die hottentottischen Bezeichnungen, die in den Text eingeschaltet sind, siehe das über die Sprache in Çapitulum V, A Gesagte.

Zu immer weiteren Fortschritten ermutigte es mich, zu sehen, wie oft gerade da, wo man es auf Grund älterer Berichte am wenigsten erwartete, trotz allen Kultureinflusses die alte Eigenart des Volkes, soweit es das Individuum und die Familie betrifft, sich oft noch überraschend rein erhalten hat. Auf sozialem und politischem Gebiete dagegen ist dem Ethnologen wohl das meiste schon unwiederbringlich verloren gegangen.

Capitulum I.

Der Körper und seine Pflege.

A. Die äußere Erscheinung

eines Hottentotten hat wenig Anziehendes.

Die Haltung des Körpers läßt niemals, weder im männlichen noch im weiblichen Geschlecht und in keinem Alterstadium, jene Würde erkennen, die beim Herero im Jugend- und jungen Mannesalter die Regel ist. Der hohen schlanken Gestalt des Herero gibt im männlichen Geschlecht eine gut entwickelte Muskulatur, im weiblichen Geschlecht ein mäßig entwickelter Panniculus schöne Formen und Ebenmaß. Das erhöht naturgemäß, wo es sich um jugendliche Körper handelt, die Anmut aller Bewegungen. Nur

ein Riemen gürtet die Lenden des Herero im Jünglingsalter, ein knielanger Fellschurz deckt Blöße und Gesäß, gibt aber seitlich mit jedem Schritt die ganze Linie des Oberschenkels frei, seinen schlanken Hüftansatz und den Übergang in die Weichen. Der Körper der Hottentotten ist trotz guter Proportionen und trotz normaler Entwicklung der Muskulatur zu klein und meist durch europäische Kleiderlumpen derart verunstaltet, daß der Anblick seiner Bewegung keinen Reiz hat. Die Bewegungen der Frauenleiber haben infolge der Überfülle des Gesäßes etwas Unbeholfenes, und junge Mädchen ohne diese Zier sind leicht fahrig in den Bewegungen ihrer Gliedmaßen.

Junges Hereroweib (vgl. die Figur einer älteren Herero-Frau auf S. 180).

Die Gliedmaßen selbst sind um so zierlicher gebaut, die Füße und Hände so klein und schlank, wie sie bei Erwachsenen unserer Rasse selten zu finden sind und in Südafrika nur von den Miniaturgliedern der Buschmännerin übertroffen werden.

Als der Teil des Körpers, den wir an uns selbst und an anderen am besten kennen, an dem wir in erster Linie bewußt oder unbewußt unser erstes Urteil über einen Menschen bilden, fesselt die Physiognomie des Hottentotten trotz ihrer Häßlichkeit nach zweifacher Richtung: Es reizt an sich schon, die Regungen des Seelenlebens in diesem fremdartigen Spiegel zu beobachten, um so mehr, je näher wir es im Laufe der Jahre verstehen lernen. Und dann ist es ein seltsames Gefühl, den Begriff der tierischen Spezies auf unser eigenes Geschlecht anzuwenden, wie es der erste Anblick des Kontrastes unserer und jener Züge unabweislich aufdrängt. Ein näherer Vergleich*), der Übereinstimmendes und Abweichendes in gleicher Weise berücksichtigt, ergibt dann folgendes:

Das Schädeldach zeigt keinerlei auffallende Merkmale. Das Vorderhaupt ist mäßig gewölbt. Der Scheitel, nach den Seiten mäßig steil abge-

*) Zahlenmäßige Angaben werden an anderem Orte veröffentlicht werden. Die folgenden Angaben beziehen sich auf den lebendigen Körper. Zur Illustration dienen auch die Tafeln X—XIII, XV und XVII. (Seitenzahlen s. vorn in der Übersicht.)

dacht, liegt meist in der Mitte, ist selten nach vorn, noch seltener nach hinten verschoben und die Scheitelbeinhöcker treten nicht hervor. Das Hinterhaupt ist niemals platt, springt immer, bald mäßig, bald beträchtlich vor. Von oben betrachtet hat das Schädeldach ausgeprägt ovoide Gestalt, den spitzen Pol nach vorn gekehrt.

Das Charakteristische dieser Scheitelansicht ist in der Schmalheit der Stirn begründet, im übrigen zeigt der Hirnteil der Stirn nichts Bemerkenswertes. Er ist bei mittlerer Höhe und Steilheit mäßig gewölbt, ohne daß Stirnhöcker ausgeprägt wären, aber das Vortreten der Augenbrauenbogen (vorwiegend in den lateralen Partien, ein Glabellarwulst fehlt meist) gibt der Stirn etwas uns Fremdartiges.

Die Jochbeine laden meist so weit seitlich aus, daß die Backenpartien unterhalb der Augen wie zwei starke Wülste vortreten.

Das Kinn ist flach gewölbt, läuft spitz zu und tritt zurück. So zieht sich das Gesicht, wenn alle Eigentümlichkeiten der genannten Teile ausgeprägt sind, im ganzen von vorn betrachtet, sowohl nach oben über den Augenbrauenbogen zur Haargrenze, als nach unten von den Backenknochen zum Kinn, spitz aus.

Die Nase des Hottentotten ist für unser Auge von ausgesuchter Häßlichkeit. Die Nasenbeine liegen so tief, daß der Ansatz der Nasenwurzel an der Stirn in vielen Fällen äußerlich überhaupt nicht markiert ist. Der Nasenrücken ist so breit und erhebt sich mit so flachem Sattel aus dem Gesicht, daß er fast verschwindet. Um so stärker macht sich der untere Teil der Nase geltend: der im Profil bald gradlinig, bald konvex, bald konkav verlaufende Nasenrücken geht da, wo unsere Nasenspitze liegt, in einen platten Wulst über. In der Mittellinie setzt sich der Wulst in eine kurze, nach oben gerichtete Nasenbasis fort, seitlich in enorm breite, aufgeblähte Nasenflügel, deren Unterrand reichlich genug ausgebogen ist, um einen Blick in die großen, quer gestellten Nasenlöcher wie in zwei Kamine frei zu geben.

Die Prognathie der Kiefer wird physiognomisch vielfach durch ein rüsselartiges Vorspringen der Lippen verstärkt. Die Oberlippe mit seichter Mittelfurche erscheint im Vergleich zur Unterlippe lang. Der braune, dicke, vorgewulstete, rissige Lippensaum umgibt eine meist horizontal gestellte, mittelgroße Mundspalte. Das Zurücktreten des Kinnes und die eingesunkene knöcherne Nasenpartie lassen die Kieferregion noch schnauzenartiger vorspringen (s. Abb. S. 176). Die Zähne zeigen meist ungestörte Reihenanordnung und die gleiche, auch für unser Gebiß typische, nach der Kiefermitte hin gerichtete Größenzunahme

der oberen Schneidezähne sowohl als der Prämolaren und Molaren beider Kiefer und eine gleich gerichtete Größenabnahme der unteren Schneidezähne.

Die Augen sehen mit dunkelbrauner Iris aus mittellang geschlitzten, wenig geöffneten Lidspalten. Die Verbindungslinie des äußeren Augenwinkels mit der Mitte des Tränenknöchens, der Caruncula, läßt vielfach eine schwache Schrägstellung der Lidspalte (nach außen aufwärts) erkennen, meist ohne daß diese Schrägstellung beim unbefangenen Anblick des Gesichts irgendwie sich aufdrängte oder von entsprechenden Befunden an unserer eigenen Rasse abwiche. Der Augenabstand ist groß.

Hottentotten vom Stamm der Tropassa, ca. 20 Jahre alt.

Auch ohne daß Altersfalten im Bereich der Lidspalte vorhanden wären, ist die Deckfalte des oberen Lids meist so stark entwickelt, daß das obere Lid in der Mitte und seitlich unter ihr verschwindet. Bald in die mediale Partie der Deckfalte ununterbrochen übergehend, bald durch einige Millimeter ungefalteter Haut von ihr getrennt, läuft in zahlreichen Fällen eine feine Hautfalte als scharfer Saum um den äußeren Augenwinkel herum, rein anatomisch einem Epicanthus tarsalis entsprechend, von der typischen Mongolenfalte dadurch unterschieden, daß sie die Caruncula frei läßt. Die gut entwickelte, mit Nickhaut versehene Caruncula ist in den seltenen Fällen, in denen sie nicht frei liegt, unter den Lidtarsen versteckt. Der Teil der Bindehaut, der bei gewöhnlicher Augenöffnung von den Lidern geschützt wird, ist glatt und von bläulich-weißer Farbe. Der frei liegende Teil dagegen, der unter Staub und Rauch viel zu leiden hat, ist gelblich

gefärbt und hat unebene Oberfläche. Nie sah ich den oberen Tarsus scharfrandig heruntersteigen. Die schwarzen Wimperhaare sind kurz, dicht gestellt. Die Augenbrauen sind meist kurz und schmal, dazu dünn behaart, medial verhältnismäßig am dichtesten; das einzelne Haar ist gewellt. Bald laufen die Brauen geradlinig, bald gebogen; sie sind niedrig und horizontal (zuweilen nach außen aufwärts) gelegen und treffen nicht auf der Stirn zusammen.

Zu erstem orientierenden Vergleich der Physiognomien sei hier (Seite 178 und 179) das Porträt eines Herero beigefügt. (Vgl. im übrigen die später folgenden Porträts von Bergdamara, Betschuanen und Buschmann).

Das Ohr liegt meist an. Vollständig oder halb angewachsene Ohrläppchen sind die Regel; eine Darwinsche Spitze sah ich nur in den seltensten Fällen und da meist am hinten umgebogenen Helixrand nur angedeutet.

Hottentott vom Stamme der Topnaars, ca. 20 Jahre alt (dieselbe Person, die auf S. 176 abgebildet ist).

Inmitten der schwarzbraunen bis schwarzen Menschenrassen ihrer Nachbarschaft stehen die Hottentotten und die dunkleren Buschmänner mit dem hellen Braun bis Fahlgelb ihrer Haut allein da. Ein mattes fahles Braungelb ist die Grundfarbe des Körpers der Hottentotten. Im Gesicht verdunkelt sie sich häufig zu braun, auf der Fußsohle hellt sie sich zur schwach gebräunten Hautfarbe unserer Rasse auf, noch mehr im Nagelbett der Füße und der Finger, hier bald mehr ins Gelbliche, bald mehr ins Rosa spielend. Unser frisches Lippenrot fehlt. Die Schleimhaut des Mundes (einschließlich der Lippenteile, die bei geschlossenem

Mund unsichtbar sind) und des Rachens ist ein trübes, violett angehauchtes Rot; von der Vulva gilt dasselbe. Die glans penis dagegen ist hellrosa gefärbt. Beschneidung sah ich in keinem einzigen Fall.

Weder die Muskeln der Schädelhaut noch die des Ohres, nur das Platysma konnten die Hottentotten, die ich daraufhin prüfte, willkürlich bewegen.

Herero, ca. 20 Jahre alt.

Die Behaarung des Körpers ist äußerst spärlich. Dies und die starke Spiralkrümmung jedes einzelnen feinen Haares bedingt es, daß sich (mit alleiniger Ausnahme der Wimpern und Augenbrauen, des Schnurr- und Kinnbartes) die Haare überall, wo sie in Feldern beisammen stehen, gruppenweise zu einzelnen kleinen isolierten Knäueln verfilzen, zwischen denen die Haut hell durchschimmert. Aber diese sichtbaren Hautpartien sind nicht kahl: die Einpflanzung der Haare in der Haut ist gleichmäßig, läßt jedenfalls keine Gruppenanordnung erkennen, die jenen Filzknäueln entspräche. Das gilt für die Behaarung des Schädels wie für die der Schamteile und Achselhöhlen. Je stärker die Spiralkrümmung des einzelnen Haares und je spärlicher gleichzeitig die Gesamtbehaarung ist, desto fester und kleiner sind die Knäuel. Übergänge aller Stadien führen von diesen kompakten Bildungen von nur wenigen Millimetern Durchmesser zu zentimetergroßen aufgelockerten Haarbäuschchen. Nur in seltenen Ausnahmefällen ist das Kopfhaar so kräftig entwickelt, daß es sich in dicht gedrängte, aber einzeln zu unterscheidende fingerlange Fransen dreht, die dann wirr in die Höhe stehen oder phantastisch um den Schädel baumeln (vgl. Taf. V). Der Hottentott selbst

bezeichnet die schwarzen runden Haarknäuel seines Kopfes mit demselben Wort, das Ziegenmist bedeutet (*/noiru-s*). Der Bur vergleicht die Haarknäuel mit Pfefferkörnern und nennt den Hottentotten „Pepperkopp". Unter mehreren Hundert Hottentotten begegnete mir nur ein einziger Kahlkopf.

Vom Bart, dessen Einzelhaare stark sind, besitzt der Hottentott nur die Teile, die bei unserer Rasse am stärksten entwickelt sind, einen schwachen Schnurrbart (besonders seitlich entwickelt) und einen Kinnbart. Ein Backenbart und die ihn vervollständigende Behaarung des Mundbodens und des Halses fehlt. Sie ist nur hier und da durch einzelstehende Haare angedeutet.

Herero, ca. 30 Jahre alt
(dieselbe Person wie die auf S. 178 abgebildete).

Die Physiognomie des Hottentotten erhält frühzeitig durch Falten erhöhten Ausdruck. Die Nasen-Mundwinkelfalte und eine feine Fältelung der Haut unterhalb des Auges tritt sehr frühzeitig auf, ebenso Stirnfalten. Im Alter vermehren und erhöhen sich die Falten oft derart zu Runzeln, daß sie dem Gesicht jede Ausdrucksfähigkeit wieder nehmen und über Hals und Brust in langen parallelen Streifen ziehen (s. Tafel XVII). Die Haut junger und gesunder Individuen beiderlei Geschlechts spannt sich straff und frisch über die Weichteile (s. Tafel XII und XIII).

Fettpolsterung des weiblichen Körpers gilt allgemein als Zierde. Die Brüste sind voll entwickelt. Die Ansammlungen großer Fettmassen über den Glutäen und an der Außenseite der Oberschenkel (Steatopygie), die den Leibern der Matronen oft unförmige Gestalt gibt, ist in dieser starken Entwicklung und scharfen Lokalisierung Rasseneigentümlichkeit. Desgleichen

die Vergrößerung der kleinen Schamlippen zur Schürze, über die an anderem Ort zu handeln ist.

So verwahrlost die äußere Erscheinung des Hottentotten auf den ersten Augenblick ist, so sind mir doch hier und da gewisse Anstandsregeln begegnet, betreffend

B. die Haltung des ruhenden Körpers.

Verpönt ist das Erheben der Knie über das Niveau des Kopfes, wie es beim Liegen auf dem Rücken und gleichzeitiger aufrechter Kniebeugestellung der Beine der Fall ist. Die Bezeichnung für eine solche Lage ist *ǂhõingoa**).

Hottentottin von Berzaba, 1,48 m groß, ca. 40 Jahre alt, mit gut entwickeltem Fettsteiß.

*) Das Wort **ǂhõi* finde ich nirgends verzeichnet; es ist ebenso scharf unterschieden von *ǂhĕi* = gebückt sein, wie von *ǂhŏi* = spotten. Soweit ich seine Bedeutung aus dem Sprachgebrauch der Eingeborenen ermitteln konnte, hat es den Sinn von „ungeschlacht". So sagte ein Mann zu einem anderen mit auffallen

Ein Hottentott, der einen meiner Leute in der genannten Stellung fand, schlug ihn auf die Knie mit den Worten: *„nē ǃhŏĭ ŋgoabats gye nī ĭū“*, d. h. „du sollst aufhören, so mit ungeschlachten Knien zu liegen“, weil es Mißgeschick bringe, wie auf eine Frage meinerseits geantwortet wurde.

Eine hohe Stellung der Knie, wie sie bei langbeinigen Personen in hockender Haltung unvermeidlich ist, wird bespöttelt. So wurde ein schlankes großes Hererомädchen mit den Worten geneckt: *„ĭūitsibeb kχoma gai ŋgoaga (e)ĭs“*, d. h. „du mit den großen (hoch aufragenden) Knieen wie eine Mücke“. (Die Mücke selbst heißt ihrer langen Beine wegen, die eben beim hockenden langbeinigen Menschen die Kniee so ungeschlacht erscheinen lassen,: *ǃhŏŋŋoab*).

Die Haltung einer Frau in halb ruhender Stellung auf ebener Erde scheint auf den ersten Blick ein Kauern zu sein: Die Oberschenkel ragen steil auf, die Kniee stehen entsprechend hoch und sind stark gebeugt. (Trägt die Frau noch ihre Volkstracht, so zieht sie beim Niedersetzen den Vorschurz zwischen die Beine hindurch unter das Gesäß.) Aber der Körper hängt nicht wie beim Kauern in den Kniegelenken, sondern sitzt mit den starken Fettpolstern des Gesäßes auf. Männer oder magere Personen können diese Ruhestellung ohne Rücklehne nur einnehmen, wenn sie relativ lange Oberschenkel haben: sonst ruhen sie auf einem fußhohen, zusammenklappbaren Schemel *(ǂnūais)*, dessen Sitzfläche mit Riemen überspannt ist. Will eine Frau, die auf ihrem Fettsteiß sitzt, eine Handarbeit vornehmen, so spreizt sie die Oberschenkel schwach und gibt damit den Armen genügend freien Spielraum.

Wenn die Frau ein Kind säugt, setzt sie sich ähnlich wie eine Orientalin hin, legt die gespreizten Oberschenkel flach nieder, schlägt die gebeugten Unterschenkel übereinander und zieht sie so an, daß der Schenkel der einen Seite auf dem Fuß der anderen Seite ruht. In der Mulde, die so die Beine der Frau bilden, liegt der Säugling so sicher, daß die Frau beide Arme zur Arbeit frei hat.

In der Stellung stillender Frauen fand ich häufig auch ältere Männer am Boden sitzen.

---

starken Gebiß: *„sa arīl kχoma ǃhŏĭ ŋgūga (e)ĭs“* d. h. „Deine Zähne sind ungeschlacht, wie die eines Hundes.“ Die übermäßig großen Hörner eines Ochsen wurden *ǃhŏĭ mūgu* genannt. Ein Fluch, der oft zu hören ist, lautet: *„ǃhŏĭ ǂkχoaga ĭb“* d. h. „Du mit dem großen Hoden“. (Hier wie in anderen Fällen zusammenhängender Wortfolgen habe ich die Höhenverhältnisse der Vokale nur da bezeichnet, wo es auf eine spezielle Unterscheidung ankam.)

Die jüngeren Männer setzen sich meist so nieder, daß sie ohne Rücklehne auf ebener Erde mit dem hintersten Teil des Gesäßes aufruhen, die Schenkel schwach gebeugt und halb gespreizt vor sich wegsetzend. Der Oberkörper ist schwach vornüber gebeugt, der Rücken krumm, die gestreckten Arme ruhen mit den Ellenbogengelenken auf den Knien oder sind unterhalb der Kniee übereinander geschlagen. So sehe ich sie noch heute wie ehedem so oft um das Abendfeuer sitzen, die Hände wie segnend über die wärmenden Scheite gebreitet, den Kopf zurückgelehnt, um den Qualm vorbeistreichen zu lassen. Die Wintermorgen sind empfindlich kalt. Sie wenden sich dann der Frühsonne in merkwürdiger Sitzstellung zu: spreizen die Beine so weit sie können, daß auch die Sitzflächen der Schenkel voll beschienen werden und kein Glied das andere beschattet.

Sind sie in guter Stimmung, so preisen sie die Wohltat der aufgehenden Sonne in der ihnen eigenen Bildersprache. Halb singend, halb deklamierend hörte ich sie in vielfacher Wiederholung sagen: *„gabu aib gye ǂgîrib ōaba sores gye ti ōasa“*, d. h. „der Wolkenschatten ist des Schakals Sohn (verächtlich), die Sonne ist meine Tochter“.

C. Ausdruck der Empfindungen.

Der männliche Hottentott legt sich aus Klugheit oder Rücksicht manche Reserve auf. Im weiblichen Geschlecht, wo diese Hemmungen meist fort fallen, zeigt ein Vergleich mit dem Hereroweib große Unterschiede. Der Gesichtsausdruck einer Hererofrau ist an sich schon maskiert durch ein braune erdige Fettsalbe, mit der das Gesicht wie der übrige Körper, die Lederkleidung und die dreizipfelige Haube eingerieben ist. Eine solche Frau erscheint, wenn sie dem Gespräch der Umsitzenden zuhörend regungslos an ihrer Lehmhütte lehnt, wie aus gleichartigem dunklen Ton geformt, der sich plötzlich belebt, wenn bei einem Worte, das ihr gilt, das Weiß der Augen und Zähne aufleuchtet.

Eine Hottentottin hat nie diese Ruhe; bezieht sich vollends die Unterhaltung auf Gegenstände, die ihre Aufmerksamkeit mehr als gewöhnlich in Anspruch nehmen, so gestikuliert sie lebhaft. Ist vollends Leidenschaft im Spiel (wenn auch nur in der Erinnerung lebendig), dann ist kaum ein Körperteil in Ruhe: der Oberkörper wird bald nach vorn, bald zur Seite gebeugt, die Arme fuchteln vor dem Gesicht des Zuhörers hin und her, bald wird mit lächerlicher Anschaulichkeit gegen die nahe Wand der Hütte nach dem fernen Ort der Erzählung gewiesen, bald mit dem Zeigefinger der

rechten Hand in der hohlen linken der Punkt präzisiert, um den sich die Auseinandersetzung dreht.

Im einzelnen muß bedacht werden, daß der Hottentott aus dem Gebärdenspiel der fremden Rassen seiner heutigen Gemeinschaft manches entlehnt haben wird. Seine Empfänglichkeit für Fremdes ist groß. Bei dieser Erwägung schrumpft die Zahl der Beobachtungen, die auf ursprüngliche, weil ihnen vorwiegend oder allein zukommende Gebärden schließen lassen, sehr zusammen. Als Gebärde der Bejahung ist ein leichtes Zurückwerfen des Kopfes unter gleichzeitigem Schließen der Augen häufig, besonders bei Frauen, zu beobachten.

Die Verneinung wird in nachlässiger Form bei geschlossenem Mund durch einen unartikulierten Laut ausgedrückt, der einem kurzen leichten Räuspern gleicht, nur daß etwas Stimme gegeben wird, in markiert ansteigendem und flüchtig auslautend-absteigendem Tonfall.

Eine ausdrucksvolle Gebärde des Erstaunens nennen sie selbst *ǂna-mana-m* (von **ǂaim* = verheimlichend zudecken und *ams* = Mund). Sie bedecken bei dieser Gebärde den Mund und die ganze untere Hälfte des Gesichts mit der flachen Hand und wenden den Kopf unter gleichzeitigem Heben der Oberlider zur Seite. Das Heben der oberen Lider (ohne Heben der Augenbrauen), das ich oft während eines Gesprächs beobachtete, bei plötzlich aufdämmernder Erkenntnis oder erwachendem Interesse, sei hier nur als Wiederkehr einer allgemein menschlichen Ausdrucksform genannt.

Scham gibt sich bei der fahlen Beschaffenheit der Haut in Erröten nicht zu erkennen. Seitliches Vorbeugen des Kopfes und Bedecken des Gesichts mit dem Ellenbogen ist eine häufige Ausdrucksform für Schamgefühl.

Eine Gebärde des Widerwillens oder starker Abneigung fand ich wieder bei Frauen stark ausgeprägt: das Gesicht wird von der Person, der die Gebärde gilt, seitwärts und schwach hinten überlehnend abgewandt. Die Augenlider hängen schlaff herunter, der Mund wird zu einer Schnute verzogen, wobei sich die Oberlippe stark den Nasenlöchern nähert, wie um sie zu schließen. Mit derselben Gebärde, *ǂonam* genannt, wendet sich ein Übersättigter ab, wenn ihm Speise gereicht wird.

Ob das Umarmen und Küssen auf die Wangen als zärtliche Begrüßung eine ursprüngliche oder eine übernommene Gebärde der Hottentotten ist, wird nicht mehr zu entscheiden sein. Eine alte Frau umarmte und küßte in freudiger Rührung einen meiner jungen Begleiter, der nach

Jahren der Trennung zu ihrem Wohnsitz kam. Sie rief andere Frauen herzu und konnte sich in ihrer Freude nicht genug tun. Die Augen waren zu tief in Runzeln versteckt, als daß ich hätte sehen können, ob sie weinte. Weinen als Ausdruck freudiger Rührung darf man wohl als einen auch den Hottentotten zukommenden Gemütsausdruck betrachten, da sie dafür eine eigene Bezeichnung haben: *//ha-ru.*

Am entgegengesetzten Ende der Skala ihrer Gemütsbewegungen waren zwei Frauen angelangt, von denen die eine mich aufsuchte, um sich verbinden zu lassen. Ihre Widersacherin hatte ihr beim Streit quer über die Nase, in den Nacken und in den Daumen blutige Wunden gebissen.

D. Nahrung.

Wenden wir uns jetzt vom Hottentottenkörper selbst ab und sehen wir zu, welche Pflege ihm in gesunden und kranken Tagen zu teil wird. Ein Volk, das sich darauf beschränkt, die zum Dasein notwendige Pflanzennahrung, wie die Natur sie wild bietet, einzusammeln, ohne daß die Dürftigkeit dieser Versorgung zum Versuch einer Bodenbearbeitung geführt hat, steht sicherlich auf einer tiefen Kulturstufe. Auch wo in Rivierbetten Wasser dicht unter der Oberfläche zu graben ist und fruchtbarer Anschwemmungsboden, getrockneter Schlamm des abgekommenen Flusses, eine Gartenwirtschaft ermöglicht, unter der Hand des Weißen auch fruchtbringend ins Leben gerufen wird, hat sich der Hottentott nicht zu geregelter Arbeit aufschwingen können. Wohl kraalen sie hier und da ein Stückchen Land mit Buschwerk ein, nennen es *!hana-b* und pflanzen in diesen „Garten" den Kalahaßkürbis, *aba-s,* den sie zu einem Butterfaß aushöhlen, oder pflanzen als Speisefrucht eine kindskopfgroße, grüne, weißgetüpfelte Kürbisfrucht, *b(e)ritsaimab,* aber bald sind sie solcher Tätigkeit überdrüssig. Es ist jedenfalls nur dem unausgesetzten Einfluß der Missionare zu danken, wo der Hottentott beim Gartenbau aushält.

Von Haus aus kennt er nur dreierlei Tätigkeit im Dienst seiner Ernährung: das Sammeln, das Jagen und die Viehwirtschaft. Wir werden später sehen, wie er diese beiden letzteren Beschäftigungen zu einer gewissen Vollendung gebracht hat. Hier soll uns nur beschäftigen, wie er die Rohprodukte, die als gegeben angenommen seien, zu Speisen verarbeitet.

1. Animalische Nahrung

liefert den Küstenhottentotten das Meer. Das Fleisch der Robben (s. S. 41 ff.)

gibt, besonders wenn es Hautgoût hat, einen gesuchten Braten. Das Fett wird weniger geschätzt, aber doch gegessen. Zur Zeit des Robbenschlages scheuen die Küstenbewohner keine Wanderung, um sich die Abfälle zu sichern. Sie gehen auch auf eigene Faust auf den Robbenschlag, aber das nur da, wo sie das Festland nicht zu verlassen brauchen, wo also gelegentlich einzelne Tiere an den Hauptstrand gehen.

Wohl stellen sie auch hie und da einem Pinguin nach, nehmen die Eier aus den Nestern, erschlagen unerfahrene junge Kormorane mit dem Kirri oder werfen eine Angel aus, die sie von Weißen gekauft haben. Im allgemeinen aber haben sich die Hottentotten, die heute die Küste bewohnen, im Dienste der Weißen so vollkommen an europäische Kost gewöhnt, daß sie den Nahrungserwerb, wie ihn noch ihre Großväter eifrig betrieben, nicht mehr kennen. Vor 80 Jahren[6]) noch fischten sie in der Walfischbai mit $4\frac{1}{2}$ m langen hölzernen Speeren, die aus schwerem hartem Holz geschnitten wurden, warfen mit ihnen 7—10 Pfund schwere Fische auf eine Entfernung von 25 m und pökelten sie auf Vorrat mit Salz, das sie aus salzigen Quellen in der Nähe der Bai gewannen.

Mit Pfeil und Bogen erlegten sie besonders während der Brutzeit Mengen von Seevögeln, gruben sie, um ihnen den fischigen Geschmack zu nehmen, in den Sand, bis sie grün wurden, weideten sie dann erst aus, häuteten sie und ließen sie zweimal 24 Stunden in der Sonne liegen; das so präparierte mürbe Fleisch soll sich viele Monate lang gehalten haben.

Eine Liebhaberei der Hottentotten, mit denen Morrell in Berührung kam, war, die Eingeweide des Schlachtviehs roh und noch tierwarm zu essen.

Auch Delphine, die in der Walfischbai in nächste Nähe des Strandes kommen, mögen damals noch erbeutet worden sein. Die Gebräuche, die ehedem beim Zubereiten der Delphine beobachtet wurden, haben sich bis heute in guter Erinnerung gehalten: sie entledigten sich aller Kleider und zerlegten den Delphin nackt. Jede Berührung des Tieres mit dem Körper, den Mund ausgenommen, galt als schädlich. Sie vermieden, während der Arbeit mit der Hand sich zu berühren, zum Kratzen bedienten sie sich eines Hölzchens. Das Fleisch des Tieres wurde in Seewasser gekocht, in kaltem Seewasser abgespült und ausgerungen. Ehe sie ihre Kleider wieder anzogen, wurde der Körper von allen etwa anhaftenden Teilchen des Tieres gereinigt.

Von niederen Seetieren bilden gewisse Muscheln und Schnecken seit alters her eine Hauptnahrung der Küstenbewohner vom Kap der guten

Hoffnung hinauf bis zum Kap Cross. Große Abfallhaufen von Patellenschalen, mit Tonscherben und den Resten von Straußeneierschalen vermischt, liegen halb vergraben in den Dünen bei Port Nolloth. Über die Weichtierarten, die als Nahrung in Betracht kommen, siehe S. 31.

Die große Languste, *Jasus lalandii Lmk.*, offenbar nach dem Vorbilde der Weißen mit einem flachen, in einen runden Rahmen gespannten, mit Schneckenfleisch geköderten Netz gefangen, wird ebenfalls gegessen.

Reichhaltigere und schmackhaftere Nahrung liefert die Tierwelt des Binnenlandes. Die verschiedenen Antilopen und das Schlachtvieh liefern die Hauptnahrung. Es gibt kaum einen Körperteil, der nicht genossen würde. Das allein bringt Abwechslung in die Fleischspeise, denn die Zubereitung ist einförmig: Kochen in Wasser, Rösten im Feuer, Backen in der heißen Asche (den Kopf in toto) und Trocknen an der Luft sind die einzigen Rezepte. Das letztere gilt besonders für das Fleisch, das nicht gleich aufgegessen oder bei reicher Jagdbeute nicht mit vollem Gewicht nach Hause gebracht werden kann. Es wird dann in große dünne Fladen zerschnitten, gesalzen und an der Luft getrocknet *(ǂhār,* verb.*)*.

Um auch das Fell schmackhaft zu machen, rösten sie es zunächst im Feuer an, daß die Haare verbrennen, schneiden es dann in Streifen, schlagen es mit Steinen weich und kochen es in Wasser oder noch lieber in Milch.

Die Fleischbrühe, *suro-b,* wird nicht hoch eingeschätzt; das Fett dagegen, roh oder als Schmalz, ist das Leckerste, was es für einen Hottentottengaumen gibt. Es wird zuweilen becherweise heiß getrunken. Was sie davon nicht in einer Sitzung bewältigen können, wird bis auf den kleinsten Rest aufbewahrt: ein Stück frisch abgezogenen Ochsenfelles wird naß zu einem Pompadour geformt und aufgeblasen; so trocknet der Beutel, bis er hart und formfest geworden ist. Dann wird die Öffnung etwa talergroß scharfrandig abgeschnitten und mit einem Riemen als Henkel überspannt. In diesen Fettvorratsbeutel, *ǂgu-bus,* gießen sie Schmalz oder ausgelassene Butter und schließen die Öffnung mit Kuhmist.

So hoch der Hottentott den Ertrag der Jagd anschlägt, er gibt sich doch in der hohen Wertschätzung der Milch in erster Linie als Hirt zu erkennen. Die Milch zieht der Hottentott, den die Kultur noch nicht entartet hat, jeder anderen Nahrung vor, sie übt als Lebenselixir in ihren Sagen wunderbare Wirkung aus. Kuhwarm *(ᵓǂai-χadai-b)* oder abgekühlt *(ᵓǂādaib)* wird die frische Milch je nach der Jahreszeit mit verschiedenen Vegetabilien versetzt: die Blüten der *Acacia horrida Willd. (ǂha-reb,* die Dornbaumblüte*)*

und die erbsengroßen grünen Früchte des Ebenholzbaumes *(Euclea pseudebenus E. Mey.*, h: *ǃna·rus)* werden gekaut und in die Milch gespuckt. Die grünen Blätter eines Gewächses mit zwiebelartiger Bildung *(*ǃkχabib)* werden trocken im Topf über dem Feuer gestampft und dann mit der Milch wie zu einem Teig vermengt (siehe vegetabilische Nahrung).

Die abgestandene, noch flüssige, aber schon angesäuerte Milch wird ihres angeblich urinartigen Geschmacks wegen Pißmilch, **ǃūdaib* genannt. **aūdaib* ist die im Eimer dick gewordene saure Milch, deren Rahm *(ǃaobeb,* auch für süße Sahne gebraucht*)* zu Butter gekarnt wird.

Das Buttern, *ǂnuba·*, geschieht in der Weise, daß die saure Milch aus dem Holzeimer in eine Kalabas, *aba·s*, gegossen wird. Diese Kürbisflasche, deren enge Öffnung mit einem Holzpfropfen verschlossen wird, rollen sie in schräger Stellung auf einer weichen, meist aus Fellen hergestellten Unterlage. Das geschieht in greller Sonne oder in der Nähe des Feuers. Nach etwa dreistündigem Rollen wird die Kalabas zum Schluß so langsam bewegt, daß die Butter sich oben sammeln kann. Dann wird die Flüssigkeit abgegossen und getrunken und die Butter, *abaǂnui·b*, d. h. Kalabasfett, in einem Holzeimer aufgehäuft *(ǃkχao*, verb*)*; sie wird frisch *(*ǃkχaoǂnui·b)* oder ausgebraten *(*ǃgē·beǂnui·b)* genossen.

Butter-Kalabas, mit Fell umspannt. 1/2 nat. Gr.

Um den Butterertrag zu steigern, werden zuweilen die frischen, dickeren Wurzelteile einer Pflanze, die im Habitus einer *Portulaca* der Kalahari gleicht, in die Milchkalabas gesteckt. Weil der Leib *(ǃkχāb)* dieser Pflanze reich *(-χa)* mit Haaren *(ǃū·ǃgu)* besetzt ist, führt sie den Namen *ǃū·ǃχaǃkχā·s*.

Der mashi a madila der Betschuanen entspricht die **ǂhu-niniǂhu·ni-*Milch der Hottentotten. Die frische Milch wird in eine gleichnamige Kalabas mit handbreit ausgeschnittener Öffnung gegossen und etwa 2 Tage still stehen gelassen, bis sie sich in eine obenstehende wässerige säuerliche Flüssigkeit und eine feste bodenständige Masse *(ǂhare·b)* zersetzt hat.

Der hölzerne Milcheimer, *ǂhoē-s*, wird mit Vorliebe aus dem Holz eines weidenähnlichen Baumes *(ǂhūi-b)*, der im Oranje-Rivier häufig ist, geschnitzt. Zum ursprünglichen Molkereigerät der Hottentotten scheint auch ein selbstgefertigter Trichter, *ǂkχaru-s*, gehört zu haben; ich habe ihn nicht zu sehen bekommen.

Frische Ziegenmilch ist die Hauptnahrung der Hottentottenkinder; auch die Erwachsenen greifen zuerst nach ihr, um die Kuhmilch zum Buttern aufzuheben.

Zum Wildpret, das die Hochjagd liefert, und zu den Produkten der Viehwirtschaft kommt nun eine Menge „Kleiner Leute"-Nahrung, wie man sie nennen könnte, die sich der Hottentott draußen in der Einöde zusammensucht oder von glücklichen Zufällen schenken läßt. Verarmtes nomadisierendes Volk ist auf diese Nahrungssuche angewiesen.

Es gibt kein Säugetier, das der verarmte Hottentott nicht äße: Mäuse, Hasen, Klippschliefer, Stachelschweine, Erdmännchen, Wildkatzen und Schakale sah ich in den Kochtopf wandern, selbst die Hyäne wird gegessen. Der Genuß ihres Herzens soll schlaftrunken machen, ein Aberglaube offenbar, zu dem der feste Tagesschlaf der Hyäne Veranlassung gab.

Andere Vögel als die jagdbaren (s. Jagd) werden nur hie und da von Kindern erlegt und gegessen. Dagegen verachtet zu Zeiten auch der Erwachsene Schildkröten und Eidechsen nicht. Die Schildkröte, **ǂkχuri-s* (im Klein-Namalande: */hu-ǂrob*), wird mit Steinschlägen getötet und im offenen Feuer im Gehäuse geröstet. Fleisch und Eier werden ohne Zutat genossen. Will die Frau das Gehäuse als Buchubüchse benutzen, werden die Weichteile ausgeschält, die Eingeweide ausgenommen und der Rest gebraten.

Zonurus polyzonus Smith. Nat. Gr.

Von Eidechsen werden mehrere Arten, so die hier abgebildete, **ǂuru-s* genannte Art, in der heißen Asche geröstet, vorwiegend von jungen Hottentotten gegessen.

Das Fett der *#uru-s* und einer neuen *Mabuia*-Art, frisch aus dem Leibe des eben getöteten Tieres entnommen, wickeln sich die Kinder in Gras ein und lutschen es wie ein Bonbon.

Auch die Insektenwelt stellt dem Hottentotten einige willkommene Gerichte. Das bescheidenste davon besteht aus einer Käferart, **/nuims* genannt.

Larve von *Acanthophorus capensis White*, links im selbstgebohrten Gang steckend. ca. $^{1}/_{3}$ nat. Gr.

Diese Käfer werden wiederum nur von Kindern gegessen, geröstet oder roh, nachdem ihnen Kopf, Beine und Flügel ausgerupft worden sind. In derselben billigen Zubereitung verzehren jene Hungerleider, die als „Buschmänner" im Groß-Namaland umherschweifen, einen großen schwarzen Käfer, *Acanthophorus capensis White*, **/naori-b* genannt. Die fingerlange und -dicke Larve dieses Käfers, der Dornbaumwurm, **#kχū-tu-/nis*, bohrt in das Kernholz der *Acacia horrida Willd.* tiefe, weite Gänge, die sie mit ihren Exkrementen füllt. Die verdaute Holzmasse ist oft von dem abfließenden Harz des Baumes durchtränkt, quillt aus den Bohrlöchern hervor und erstarrt zu einer dunkelbraunen, wie mit Zuckerguß bedeckten knusperigen Masse, die von den Hottentotten, groß und klein, eifrig gesammelt und gegessen wird.

Acanthophorus capensis White.
ca. $^{1}/_{2}$ nat. Gr.

Die Larven selbst sind ebenfalls ein Leckerbissen. Um zu ihnen zu gelangen, brennen sie den Dornbaum, wenn er im Absterben begriffen oder abgestorben ist, nieder und holen sich mit spitzen Hölzern aus den glühenden Holzstücken den im eigenen Fett gerösteten Braten heraus. Oder sie warten, bis die Larve das Hinterteil zur Kot-Entleerung aus dem Bohrloch herausstreckt und spießen sie mit einem Dorn.

Mehr Scharfsichtigkeit als die Dornwurmsuche erfordert das Auffinden einer Wohnung eßbarer Termiten. Es gilt, die Stelle ausfindig zu machen, an der man graben muß, um auf die unterirdische Wohnung von *Hodotermes viator (Latr.)* zu stoßen. Das erste Anzeichen gibt der Mist der Tiere, winzige Ballen, die zu kleinsten bis maulwurfshügelgroßen Haufen beisammen liegen. Im Bereich dieser Misthäufchen sind nun die runden, im Durchmesser meist erbsengroßen Öffnungen im Boden zu finden, in denen die unterirdischen Gänge ausmünden. Verfolgt man diese Gänge, so stößt man in wechselnder Tiefe auf die Wohnung; zuweilen schon 1 bis $1^1/_2$ Fuß unter der Oberfläche, wenn ein Fels oder eine harte Bodenschicht in weichen Grund eingelagert ist und dem Haus von oben her Schutz gibt; zuweilen aber muß man über mannstief graben, ehe man zum Ziele kommt.

Die unterirdische Wohnung hat die Gestalt einer Linse von ca. $^1/_2$ m Durchmesser und 20—25 cm Höhe. Das Baumaterial ist eine papierdünne, spröde, zerbrechliche, gelblichgraue Masse; sie ist widerstandsfähig gegen Wasser. Man kann das Haus tagelang unter Wasser setzen, ohne daß es zergeht; es wird nur weich und weniger brüchig.

Das Haus ist aus etwa 40 Etagen, jede durchschnittlich $^1/_2$ cm hoch, aufgebaut. So kompliziert auf den ersten Blick das Labyrinth der vielen Hunderte allseitig kommunizierender Räume erscheint, es läßt doch ein einfaches Bauprinzip erkennen: Den Wendelgang. Unzählige Wendelgänge sind bald weit voneinander entfernt, bald eng aneinander gerückt, bald in regelmäßigen horizontalen Fluchten, bald mit stark geneigten Achsen und dementsprechend abschüssigen Bahnen neben- und übereinander gefügt, aber immer so, daß die Lauffläche jedes Wendelganges ohne Unterbrechung in die der Nachbarschaft übergeht. So kommen Kammern, Hallen, Gänge, Tore und Pfeiler zustande.

Die Zusammensetzung der Bewohner wechselt je nach der Jahreszeit. Im Juli 1904 fand ich in einem Bau Eier, Larven in allen Übergängen bis zum erwachsenen Arbeiter, Arbeiter verschiedener Größe, großkieferige Sol-

daten, drei Königinnen von ca. $2^1/_2$ cm Länge, endlich*) neben einigen wenigen noch unentwickelten Flügeltieren zahlreiche, meist ungeflügelte Nymphen.

Auf diese fetten, weißen, 12 mm langen Nymphen hat es der Hottentott abgesehen. Er schaufelt zunächst die ganze Wohnung mit Insassen und anhaftender Erde in einen Sack, um in der Hütte das Eßbare auszusondern. Zu diesem Zweck schüttet er die Masse portionsweise in ein Gefäß mit lauem Wasser und rührt mit einem Zweigstumpf so lange den Grund auf, bis alle Tiere oben schwimmen; dann schöpft er sie mit den Händen ab, preßt das Wasser aus und trocknet sie über dem Feuer, bis sich die eßbaren Individuen von den übrigen auswannen lassen. Der so gewonnene reine „Hottentottenreis", *!gîbes* ist durch das Trocknen über dem Feuer schon schwach angeröstet und wird meist ohne Zutat gegessen.

Ich habe oft gesehen, daß die Tiere beim Sammeln lebendig genascht wurden. Während dann der Alte aus dem dunklen Lehmwasser die Insekten fischt, hocken die Kinder herum und führen, was nebenher krabbelt, zum Mund. Lebendig genossen fand ich die Tiere fast ohne allen Geschmack, angeröstet sind sie wohlschmeckend.

Ein Gericht, auf das nicht fest zu rechnen ist, aber ein überreiches, wenn es überhaupt geboten wird, sind die Wanderheuschrecken.

Wo sich ein Schwarm niedergelassen hat, deckt er den Boden und bepackt *(!gare)* die Büsche mit seinen Abertausenden, *!garethums* nennt deshalb der Hottentott die auf den Zweigen sitzenden Tiere. Unter diesen sind die eiergefüllten Weibchen, *!kx'äithumti*, die begehrenswertesten. Wenn sie nach ihrer Tagesarbeit, die im Eierlegen besteht, ihre Nachtquartiere bezogen haben und dicht gedrängt an den Zweigen hängen, legt der Hottentott Feuer an den Busch; allenthalben lodert es auf. Am nächsten Morgen wird die Asche mit Zweigen zusammengekehrt, in Felle gesammelt und auf große Felsplatten ausgebreitet. Hier werden die eerhaltigen Tiere ausgelesen; die anderen werden nur gesammelt, wenn die Eiertiere nicht in genügender Zahl sich vorfinden. Die Auslese wird in Säcke gefüllt und auf Tragochsen zu den Hütten gebracht.

---

*) In den Nestern von *Hodotermes viator (Latr.)* fand ich einen neuen Cetoniden, *Trichoplus aepytus Kolbe.* Die Hottentotten kennen diesen ca. 9 mm langen, gleichförmig schwarzen Termitengast gut; sie nennen ihn *tkxautsams.*

Dort wird die Masse ausgebreitet, Frauen sitzen rings herum und stampfen sie mit Steinen klein. Die fertig zubereitete, hellbraune weiche Masse wird in Fellsäcke gefüllt und aufgehoben. Wohlschmeckender als roh gegessen soll sie mit Milch angerührt sein.

Obwohl ein Heuschreckenschwarm eine schwere Schädigung, oft eine Vernichtung des Weidefeldes bedeutet, ist die Zeit des Heuschreckenbrennens doch eine Festzeit, wenigstens für die Jugend. Der Aufsicht der Alten, die bei den Hütten bleiben, wenn der Heuschreckenplatz weiter entfernt ist, sind die jungen Leute entzogen und genießen nun ungebunden ihre Freiheit; besonders in Venere feiern sie.

Der Überfluß an Nahrung läßt die kommunistischen Grundsätze, die ohnehin im Volk lebendig sind, uneingeschränkt zur Geltung kommen: keiner darf einem anderen wehren, von den Heuschrecken zu essen, die jener gesammelt hat; schon eine abwehrende Handbewegung ist verpönt. Wer dem entgegenhandelt, wird ihrer Ansicht nach mit Übelbekommen der Heuschreckenmahlzeit bestraft. So tierisch uns eine Heuschreckenmahlzeit erscheinen mag, der Hottentott hält sie in Ehren. Mit einem merkwürdigen Gemisch von christlicher und heidnischer Phantasie erzählte mir ein Hottentott, daß selbst Gott, als er vom Himmel auf die noch unbevölkerte Erde herunterkam, lange Zeit nur von Heuschrecken gelebt habe; brauche er sich dann dessen zu schämen?

2. Die vegetabilische Kost

der Hottentotten stellen mit den verschwindenden oben genannten Ausnahmen (Gartenbau) wilde Pflanzen*). Die wichtigsten an Menge und Nährwert sind

a) die unterirdischen, mit Reservestoffen angefüllten Teile gewisser Pflanzen, mögen es Wurzelstöcke, Knollen oder Zwiebeln sein (s. Analysen im Anhang).

Die eßbaren „Feldzwiebeln" (kapholländisch: Uientjes, h: *kyai-ran*) gehören verschiedenen Formen an: die Iridaceen sind in den Ebenen um Kubub vor allem durch eine *Babiana*-Art (h: *°gûnub*) vertreten, die sich auch in der Trockenzeit leicht an ihren verdorrten Blättern verrät. Auf den Kubober Bergen dagegen wächst eine Feldzwiebel, die nur zu finden

*) Die hierher gehörigen Pflanzen sind botanisch und nahrungsphysiologisch meist so mangelhaft bekannt und die Notizen über sie in der Literatur so verstreut, daß ich von einer Zusammenstellung der Beobachtungen unserer Kommission absehe und mich hier auf eine Mitteilung der wenigen eigenen Beobachtungen beschränke.

ist, wenn der Regen die jungen Blätter herausgelockt hat. Die Hottentotten nennen diese Art, die sich nicht bestimmen ließ, *°/goo-beb.*

Babiana spec. $^{1}/_{3}$ nat. Gr. *Moraea* spec. $^{1}/_{3}$ nat. Gr. *Ixia* fol. $^{1}/_{3}$ nat. Gr.

Beide Uintjes-Arten werden in guten Jahren sackweise gesammelt. Die Zubereitung der erstgenannten Zwiebel ist zwiefacher Art: sie wird ent-

weder in der heißen Asche geröstet, oder die Zwiebeln werden frisch von der Faserumhüllung gereinigt und in einem Felsnack durch Klopfen mit Steinen zerkleinert. Wenn dann die Masse in der Sonne getrocknet worden ist, wird sie gemahlen mit Milch zu Brei gekocht.

Die Zwiebel einer anderen ellipsoiden Iridacee, einer *Moraea*-Art mit eigentümlich gebrochten Blättern (ǂ: *tgarib*), soll dem Orte Karibib *(tgo-ribeb)* den Namen gegeben haben.

Zwiebelähnlich sind die unterirdischen Reservoire ellipsoider Oxalidaceen. Die Uientje einer Art der Gattung *Oxalis*, von den Hottentotten *°ǂi-trobit* genannt, wird roh oder in der Asche geröstet gegessen. Eine andere Art *(°ǂkp-teb)* wird auch in kochender Milch zerstampft. Die *Oxalis obtusa L. f.* (ǂ: *ǂkyo-ren*) gilt als giftig für das Vieh; eine verwandte ungiftige Art gräbt sich der Pavian aus.

Grielum humifusum Thbg. ⅔ nat. Gr.

Ihrer Wirkung auf den Organismus wegen seien hier noch einige Feldzwiebeln genannt, die sich z. Z. botanisch noch nicht charakterisieren lassen: die *ǂhatti*-Uientje[50]·[51]) soll, übermäßig genossen, die Ohrspeicheldrüse anschwellen lassen. Einem Bergdamara mit dieser Art geschwollenem Backen hörte ich von einem Hottentotten zugerufen werden: *„ǂkyare-ǂgarib ǂkyema ǂhanǂa tamara !"*, d. h. „du mit dem Hanizwiebelkopf wie ein Zebrahengst", der ja bekanntlich an seinem breiten Kopf und Hals kenntlich ist.

Einer anderen Uientje mit gelben Blüten und braunroter Zwiebel wird nachgesagt, daß ihr übermäßiger Genuß zur Zeit des Aufsprießens der Pflanze

Blutharzen hervorrufe. Ihr Name, **ao-beb*, spielt vielleicht auch auf die Farbe des eßbaren Teils an.

Welche Uientje die Bergdamara **ǂgŏ-gîreb* nennen, und welche Pflanze dem **ao-mareb* der Hottentotten entspricht, konnte ich nicht feststellen.

Ceropegia spec. ½ nat. Gr.

Wenn man mit den unterirdischen knolligen Gebilden, die sich der Hottentott gräbt, nicht auch die zugehörigen Blätter und Blüten sammeln kann, so ist es meist unmöglich, den Fund zu bestimmen. So kann ich hier nur drei Namen angeben: *Oxalis hirsutissima Thbg.* (h: **ǂkya-ib*, oder **tsî-(gangai-eb)*, eine Rosacee mit krautig-saftigen, glatt auf dem Boden kriechenden Zweigen und hell-schwefelgelben Blüten liefert dem Hottentotten in karottenförmigen unterirdischen Teilen ein Gericht.

Dasselbe gilt von einer Umbellifere, einer *Peucedanum*-Art.

Eine windende Asclepiadacee aus der Gattung *Ceropegia* bildet eßbare kartoffelähnliche Knollen mit gelbbrauner runzelig-höckeriger Oberfläche. Die rohen Knollen sind hart, aber saftig und kühl genug um zu erfrischen.

Die Aufmerksamkeit späterer Reisender möchte ich auf folgende Pflanzen lenken, von denen Blätter und Blüten dringend erwünscht sind, will man die wilden Feldfrüchte der alten Einwohner des Landes noch kennen lernen:

α) °*omam‖gaub* ist eine Pflanze mit succulenten Blättern; der möhrenartige unterirdische Teil hat stark abführende Wirkung. Der Name der Pflanze drückt das drastisch aus: „Mar läßt schon in der Tür *(ams)* der Hütte *(oms)* fallen *(‖gau)*" oder „erreicht den Hof mit Müh und Not" in optimistischer Übersetzung.

omam‖gaub $^1/_3$ nat. Gr.

Der „Strandkohl". $^1/_3$ nat. Gr.

β) °*‖go-‖marib-* (1 Terz st.) oder *‖ha-bab* hat einen glatten, möhrenartigen unterirdischen Teil und dünne, schmale, 3 cm lange, am Rand eingekrunkelte Blätter.

7) *°ǂgya-ku* bildet bis kindskopfgroße saftige Wurzelgebilde.

Pelargonium incrassatum Curt., h: *°ia-mitai-b*, der „Straußenfuß" (nach der Gestalt der austreibenden Blätter so benannt) ist die letzte der Pflanzen, die ihrer edlaren unterirdischen Teile wegen hier zu nennen wären.

b) Von den Früchten stehen die der Kürbis- und Gurkengewächse des Wasserreichtums ihres Fleisches und des Nährgehalts der Kerne wegen oben an.

Die Topnaars im Walfischbaigebiet haben ihren Stammesnamen *ǂna-ranin* von der Kürbisfrucht *ǂna-rab* erhalten, der *Acanthosicyos horrida Welw.*, von der sie einen großen Teil des Jahres leben (s. Analysen im Anhang). Die Zeit der Narareife fällt in die 4 ersten Monate des Jahres; die Hauptemtezeit ist der Februar und März.

Dann veröden die Werften. Die ärmeren Familien ziehen mit Sack und Pack in die Dünen, nehmen entweder ihr Mattenhaus mit oder errichten notdürftig aus Strauchwerk ein Obdach, kaum eine Hütte zu nennen, und kommen an ihre alte Wohnstätte nur, um Wasser zu holen, wenn es im Narafeld selbst nicht zu finden ist. Wohlhabendere Hottentotten bleiben zu Haus, lassen sich durch ihre Hörigen die Nara bringen und kommen nur hie und da auf einen Tag zum Besuch oder zur Inspektion heraus.

Halbreife Narafrucht. $^1/_3$ nat. Gr.

Die einzelnen Familien haben auf bestimmte Narabüsche (s. Tafel IX oben und Abbildungen S. 146, 147) erbliches Eigentumsrecht. Das ist der einzige mir bekannte Fall von Privatbesitz eines unbeweglichen Gutes außerhalb des Hüttenbereichs bei den Hottentotten. Seine Narabüsche verteidigt der Hottentott gegen Übergriffe von seinesgleichen auf dem gesetzlichen Wege der Klage vor dem Kapitän. Mit Bergdamara und Buschmännern wird kurzer Prozeß gemacht. Mehrere Fälle sind mir bekannt geworden, in denen die Diebe einfach niedergeschossen wurden auf dem Anstand am Narabusch, wo der Besitzer ihre Spuren zufällig gemacht und damit zugleich das Todesurteil gefällt hatte. Wenn überhaupt der Kapitän von einem solchen Vorfall Notiz nimmt, wird er nie die Partei des Getöteten nehmen.

Bei der Zubereitung der Nara fand ich im Besitz der Hottentotten im Walfischbaigebiet noch Knochenmesser vor, aus Rippen oder auch aus Unterschenkelknochen des Rindes hergestellt. Die Bezeichnung für ein solches Knochenmesser, *ǂâ-ros (ǂ Terz fallend), scheint mir soviel wie „das kleine Scharfe" zu bedeuten (ǂâ — scharf sein, -ro, Diminutivum, -s, Personalsuffix, fem.).

Ornamentierte Knochenmesser der Topnaar. ca. ⅓ nat. Gr.

Mit diesen Messern also wird die Frucht halbiert und in Zeiten des Überflusses roh ausgegessen. Der Inhalt, der sich aus der reifen Frucht in fünf natürlichen Doppelabteilungen leicht von der Schale lösen läßt, hat schwach rötlich gelbe Farbe und ist mit einem kühlen, süßen Saft durchtränkt, der im Geschmack und Geruch einem dünnen vanillierten Eiergetränk nicht unähnlich ist. Aber eine einzige Frucht genügt, dem Neuling in solchem Genüssen auf Zunge und Gaumen ein lästiges Gefühl von Wundsein zu erregen.

Ihre Bedeutung als Volksnahrung gewinnt die Nara erst, wenn sie haltbar zubereitet als Vorrat in die Hütten geht. Die ausgeschälte Frucht wird in walnußgroße Stücke zerschnitten, die reifen Früchte nur mit Fettzusatz, die nicht völlig ausgereiften auch mit etwas Wasser angesetzt, gekocht und mit einem Quirl primitivster Art, *dâdi-b (auch /aodo-s genannt) zu Mus verrührt. Dann wird die heiße Masse in ein Sieb gegossen, in ein Binsenkörbchen, *gutôrus, das so lange um starken Henkel auf und nieder geschüttelt wird, bis der schwefel- oder braungelbe Brei durchgegangen ist. Der Brei wird auf eine Dörre gegossen, nachdem ihm zuvor im Sand ein schwach geneigtes Lager geglättet worden ist. Nach 1—2 Tagen ist die Masse zu einem dunkelbraunen, auf der Unterseite stark mit Sand inkrustierten

[p 198a]

Fladen erstarrt. Ein solcher Narakuchen, *ǂgoaĭg(a)a-ribeb*, ist ungefähr ½ m breit, ¾ m lang und 3 mm dick, biegsam, knetbar, zähe, auf dem Schnitt dunkelschliérig glänzend, wenn zerrissen braungelb zerfaserend. Er hat den würzigen Geruch frischen Pumpernickels und läßt an den Fingern einen Fettglanz zurück. Als ich mir die Kuchen zuerst zeigen ließ, sah ich erwartungsvoll den alten, schmutzigen, eingerissenen Lappen, in dem ich die Leckerbissen vermutete, auseinandergewickelt werden, bis ich sah, daß es der Kuchen selbst war, mit dem hantiert wurde. Er schmeckt besser als er aussieht: Süß, kräftig und aromatisch; er zergeht langsam im Munde.

Korbeimer der Topnaars. ½ nat. Gr.

Harnspieß. ½ nat. Gr.

Jede Frucht enthält etwa 250 Kerne. Sie bleiben im Sieb zurück, werden zum Trocknen ausgebreitet und in Säcke gefüllt. Einzeln aus der harten Schale gelöst, ist der weiche Kerninhalt ebenso schmackhaft als nahrhaft. Die Hauptmasse wird aber mitsamt den Schalen in einem großen starken Holzbecher zu einer braunen, grobmehligen

Nara-Kuchen. ½ nat. Gr.

Masse zerstampft, die mit der Hand zu Bissen geformt und ohne Zutat gegessen wird.

Der Stampfbecher **hai-os* (der hier abgebildete, ist von einem Hottentotten aus dem Holz des Anabaumes geschnitzt) gleicht dem Holzgefäß, in dem die Buren und Bastards den Weizen stampfen und ist vielleicht von diesen entlehnt. Der Stampfer, *ǂō-ab* (= Arm) stammt vom Holz der Giraffenakazie.

Hinter der Nara stehen die übrigen Cucurbitaceen *(z. B. Cucumis, Citrullus* und *Coccinia)* des Namalandes zurück. Von den Kürbissen, die sie *tsaima-b* nennen, essen die Hottentotten nur die süße Art mit dem Fleisch, von der bitteren Art, **so-robe-tsaima-b (Citrullus colocynthis L.)*, frißt nur das Vieh Laub und Früchte und der Buschmann die Kerne. Die Tsamagewächse sind dagegen in der Kalahari (s. d.) entscheidend für das Tier- und Menschenleben weiter Strecken.

Namkara-Stampfer. ⅓ nat. Gr.

Von genießbaren Baumfrüchten sind außer denen des früher erwähnten Rasenkibusches und Schwarzebenholzbaumes die „wilde Feige", *ǂnoima-s*, und die Körner einer Anacardiacee, eines Taaibusches *(Rhus celastroïdes Sond*, h: *ǂa-nas)* zu nennen. Die Früchte der *Grewia flava D.C. (*h: *ǂaũis)* werden wir in der Kalahari kennen lernen.

c) Die Findigkeit des Hottentotten bei der Nahrungssuche wird frühzeitig zur Entdeckung geführt haben, daß gewisse Ameisen Samen eintragen, die auch für den Menschen genießbar sind. So sammeln große schwarze Ameisen, deren Bestimmung noch aussteht, die Kerne, die in flügelförmigen Lamellen eingeschlossen, fächerig in den gerippten Früchten der *Augea capensis Thbg.* sitzen. Die Hottentotten plündern diese Vorratshaufen der Ameisen („Mierkost"), rösten die Kerne in der Pfanne, zermahlen sie mit Steinen und essen das Mehl.

Besonders geschätzt sind solche Ameisenvorräte, die ausschließlich oder vorwiegend aus Samen der *Aristida*-Gräser bestehen. Ein derartiger Grassamenvorrat heißt *tsa-ǂmab*. Die Frauen kochen ihn mit Milch zu Brei.

Endlich werden auch die *//kχuni-b* genannten Vorräte, die aus den Samen der Buschmannskerze *(Sarcocaulon)* bestehen, gegessen. Die Hottentotten, mit denen ich diese Samen sammelte, behaupteten, daß mit den eintragenden Ameisen eine Schlange, *//kχu-ǃnibe-b* genannt, häufig zusammenlebe. Ein anderer Name dieser fragwürdigen, einstweilen zoologisch weniger als ethnologisch beachtenswerten Schlange ist **/ga-riao/ga-ǃmi. /gariaob* ist ein frischer, arbeitsfähiger, junger Mann, */gaǃm* ist töten. Der Name bedeutet also „Burschentöter": die Phantasie läßt diese Schlange um beide Fußgelenke des Mierkost-Diebes sich ringeln, um ihn festzuhalten, bis auf ihren Pfiff eine giftige Schlange ihn zu töten kommt.

Hölzerne Wannschüsseln, die untere mit eingebranntem Muster verziert. 1/4 nat. Gr.

Das Reinigen der Ameisenvorräte von Staub und Steinen geschieht in einer flachen, langgestreckten Holzschüssel *(ᵉ'nu-bi/o-reb)*. Die Masse wird hier durch einfaches Auf- und Niederschwenken der breit vor den Leib gehaltenen Schüssel von staubigen Beimengungen gereinigt: der Staub geht in die Luft, während die schweren Bestandteile in die niedersinkende Schüssel zurückfallen. Von Steinen wird die Kost durch eine eigenartige Doppelbewegung der Schüssel gereinigt: die rechte Hand faßt die Schüssel mit lockerem Griff an einer schmalen Seite und stößt die Schüssel nach vorn und oben. Die linke Hand unterstützt diese letztere Bewegung, indem sie die Schüssel (locker mit dem Daumen die Mitte einer Längsseite, mit den übrigen Fingern die Unterseite fassend) im Rhythmus der rechten aufwärts gleiten läßt. Alle Steine sammeln sich im tiefen, hinteren, die Kost im vorderen Bereich der Schüssel.

d) Als Gemüse seien hier einige Pflanzen aufgeführt, deren Blätter und Blüten oder fleischige Stammteil gegessen werden.

Eine Asclepiadacee, *Trichocaulon pedicellatum Schinz*, bildet dicke, fleischige keulen- oder birnenförmige Kolben, die der Pflanze den Namen */naǃba-kχaǃrab*, das heißt Nashornhoden, eingetragen hat. Nach Ausdrücken

oder Aussaugen des ungenießbaren Saftes wird das übrigbleibende Fleisch roh gegessen. Umgekehrt werden zwei dornbesetzte Sukkulenten *(ǂgoia-b* und *ǂkχo-bab* genannt) ihres Saftes wegen gesucht. Ein säuerlicher Saft erfrischt auch in den fleischigen Blättern gewisser Geraniaceen.

Anthericum drepanophyllum (Buk.) Schtr. 1/2 nat. Gr.

Pelargonium zonale Willd. 5/6 nat. Gr.

Die runzeligen, von graubrauner Rinde bedeckten, auf frischem Schnitt innen rötlichen Äste von *Pelargonium crithmifolium Smith, P. carnosum (L). Ait.* und *P. zonale Willd. (*h: **ǂhurms)* werden in der heißen Asche geröstet.

Eine Liliacee, *Anthericum drepanophyllum (Buk.) Schtr.*, h: **ǂkχo-rob*, liefert ein wohlschmeckendes Gemüse.

Kraut und Blumen der *ǂũrobis* genannten *Oxalis*-Art werden über dem Feuer in der Pfanne gedörrt, gestoßen und nach dem Erkalten in roher Milch durchgeknetet. Die Milch gerinnt dann. Alle grobfaserigen Teile werden ausgelesen. Kraut und Blüten zerteilen sich fein und werden aufgegessen.

Eßbare Blüten bieten mehrere Kompositen: die Blüten zweier *Gazania*-Arten (einer weiß- und einer gelbblühenden Art, beide **ǂgo-boũnâis* genannt) werden gern gegessen, roh oder unter Salzzusatz in kochender Milch zu einem Brei zerrührt.

Unter dem Sammelnamen *ǂgĩ-gyeiga-mes* werden eine Anzahl Kompositen zusammengefaßt, zu denen auch solche mit eßbaren Blüten gehören,

so die *Berkheya corymbosa D. C.* Die genannte Hottentottenbezeichnung umfaßt aber auch eine Hydrophyllacee mit eßbaren Blüten, *Codon Royeni Thbg.* (und wird endlich auch auf Kompositen angewandt, die nicht genießbar sind wie *Eremothamnus Marlothianus O. Hffm.*). Es muß zwar bedacht werden, daß manche der genannten Blüten für den Erwachsenen nur gelegentliche Zutaten sind, aber man darf an ihnen nicht achtlos vorbeigehen, weil sie für die Ernährung der Kinder, die sich selbst durchzuhelfen haben und sich an ihnen sättigen können, von Bedeutung sind. Das gleiche gilt von dem Gummiharz *(hai-rab)* der Akazien.

Codon Royeni Thbg. Nat. Gr.

3. Genußmittel

waren den Eingeborenen in früherer Zeit Aufgüsse aus Schotenfrüchten und Kräutern verschiedener Art. Auch heute noch werden die Kapseln von *Ectadium virgatum E. Mey.* und die Samen in den fingerlangen, steif

aufrecht stehenden Hülsen der *Acacia hebeclada D. C.* geröstet, gemahlen und kochend aufgegossen. Ebenso verwerten sie die Samen eines schotentragenden Busches, den sie *ǂkχāīs* nennen, leicht kenntlich an über fingerlangen, weichen, kiefernadelartigen Blättern, die paarweise an der Wurzel eines gelben, harten, spitzen, zentimeterlangen Dornes sitzen. Auch ein Farnkraut wird zu Tee aufgebrüht. Aber mit der Gewöhnung der Eingeborenen an unseren Kaffee und Tee haben die genannten Pflanzen ihre Rolle, wenigstens im Haushalt des gesunden Hottentotten, ausgespielt. Im übrigen ist der Hottentott seit seiner Berührung mit dem Weißen Sklave des Alkohols und des Tabaks geworden.

Farob, Teefarn. $^{3}/_{4}$ nat. Gr.

Tabak ist den Hottentotten beiderlei Geschlechts unentbehrlich; er ist das erste, nach dem sie frühmorgens beim Erwachen greifen. Sie haben ihn in Form großer Rollen oder als stark gepreßten amerikanischen Plattentabak kennen gelernt. Da ihn der Raucher erst schneidet *(χao)*, dann in die Pfeife stopft *(ǂhāi)*, nennen sie ihn **χaoǂhaib*, wenn sie nicht das Fremdwort *ta-bagab* vorziehen. Wilder Hanf, *da-χab*, den die Betschuanen so leidenschaftlich rauchen, ist im Namaland nicht unbekannt, wird aber seltener genossen. Die Hottentotten sind sparsame Raucher, sie ziehen den Rauch tief ein, halten ihn solange als möglich bei sich und lassen ihn nur langsam aus Mund und Nase abziehen. Die Tabaksschmiere ihrer Pfeifen wischen besonders Sparsame in eine kleine Ledertasche, *ǂnuni-ǂga-ǂrus*. Ist ihr Tabaksvorrat zu Ende, so zerschneiden sie das nikotingetränkte Leder und rauchen die Schnitzel mit Häcksel vermengt.

Der Alkohol war dem Hottentotten von Haus aus bekannt. Wo sie weit draußen im Feld den Genuß sich nicht anders als nach alter Väter

Art verschaffen können, brauen sie auch heute noch ihr Honigbier, *ǂkχa-ɪrib.*

Die wilde afrikanische Honigbiene (h: *ǂhabu-b)* baut im Namalande ihre Waben meist in Felshöhlen, seltener in hohle Bäume. Der Hottentott kennt genau die einzelnen Teile des Bienenbaues: Er unterscheidet genau am Honig *(dani-b)* den in den Waben aufgespeicherten Pollen *(ǂna!o-b)* vom Honigseim *(hũ-ɪdanib).* Die wächsernen Bienenzellen, zu einer Wabenscheibe vereinigt, wie sie bei der Zuckerbierbereitung nach Entleerung ihres Inhalts oben aufschwimmt, wird **ǂha-ɪmi* genannt. Davon werden die Waben, in der Brut liegt, als *ǂãib* unterschieden, und **tsžb* oder *tsžrab* ist die Masse, mit der die Bienen die gefüllten Honigwaben abdeckeln.

Honigstock. 1/6 nat. Gr.

Die Höhle, vor der Bienen gesehen werden, wird zunächst mit einem langen fingerdicken Holz sondiert. Klebt Honig an der Sondenspitze, so wird ein Feuerbrand in den Höhlengang gelegt und dadurch die Bienen so weit möglich vertrieben. Dann kriecht ein Mann in die Höhle und bricht die Honigwaben mit einer spitzen hölzernen Gabelhacke los.

Wo die Höhle zu eng ist, als daß ein Mann hineinkriechen könnte und wo ein kaum handbreiter Spalt den einzigen Zugang bildet, bedienen sie sich eines besonderen Honigstockes, **ǂa-rub* oder *ǂa-nib.* Sie schneiden aus den Zweigen des Taaibusches, besser aus den Wurzeln des Dornbaumes, einen langen, etwa kleinenfingerdicken Stock und befestigen an seinem Vorderende mit Lederstreifen zwei schwächere, fingerlange, spitz zulaufende Hölzchen, *ǂgaĩnkχa,* die nach hinten gerichtet sind; so kommt ein gabeliger Widerhaken zustande, der die Honigwaben faßt, wenn der Stock aus der Bienenhöhle herausgezogen wird. Aus der Haut des Leguans macht sich der Hottentott endlich auch einen Honigsack, **ǂkχo-rob,* in dem er den Honigseim sammelt.

4. Salz

bietet das Namaland in der Küstenwüste reichlich genug für den Haushalt s. Tafel IX unten). Die Weiber sammeln den salzinkrustierten Boden in Eimern, füllen Wasser auf, lassen die Lauge klar abstehen und gießen sie dann in ein flaches Gefäß, um sie in der Sonne verdunsten zu lassen.

5. Das Einnehmen der Mahlzeit

ist an keine bestimmte Stunde gebunden; nur das Frühstück als die erste Mahlzeit des Tages hat einen Namen: *so-bos*. Tagsüber regelt bei der Hütte das Ankommen des Viehes, auf der Wanderung die Einteilung des Marsches in Trekks, auf Jagdzügen ein glücklicher Schuß Zeit und Ort der Mahlzeit.

Im Feld dienen als Schüsseln und Teller mit Vorliebe die Zweige von *Mesembrianthemum Marlothii Pax* (s. S. 85), oft aber auch andere Büsche. In geordneten Verhältnissen dient die hölzerne *tore-s* als Eßschüssel; mit einem großen Holzlöffel, *#goia-b*, wird aus ihr den Umsitzenden ausgeschöpft.

Holzlöffel. $^1/_3$ nat. Gr.

Ständige Eßgewohnheiten fehlen. Nur zwei Gelegenheitsbräuche, die hie und da bei guter Laune eingehalten werden, sind mir begegnet. Ist die Zwiebelsuche erfolgreich gewesen, so machen sich alle, die im Kreis um den vollen Topf sitzen, ein kindliches Vergnügen, das sie **a-müga-ro* nennen. Es handelt sich da nicht um einen improvisierten Scherz, sondern um eine im Volk wohlbekannte Sitte: der Reihe nach darf jeder so lange zugreifen, als es ihm gelingt, die Zwiebel, die er hochwerfen muß, mit dem Mund aufzufangen. Auch alte Leute schließen sich dieser Sitte nicht aus.

Tsu-bugu/hu-ru nennt der Hottentott den Scherz, den Kinder sich machen, wenn sie ein Stück Fleisch, das ihnen gemeinsam gegeben wurde, in kleine Stücke zerschneiden, eines nach dem anderen auf einen Stein in ihrer Mitte legen und sobald die Hand des Gebenden zurückgezogen wird, mit schnell zufahrenden Händen zu greifen suchen. Dem Schnellsten gehört der Bissen.

E. Die Hautpflege

der Hottentotten kann schon aus dem Grunde, daß Wasser im Lande ein Wertobjekt ist, nicht ausschließlich nach unseren Grundsätzen der

1. **Reinlichkeit** beurteilt werden. Wo in der heißen Jahreszeit größere Wasseransammlungen, wie im Fischflußgebiet, sich halten, badet auch der Hottentott. Es wird ihm sogar Schwimmfertigkeit nachgerühmt [66]). Aber vor Waschwasser als täglichem Reinigungsmittel scheut er.

Dagegen ersetzt ihm frischer Ochsen- und Kühmist Wasser, Bürste und Seife zugleich und die trockene Luft das Handtuch. So sonderbar es auf den ersten Blick erscheint, so wirksam ist doch eine solche Waschung: Die Mistfeuchtigkeit genügt, die angetrockneten Hautausdünstungen zu lösen, die feinen Pflanzenfasern scheuern um so wirksamer, je trockener sie im Laufe der Einreibungen werden, und schließlich fegt die flache Hand ihren letzten Rest als leichten Staub von dem gereinigten und zugleich angenehm frottierten Körperteil ab.

2. Um der Haut die nötige **Geschmeidigkeit** zu geben, schmiert sich der Hottentott zum mindesten Gesicht, Kopfhaut, Hände und Arme, am liebsten aber, besonders die Frauen, den ganzen Körper mit Fett ein (*ǂkχaus(e)n* oder *soibos(e)n*).

Fetthornbüchsen. 1/4 nat. Gr.

Die Fettbüchse, **ǂkχĭ-nas* oder **/gŏunăs*, die in keiner Hütte fehlt, wenn die Insassen etwas auf ihr Äußeres halten, wird aus einem Ochsenhorn herausgeschnitten und die beiden Öffnungen des Ausschnitts mit Rindsleder, der Boden fest, der Deckel beweglich, geschlossen. Dem Fett vom Rind und der Ziege wird das des Schwanzes der Fettsteiß-Schafe seiner Weichheit wegen vorgezogen. Der Schmalz wird in die Ochsenhornbüchse über einen kleinen, drinnen liegenden Fellstreifen gegossen, von dem sich die Salbe jederzeit bequem in kleiner Menge zwischen den Fingern abstreifen läßt.

Das Einschmieren des Körpers mit Fett ist zugleich eine gründliche Massage, das Wort */gu-ri* bezeichnet beides. Zur Linderung eines allgemeinen Krankheitsgefühls, zur Körperpflege Schwangerer und zur Erhöhung

des Wohlbefindens (z. B. um vor dem Schlafengehen eine angenehme Müdigkeit hervorzurufen) ist die Massage die beliebteste Art der Körperpflege bei den Hottentotten.

Eingestochenes Ornament rund um die Feuthornbüchse. 1/2 nat. Gr. Die senkrechten Linien geben die natürliche Zeichnung des Hornes an.

Wohlgeruch suchen sie der Haut zu geben, indem sie sich mit Buchu einpudern *(ǁnôs(e)ñ)*. Der Buchu, *sâtb*, ist ein feines braunes Pulver, das sich die Frauen aus folgenden Bestandteilen, bald einzeln, bald vermischt, je nach Vorrat und Geschmack, zusammensetzen:

a) Aus den kurzen, fleischigen Blättern gewisser *Mesembrianthemum*-Arten, die sie **gai-* und **ǂkχari-ǂga-eb* nennen. Statt dieser Blätter dienen ober- und unterirdische Teile der verschiedensten St. äucher zur Buchubereitung, so der schlank zwiebelähnlich angeschwollene Wurzelteil einer *Cyperus*-Art.

b) Flechten sind sehr beliebte Buchu-Ingredienzien. Die *Parmelia hottentotta (Thbg.) Ach.* wird von den Steinen abgekratzt und daher **ǁu-inkχao-b*, d. h. „Steinkratz", genannt. Andere Buchuflechten gehen unter dem Namen **ǁna-ǂrobeb* und **ǁu-ǂrisâ-b*.

c) Das Sporenpulver eines Bauchpilzes (wie es scheint einer *Podaxon*-Art) ist an sich schon ein so feiner Puder, daß die Frauen den ge-

trockneten Sporenbehälter an einem Faden um den Hals hängen und ihn von selbst über Hals und Brust sich entleeren lassen. Die unterirdischen Teile des Pilzes werden getrocknet und gepulvert.

Die Buchukräuter heben die Frauen, die sie auch einsammeln, in einem Säckchen auf, das mit Vorliebe aus dem in toto abgezogenen Fell eines vorzeitig geborenen oder dem Mutterleibe entnommenen Lammes hergestellt wird. Die Pflanzenteile werden, wenn sie trocken sind, entweder direkt oder nach kurzem Rösten über dem Feuer auf Steinen pulverisiert, das Pulver häufig noch mit feinem Quarzstaub, *#guru-s*, versetzt, in eine flache Holzschüssel, *tsari-s*, geschüttet und durch Wannen von den groben Bestandteilen gereinigt.

Der so hergestellte Puder wird in eine Schildkrötenbüchse, */ü-ros*, gefüllt, die den unentbehrlichen Toilettengegenstand jeder Frau und jedes erwachsenen Mädchens darstellt. Die vordere Öffnung einer Schildkrötenschale wird durch Abschneiden eines Stückes des Bauchschildes erweitert, die hintere Öffnung mit dem geschwärzten Harz derselben Pflanze verklebt, aus der sie Perlen drehen. Zuweilen gibt die eintrocknende Haut und die eingezogenen Hinterbeine des Tieres einen genügenden Verschluß. Statt mit Harz wird der hintere Verschluß zuweilen auch mit einem erhärtenden Brei aus den gestampften frischen Speicheldrüsen des Rindes hergestellt. Ein Stück weiches Schakalfell dient als vorderer Verschluß und zugleich als Puderbausch. Durch ein Loch des Bauchschildes wird ein ledernes Henkelband gezogen.

Buchubüchsen. $^2/_3$ nat. Gr.

Die Männer reiben sich meist nur die Achselhöhlen und den Hals, die Frauen den ganzen Körper mit Ausnahme des Gesichtes mit Buchu ein.

Sie nehmen damit den Schweiß von der Haut und die Ausscheidungen der Regel weg. Die Angabe eines Hottentotten, daß sich die Frauen auch die Vulva und Scheide mit Buchu bestreuen, um hier durch die zusammenziehende Wirkung des Pulvers jungfräuliche Reize zurückzugewinnen, konnte ich nicht kontrollieren.

Lediglich des Wohlgeruches wegen räuchern sich *(ǂs(e)n)* die Frauen vielfach auch mit Buchu, indem sie das Pulver auf heiße Steine legen und den Dampf in die Kleider ziehen lassen. Buchu wird dem Säugling in die Fellwindel und dem Toten in das Leichenhemd und auf das Grab gestreut.

4. Die Farbe der Haut zu verschönern, bemalen sich *(ǂhoǂbe.)* Frauen und Mädchen das Gesicht. Das Pulver eines durch Eisenoxyd rot gefärbten Tonschiefers, *ǂnaub* genannt, wird mit rohem, durch Kauen geschmeidig gemachtem Fett verrieben und die Salbe mit dem Finger ins Gesicht geschmiert. Eisenrost dient, wo der Stein fehlt, als Ersatz. Der Effekt ist ein gleichmäßig braunroter Überzug des Gesichts, der zuweilen auch für unsere Augen die Reize eines hübschen jungen Gesichts erhöht, wenn er gut abgetönt ist.

Ein merkwürdiges Schönheitsmittel ist eine dunkelbraune klebrige Masse, die sich zuweilen in fingerdicker Schicht auf der Oberfläche von Felsen findet und „Steinschweiß", **ǂu-i aos-(e)ni* genannt wird (s. Analysen im Anhang). Die Stückchen werden auf einem flachen Stein wie Tusche mit Wasser angerieben und über das eingefettete Gesicht geführt. Die schmierig-fleckige Verteilung dieser Schminke ist häßlich.

Dunkle phantastische Gesichtsmasken malen sich die Hottentottenweiber mit Vorliebe an. Auf das vorher eingefettete Gesicht wird mit einem Fellwisch schwarzer oder roter Puder aufgetragen. Einen schwarzen Puder gewinnen sie aus den knolligen unteren Stammteilen eines *Pelargonium*, die scharf geröstet werden und dann aus ihrer Rinde eine staubtrockne, zerreibliche, dunkle Masse leicht ausklopfen lassen. Wer Rot vorzieht, stellt sich aus dem trocknen Kernholz der Giraffenakazie ein **ǂgürb* genanntes Pulver her. Ist das Gesicht fertig gepudert, wird vor dem Spiegel mit einem nassen Zipfel die gemalte Gesichtspartie scharf umrandet, hier und dort wieder rein gewischt, bis das Gesicht wie mit einer Faschingsmaske teilweise zugedeckt ist, aus der je nach dem Geschmack der Künstlerin bald nur die Augen und Nasenlöcher, bald auch die seitlichen Stirnpartieen und die Backenränder hervorsehen.

5. Haarpflege fehlt meist gänzlich. An der Küste wäscht sich der Hottentott zuweilen den Kopf mit dem Gelb roher Pinguineier, um den

Haarwuchs zu befördern. Rasur sah ich nirgends. Ein altmodischer Hottentott pflegte sein Haar mit der getrockneten rauhen Schleimhaut einer Rinderzunge zu bürsten.

Unserem Schweißtuch entspricht ein Schakal- oder Silber-Schakalschwanz, oder der dichtbuschige Schwanz des Löffelhundes, zuweilen ein Bündel Straußenfedern; **/na-bes* oder *gams* heißt dieser Schweißwedel.

Flöhe überwiegen auf den Küstenhottentotten, Läuse auf den Bewohnern der höheren Partien des Landes.

F. Medizin.

Die Medizin der Hottentotten wird durch die ausgezeichneten anatomischen Kenntnisse, die jeder einzelne von Jugend auf bei der Zerlegung des Schlachtviehs und Wildpreis sich aneignet, in keiner Weise gefördert. Über die Verrichtungen der einzelnen Teile machen sie sich keine oder nur vereinzelte verworrene Vorstellungen, und wo am kranken Körper kein äußerlich wahrnehmbarer Schädigungsgrund ersichtlich ist, geben sie alle anatomische Erfahrung preis.

So führen sie diffuse Schmerzen im Oberschenkel, zuweilen auch im Unterschenkel auf ein Heruntersacken der Eingeweide zurück. Massage in der Richtung nach dem Leibe soll die verlagerten Därme wieder zurückdrängen. Um sie aber vorher zu entleeren, wird das kranke Bein in der Richtung auf den Fuß massiert. Dadurch soll der Kot ausgestrichen werden; wohin er gerät, darüber machen sie sich kein Kopfzerbrechen. Der tatsächlich oft eintretende Erfolg der Kur bestätigt ja in ihren Augen die Diagnose zur Genüge. Am klarsten ist ihr Vorgehen noch, wo ihnen eine

1. Chirurgische Behandlung

angezeigt erscheint.

a) Der Aderlaß ist ein Universalmittel gegen jede auch nur einigermaßen lokalisierte Beschwerde. Im einfachsten Fall werden etwa 1 cm lange Einschnitte, *igo-regu*, in die Haut über dem leidenden Körperteil gemacht. Fast alle Hottentotten, die ich bei Körpermessungen näher untersuchte, wiesen Spuren dieser Aderlässe auf. In einem Fall war die Gegend des Schambergs und des Kreuzes mit einigen 40 halbzentimeterlangen Narben bedeckt. Die Wunden waren dem Mann als Kind vom Vater beigebracht worden, um „das tiefe Herunterfallen des Darmes in den Unterleib", an dem der Knabe litt, zu heilen.

Einen Aderlaß im engeren Sinne nennen sie *°/hui-ekys-rub* („Aderaufschlagen"). Er wird speziell gegen Steifheit und Schmerzen in den Gliedern angewandt und soll deren Anschwellung verhindern. Der Patient muß vor dem Eingriff ein heißes Getränk zu sich nehmen, dann wird ihm die Schneide eines scharfen Messers quer auf die Vena mediana cubiti im Ellenbogengelenk des rechten Armes gelegt und gegen den Messerrücken mit einem Stöckchen Holz geschlagen, daß die Klinge einfährt. Sie entnehmen bis gegen 100 ccm Blut, soweit ich schätzen konnte.

An das Öffnen der Ader schließt sich das Schröpfen, *gorra*. Als Schröpfinstrument *(°/hūrradi*, von „*°/hūi* = das Mark aus den Knochen saugen) dient ein Kalb- oder Ziegenhorn, das durch Kappen der Spitze auch am freien Ende eine Öffnung erhält, die Saugöffnung, die der Schröpfende in den Mund nimmt. Die entgegengesetzte, ebenfalls glatt abgefeilte, weitere Öffnung wird über den blutenden Einschnitt der Haut fest angedrückt. Das blutgefüllte Horn entleeren sie, um den Anblick des Menschenblutes schnell zu verwischen, nicht auf den Boden, sondern in einen nassen Kuhmistfladen.

Schröpfhorn. $^1/_3$ nat. Gr.

Die Wunde wird folgendermaßen geschlossen: sie stecken einen Dorn, *d*, zweimal tief in der Haut fest (bei *c*, rechts und ebenso links neben der Vene *a*) derart, daß er quer über die Schnittwunde *b* zu liegen kommt. Unter die freien Enden des Dornes schlingen sie einen Faden und schnüren ihn fest zusammen. Die Haut zwischen den Doppelstichstellen wird dadurch in zwei Falten erhoben, die sich fest gegeneinander pressen und so das Gefäß schließen. Der Dorn wird dann an beiden Enden gekürzt, so daß er unter dem Wulst des Schnürfadens verschwindet. Der Arm muß so lange in der Binde getragen werden, bis Dorn und Faden sich spontan ausstoßen.

Wundverschluß.

Westlich von *!Haγaβâβ*, im Grenzgebiet der Witbói und der roten Nation, soll ehedem, als das Wasser dort noch reich stand, ein Kurort im hottentottischen Kleinstil bestanden haben! Leute, die irgendwelche Beschwerden hatten und sich zur Ader lassen wollten, wateten barbeinig im Teich von *!Oãs* und ließen sich von den zahlreichen Blutegeln, die dort hausten, schröpfen.

Wenn man, ohne Arzt zu sein, nach kraß hervortretenden Symptomen sich ein Urteil erlauben und dabei auch auf den Sprachgebrauch der Buren (der den Ärzten in der Kapkolonie wohl bekannt ist) sich stützen darf, dann möchte ich behaupten, daß die Krankheit, die der Hottentott *!hutlitsa-b* oder häufiger, in Anlehnung an das Burenholländische „vulziekte", *fi-hiß* nennt, die Syphilis ist. Einzelne syphilitische Geschwüre werden mit einem halbscharfen, mehr reißenden als schneidenden Instrument (z. B. einem Quarzsplitter) oberflächlich geöffnet und die Wunde gewaschen, mit Seewasser von den Küstenbewohnern, mit einer Seife aus der Asche eines *ǂgaub* genannten Baumes im Binnenland. Darauf wird die Wunde tüchtig ausgeschabt. Schuld die Blutung nicht, bestreuen sie die Wunde mit Seetangpulver. Die starken hohlen Stiele der *Ecklonia buccinalis (L.) Hornem.* (!n: *!khîb*), die das Meer überall auswirft, werden langsam verkohlt (nicht verascht) und die Kohle pulverisiert. Vor dem Pudern der Wunde trinkt der Kranke zwei Schluck Seewasser.

Treten die Geschwüre diffus über dem ganzen Körper auf, so wird, wie mir ein eingeborener Augenzeuge mitteilte, der Kranke gewaschen und die Haut solange mit den Fingernägeln bearbeitet, bis der Körper blutüberströmt ist. Ein Mann überwindet das Zerkratzen der Haut, aber andere sind nötig, um den Patienten festzuhalten, der in seinem Schmerz um sich schlägt, zuweilen schließlich wird, so daß die Prozedur unterbrochen werden muß. Pudern beschließt den Akt. Wenn unter dem Schorf von neuen Geschwüre sich bilden, wird die Haut abermals aufgerissen.

Zur Hilfeleistung werden vom anderen Geschlecht immer nur der Gatte oder bejahrte Personen zugelassen. Die Behandlung selbst darf nur von solchen vorgenommen werden, die bereits von der Krankheit befallen waren. Im anderen Fall, sagen sie, würde die Behandlung nichts nützen. Sie kennen aber auch die Gefahr der Ansteckung, denn der Kranke darf mit Gesunden weder Lager noch Eß- und Trinkgeschirr teilen. Sie glauben nach dem Verschwinden der Geschwüre an eine Heilung und damit erworbene Immunität.

b) Unblutige Behandlung wird einigen Fußleiden zu Teil. Als „Fetzen-Fuß", **ui-gyeui-hes*, oder Erbsenfuß, **ui-mero-s*, wird eine Krankheit bezeichnet, die mit einem Anschwellen des Fußes und der einzelnen Zehen beginnt. Die auftretenden Teile der Sohle werden schmerzhaft, röten sich und die Haut blättert ab. In der Mitte des entzündeten Bezirks schimmert ein länglicher, ca. 2 cm großer dunkler Körper, **akiri*, durch. Um sein Herauseitern zu befördern, wird der Fuß in den warmen Mageninhalt einer frisch geschlachteten Ziege und für eine Nacht in den kleinen Magen desselben Tieres gesteckt. Öffnet sich der entzündete Bezirk, dann wärmen und weichen sie Pferdemist in Wasser und bestreichen den Fuß damit und binden ihn ein bis der genannte dunkle Körper aus der Wunde abgeht.

In der kalten Jahreszeit leidet der Hottentott nicht selten an blutig eiternden Einschnitten auf der Beugeseite der Gelenke an der zweiten bis vierten Zehe. Die Krankheit wird **o-ragyetsi-hes*, d. h. „Ringelche" genannt.

Eiternde Risse, **o-hagu*, in der Haut der Ferse werden mit Ohrenschmalz verschmiert, unter Umständen zugenäht, wo Nadel und Zwirn nicht zur Hand ist, mit Dorn und Bast. Um die Zehenwunde zur Heilung zu bringen, wird der Fuß in den warmen, ungereinigten Netzmagen einer Ziege oder eines Schafes, am besten (weil am größten) eines Rindes gesteckt. Hier bleibt der Fuß so lange bis der Mageninhalt erkaltet ist. Unter dem Namen **tho-ruagûr* ist diese Heilmethode jedem Hottentotten geläufig.

Als gutes Pflaster bei Hautschwierigkeiten an den Füßen gilt die frisch abgezogene Haut der Eidechsen aus der Gattung *Agama*; als Salbe wird das frische Gehirn dieser Tiere aufgeschmiert. Die getrocknete Wurzel des *Zygophyllum cordifolium L. f.* (der braunen Blätter wegen **ui-khaib* genannt) gilt pulverisiert, mit Fett verrieben, eine Wundsalbe.

Die Geschwüre mannigfacher Art, die unter dem Namen *ma-ragu* gehen, habe ich nicht unterscheiden können.

Bezeichnend für ihre Bildersprache ist eine Ausdrucksweise, mit der das Umsichgreifen eines Krankheitsherdes bezeichnet wird: Die Krankheit „hasst Hitzen" *(tam, verb.)*.

Als letzte chirurgische Leistung sei das Schienen *(gui-)* eines Knochenbruchs *(*kyio-s)* genannt. Sie schnitzen um das gebrochene Glied 3 schmale Holzleisten, die sie an den beiden Enden untereinander verbinden, so daß sie eine Art Futteral bilden. Das Glied wird vorher mit einem Fell umwickelt und für freie Blutzirkulation Sorge getragen.

2. Geburtshilfe.

In die intimen Fragen dieses Gebietes kann sich nur Einblick verschaffen, wer nach längerer Anwesenheit im Lande das Vertrauen älterer Weiber so weit gewonnen hat, daß überhaupt ein ernstes Eingehen auf dieses Thema möglich ist. Hat man dieses Vertrauen, dann ist man wohl vor bewußten Täuschungen sicher, aber nie soll man sich auch hier auf eine einzelne Person verlassen, stets das Gehörte aus anderem Munde und am anderen Ort auf seine Zuverlässigkeit prüfen, ohne in jedem einzelnen Fall das geringste der schon gewonnenen Kenntnis durchblicken zu lassen. Auf diese Weise konnte ich mit Zeit und Geduld aus den Angaben der Eingeborenen selbst über eine Reihe von Punkten eine unabhängig übereinstimmende, somit glaubwürdige Auskunft gewinnen. Direkte Beobachtungen auf diesem Gebiete waren mir nicht möglich. Ich habe die Lücken dadurch auszufüllen versucht, daß ich mir Handgriffe, von denen ich in Erfahrung gebracht hatte, daß sie an Schwangeren, Gebärenden und Wöchnerinnen vorgenommen werden, am Körper einer mir vertrauten Person ad oculos demonstrieren ließ.

a) Schwangerschaft (*ǂgûb-i, ǂgum*, verb.). Als ersten Symptom der Schwangerschaft sieht das Hottentottenweib meist nicht das Ausbleiben der Regel, sondern das Eintreten von Schwangerschaftsbeschwerden, *ǂgao-rab*, wie Appetitlosigkeit, Übelkeit, Erbrechen etc. an, vorausgesetzt, daß die betreffende Person sonst nicht unter diesen Störungen zu leiden hatte. Das Auftreten der Schwangerschaftsverfärbung im Gesicht bezeichnen sie mit demselben Wort, das Schminken bedeutet: dasselbe. Ob die früher genannte Sitte der Gesichtsbemalung ursprünglich vielleicht in einem Zusammenhang mit der Schwangerschaft stand, wird schwer zu entscheiden sein.

Mit Sicherheit behaupten Hottentottenweiber, Schwangerschaft im zweiten Monat durch Massieren des Leibes und durch Betasten der veränderten Gebärmutter von den Bauchdecken aus nachweisen zu können. Sobald Schwangerschaft vermutet wird, wird der eingefettete Leib wöchentlich zwei- bis dreimal von zwei Frauen 1—1½ Stunden lang massiert. Die Massage beginnt, nach abwärts fortschreitend, in der Mittellinie zwischen den Brüsten. Mit breit aufgesetzten Daumen fahren sie den Rippenbogen entlang seitwärts und kehren mit flach aufgelegten fünf Fingern von der Gegend oberhalb der Darmbeinkämme zur vorderen Bauchwand zurück. Sie achten nun sorgfältig darauf, ob sie ein Glucksen im Dickdarm hören; haben sie einen Wind

gefunden, so sind sie zufrieden; sie streichen ihn auf der linken Körperseite abwärts, bis er entweicht, um dadurch zu verhindern, daß er „in den Kopf" geht, denn dort würde er fieberhafte Erkrankung der Wöchnerin hervorrufen. Den Schluß der Massage bildet ein zartes Aufwärtsstreichen auf den Weichen zu beiden Seiten der Mittellinie. Dabei fühlen sie die Gebärmutter durch und stellen bei jeder neuen Sitzung fest, ob und in welchem Grade sie sich vergrößert hat.

Schwangere binden sich zuweilen ein ledernes Band, do-mrob, um den Leib, um ein Vorhängen des Bauches zu verhindern.

Über das Geschlecht des erwarteten Kindes sagen sie nichts Bestimmtes aus. Einen Knaben vermuten sie, wenn der Gebärmuttergrund einen großen Breitendurchmesser hat.

Erst vom 7. Monat ab gilt die Frucht als lebend. Über die definitive Lage des Kindes im Uterus sind sie offenbar gut orientiert; sie unterscheiden genau, ob der Rücken des Kindes dem der Mutter zugekehrt ist, ob dementsprechend die Stirn des Kindes gegen die Bauchwand der Mutter sieht oder nicht. Man kann also sagen, daß sie erste und zweite Schädellage (jede in ihrer häufigsten Unterart) wohl unterscheiden. Sie wissen, daß diese Lagen die einzig normalen sind.

Daß sie abnorme Lagen erkennen, ist nach dem Vorgehenden anzunehmen, sie korrigieren sie aber nicht, weder vor noch in der Geburt. Einführung der Hand in die Geschlechtsöffnung zum Zweck der Untersuchung ist unbekannt.

Eine besondere Diät hat die Schwangere nicht zu befolgen. Sie achten nur darauf, daß sie nicht an Verstopfung leide, weil das die Geburt erschwere und den Wochenfluß hemme.

Vorsichtsmaßregeln anderer Art hängen mit dem tiefgewurzelten Glauben an „das Versehen" Schwangerer zusammen. Die Geschichten, die hier die Hottentottinnen zu erzählen wissen, decken sich im Prinzip mit denen von Frauen unserer Rasse. Charakteristisch für das Hirtenvolk ist, daß eine Schwangere, die noch die Sitten ihrer Eltern ehrt, nicht zugegen sein darf, wenn geschlachtet wird; sonst würde ihr Kind mit aufgeschlitzter Kehle zur Welt kommen. Die Frau darf sich auch nicht mit hochgestreckten Armen oben am Mattenhaus zu schaffen machen, um ihr Kind vor verhängnisvoller Umschnürung durch die Nabelschnur zu bewahren.

Ihre Vorstellungen von der Einbettung des Embryo im Mutterleibe stehen wieder in merkwürdigem Gegensatz zu ihren guten anatomischen

Kenntnissen des Tierkörpers: die Empfängnis findet ihrer Ansicht nach in der Harnblase, *#kyara-s*, statt. Dort bildet sich eine zweite Blase, in die der Embryo dann eingeschlossen wird. Der Embryo ist nur ein Anhängsel des Embryo, das mit der Ausstoßung des Fruchtwassers, *#aiha-b*, der Nachgeburt und des Blutes in Stücke geht und sich bei der nächsten Schwangerschaft neu bildet. Dieser Anschauung entsprechend haben sie für Gebärmutter und Nachgeburt vielfach nur eine Bezeichnung, *#khi*. Aufgeklärtere unterscheiden beides, indem sie *#khi #gu* „was in der Mutter bleibt", also den Uterus, nennen und mit *#khi* die Nachgeburt in unserem Sinne bezeichnen. Aus einer stärkeren Inanspruchnahme der Harnblase infolge des Wachstums der Frucht erklären sie sich vielfach die Harnbeschwerden Schwangerer: die Blase ist eben der Mehrbelastung nicht gewachsen.

Den Eintritt der Geburt berechnen sie nur ungenau. Die Rechnung fängt mit dem Neumond nach Auftreten der ersten Schwangerschaftszeichen an. Jeder Neumond wird mit einer Kerbe in einer der Hüttenstangen verzeichnet. Wenn sie die neunte Kerbe geschnitten haben, halten sie sich für das frohe Ereignis bereit. Beispiel: Eine Frau bemerkt am 15. Januar 1904 zur Zeit des ersten Mondviertels, daß sie empfangen hat. Als Tag des folgenden Neumonds (16. Februar) macht sie die erste, am neunten Neumond (9. Oktober) die letzte Kerbe. Jetzt, 246 Tage, nachdem sie die ersten Schwangerschaftszeichen bemerkt hat, erwartet sie das Kind. Der Schwangerschaftskalender einer weißen Frau würde die Geburt auf Ende Oktober festsetzen.

b) Die Geburt. *#gara-s* das Gebären, *#ai-hi* das Geborenwerden; daneben hört man auch *°aiße-s* die Erleichterung, *kûi* das Bekommen; *ôa-s* bezeichnet das Kalben des Viehs und ist, vom Menschen gesagt, als roher Ausdruck verpönt). Zwar habe ich Frauen unmittelbar vor der Geburt gesehen mit dem Stabe der Hebammen in Hilfsbereitschaft: einmal sechs Weiber, in einer Hütte von knapp 3 m Durchmesser zusammenhockend, und in den Qualm des rußenden Feuers in ihrer Mitte mischte sich der Rauch des Kaffees, den sie brannten, und der Tabakpfeifen, die ununterbrochen die Runde machten. Es kostete Mühe, im Hintergrund auf dem Boden, mit Fellen zugedeckt, die Frau zu erkennen, der diese Versammlung galt. Ich konnte auch Wöchnerinnen besuchen und über die Einzelheiten des Wochenbetts mich orientieren. Aber trotz aller persönlichen Beziehungen zu mehreren Familien und deren weiterer Verwandtschaft ist es mir nie geglückt, Augenzeuge einer Geburt zu sein. Trotz ausdrücklich von der Schwangeren selbst eingeholter Erlaubnis, der Geburt beiwohnen zu dürfen,

wurde mir entweder erst das eben beendete Ereignis mitgeteilt, oder, wo ich es bevorstehen sah und rechtzeitig kam, die Erlaubnis nachträglich entzogen. Die Rücksicht auf die Kreißende, die den herrschenden Anschauungen entsprechend die Gegenwart auch eines männlichen Hottentotten nicht duldete, zwang dann zum Nachgeben. Zu aufrichtigem Dank bin ich daher meiner hochverehrten betagten Freundin Frau v. B. verpflichtet, die unter Hottentotten groß geworden und in ihren Hütten jährelang häufig als Geburtshelferin tätig gewesen ist; sie hat die Geburtsgebräuche, wie sie bei den noch kulturfremden Hottentotten des kleinen Namalandes anzutreffen waren, auf das beste kennen gelernt. Die Mitteilungen, die sie mir machte, habe ich an früheren und späteren Erkundungen im Groß-Namalande eingehend geprüft und würde deshalb auch ohne die persönliche Garantie meiner Gewährsmännin die Verantwortung für das folgende übernehmen.

Fälle, in denen eine Hottentottin im Feld niederkam und abends den Sprößling munter nach Hause trug oder sich selbst in einem warmen Kuhlager entband*), dürfen nicht als Norm angesehen werden. Es sind genügend Fälle bekannt, in denen Burenfrauen auf der Wanderschaft nicht minder primitiv geboren, ohne daß dies einen Schluß auf die Gewohnheiten unserer Rasse zuließe. Die Geburt ist bei den Hottentotten wie bei uns, in geordneten Verhältnissen, ein sorgsam vorbereitetes Ereignis.

Wer irgend kann, läßt sich, und wenn es von weit her wäre, eine in Hebammendiensten erfahrene Frau kommen. Diese wichtige Person bezeichnen die Hottentotten mit verschiedenen Namen. Sie ist entweder die *ikyâ-ris*, d. h. „die das Kind fängt *(ikyâ)*," oder die *sitâ-ris*, d. h. „die da sitzt *(sitâ)*." Stunden und halbe Tage lang wartend, bis sie zugreifen kann. Unserer Oberhebamme entspricht, insofern als sie die entscheidenden Anordnungen trifft, die *°ikyâi-matsas*, „die Frau, die den Nabel abschneidet".

Meist finden sich mehrere Frauen zu einer Geburt ein und nicht bloß als Zuschauerinnen. Wenn die ersten starken Wehen einsetzen, legt sich die Kreißende auf die linke Seite. Die Wehefrauen ordnen sich nun, nach dem was ich ermitteln konnte, folgendermaßen gruppiert: Eine sitzt hinter der Kreißenden am Kopfende des Lagers und stützt ihr mit dem Knie Schultern und Rücken, um sie in ihrer halb aufgerichteten, halb liegenden Seitenlage zu halten. Ihr gegenüber sitzt eine zweite Frau und schlingt den rechten Arm um den Oberkörper der Kreißenden. Sie hat die Aufgabe, sobald eine Wehe einsetzt, den Oberkörper der Frau vornüber zu beugen, ihr den Kopf gegen die Brust zu halten und ein Tuch vor den

Mund zu legen, so daß sie nicht frei ausschreien kann. Es würde den Tod des Kindes bedeuten, würde sich die Mutter auf den Rücken legen oder die Beine strecken. Ihr linkes Bein liegt, im Knie stark gebeugt, platt auf dem Boden; das rechte Bein, ebenfalls gebeugt, steht frei auf, der Oberschenkel ist so weit als möglich abgespreizt, der Fuß findet im Knie des linken Schenkels eine Stütze. Die dritte Wehefrau, die der Kreißenden gegenüber nahe dem Fußende des Lagers sitzt, hat eine doppelte Aufgabe: Mit der linken Hand muß sie die Schenkel der Frau in der eben genannten Lage erhalten; die rechte Hand drückt durch die Bauchdecken mit abgespreizten Daumen gegen den Gebärmuttergrund, um das Fortschreiten der Austreibung zu kontrollieren. Die Oberleitung der Geburt hat die Alte, die der dritten Wehefrau gegenüber auf der Rückseite der Gebärenden Platz nimmt. Ihre linke Hand liegt, innerem fühlend, in der Steißgegend der vor ihr Liegenden; die Hand folgt dem vorwärtsdrängenden Kopf des Kindes über das Steißbein zum Damm bis zur Schamspalte. Sobald sie mit der rechten Hand, die zwischen den Beinen der Kreißenden durchgeführt wird, fühlt, daß der Kopf ins Einschneiden kommt, läßt sie die Frau bei der nächsten Wehe so stark als sie kann, mitpressen.

Ist der Kopf geboren, warten sie keine weitere Wehe ab, sondern ziehen das Kind hervor, indem sie es unter den Kniekehlen fassen.

Der einzige energische Eingriff in den Verlauf der Geburt, den sie vornehmen, wenn die Austreibung trotz starker Wehen nicht von statten geht, ist die Erweiterung der Schamspalte. Zunächst wird versucht, sie in seitlicher Richtung zu weiten. Nützt das nichts, dehnen sie auch in der Längsrichtung. In einem Falle sollen vier Frauen ihre Finger in der Vulva gehabt haben. Hat auch diese Dehnung nicht Erfolg, dann wird der Damm absichtlich eingerissen, oft bis in den After, um Platz zu schaffen. Heilung eines Dammrisses wird nicht einmal versucht, schon deshalb nicht, weil man ja, wie mir eine Hottentottin als selbstverständlich mitteilte, dem folgenden Kind dadurch den Weg verlegen würde.

Alle Handgriffe werden unter der Fellecke vorgenommen, unter der die Gebärende liegt. Während der Geburt wird der Kreißenden Suppe zur Stärkung gereicht. Die Geburtshilfe liegt ausschließlich in den Händen von Frauen, mögen sie alt oder jung, Mütter oder nicht Mütter sein.

Mit der Niederkunft der Frau bringen sie hie und da den heißen Ostwind in vagen Zusammenhang. Wenn er weht, kann man die Frage hören: „Welche Frau mag heute niedergekommen sein?“

Das Abnabeln wird unverzüglich vorgenommen. Die Nabelschnur wi
etwa in der Mitte mit Sehnen- oder Dornbaumbastgarn unterbunden un
mit dem langen Fadenende an das linke Bein der Mutter geknüpft, um ei
Zurückschlüpfen zu verhindern. Zuweilen binden sie die Schnur an eine
der Hüttenstangen fest. Dicht hinter der Unterbindungsstelle, die am mütte
lichen Ende bleibt, wird dann die Schnur durchschnitten. Eine Spanne we
(sie messen mit abgespreiztem Daumen und Mittelfinger) vom Nabel de
Kindes entfernt wird jetzt die Schnur noch einmal unterbunden und dan
durchschnitten. Vom Blut, das aus dem Schnitte tropft, wird der Mutte
etwas eingegeben, wenn sie zu stark blutet.

Das Abnabeln nimmt die Alte vor, die bei der Geburt die Oberau
sicht hatte. Sie allein erhält auch Honorar: Das übliche waren zwei Ziege
für einen Jungen und eine Ziege, wenn ein Mädchen geboren wurde.

Sie machen keinen Unterschied zwischen toten und scheintoten Kindern
kennen keine Wiederbelebungsversuche. Kindern, die mit einem „Helm
ago-boro (later. Schnalzlaut), unserer Glückshaube, zur Welt kommen, werde
prophetische Gaben zugeschrieben.

Über die Lösung der Nachgeburt machen sie sich meist wenig Sorge
es ist ihnen gleich, ob sie nach einer Stunde oder nach Tagen kommt. I
einem Fall war die Nachgeburt noch am dritten Tage nicht gekommen, di
Frau fieberte, die Nabelschnur, an einer der Hüttenstangen angebunden
war zu einem trockenen Strang zusammengeschrumpft. Keine der Frauen
dachte an einen Eingriff. Ein durchreisender Arzt entfernte die Nachgebur

In anderen Fällen wiederum wird Medizin gegeben, wenn die Nach
geburt ausbleibt. Aus den unteren Stammteilen eines **ho-rus* genannte
Busches quillt ein Harz, das sich mit Sand und Staub inkrustiert und z
schwarzen Knollen mit rauher Oberfläche erhärtet. Diese Masse, **nuru-k*
(s. Analysen im Anhang), wird zermahlen und mit heißem Wasser aufge
brüht. Der Trank gilt, besonders stark zubereitet, auch als gutes Mittel
die Nachblutungen, deren Verhaltung als todbringend gilt, herbeizuführen
Zuweilen greifen sie auch, wenn die Nachgeburt am dritten Tage noch nich
gekommen ist, zu dem beliebten Mittel des Fellumschlags: Ein frisch abge
zogenes, lebenswarmes Ziegenfell wird (die nasse Seite nach innen) mit dem
Schwanzende auf die Kreuzgegend der Frau gepreßt, zwischen den Beinen
durchgezogen und auf dem Unterleib ausgebreitet.

Die Nachgeburt wird in die Erde gegraben.

c) Der Säugling. Mit dem neuen Erdenbürger werden nicht viel Umstände gemacht. Er wird nicht gewaschen, sondern mit einem Fell abgewischt, am ganzen Körper eingesalbt und mit zusammengeringelter Nabelschnur in ein Fell gewickelt. Eine Salbe aus Fett und einem Pulver aus gebrannten Straußeneierschalen wird stets für ihn bereit gehalten. Die Masse wird dem Kind auf Stirn, Schläfen und Nase, vor allem auch in die Nasenflügel gestrichen, um Niesen und damit Schleimentleerung herbeizuführen. Die Fontanellen werden dick verschmiert, weil ihrer Ansicht nach an diesen Stellen Krankheiten am leichtesten Zutritt haben.

Die neugeborenen Kinder reiner Hottentotten, die ich am Morgen nach der Geburt sah, hatten nicht fahlgelbe, sondern rosig angehauchte Haut.

Wenn der Nabelschnurrest abfällt, reiben sie in die Wunde eine verkohlte, trockene, zupferartige Masse, die aus den unterirdischen Teilen von *Oxalis caledonica Sond* (h: **thotabe-s*) hergestellt wird. Ist die Nabelwunde entzündet, wird diese Masse mit Fett verrieben aufgestrichen.

Säugende Topnaarhottentottin, ca. 35 Jahre alt.

Ein weit verbreitetes und für den Fortbestand der Rasse verhängnisvolles Vorurteil der klein-namaländischen Hottentotten war es, daß sie die Milch der Mutter erst etwa am dritten Tage nach der Geburt dem Kinde für zuträglich hielten. Bis dahin wurde dem Neugeborenen verdünnte Ziegen- oder Kuhmilch zu schlucken gegeben, wenn ihm nicht eine andere Frau, die ein eigenes Kind schon stillte, die Brust gab. Wurden im anderen Falle die künstlich gefütterten armen Geschöpfe am vierten Tage angelegt, waren sie oft schon zu schwach, um ergiebig saugen zu können.

Das Kind wird entwöhnt, indem sich die Mutter die Brustwarzen mit dem bitteren Blattsaft einer Aloë einreibt. Leidet die Mutter darunter, daß sie die Milch nicht mehr abgibt, dann melkt man sie ihr einige Male direkt in die heiße Asche des Herdfeuers ab. Wie dort die Milch verbrozelt, so soll sie auch in der Frau austrocknen.

d) Wochenbett. Unmittelbar nach der Geburt wird die Frau so warm als möglich zugedeckt, damit sie in Schweiß komme.

Von einem merkwürdigen Gebrauch, der heute wohl nicht mehr ausgeübt wird, berichteten mir Augenzeuginnen: Der Frau, die eben geboren hat und immer noch auf der Seite liegt, drücken eine oder mehrere Frauen fest auf den Hüftknochen. Zuweilen wurde diese Manipulation des „Hüftensitzens", **tnũthum*, so vorgenommen, daß die ausübende Person, während sie den Fuß auf die Hüfte der Entbundenen setzte, mit dem Arm an einer der Hüttenstangen Halt suchte, um sich noch fester gegen die Wöchnerin anstemmen zu können. Der Sinn dabei ist: Die Knochen, die ihrer Auffassung nach durch den Geburtsakt auseinandergewichen sind, wieder zusammenzudrücken. Dahin zielt auch die Vorschrift, daß die Wöchnerin nur auf der Seite liegen darf. Die Knochen der einen Seite sollen mit ihrem Gewicht gegen die der anderen drücken; in Rückenlage der Frau würde das Becken, wie sie sagen, auseinanderweichen.

Eine hottentottische Wöchnerin vom alten Schlag kommt mit Wasser nicht in Berührung, nicht einmal im Anschluß an die Geburt wird eine Waschung vorgenommen. Eine Weiße wollte einer Hottentottin, die stark blutete und schon mehrfach ohnmächtig geworden war, ein kaltes, nasses Tuch vorlegen. Als sie es aus dem Wasser nahm und ausrang, verließen die eingeborenen Weiber die Hütte und machten die Weiße für den Tod der Frau, den sie nach der Berührung mit dem Wasser für unabwendbar hielten, verantwortlich.

Die Wöchnerin bleibt in ihren Decken bis zum dritten, zuweilen bis zum siebenten Tage liegen. Nur die Decke, die ihr als Unterlage dient, wird gewechselt. Um ihre Bedürfnisse zu verrichten, verläßt die Wöchnerin vom ersten Tag ab ihr Lager.

Um die Nachwehen zum Verschwinden zu bringen, wird ein heißer Aufguß derselben gerösteten und zermahlenen wurzelartigen Gebilde gegeben, die auch bei der Nabelwundpflege verwandt werden.

Vom siebenten, zuweilen erst zehnten Tage ab geht die Wöchnerin meist wieder ihren Beschäftigungen nach. Die Angabe einer Frau, daß die

Regel, selbst wenn das Kind gestillt wird, schon einen Monat nach der Geburt wieder einsetzt, habe ich nicht kontrollieren können.

Zum Schluß ein Wort über mehrfache Geburten. Zwillinge zu gebären, scheint nicht als Glück zu gelten. Ein Fall von Drillingsgeburt ereignete sich im Jahre 1897 im Orte Spektakel. Die Hottentottin Anna Marie gebar in zweiter Ehe einem freigelassenen Negersklavenabkömmling, Johannes Fortani, zwei Knaben und ein Mädchen, die jedenfalls bis zum Jahre 1902 noch lebten. Auch einen Fall von Fünflingsgeburt konnte ich aus dem Jahre 1884 oder 1885 ermitteln. Der Vater Jacobus van Neel war ein Bastard, die Mutter, Trein genannt, brachte drei Mädchen und zwei Knaben lebend zur Welt. Die Kinder starben unmittelbar nach der Geburt.

Die medizinischen Kenntnisse und Heilmethoden der Hottentotten werden um so unklarer, je mehr sie sich dem Bereich des inneren Klinikers nähern. Das Wenige, was mir hier der Mitteilung wert erscheint, sind einige ausgewählte Beobachtungen über

3. Die Behandlung mit Medikamenten.

Nichts läßt der Hottentott da unversucht. Außer dem praktischen Erfolg, mag er eingebildet oder wahr sein, leitet ihn ab und zu auch eine Überlegung: Er weiß, daß unter den Pflanzen seines Landes manche Heilpflanze ist, doch weiß er auch von manchem Leiden, für das ein Kraut wohl gewachsen ist, das er aber nicht kennt. Weiter weiß jeder Hirtenknabe, daß die Ziege in der Wahl ihrer Futterpflanzen nicht heikel ist, sie frißt fast alles, also wohl auch (so kalkuliert der Hottentott) die Heilkräuter, die er noch nicht kennt. Die wirksamen Substanzen dieser Pflanzen gehen in die Ziege über und werden zum Teil auch im Mist enthalten sein. Deshalb gilt Ziegenmist als Heilmittel.

So besteht die Behandlung der Windpocken, *ikχo-ras*, darin, daß der Kranke einige Male am Tage einen Trank erhält, in dem etwa ein halbes Liter verdünnter Milch mit einer Hand voll frischem (oder dem doppelten von altem) Ziegenmist eingekocht ist. Von anderer Nahrung darf ihm nur mageres Ziegenfleisch gereicht werden.

Ob folgendes Verfahren, von dem mir zwei Augenzeugen unabhängig von einander berichtet haben, noch viel angewandt wird, sei dahingestellt: Mehrere Männer fielen über eine Ziege her, zogen ihr so schnell als möglich das Fell ab, um es noch warm dem Kranken auf den Leib zu legen. Es mag wohl sein, daß dieser Umschlag als wohltätiger Hautreiz wirkt.

Als unfehlbares Gegengift gegen Schlangenbiß gilt der getrocknete Leib der sogenannten Springschlange, **ǂno-ǂhoɪao-ɪs, Scelotes capensis Gthr.* Einige Finger breit oberhalb und unterhalb der Bißstelle wird je ein ca. 1 cm langer, tiefer Einschnitt geführt und das Blut etwa ½ Stunde lang aus jeder dieser Wunden mit dem Schröpfhorn ausgesaugt. Dann wird je ein kleines, kaum 1 mm messendes Bröckchen der getrockneten Eidechse in die Wunde gedrückt und mit Holzkohle eingerieben. Die Bißstelle selbst wird nur mit Wasser gewaschen.

Die „Springschlange", *Scelotes capensis Gthr.* 1½ nat. Gr.

Ebenfalls einer wissenschaftlichen Prüfung wert ist vielleicht die Verwendung des Schlangengiftes selbst als Heilmittel gegen giftigen Schlangenbiß.

Ein Hottentott, der die Giftschlangen seiner Heimat gut kannte, hatte sich angewöhnt, ein Tier, das ihn gebissen hatte, sofort zu verfolgen, ihm die Giftsäcke auszuschneiden und ein wenig von ihrem Inhalt, in Wasser getropft, zu trinken. Den Rest des Giftes trocknete er und hob ihn sorgfältig auf.

Ein anderer nahm als Präservativ gegen die Giftwirkung von Schlangenbissen die frische Galle einer *Cobra (*h: *ǂhuni-ǂhui-b)* ein; die Gewohnheit scheint nicht vereinzelt zu sein, denn Männer mit dieser Gewohnheit werden *ǂaoǁgū aon*, d. h. Schlangengiftmänner genannt. Dem Hautsekret solcher Giftesser wird mit Bestimmtheit (ob mit Recht, muß erst entschieden werden) Heilkraft bei Schlangenbißvergiftung zugeschrieben. In eine kleine, neben der Bißstelle beigebrachte Schnittwunde reibt der Giftesser von seinem Schweiß dem Patienten ein; oder er löst, was er sich von der Haut abgerieben hat, in Wasser auf und läßt es den Gebissenen trinken. Wer die schweißgetränkten Kleidungsstücke eines Hottentotten gerochen hat, dem erscheint die Angabe plausibel, daß, wenn überhaupt der Schweiß der Giftesser heilkräftig ist, dann schon

ein wenig des wässerigen Auszugs aus einem Stückchen seiner Kleidung wirksam ist.

Denselben Grundsatz, den der zuerst genannte Giftesser verfolgte (die Giftwirkung des Bisses durch Teile des giftigen Tieres selbst sofort zu bekämpfen), befolgen viele Hottentotten, wenn sie von einem Skorpion gestochen worden sind. Sie suchen unverzüglich einen lebendigen Skorpion, zerquetschen ihn und legen die frische Masse auf die künstlich etwas erweiterte Stichwunde. Gleichzeitig wird dem Kranken eine dünne Lösung von Tabakssaft in Wasser als Brechmittel gegeben, auf Grund der unklaren Vorstellung; auf diesem Wege das eingedrungene Gift aus dem Körper beseitigen zu helfen.

Es scheint, daß Tabakssaft (Pfeifenschmirgel) in die Wunde selbst oder in einen Hauteinschnitt neben ihr eingerieben, als Gegengift bei Schlangen- und Skorpionenstichen wirkt.

Ob sich im Übrigen trotz des blinden Probierens und der Selbsttäuschung der eingeborenen Heilkundigen und Kranken doch auch brauchbare Medikamente in ihrem Arzneischatz finden?

Alter Klippdachsharn, **ǂaũ-ǂaru-b*, der sich in Höhlen faustdick ansammelt, gilt als Heilmittel gegen jede Art von Verhaltung. Ein wallnußgroßes Stück wird in etwa ½ l heißen Wassers gelöst und der Trank heiß genommen. Er soll Verstopfung, Harnverhaltung, krankhaftes Ausbleiben der Regel kurieren und den Wochenfluß befördern. In dieselbe Kategorie gehören die vermeintlichen Wirkungen des früher genannten „Steinschweißes."

Ebensowenig vertrauenerweckend wie die vorhergehenden sind ihre Medikamente gegen Geschlechtskrankheiten. Als Präservativ gegen Gonorrhoe, **ǂgaims*, reibt sich der Mann oder die Frau rechts und links in eine kleine Schnittwunde der Leistengegend eine kleine Messerspitze voll eines Pulvers ein, das aus den Wurzeln der **ǂgurisab*-Pflanze*) hergestellt wird. Die Gonorrhoe selbst behandeln sie lokal, indem sie den Milchsaft aus den frischen Blättern einer **ǂgubi-b* oder **χamǂkχairab* genannten Pflanze in die Harnröhre tupfen. Oder sie graben die Wurzel der Pflanze aus und trinken den heißen Aufguß der zerstoßenen Masse in möglichst großen Quantitäten.

Syphiliskranke (denen sie empfehlen, frühmorgens einen Schluck ihres eigenen Harns zu trinken) schreiben dem Tee aus den stark aromatisch

*) Wo es mir nicht möglich ist, den botanischen Namen zu nennen, gebe ich wenigstens die Bezeichnung der Eingeborenen, die späteren Untersuchern ein Anhalt sein kann.

nach Terpentin riechenden, fleischigen Blättern einer Geraniacee (wie es scheint) eine Heilwirkung gegen den Ausschlag zu.

Die Medizin der Hottentotten ist eng verbunden mit

4. Zauberei.

Der */gai-ǂaob* genannte Arzt oder Zauberer, zu dem sich jeder machen kann, der es sich zutraut, trägt seinen Namen nach der Zaubermasse, */gaib*, die er in einer Büchse bei sich trägt. Die vegetabilischen Bestandteile dieser Masse sind Wurzelstücke der verschiedensten Pflanzen; das Fleisch und die Knochen von Chamäleon-Arten, Elefanten-Spitzmäusen, Fledermäusen und eines kleinen Vogels aus der Familie der Sylviiden (h: *ǂoregu*) werden getrocknet, bald grob zerkleinert, bald pulverisiert in das rohe Bockfett gesteckt, das die Zauberbüchse füllt und die wirksamen Bestandteile aus den verschiedenen Ingredienzien ausziehen soll.

Die Zauberbüchse ist zugleich der Giftvorrat des Hottentotten. Während das Bockfett nur Heilkraft besitzt, soll der übrige Inhalt, heimlich in den Tabak gemischt oder an das Pfeifenmundstück des Feindes geschmiert, Giftwirkung haben.

Die Büchse ist zugleich ein Wahrsagegerät. Ein Garnfaden wird in das Fett gesenkt; sein Ende, das frei aus der geschlossenen Büchse ragt, wird angebrannt und gegen den Wind gehalten. Die Richtung, in der der Rauch verpufft, schlägt der Hottentott ein, wenn er einmal ratlos ist, wo er entlaufenes Vieh oder einen verloren gegangenen Begleiter suchen soll. Will er seinen Gefährten noch unterwegs erreichen, um vor ihm seine Ochsen an der spärlichen Wasserstelle tränken zu können, so bindet er einen Knoten in den Faden und brennt ihn an: Wie hier am Knoten das heranglimmende Feuer erlischt, gleichsam angehalten wird, so soll der Gefährte auf seinem Weitermarsch angehalten werden, bis er eingeholt ist. Wer in dem Ruf steht, auf diese Weise in den Gang der Dinge eingreifen zu können, steht meist auch als Arzt in Ansehen. Neben zielbewußtem Betrug enthält die ärztliche Zauberei manche Prozedur, die auf gutem Glauben beruht und vielleicht suggestiv wirkt. Kopf- und Gliederschmerzen werden mit zwei speziell diesem Zweck dienenden größeren Glasperlen, */gai-ǂa-ǂmra*, weggezaubert: Ein Faden wird fest um den Kopf geschnürt, die beiden Perlen liegen dicht beieinander in der Mitte der Stirn. Sind sie im Laufe der Stunden weit auseinandergerückt, dann hat der Schmerz verschwunden zu sein.

Eine Lendenkette, *ǂnūti-b*, aus runden Straußeneier-Schalenstückchen hergestellt, bindet ein Hottentottenweib sich oder dem Kinde um die Hüften, wenn sie im Unterleib Beschwerden fühlt.

Die sogenannte Schreckkrankheit der Kinder, die sich darin kundgeben soll, daß das Kind aus unbedeutendem Anlaß in Ohnmacht fällt, hat ihren Namen **/kxams* von der Eland-Antilope, deren Fell in diesem Fall als Heilmittel hoch geschätzt wird. Das Fell wird in kleine Platten von Oktavformat und in $^1/_2$ cm breite Riemen geschnitten, getrocknet und mit Elandfett geschmeidig gemacht. Die Heilmethode besteht darin, daß ein kaum linsengroßes Stückchen der Fellplatte verascht, mit der Nagelfläche zerrieben und, in einen Schluck Milch vermischt, dem kranken Kind zu trinken gegeben wird. Der Riemen wird dem Kinde, wie die Figur zeigt, um die Brust gebunden. Wenn er nach einigen Tagen von selbst abfällt, gilt die Kur als erfolgreich beendet. Als Honorar bekam der Zauberer in dem mir bekannten Fall eine Ziege.

Knüpfung des Elandfellstreifens. In der Halsgegend: Vergrößerung der Endschlinge.

Mangelhafte und unregelmäßige Ernährung, Entbehrungen aller Art, Unsauberkeit, vorzeitiger Geschlechtsverkehr und übermäßiger Genuß von Alkohol und Tabak sind die Hauptschädigungen, unter denen der Hottentottenkörper leidet. Lungenschwindsucht *(ǂnoba-b)* und Geschlechtskrankheiten sind weit verbreitet. Die Syphilis fordert viele Opfer.

Wohl abergläubischer Furcht entsprungen, aber praktisch von hohem hygienischem Wert ist die Gewohnheit des Hottentotten, nach einem Todesfall die Hütte abzubrechen, um sie abseits, auf reinem Boden, neu aufzubauen.

Capitulum II.

Die Hütte und das Handwerk.

A. Die Hütte.

Die Hütte, *o-mi*, der Hottentotten stellt den Typus einer Nomadenbehausung dar: einen luftigen Wind- und Sonnenschutz, leicht an Gewicht,

einfach im Material wie in der Konstruktion und deshalb leicht einzureißen, aufzupacken und an anderem Ort wieder aufzubauen.

1. Materialien und Bau.

a) Das Gerüst der Hütte wird am besten vom Dornbaum genommen, der Elastizität seines Holzes wegen; demnächst kommt der schon leichter brüchige Hakjesdorn in Betracht, die Verwendung einer anderen Holzart ist Notbehelf.

Der Kuppelform der Hütte entsprechend gibt man den Gerüststangen eine bestimmte Krümmung*). Der frisch gekappte, entzweigte Ast (unten ca. 3 cm im Durchmesser stark) wird platt auf den Boden gelegt, das eine Ende und die Mitte mit je einem großen Stein beschwert, das freie Ende umgekrümmt, gegen einen Steinklotz gestemmt und in dieser Spannung gehalten bis das Holz getrocknet und damit gestaltfest geworden ist. Oder sie stecken die Äste bündelweise aufrecht in den Boden, schnüren die freien Enden zusammen, biegen sie nach unten und halten sie mit einem Riemen, der am Boden verankert ist, gespannt.

Hüttengerüst.

Die fertigen Gerüststangen, */hainagu*, werden senkrecht in den Boden gegraben, je nach der Größe der Hütte zu 20—60 in einen Kreis von $3^1/_2$—5 m Durchmesser geordnet. Die aufsteigenden Stammteile bilden dann das Wandgerüst und gehen mit ihren dünn auslaufenden umgebogenen Enden ohne Grenze in den Dachteil des bienenkorbähnlichen Baues über. Das montierte Gerüst stellt ein weitmaschiges Netzwerk von durchschnittlich $2^1/_2$ m

*) Diese Krümmung liegt als tertium comparationis einer hottentottischen Bezeichnung für Regenbogen zugrunde: **/a-bi/ha-/nab* d. h. „Regen-Hüttenstange."

Höhe dar; wo sich die Stangen entgegenlaufen oder seitlich überkreuzen, werden sie mit Riemen oder Baststricken aneinander geschnürt. Die Hölzer, die in flachem Bogen mit starker seitlicher Neigung gegen den Boden im unteren Wandteil verlaufen (meist 4 Paare), werden als **ǀnaǀnihaigu* besonders unterschieden. Größere Hütten erhalten zuweilen die nötige Festigkeit noch durch einen armstarken, senkrecht im Mittelpunkt der Hütte eingerammten Pfahl, der, wie bei den Betschuanen, die Dachmitte trägt. Sie nennen ihn dementsprechend **ǂgurihaib* oder *kχāǀnab*, auch **ǀnačhaib*, weil er im „Nabel" der Hütte steht.

Die Herstellung der Gerüststangen ist Männerarbeit.

b) Die Matten, die Dach und Wände bilden, werden von den Frauen hergestellt. Das Material zur Herstellung der Matten liefert ein Riedgras, gewöhnlich Binse genannt, eine *Cyperus*-Art aus der Sektion *Mariscus*, mit fettglänzenden Halmen und daher von den Hottentotten als *ǀhu-ǀmiǀharu-s* bezeichnet. Die Pflanze ist an Grundwasserstellen häufig.

Cyperus, Matteubinse.

Die Halme werden einzeln ausgezogen (nicht geschnitten), und, bis sie getrocknet sind, weggelegt.

Das Stechen und Säumen *(kχu-iam* oder **kχu-im)* einer Matte erfordert viel Arbeit. Die Frau sitzt in der früher (S. 181 unten) beschriebenen Haltung auf einem Fell am Boden. Vor ihr liegt, unregelmäßig aufgerollt, die werdende Matte. Etwa 20 Halme faßt sie von dem losen Haufen, der neben ihr aufgeschüttet ist, legt sich das Bündel quer vor die Füße, richtet die neuen Halme den bereits gehefteten an und hält sie dabei mit den Zehen des rechten Fußes in der gewünschten Lage am Boden. Zum Zusammennähen der Halme dient ihr eine knöcherne Nadel, **ǂkχa-ru nā-b*, aus einer Rippe oder einem Beinknochen gefertigt. Mit der linken Hand hält die Frau die eingefädelte knöcherne Nadel, mit der rechten schiebt sie über deren vorwärts gerichtete Spitze 3—5 Halme gleichzeitig hinüber, so

a *b*

Knöcherne Nadel z. Mattenstechen. *a* von der Kante. *b* v. d. Flachseite. 1/1 nat. Gr.

daß sie durchbohrt werden. Dann werden die gespießten Halme über die Nadel weg auf den Bastfaden gezogen und den dort angereihten angefügt.*)

Sind auf die geschilderte Art einige Tausend Halme aneinandergereiht, so werden sie in umgekehrter Reihenfolge (siehe die Pfeile in der schematischen Abbildung) in einigen Zentimetern Abstand vom ersten Stichfaden abermals durchbohrt und auf den Bast gezogen. Dasselbe wiederholt sich in abwechselnd entgegengesetzter Richtung so oft, bis jeder Halm bei einer Länge von ca. 1 m 16—18mal durchstochen ist.

Stechen und Säumen der Matten (Schema). *a* Halm, *b* Stichfaden, *c* Saumfaden.

Die freien Enden der Halme werden nun noch, in der Weise wie die Figur zeigt, jederseits paarweise oder zu dritt fest aneinander geschnürt und mit dem randständigen Stichfaden am Anfang wie am Ende der Matte verknüpft. Was von den Halmen über diesen Schnürsaum ragt, wird bis auf Fingerbreite mit dem Messer glatt abgeschnitten.

Damit ist die Matte jetzt fertig zum Gebrauch hergerichtet. Sie wird im allgemeinen */haru-b* (1 Terz steigend) genannt; mit */gũ/b* wird eine Matte bezeichnet, die aus beträchtlich stärkeren und längeren Halmen gefertigt ist.

Die Länge einer Matte schwankt je nach der Größe der Hütte (deren Wölbung sie ungeteilt überspannen soll) und je nach der Lage der Matte auf dieser Wölbung zwischen 4 und 8 m bei knapp 1 m Breite.

Die Halme liegen in der Matte nur so dicht aneinander, daß sie direktes Sonnenlicht abhalten. Durch die Ritzen lassen sie zerstreutes Licht genügend ein, um die Hütte angenehm zu erhellen, und Luft, sie zu ventilieren. Die Lehmhütte des Herero dagegen ist düster und dumpfig, bietet aber besseren Schutz gegen den Regen. Nur wenn es langsam rieselt und die Matte Zeit hat zu quellen, schließen sich auch die Halme zu einem Regen-

*) Im Klein-Namalande sah ich, daß die Matte nicht mit der eingefädelten Nadel gestochen wurde. Die Binsen wurden vielmehr mit einem platten Eisenpfriemen durchbohrt; der eingeführte Pfriemen wurde halb auf die Kante gestellt und so ein Kanal für den Faden klaffend gehalten. Der Faden wurde an einen Binsenhalm wie an eine Nadel gebunden und damit in den Stichkanal eingeführt. Diesen Einführhalm nennen die Klein-Namalander */kyo-rarab*, während die Topnaars mit diesem Wort das in die Knochennadel eingefädelte Ende des Bastfadens bezeichnen.

dach zusammen. Eine Matte hält 10—15 Jahre. In diesem ehrwürdigen Alter wird sie *tha-mi* genannt.

c) Die Befestigung der Matte am Gerüst erfolgt mittelst Riemen oder Baststricken an den henkelartig vorragenden Umbiegungen der Stichfäden, also längs der Mattenschmalseiten. Im Bereich der unteren Hüttenwand bis etwa in Mannshöhe werden die Matten (meist drei) mit ihren Längsseiten dem Boden parallel aufgehängt *(/nami)*; sie umfassen so das Gerüst kranzartig; die Ränder greifen breit übereinander. Die übrigen Matten werden senkrecht darüber längs über das Gerüst hinweggelegt, meist so, daß sie von Tür zu Tür verlaufen.

Fertige Mattenhütte.

2. Die Einrichtung der Hütte enthält nichts, was über die nackten Bedürfnisse des täglichen Lebens hinausginge. Zwei Türen, von denen immer nur die eine benutzt, die andere verschlossen wird, regeln die Ventilation. Die Türöffnungen, *°omaama*, d. h. „Hüttenmünder", ca. 60 cm breit, 1½ m hoch, liegen einander gegenüber, die vordere ist gegen Osten gerichtet. Der Türflügel selbst ist ein hart und straff getrocknetes Ziegen- oder Kalbfell, *°/gûnusgoas*. Außer in der Mitte seines oberen Randes ist auch seitlich je ein Riemen am Fell befestigt, mit dem es bei schlechtem Wetter fest an die Hüttenwand angeschlossen wird. Gehen die Bewohner aus, wird zur Vervollständigung des Verschlusses ein Stein auf den niederhängenden Rand des Felles gelegt. Aus alter Zeit hat sich hie und da die Erinnerung erhalten, daß zu Türfellen Elephantenohren verarbeitet wurden.

Schematischer Grundriß einer Hütte.
a Vorder-, *b* Hintertür, *c* Feuerstelle, *d* Stelzer, *e* Gerbstangen, *f* Seitenbaume, *g* Hinterraum.

Im Innern ist der geebnete Boden mit Fellen bedeckt. Nur in der vorderen Hälfte, der Tür genähert, bleibt die Feuerstelle frei.

Ist die Familie groß, so wird eine Herdstelle neben der Hütte unter freiem Himmel hergestellt, durch einen Halbkreis von ausgerauften Büschen gegen den Wind geschützt. Aber mag auch in einer solchen Windschirmküche, *#haob*, gekocht werden, die Feuerstelle im Innern der Hütte fehlt niemals. Das Abendfeuer, das gleich nach Sonnenuntergang angezündet wird, vereinigt die Familie und die unvermeidlichen Kostgänger, Freunde, Verwandte und Nachbarn.

Die Schlafstätten, *kχa-rogu*, liegen auf ebener Erde. Felle beliebiger Art sind die Unterlagen, Schafkompersen (s. S. 234 *β*) die Zudecken. Die Seitenteile der Hütte, *ǂanira*, d. h. der Raum hinter der Feuerstelle rechts und links neben dem Hinterraum (siehe unten) bieten die besten, dem Hausherrn und der Hausfrau, demnächst den älteren Familienmitgliedern reservierten Schlafplätze. Der Türe genähert schläft das ledige Gesinde, Knecht oder Magd, meist Berg-Damara- oder „Buschmann"-Leute, zur Beaufsichtigung der Kinder und des Viehes.

Das Hausgerät (s. Handwerk) und die Vorräte hängen an den Gerüststäben frei oder in Sehnennetzen und in Fellsäcken verpackt. Im Grunde des Hinterraumes, *ǂgu-rub*, d. h. des Raumes zwischen der Feuerstelle und der Hintertür, steht der sogenannte Steiger, *ǂhâs*, ein aus vier senkrechten, mit Zweigstümpfen als Aufhängehaken benutzten Ästen *(ǂâ!ti)*.

Ich habe der vorhergehenden Beschreibung solche Hütten zugrunde gelegt, die noch nicht die Zeichen jener rapid fortschreitenden Degeneration trugen, die das Volkstum des Namalandes heute auf allen Gebieten aufweist. Wird in 20 Jahren noch eine Mattenhütte zu finden sein wie die hier beschriebene? Sie werden allmählich alle wie die von Angra Pequena aus Lumpen und Abfällen des Haushalts der Weißen zusammengeflickt werden. Und wo früher, im Kreis zusammengeschlossen [67]), von einer Hecke aus gekapptem Dorngestrüpp umgeben [68]) [69]), Hütte an Hütte zu einem Kraal oder einer Werft *(ǂgaûs, ǂhaîs)* vereinigt war, und wo jetzt noch lockere Hüttengruppen *(ǂharigu)* beisammenstehen, werden bald nach dem Vorgang von Keetmanshoop schnurgerechte, polizei-übersichtliche Straßen entstehen, schließlich in Lokationsbaracken die letzten Reste ursprünglicher Wohnart verschwinden.

B. Lederverarbeitung.

Ehe der Weiße ins Land kam, waren die Felle der Haustiere und des Wildes das ausschließliche Material für die Kleider und Decken der Hottentotten. Heute muß man die Reste aus dieser Zeit mühsam zusammensuchen; sie sind zu finden, man muß sie nur aufzuspüren wissen: so in den Fellsäcken von Frauen, die sich trotz aller Druckstoffe und alles bunten Tücherschunds von ihrer Altvätermode noch nicht ganz getrennt haben und ihren Vorkaross und Fellschurz noch aufheben, — oder draußen im Feld, in den Hütten verarmter Viehknechte, die sich den Luxus europäischer Artikel nur von Zeit zu Zeit einmal leisten, im übrigen ihr Handwerk noch wie die Hottentotten vor 50 Jahren ausüben. Zu ihnen bin ich in die Schule gegangen.

1. Das Gerben, *ino-ro* im weiteren Sinne (gewöhnlich Frauenarbeit).

a) Das Verfahren selbst setzt sich aus folgenden Manipulationen zusammen: Das frisch abgezogene Fell wird, mit der Haarseite nach oben, zunächst zum Trocknen ausgebreitet, meist auf die Hütte gelegt, damit es vor Hunden sicher ist.

Ist das Fell trocken und hart, so wird es mit dem Saft sukkulenter Pflanzen, die auf der Fleischseite des Felles zerstampft (**ia-mai*) werden, aufgeweicht.

Die überschüssige Flüssigkeit wird abgegossen und das Fell zusammengerollt, damit es nicht vorzeitig trockne. Die Frau kniet sich nun auf die Rolle, nachdem sie nur so viel davon flach ausgebreitet gelassen hat, als sie zurzeit bearbeiten kann. Die Fleischseite des Felles wird mit Sandsteinpulver bestreut und mit einem faustgroßen Stück des Gerbesteins (**ikyoma*) fest gerieben (*mâi*).

Hat der Sandstein alle Fleischfetzchen abgeschabt, so lassen sie das Fell wieder halb austrocknen, walken (*ino-ro* im engeren Sinn) und kneten es dann wie Wäsche und schmieren die Außenseite mit weichem Fett ein.

Das Fell ist jetzt zwar trocken-geschmeidig, würde aber, wenn einmal vom Regen durchnäßt, beim Trocknen wieder hart und brüchig werden. Um das zu verhindern, wird das Fell mit dem zerstampften und aufgeweichten roten Bast der *Acacia horrida Willd.* gegerbt (**hasi*, wohl entlehnt). Dann wird das Fell, die Bastbäusche darin eingewickelt, für eine Stunde in die rote Bastlauge gelegt bis es sich vollgesogen hat. Halb wieder getrocknet,

wird es noch für etwa eine halbe Stunde in eine flache Grube ausgebreitet und mit schwach angefeuchtetem Sand zugedeckt *(thare-)*. Zum Schluß faßt ein Mann das Fell am Schwanz-, ein anderer am Kopfende, Frauen und Kinder an den Seiten und zerren und dehnen es glatt.

An der Sonne endgültig getrocknet, ist dann das Fell dauernd weich, regenfest und auf der Innenseite schön rotbraun gefärbt.

b) Die Gebrauchsgegenstände, die aus gegerbten Fellen hergestellt werden, sind:

α) Bodenfelle, *ngoro-n*. Sie sind die Teppiche der Hütte. Junge Rinder, Ziegen, Schafe, Springböcke und Ducker liefern das Material. Ein Einzelfell dieser Art wird *ngoro-s* genannt. *ngoro-b* ist die große Decke, die aus etwa sechs zugeschnittenen und mit Sehnenstreifen zusammengenähten Bodenfellen besteht.

β) Felldecken, „Kompenser", *nro-mti*, aus Schaf-, Schakal-, Löffelhund-, Klippdachs- oder Luchsfellen hergestellt, als Pelzumhang oder „Kaross", ein bequemes, schönes und warmes Kleidungsstück der Frauen (s. Tafel X); heute ist es fast vollständig durch europäische Kleidung verdrängt.

γ) Der Vorschurz*) *(ngoro-b, : Terz anzigend)* der Knaben ist ein Fellsatz, der aus jedem beliebigen schwachen Fell geschnitten wird; Ziegen-, Klippdachs- und Schakalfelle werden am häufigsten verwandt (s. Tafel XI). Das Fell ist an einem starken Lederriemen, *°nkyo-ngoro*, befestigt, der den Körper halb umfaßt und häufig ein Zick-zackornament erhält. Die Bezeichnung dieses Ornaments, *°nkyomthoti*, drückt aus, daß ein ähnlich schwarz-weißes Muster um die Mündung des hölzernen Milchbehälters eingebrannt wird.

δ) Der Hinterschurz *(ngoro)* der Mädchen (als weibliches Kleidungsstück auch speziell noch als *ngoro-khoi* bezeichnet) wird ausschließlich von Schaffell gefertigt, am liebsten von einem braun-weiß oder schwarz-weiß gescheckten. Mit einem messerartigen Instrument werden die Haare bis auf einen schmalen Rand und breite Ecken ausgestoßen. Der bunte Fellsaum hebt sich gut vom rotbraunen Leder ab. Der Hinterschurz deckt Gesäß und Schenkel bis zu den Knieen. Nach diesem Kleidungsstück wird die Fledermaus *se-ntsingo-khoi* benannt, da die Flughaut dem hängenden Tier so anliegt wie einer Frau der Hinterschurz.

ε) Alle Pelzmützen, *ngohoti*, die ich sah, waren aus dem Rückenfell des Erdwolfs gemacht. Der Rückenkamm des Tieres bildet auch auf der Mütze einen Längskamm langer Borstenhaare (s. Namib-Buschmänner, S. 99).

*) Vor- und Hinterschurz werden im Buschen „Bruchkarree" genannt.

[p234a]

ζ) Von kleinen Täschchen ist der sogenannte Schelmsack, *ǂkûnǂkûs*, zu nennen. Er trägt seinen Namen daher, daß er zur Aufbewahrung kleiner entwendeter oder einem anderen vorenthaltener Gegenstände dient. Der hier abgebildete ist aus dem Fell des Erdmännchens *(Cynictis)* hergestellt.

η) Ein Netzbeutel wird aus Gemsbock-Fellstreifen geknüpft.

2. Das Anfaulenlassen, *ǂûi*.

Das frische Fell wird fest zusammengeknüllt und in ein gegerbtes Fell eingewickelt, der Sonne ausgesetzt, nachts in die Nähe des Feuers gelegt, um die Fäulnis zu befördern. Ochsenfelle graben sie auch in den Erdboden der Hütte ein, knietief neben die Feuerstelle. Nach 3—4 Tagen stinkt das Fell und die Haare lassen sich leicht ausziehen. Das enthärte Fell wird zusammengerollt, ein Mann stellt sich mit beiden Füßen darauf und bearbeitet es von oben und unten und von der Seite her mit Fußtritten, bis es weich und fast trocken ist. Dann wird die Fleischseite mit Fett eingerieben.

Mütze aus dem Rückenfell des Erdwolfs. $^1/_3$ nat. Gr.

ǂkûnǂkûs. $^1/_3$ nat. Gr.

Auf diese Weise werden alle Felle vorbereitet, die zu Riemen geschnitten werden sollen. Die ganze Ochsenhaut oder die einer Oryx-Antilope wird in immer engeren Spiralen vom Rande her in einen großen Streifen aufgeschnitten *(ǂkarî-*, verb.). Die Weiterbehandlung ist verschieden, je nachdem es sich um Pack- oder um Ochsenriemen handelt.

a) Der Packriemen, *gurybûb*, muß glatt sein, damit er dem Lastier anliegt und nicht durch Rollen scheuert; er wird deshalb im Gegensatz zum Ochsenriemen nicht gedreht. Der unregelmäßigen Außenkontur des

Nordwand aus Fellstreifen geflochten. ¼ nat. Gr.

Felles entsprechend ist der Rahmreifen vielfach geknickt und mit ausspringenden Ecken besetzt. Es fordert einen vollen Tag Arbeit, ehe alle Unebenheiten weggeschnitten und die Verdrehungen glatt gedehnt sind. Der fertige Riemen ist ca. $2^1/_2$ cm breit. Die Abfälle werden zu Spannsenseln oder Nasenriemen (für den Reitochsen) verarbeitet.

Drehen des Ochsenriemens.

b) Zur Herstellung von Ochsenriemen (Stärkeriemen zum Festmachen der Ochsen) wird der naß aus dem sinkenden Fell geschnittene Spiralstreifen an einem genügend ausgreifenden Ast eines starken Baumes, in der Weise wie sie die Figur zeigt, aufgehängt und beschwert. Ein schenkelstarkes, knieförmig gebogenes Holz ist mit Riemen an einem schweren großen Stein befestigt. Zwischen Holz und Stein steckt der Drehstock; an ihm geht der Mann wie ein Esel in der Mühle im Kreis herum bis die lang herunter und hier nebeneinander hängenden Hautstreifen sich zu einem fest gedrehten Tau verkürzt haben. Dann zieht der Mann den Stock heraus, läßt das übergedrehte Tau zurückschnurren und dreht es in entgegengesetzter Richtung von neuem auf. Von Zeit zu Zeit wird das

Tau eingefettet. 4—5 Tage wird diese Arbeit fortgesetzt, dann ist der Riemen rund, fest und geschmeidig. Er wird dann in einzelne Ochsenriemen zerteilt. Ob diese Art der Lederbearbeitung dem Hottentotten ursprünglich eigen war oder ob er sie entlehnte, erscheint unsicher. Buren sowohl als Betschuanen (in Kanya) sah ich in der geschilderten Weise sich Ochsenriemen herstellen.

c) Schuhsohlriemen, *ǂ-gu*, werden mit Vorliebe aus den Fellen der Rapidorcasantilope hergestellt, Peitschen, sonstige, wohl nach dem Vorgang der Buren aus Ziegenleder geflochten. Das beste Material für den Vorschlag liefert der Kudubull; der echte Schambok, *ǂuiba-b*, wird aus Nilpferdhaut geschnitten.

Vorschurz der Mädchen. ⅛ nat. Gr.

d) Frauen und Mädchen verfertigen sich ihren Vorschurz (hier speziell *to-ǂab* genannt) folgendermaßen:

Aus einer enthärteten Schaf- oder Ziegenhaut wird ein rechteckiges Stück ausgeschnitten und von einer der Längsseiten (vom späteren Unterrand aus) in tief einschneidende, ca. 1 mm breite Streifen zerschlitzt. An der gegenüber liegenden Längsseite bleibt ein ca. 15 cm breiter Rand erhalten, der späteren Oberrand des Schurzes. Das so zusammengeschnittene Fellstück wird in 3 Lagen gefaltet, so daß das Streifengehänge dicht genug wird, um die Blöße zu verdecken. Der Oberrand wird um-

---

*) Man hat das Wort *to-ǂab*, Vorschurz der Frauen, an verschiedenen Wortformen verdächtigen wollen: der Vorschurz sag — sexuelle sun sunt sexus — gelegentlich sexus; demzufolge hat Dickens*) das Wort von der Bezeichnung für „vagina" abgeleitet und mit „Trieb" übersetzt. Das ist sprachlich unmöglich, da vagina nicht *ǂab*, sondern *ǂabi* heißt. Krönlein*) bringt, offenbar an das Streifengehänge anknüpfend, das Wort mit der Bezeichnung für „schlitzen" in Zusammenhang. Aber den gleichbedeutenden Eigennamen der Haut zu Halbwerken wird *ǂabi* (= Torn-ung) gegenüber, in Tonalismus, Wortzeichen und Lage den Schön-Akzenten verschieden von der Bezeichnung für den Vorschurz. Es handelt sich hier meiner Auffassung nach um drei Worte, die sich nicht verwechseln dürfen können: drei Schnure mit gleicher Konsonantenfolge, jedes phonetisch und begrifflich selbständig.

geknickt und durch den Knick das Aufhängeband gezogen, ein 1 cm breiter rechts und links noch festgenähter Lederstreifen, *ñâ-ab*, der um die Hüften geschlungen und hinten geknüpft wird.

e) Der Sparsack, *ma-mabbi*, nimmt alle später vielleicht noch brauchbaren Abfälle des Haushalts auf. Da sind ein paar Kaffeebohnen liegen geblieben, dort liegen Kürbiskerne, hier ein Streifen Leder, dort hat jemand ein Stück Tabak fallen lassen, — alles derartige wird in den breiten Sack gesteckt, der mit zwei Riemen seiner Oberecken an Stützpfählen der Hütte hängt. Zu seiner Herstellung werden zwei Ziegen- oder Klippbockfelle mit ihren Rändern aneinandergepaßt und mit Sehnensträhnen rundum zugenäht, bis auf eine Stelle in der Mitte einer der Längsseiten. Die hier freigelassene Öffnung ist gerade groß genug, eine Hand einzulassen. In Zeiten der Not wird in den Sack gegriffen, er ist die letzte Zuflucht: eine Hand voll Kaffee und einige Pfeifen Tabak sind sicher aus dem Trödelkram, der sich hier angesammelt hat, noch zusammenzurauchen.

f) Eine sonderbare Sparbüchse für Tabak ist bei armen Hottentotten das Kopfkissen, *ekye-ôb*. Aus zwei Ziegen-, Schaf-, Klippspringer- oder Steinbockfellen wird ein Paar gleichgroßer Quadratstücke geschnitten, an drei Seiten zugenäht, die so entstandene Tasche mit Klippspringer- oder Ochsenhaaren oder Federn vollgepfropft und dann geschlossen. Will sich jemand für schlechte Zeiten Tabak sparen, so verkleinert er ihn, öffnet das Kopfkissen an einer Naht, streut die Krümel zwischen die Kissenfüllung *(ikyubi)* und näht zu. Auf diese Weise schützt er sich vor eigener Nascherei: Es muß schon harte Notzeit sein, ehe er sich entschließt, das Kissen aufzutrennen, um aus einem Haufen Haare einen Fingerhut voll Tabakstaub sich zusammenzulesen.

β. Das Frischtrocknen.

α) Was vom Rückenfell einer Oryx-Antilope oder einem Rinde für Sohlenleder bestimmt ist, wird frisch abgezogen, in lange rechteckige Stücke zerschnitten *(ikye-ni*, verb.) und hart getrocknet. Die steifen Platten werden auf ein Lager von frischem Kuhmist gelegt und mit Kuhmist zugedeckt oder in feuchten Sand gegraben, bis sie sich erweicht haben. Dann rollt man sie, schlägt sie mit Holz geschmeidig, feuchtet sie in nassem Sand schwach nach, schneidet sie zu und verwendet sie ohne weiteres. Die Haarseite des Fells wird zur Außenfläche der Schuhsohle *(khaibe-b*, auch *-m Sehuh)*. Es ist anzunehmen, daß nicht der hier abgebildete, jetzt von Hottno-

ottos viel getragene Schuh, sondern die Sandale, *ikyabo-s*, die ursprüngliche Fußbekleidung war.

b) Zu einem großen Wassersack, *gurbo-b*, wird die Haut einer Ziege, eines kleinen Kalbes, Oryx-Kalbes oder eines Steenbocks verarbeitet: das linke Vorderbein eines frisch erlegten Steenbocks wird längs geschlitzt und der Schnitt bis zur vorderen Schultergegend verlängert. Aus dieser Öffnung wird der ganze Körper aus dem Fell geschält; Kopf und Beine werden abgeschnitten und, ebenso wie die Schulteröffnung, der After und Blase- oder Schußwunden zugenäht; das Fell des rechten Vorderbeines dient als Ein- und Ausgußröhre und erhält einen leicht aufzuknotenden Steinverschluß. Das frisch abgezogene Fell wird umgekrempelt, die Fleischseite von allen Fleisch- und Fettteilchen gesäubert und dann getrocknet. Die Haare bleiben und kleiden die Innenseite des Sackes aus.

Frauenschuh. 1/4 nat. Gr.

Schemenhaft der Mündung des Fellwassersacks.

Der Mündungsschlauch wird umgebogen, in den Knick ein Stein (*a*) gebunden und der Schlauch zweimal um Stein, fest auf sich selbst zusammengeschnürt. Die Enden beschweren Anfang und Ende des Schnürbandes (rechts um die Fußknöchel, links um einen Finger, gebunden).

Frischer und kühler bleibt das Wasser in Säcken aus Tiermägen, wie sie sich die Kaffernhottentotten z. B. aus dem Magen der antarktischen Pelzrobbe herstellen.

Diagonaler Querschnitt einer Öffnung mit einer Flechtart und Schnürung. Die Richtschnüre wird in der Richtung der Pfeile durch Löcher gezogen, die im Umkreis der verschließbaren Stelle gemacht sind. Um diese Öffnung als feinen Hals wird die Pelzhaut in konzentrischen Schlingenführung geschnürt.

4. Gemischte Behandlung.

a) Für die Kaapstecke, *skoe*, meinen Ziege, Kalb, Oryxkalb, Steenbock, Springbock, Klippspringer und Ducker ihr Fell lassen. Dem Tier wird

der Kopf abgeschnitten, dann von einem bogenförmigen Schnitt aus, der längs den Hinterläufen und quer über die Dammgegend geht, das Fell mit der Faust losgestoßen und umgestülpt vom Leib gezogen. Das Fell lassen sie nun zunächst in der oben angegebenen Weise anfaulen. Ist es dann

Wanderknappsack, aus einem Bockfell hergestellt. 1/4 nat. Gr.

enthärt und trocken, so wird es gegerbt wie unter 1. beschrieben. Im fertigen Sack ist die ehemalige Haarseite nach innen gekehrt, dem Sackgrund entspricht das Kopfende des Tieres.

Kleiner Handknappsack, aus dem Fell eines Ziegenlammes hergestellt. 1/4 nat. Gr.

Die größeren Knappsäcke dienen zur Aufbewahrung alle Gegenstände, die man bei einer Fußwanderung benötigt, entsprechen also unserem Rucksack. Kleinere Säckchen dienen als Pompadour, den Frauen für ihre Buchukräuter, den Männern (zuweilen auch Frauen) als Pfeifentabak-, Zunder- und Feuerstein

dose; der beiden letzteren Gegenstände wegen heißt dieser männliche Pompadour *doro ǂhōīs**).

b) Das Oberleder wird aus der Bauchhaut der Oryx-Antilope geschnitten oder von der Kuh und jungen Rindern, im Notfall von dem frischen Fell alter Tiere genommen. Die Bearbeitung entspricht der des Knappsackleders.

Doro ǂhōīs. ca. 1/4 nat. Gr.

c) Aus Ziegen-, Steenbock- oder Klippspringerfellen schneidet sich der halbwüchsige Hottentott seinen Hinterschurz (s. Tafel XI). Zuweilen hängen vom Unterrand des Schurzes drei lange, 4 cm breite Riemen bis auf den Boden herunter, ein Schmuck in ihren Augen, wenn sie im Winde flattern.

C. Seilerei.

Der Bau der Hütte und das Anfertigen der Fell- und Leder-Gebrauchsgegenstände *(sa-ran* genannt, soweit sie als Decken oder Kleider direkt dem Körper zugute kommen*)* erfordert Stricke und Garn. Die Sehnen der erlegten oder geschlachteten Tiere liefern das beste Garn zum Aneinanderstücken der Felle; zum Mattenstechen wird nicht Sehnengarn, *saba-b*, sondern Baststrick, *tsa-rib*, gebraucht.

Das beste Material für die Herstellung von Stricken liefert die *Acacia horrida Willd.* Die frisch gekappten, von Seitenzweigen und Dornen befreiten Äste werden kurz durch die heiße Asche der Feuerstelle gezogen, die Rinde dann an einem Ende des Zweiges durch Klopfen vollends vom Holz gelockert, mit den Nägeln gelöst und in Streifen abgezogen.

Das weitere ist Frauenarbeit. Die Borke, *soro-b*, die darunter liegende rote Rindenschicht, **hmib* (wohl entlehnt), wird nicht zur Strickherstellung benutzt. Nur die innerste weiße Schicht, die sich leicht abschlitzen läßt, ist brauchbar. An dieser weißen Fasermasse, *idib*, wird wieder die nasse, dem

*) Die Zunderdose, die dem Hottentotten von den Weißen verkauft wird, wird mit demselben Wortstamm *ǂhōīs* bezeichnet, der „Zucker" bedeutet. Das ist ein Überbleibsel aus der Zeit, da das ursprüngliche, längst verschwundene Feuerzeug der Hottentotten noch Bekanntschaft war, wie sie den Buschmann noch heute zum Feuermachen dienen (s. Kälteart).

Holz unmittelbar anliegende, von der äußeren zäheren, nicht nassen Schicht getrennt. Die Fasern werden zum Trocknen aufgehängt, später in lauwarmer Milch (im Notfall Wasser) wieder aufgeweicht, klumpenweise in den Mund genommen, ausgesaugt und zerkaut. Jetzt sind die Fasern genügend vorbereitet, um zu Stricken gedreht zu werden.

Die folgende Arbeit nehmen die Frauen nur ungern, zuweilen überhaupt nicht in Gegenwart junger Männer vor. Seitwärts auf dem Boden sitzend entblößen sie bis fast zur Hüfte einen der Oberschenkel; dessen Fläche dient ihnen als Unterlage bei der Arbeit: Zwei Bastfasern werden quer über den Schenkel ausgestreckt, zwischen den Fingern der linken Hand gehalten und mit der Fläche der rechten fest über die Schenkelhaut gerollt, so daß sie sich um sich selbst drehen. Durch diese erste, kniewärts gerichtete Rollbewegung wird jede der beiden Fasern einzeln zu einem Faden gedreht; das unmittelbar folgende rückwärtige Rollen dreht dann diese beiden Fäden in entgegengesetztem Sinne wieder zu einem einzigen Faden zusammen.

Die Aufgabe, aus Hunderten kurzer Fasern ohne Knüpfen einen zusammenhängenden Strick von vielen Metern Länge herzustellen, lösen sie folgendermaßen:

Herstellung langer Schnüre aus kurzen Fäden (Schema).

1. (Siehe Figur I.) Das Ende des Fadens a, der verlängert werden soll, wird gabelig ausgefasert; dem kürzeren Gabelast wird der längere, dem längeren Gabelast der kürzere Schenkel des anzustückenden, gabelig geknickten Bastfadens b_1 angelegt. Der Faden b_1 ist halb so stark als a.

2. (Siehe Figur II.) Jeder Gabelast wird, soweit er aus den zwei lose nebeneinanderliegenden Fasern oder Faden besteht (bis °), durch eine kniewärts gerichtete Rollbewegung zu einem einzigen Faden zusammengedreht. Das rückwärtige Rollen schlingt dann die gedrehten Gabeläste zu einem einzigen Fadenstück zusammen. Der Faden b_1 ist jetzt verankert. Das frei hervorragende Ende des Fadens a wird nun wieder in einen längeren und in einen kürzeren Gabelast ausgefasert; dem letzteren wird das frei vorragende Ende des Fadens b_1 beigegeben.

3. (Siehe Figur III.) Eine doppelte Rollbewegung schließt die losen Fäden bis ** zu einem neuen Fadenstück zusammen. An das letzte Endchen des Fadens *a* wird dann der längere Schenkel des Fadens b_2, an das frei vorragende Ende des Fadens b_1 der kürzere Schenkel des Fadens b_2 angelegt und alle diese Teile bis *** zu einem Fadenstück zusammengedreht.

Sehnen-Netzbeutel. $^1/_6$ nat. Gr.

Auf diese Weise schließen sich alle kürzeren Fäden zu einem Strick zusammen, dessen Festigkeit nichts zu wünschen übrig läßt.

Der einzige ausschließlich aus Sehnen

Verschlingung der Sehnenfäden im Netzbeutel.

Verslechtung der Netzmaschen an einem der beiden Enden des Beutels. $^1/_3$ nat. Gr.

(und zwar am liebsten aus denen der Oryx-Antilope) hergestellte Gebrauchsgegenstand ist ein großer Netzbeutel, *tûti-s*, der in der Hütte als eine Art Beuteltruhe zur Aufbewahrung aller möglichen Dinge, auf der Wanderung als Rucksack für die Schlafdecke dient. Ein ähnlicher Beutel wird auch aus schmalen Gemsbockfellstreifen geknüpft (s. S. 236).

D. Die Holzschnitzerei und Korbflechterei

sollen hier nur des Zusammenhanges wegen kurz genannt werden. Von Holzgeräten hatten wir den Stuhl (S. 181), den Quirl (S. 199), die Wannschüssel (S. 201), den Löffel (S. 206), Stampfbecher (S. 200) und Honigstock (S. 205) zu nennen gehabt. Die hier folgenden Abbildungen sollen zur Vervollständigung die Haupttypen der Holzschüsseln und -Eimer zeigen.

f

Ein sachkundiger Hottentott berichtete mir, daß man die genannten hölzernen Hohlgefäße, die heute meistschon durch europäische Blechwaren verdrängt sind, doch hie und da auch heute noch halb bohrend, halb kratzend mit einem Instrument herstellt, das *°gure-s* genannt wird und aus einer rechtwinkelig gekrümmten Messerschneide an hölzernem Griff besteht. Leider gelang es mir nicht, ein solches Werkzeug zu erhalten.

Bemerkenswert ist die Manier der Hottentotten, Holzgefäße zu flicken. Sprünge und Risse in den Schüsseln und Töpfen werden mit zähen Wurzelfäden geschlossen: Rechts und links neben dem Riß *(a)* wird das Holz durchbohrt und durch die Löcher quer über den Riß der Wurzelfaden *(b)* gezogen, so daß die Querbrücken außen zu liegen kommen und

dem vielfach verschlungenen Flickfaden *(c)* in der Weise, wie es die Figur zeigt, Anhaltepunkte geben. Es sind nur zwei Parallelen des Längsfadens gezeichnet und alles so auseinander gerückt, daß die Art der Verschlingung zu sehen ist. Bei * ist das Endstück des Querfadens; es wird mit einigen Querschlingen fest verankert. Das ganze Flickwerk wird mit Fett bestrichen; dann sammelt sich nebenbei allmählich genügend Staub in dem Wurzelgeflecht an, daß der Riß verklebt.

Die Korbflechterei tritt, wenn wir vom Mattenstechen absehen, ganz zurück. Außer den Narasieben (s. S. 199) wären hier nur noch die Fischreusen zu nennen, mit denen die Hottentotten im Fischfluß auf Fang ausgehen; sie sind mir nicht zu Gesicht gekommen.

E. Die Ton-, Stein- und Metallarbeit

der Hottentotten ist in den primitivsten Anfängen stehen geblieben.

1. Aus Ton und Sand haben sich die Hottentotten ehedem einfache Töpfe von Urnenform geknetet und gebrannt. Das beweisen die Scherben, die in den alten Schneckenabfallhaufen des südlichen Küstenstrichs vom Kap der guten Hoffnung bis nach Port Nolloth häufig zu finden sind. Heute wird Töpferei nicht mehr geübt. Aber die Vorzeit des Namalandes liegt nicht weit zurück, die erste geschichtliche Urkunde vom Hottentottenvolk ist ja nur wenige Jahrhunderte alt. Es war deshalb nicht aussichtslos, nach einem jener alten Tongefäße, die ich als Vorzeitsreste im Dünensand der Küste bei Port Nolloth vergraben fand, auch in den Hütten der Überlebenden zu suchen. Der einzige Fund, den ich nach vielen vergeblichen Bemühungen zu verzeichnen habe, ist der nebenstehend abgebildete. Das Tongefäß wird *tgoaxûn*, d. h. Lehmtopf, genannt; eine andere Bezeichnung, °*kyoē-kyoēsûn*, war mir insofern von Interesse, als sie den einzigen Fall abgab, in dem mir die alte eigene Stammesbezeichnung der Hottentotten (siehe S. 322) zu Ohren kam.

Gebranntes Tongefäß alter Art. 1/4 nat. Gr.

Während auf der einen Seite europäische Importware die Tongefäße abgelöst hat, sind auf der andern Seite verarmte Namib-Nomaden in ihrem

Kochgerät wieder auf den denkbar tiefsten Kulturzustand zurückgesunken, indem sie statt des Topfes das Brustbein eines Straußes, **ŋǔis* genannt, auf das Feuer setzen.

2. Der Stein, wie ihn die Natur roh bietet, spielt heute im Haushalt der Hottentotten eine untergeordnete Rolle.

Handsteinmühle. 1/4 nat. Gr.

Nur ein Steingerät ist heute wie ehedem unentbehrlich: die Handmühle. Sie besteht aus zwei Steinen, einer dünnen Steinplatte, **ui aib* (stets masc. gen.), als der Unterlage und einem Rundstein*), **uiams* (stets fem. gen.), der geradlinig auf der Platte vor- und rückwärts gerieben und dabei schwach gerollt wird. Auf dieser Mühle werden Wurzeln, Schoten, Kaffeebohnen, Buchukräuter, Schminkfarben, kurzum alles gemahlen, was in Pulverform verwendet wird.

Die drei Kochsteine, *ǀnôiti*, auf denen der Kochtopf im Feuer steht, der Schleifstein, *ikχô-ǂuis*, und der Feuerstein, *ǀnôrns* (bei Keetmanshoop nicht selten), mit dem sie gegen einen Eisengriff Funken an den Zunder (meist morsches Holz) schlagen, sind die letzten rohen Steingeräte, die der Hottentott in Gebrauch hat.

Für Steinbearbeitung ist weder der Sand- oder Kalkstein der Tafel-Landschaften noch der Gneis und Granit des Urgebirges ihrer Heimat geeignet, wohl aber lokal der Serpentin, dessen Vorkommen [49]) bei Kaukaussib und an der Südseite des Brandberges im Kaokoland nachgewiesen und an

*) Die Geschlechtsendungen der beiden Bezeichnungen sind hervorzuheben, weil ihr Gegensatz in diesem Zusammenhang konstant gewahrt und diese Art Gegenständlichkeit typisch für das Sprachgefühl der Hottentotten ist: Der platte Stein ist stets männlichen Geschlechts, weil er schlaff und schwächlich ist (im Verhältnis zu seiner Masse eine große Oberfläche hat), während der kompakte Rundstein an die gewölbten und gedrungenen Formen des Frauentypus erinnert und daher die weibliche Endung erhält.

In der Umgebung von Kubub liegen nahe beieinander zwei Wasserstellen, **ikχoaxa-b* und **ikχoaxa-ŋ*, jede am Hang einer hohen Urgesteinserhebung. Der eine Berg erhebt sich schlank mit spitzem Gest: Seine Wasserstelle wird ausschließlich und scharf durch die männliche Kasusendung von der anderen Wasserstelle unterschieden, die demselben Namen aber mit weiblicher Endung führt, da sie von mehr gerundeten, sanfteren Kuppen überragt wird.

Wie hier die Kasus, so ist in anderen Fällen die Größe der verglichenen Objekte bei der Wahl der Geschlechtsendung entscheidend: So sind die konventionellen Bezeichnungen für die Frauentypen und für die Hinterbacken des Weibes männlichen Geschlechts, während die entsprechenden Teile des männlichen Körpers, ihrer geringen Entwicklung wegen, die weibliche Endung erhalten.

So ist sich der Hottentott überall auch der sinnlichen Wurzel seiner Gemeinsprache bewußt.

anderen Stellen, die nur den Eingeborenen bekannt sind, zu vermuten ist. Den Serpentin schneidet der Hottentott mit dem Messer zu Pfeifen; als Modell dient ihm dabei die Pfeife, die sich, wo er den weichen Stein nicht hat, am einfachsten aus den Markknochen mittelgroßer Säugetiere herstellen ließ. Diese Knochenpfeife, */hani-b*, ist viel im Gebrauch; der Markraum wird mit einem Grasbüschel dicht genug zugestopft, daß die Asche nicht mit eingesogen wird. Die gewöhnliche Serpentinpfeife, */ui/kχôb*, wird ebenso benutzt. Man würde sie für eine nach europäischem Muster geschnittene

a b c d e f

a und *b* Knochen-Tabakpfeifen. *c*—*e* Serpentinpfeifen einheimischen Modells.
f Serpentinpfeife nach europäischem Muster.

Zigarrenspitze halten, wenn der Hottentott überhaupt Zigarren rauchte. Dagegen ist die europäische Stummelpfeife unverkennbar das Modell für die Pfeifenform, die sie */hu-bes* nennen.

3. Ein Metall war dem Hottentotten schon vor seiner Berührung mit europäischer Kultur ein geschätzter Artikel: das Kupfer, das er vermutlich von seinen Bantunachbarn im Norden eintauschte. Mit dem Verschwinden des einheimischen Schmuckes und bei der leichten Gelegenheit, alle technisch nützlichen Metalle vom Weißen zu erhandeln oder zu stehlen, ist das Kupfer jetzt vielfach vom Eisen und Messing verdrängt. Der männliche

Hottentott schneidet jetzt dreierlei Schmuck, je nach dem verfügbaren Material aus Eisen, Messing oder Kupfer, seltener Blei.

Armbänder und Armringe, */gunuti*, tragen Frauen und Mädchen an beiden Armen dicht oberhalb des Handgelenks, zuweilen 10 Stück beisammen. Bei Männern sah ich — wenn überhaupt — dann nur eines am

Armringe. ⅓ nat. Gr.

rechten Handgelenk. Eine einfache Ornamentik wird durch Einkratzungen, Einkerbungen und Einstiche hervorgebracht. Die Muster, stets nur an der Außenseite angebracht, stimmen denen aus unserer Vorgeschichte und sind das einzig Bemerkenswerte an diesen Schmucksachen. Denn weder das Material noch die Instrumente zu seiner Bearbeitung sind den Hottentotten original, sind vielmehr den Werkstätten der Weißen entnommen.

Im einfachsten Fall stellt der Armschmuck einen einfachen, ringförmig umgebogenen, offenen, unverzierten Eisendraht dar, von D-förmigem Querschnitt oder von vierkantiger, außen schwach gewölbter Gestalt. Ein solches glattes, unverziertes Eisenband ist in Fig. *a* abgebildet.

Das in *b* abgebildete vierkantige Messingarmband mit verjüngten Enden ist mit eingehauenen oder eingeschnittenen Querlinien verziert, die von der Mitte des Bandes nach beiden Seiten zu divergieren. Gekreuzt werden diese Linien von unregelmäßigen, den Rändern genähert und parallel verlaufenden Längsrillen. Ein kupfernes Armband *(c)* mit abgerundeten Kanten ist in unsauberer Arbeit mit dichtgestellten, unregelmäßigen Quereinschnitten und Gruppen längsverlaufender Rillen verziert.

Der vierkantige Messingstreif *d* zeigt neben einer plump und unzusammenhängend gezogenen Mittellinie regellos verteilte Einkerbungen an den Rändern. Diese Kerben legen sich auf einer etwas fortgeschritteneren Stufe regelmäßiger so zusammen, daß sie nach einer Mittellinie konvergieren; so in dem schmalen Eisenband *e*, dessen Kerben so tief eingehackt sind, daß das Material sich seitlich aufgewulstet hat und so die Plastik erhöht. Das folgende Eisenband *f* zeigt ein regelmäßig von kleinen glatten Feldern unterbrochenes „Fischgräten"-Muster, wie ich es nach Analogie prähistorischer Ornamentik auf Anregung meines verehrten Kollegen Dr. Eichhorn nenne. Als zusammenhängendes Muster tritt dieses Ornament noch primitiv im dicken, plattgedrückten Kupferdrahtring *g* und im Eisenreifen *h*, endlich am deutlichsten und regelmäßigsten, mit Divergenz der Winkellinien nach den freien Enden zu, im Messingring *i* uns entgegen.

Weit verbreitet, gleich beliebt auf Holzgeräten (eingebrannt) wie auf Schurzgurten (eingeflochten) und auf Serpentinpfeifen (eingekritzt), ist das Zickzackornament auch auf den Armbändern der Hottentotten (eingeschnitten oder eingeschlagen). Bald stellt es eine einfache und fortlaufende Linie *(k)*, bald ein doppeltes bis dreifaches und nicht überall geschlossenes durchgeführtes Liniensystem dar *(l)*. Die beiden zickzackornamentierten vierkantigen Armbänder sind aus Messing geschmiedet.

Nur in messingenen *(m)* und kupfernen *(n)* Armbändern sah ich ein Punktmuster in Gestalt tiefer viereckiger oder runder, in zwei- oder dreireihiger Anordnung stempelförmig eingeschlagener Eindrücke.

Als letztes Ornament sind schraffierte oder karrierte Felder verschiedener Gestalt auf den Armringen zu nennen. Ein bandförmiger, dünner,

vierkantiger Eisenring *(o)* zeigt vier Parallelogrammfelder mit seitenparallelen Karrierlinien. Ein goldig glänzendes Metallband *(p)* von flach-dachförmigem Querschnitt zeigt zwei Reihen mit Kerbschnitten ausgefüllter Dreiecke, die mit der Basis dem Rand aufsitzen, mit den Spitzen auf die Mittelkante stoßen. In der regelmäßigen Schraffur seiner Dreiecksfelder erinnert ein Eisenband *(q)* mit flach D-förmigem Querschnitt auffallend an die prähistorischen „schraffierten Dreiecksmuster". Eine regellose Kombination von Randkerben, Längsrillen und karrierten Dreiecksfeldern zeigt der letzte der hier abgebildeten Armringe *(r)*.

Selten sind Armringe aus spiral um eine Drahtachse gewundenem Messing- oder Eisendraht mit Haken und Öse.

Fingerringe haben keine Eingeborenenbezeichnung. Frauen tragen zuweilen bis 15 Stück am dritten bis fünften Finger beider Hände.

Fingerringe aus Kupfer, Messing und Eisen. $^{2}/_{3}$ nat. Gr.

Ohrringe, *gumß*, sind bei beiden Geschlechtern beliebt. Die Durchbohrung des Ohrläppchens wird an den Kindern beiderlei Geschlechts im Alter von 3—4 Jahren von der Mutter vorgenommen. Das Ohrläppchen wird zunächst zwischen den Fingern eine Zeit lang geknetet und dann mit einer kreisförmig zurecht gebogenen Nadel durchbohrt. Die Blutung wird mit der heißen Asche des Herdfeuers gestillt. Wenn nach einigen Tagen die Heilung vollendet ist, wird die Nadel entfernt und durch den Ohrring ersetzt. Über schwerhafte Schwellung des Ohrläppchens nach der Durchbohrung wurde häufig geklagt.

Eiserne Ohrringe. $^{2}/_{3}$ nat. Gr.

Ein Schmuck, der sich trotz seiner unbequemen Herstellung und seines unscheinbaren Aussehens gegen alles bunten eingeführten Glasperlen hält,

sind Hars-Perlketten. Das gelbe Harz einer *Otkonno*-Art *(h: ǂgûs)* wird mit der kalten Kohle des Herdfeuers verrieben. Dieses Gemisch (ein Pulver) wird mit einem brennenden Holzspahn erwärmt und mit der anderen Hand gleichzeitig geknetet. Die warme Masse wird dann mit der flachen Hand über einer ebenen Unterlage zu Würsten gerollt. Von diesen Würsten werden kleine Stücke abgenommen und über dem daselbst unterhaltenen Feuer zu Pillen gedreht, die Pillen auf ein Holzstäbchen gespießt und nach dem Erhärten auf Schnüre gereiht, häufig mit regelmäßiger Einschaltung einiger bunter Steine oder Glasperlen. Die Perlketten (wie die Pflanze, aus der sie gefertigt werden, genannt) sind oft zu einem dicken Kettenbündel, *ǂgo-ûsi*, vereinigt, das unter Hottentotten guten Handelswert hat: Ein zehnfach weit um den Hals zu schlingendes und auf die Brust fallendes Kettenbündel hat den Wert einer Matte=ziege.

Halskette.
ǂGam und ǂnuro: Aus Harz gedreht. In das Mittelstück Straußeneierschalen geschlagen.

Eingeführte Glasperlen sind beliebt. Die grobperlige Kette wird als *ǂnuro* von der kleinperligen, *ǂgo-rab*, unterschieden. Der Kniebehang, *ǂgo-rakya-ib*, aus dichtgedrängten kleinen Glasperlreihen hergestellt, wird nur noch selten unter dem Fellschurz getragen.

Capitulum III.

Lebensführung

Das Groß-Namaland ist als einer der typischen Trockengebiete Südafrikas so spärlich bewachsen, als daß es der Tierwelt auf beschränktem Raum genügend Futter und Wasser bieten könnte. Die Charaktertiere der südafrikanischen Grassteppe, zugleich für wertvollstes Wild, die Antilopen, müssen daher über weite Strecken schweifen, um sich den dürftigsten Lebensunterhalt zusammenzusuchen. Wie das Raubwild, so folgt der Jäger diesen Herden; und wo der Eingeborene diese unsichere Lebensführung, die ihn heute in Not, morgen in Überfluß läßt, mit dem geregelten Leben eines Hirten vertauscht hat, tritt die Notwendigkeit weiter Wanderungen um so gebieterischer an ihn heran, je zahlreicher sein Vieh *(ges-ab)* ist.

In normalen Regenjahren sind diese Wanderzüge in das Weidefeld *(thabe-, verb.)* nach Zeitpunkt und Ziel durch langjährige Erfahrungen geregelt. In Dürrezeiten ist die Weidesuche schwierigste und dringendste, und mehr Familien als sonst machen sich reisefertig; wie kommen Fälle genug, in denen schließlich der ganze Stamm seine Wohnsitze verläßt. Für eine weite Wanderschaft wird die Hütte abgebrochen und mit Stangen, Matten und dem innern Hausgerät auf Tragochsen gepackt. Der weidewechselnde Hottentott ist im Besitz eines Ochsenwagens, jenes bekannten schweren 10—12-spännigen Gefährts, das der Bur in Südafrika eingeführt hat. Vordem soll der umherwandernde Hottentott aus starken Zweigen ein Lager verfertigt, darauf seine Binsenmatten, Felle und Hausgeräte aufgepackt und davor Ochsen gespannt haben, die das Ganze wie einen Schlitten fortschleiften. Wie der Wagen den Packochsen, so ist das Pferd dem Reiseochsen im Notfalle fast verdrängt. Immerhin sieht man noch Ochsen,

Südafrikanischer Ochsenwagen.

dessen die Nasenscheidewand zum Durchtritt des Zügelriemens, *halsgrick*, durchlöchert ist.

Also wenn möglich barfuss und im Wagen steht der Hottentott im Wichtigkeit. Die halbwüchsigen Kinder haben die Kälber und das Kleinvieh zu weiden, so langsam, daß die Tiere dabei weiden und die Lämmer Schritt halten können. Deshalb pflegen die Kleinviehherden frühmorgens eher als die Alten aufzubrechen. Die Rinder werden auf dem Marsch meist so schnell getrieben, als daß sie gehörig weiden können; dafür werden sie den Nachts im Feld gelassen.

Vor 150 Jahren waren die Hottentotten die reichsten Viehbesitzer des westlichen Südafrika vom Wendekreis bis zum Kap der guten Hoffnung. Van Riebeeck war ein nüchterner Beobachter und schrieb sein Tagebuch nicht zur Unterhaltung des Publikums. Wenn er sagt[*], daß zu Zeiten im Umkreis des Tafelberges das Land mit Vieh wie mit Gras bedeckt war, so dürfen wir ihm glauben. Noch in den ersten Jahrzehnten des 19. Jahrhunderts waren vieltausendköpfige Herden von Rindern und Schafen nicht selten. Die Jagd scheint damals mehr von Buschmännern ausgeübt worden zu sein; heute ist sie Teil der Hottentotten auf das Niveau dieser seiner verachteten Feinde und Leibeigenen gesunken. Der Hottentott von heute hat sich, wenn er nicht in den Dienst des Weißen tritt, als Hirt und Jäger zugleich durchzuschlagen.

Hottentotten-Viehherden. ca. 1 Jahr alt.

A. Haustiere und Viehwirtschaft.

1. Das Rind.

Mit der dunklen Frage nach der Herkunft der Hottentotten wird immer auch die verbunden sein, wie sie in den Besitz des Rindes kamen. Wie kam das Volk von indonesischen Südseeinseln der alten Welt in den Besitz dieses

Hausrinds, dessen Ursprung in Asien zu suchen ist? Ägypten wird als das Land angesehen, das in vorgeschichtlicher Zeit die Rinderzucht von Westasien her den Hirtenvölkern Afrikas übermittelt hat. Ein schmaler Landstreifen, der nahe der Ostküste Afrikas vom oberen Nil zum Südkap zieht und mit einzelnen Unterbrechungen von rinderhaltenden Negerstämmen bewohnt wird, bezeichnet vielleicht die Straße, auf der das Rind als Haustier von Norden nach Süden gewandert ist[74, 75].

α) Die Viehraubzüge der Hottentotten in das Gebiet der benachbarten Bantustämme (vor allem der Herero, zum Teil auch der Ovambo), ferner der Austausch ihres Viehes mit dem der Kapkolländer von Süden, der Betschuanen von Osten her, hat den Rinderbestand des Namalandes stark

Hottentottenkuh.
Spannweite der Hörner: 71,5 cm. Höchster Punkt der Stirn bis zum oberen Rand der Schnauze in oberer Nüstenhöhe: 53,5 cm. Vordere Rückenhöhe: 109,5 cm. Hörnerspitze bis Schwanzwurzel: 195 cm.
Als Namaqua-Kuh wird von den Amerikanern noch eine Rasse unterschieden, die sich von der Hottentottenkuh durch kürzeren, dickeren Kopf, kürzere Beine und gedrungeneren Körperbau unterscheiden soll.

durcheinander gemengt, sodaß sich die Rasse nicht mehr klar feststellen läßt, die den Hottentotten ursprünglich, d. h. zur Zeit ihrer Entdeckung, zu eigen war. Den einzigen Anhaltspunkt gibt hier eine von Eingeborenen und Ansiedlern aufrecht gehaltene Überlieferung, die, ohne sich kontrollieren zu lassen, einen gewissen Rindertypus als den im Namaland heimischen, als Abbild den alten Rindes der Hottentotten bezeichnet. Es wird sich aber dabei nur um eine Annäherung an diesen Rind handeln. Zwei solcher Rinder sind hier dargestellt. Ein Kenner der Hausrindrassen wird vielleicht aus einem Vergleich[76] dieser Abbildungen mit denen des „Afrikaner"-, Betschuanen- und Damarrindes das Charakteristische der namaländischen Rasse präzisieren können. Übrigens nennt der Hottentott die

von Europa eingeführten Kühe, deren auffallendster Charakter ihre kleinen Hörner sind.

b) Die Fortpflanzung des südafrikanischen Rindes weist trotz der verschiedenen Rassenmischungen gemeinsame Grundzüge auf. Zur Zeit der besten Weide, d. h. im Herbst, wenn die Sommerregen der sogenannten großen Periode niedergegangen sind, also in unserem Gebiet im März-April, springt der Bulle im allgemeinen am häufigsten und am wirksamsten. Dementsprechend fällt bei der sommerlichen Trächtigkeitsdauer der Kuh die Hauptkalbezeit in den Dezember und Januar. Die Unregelmäßigkeiten im Eintreffen der Regen und deshalb auch im Ausprießen der Weide ver-

„Afrikaner"-Kuh, im ehemaligen Protektorat und Transvaal heimisch, 5 Jahre alt, mit ihrem dritten Kalb.

schieben im einzelnen die Sprungzeit des Bullen und damit den Termin des Kalbens.

Den Zuwachs seiner Herde verfolgt der Hottentott genau an der Lebensgeschichte jeder einzelnen Kuh. Das Alter der Rinder kennt er besser als sein eigenes; er weiß auch von jeder Kuh seiner Herde, ob sie zum erstenmal trächtig ist (*tro-as*, verb.) und zum erstenmal kalbt (*ikyaxa*), oder ob sie zum zweiten und drittenmal trägt (*iqua* und **inna- ikyaxa gwana-a*).

Wenn die Partie dicht unter der Schwanzwurzel der trächtigen Kuh ihre Prallheit verliert und die inneren Teile mit jedem Schritt unter der Haut schlottern, wird das Kalb noch an selbem Tage erwartet. Ein Hirt

hat dann speziell die Kuh zu hüten und Mutter und Kalb sogleich nach Hause zu bringen.

Die Milchsekretion der südafrikanischen Kuh hat im Gegensatz zu der unserer einheimischen Rinder noch ganz die ursprüngliche Form einer Teilerscheinung der Fortpflanzung bewahrt, ist periodisch wie diese und in ihrer Quantität dem Nahrungsbedürfnis des Kalbes angepaßt. Deshalb nennt der Hottentott die Milchkuh *tara-gumm (von tara-, gebären). Ist das Kalb so weit, daß es sich selbst ernähren kann, so hört die Milchsekretion auf, die Kuh „wird trocken", *ti oder ti. Im einzelnen schwankt der Milchertrag der Kuh innerhalb weiter Grenzen. Es gibt eingeborene Kühe, die bei guter Weide bis kurz vor dem nächsten Kalben, wenn auch stets abnehmend, Milch geben. Treten alle die Milchproduktion günstig beeinflussenden Umstände zusammen, dann soll auch die südafrikanische Kuh 10 bis 15 Liter Milch täglich geben können; ca. 4 Liter pro Tag scheint für die „Afrikaner"-Rasse das Mittelmaß zu sein [8]). In trockenen Jahren gibt die Kuh unter Umständen so wenig Milch, daß das Kalb verhungert, von Melken also nicht die Rede ist.

Stirbt das Kalb vor der Zeit oder hat die Kuh ein totes ausgetragenes Kalb geworfen (*kyaxa), gibt sie zunächst mit Ausnahme der Biestmilch (s. unten), die sich leicht abmelken läßt, nur wenig Milch, je ½ bis ¾ Liter früh und abends in der ersten Woche, allmählich gibt sie bei geeigneter Behandlung so viel wie eine Kuh mit lebendem Kalb. Will die kalblose Kuh ihre Milch nicht von sich geben, bläst ihr der Hottentott mit Erbsig Luft in die Schamteile, oder er räuchert sie mit dem Fell des krepierten Kalbes. Jedes Stück Vieh, gleichgültig ob Kuh, Ziege oder Schaf, das ohne Hilfe des Kalbes oder Lammes gemolken wird, heißt ara-a. Die Milchproduktion der südafrikanischen Kuh soll nach dem dritten oder vierten Kalbe am ergiebigsten sein.

c) Während bei den viehhaltenden Bantustämmen lediglich das Melken Geschäft des Mannes ist, melken bei den Hottentotten regelmäßig die Frauen und Mädchen, der Mann nur ausnahmsweise (über die Tageszeit des Melkens siehe Herdenbericht).

Der Kuh werden vor dem Melken die Hinterbeine mit Riemen zusammengebunden, oberhalb der Fußgelenke bei ruhigen, dicht unterhalb der Kniee bei unruhigen Tieren. Stößige werden außerdem mit einem Riemen, der um die Hörner geschlungen wird, an einem Pfahl bei der Hütte oder beim Kraal festgebunden. Die genannten drei Arten der Fesselung werden als *ga-rubi, *ti-bi und *ga-mubi unterschieden.

Steht die Kuh, so wird das Kalb für kurze Zeit zugelassen (die jüngeren länger als die alten), dann kommt die Frau mit dem Holzeimer, jagt das Kalb mit dem Stock vom Euter und melkt. Wo viele Kühe sind, wird in einer Stunde nur einmal gemolken. In anderen Fälle wird das Kalb zum zweitenmal zugelassen. Die Milch, die die Kuh dann gibt, die Nachmilch, *gubâ*, ist nach Aussage der Hottentotten dicker und vielfach auch gelber als die erste, die sie *ai-dâb* oder Vormilch nennen. Die Nachmilch wird deshalb mit Wasser verdünnt. Die Milch, die die Kuh gibt, nachdem das Kalb zum drittenmal angelegt hat, heißt *°hakigubâ*, die vierte Milch *°hakigôrigubâ*; doch wird die Kuh nur selten in dieser Weise bis auf den letzten Tropfen ausgemolken.

Von der gewöhnlichen Nachmilch unterscheidet der Hottentott als *ramidâb* die Milch, die gewonnen wird, wenn die Kuh nach dem ersten Abmelken einige Stunden lang wieder weidet und dann unter Vorlegung des Kalbes von neuem angemolken wird.

Die unmittelbar nach dem Kalben abgemolkene Milch, *ekurigi*, „Biestmilch", gilt als schädlich für das Kalb, weil sie zu harter Masse im Magen gerinne. Um so mehr schätzt sie der Hottentott für sich selbst. Er trinkt sie meist gekocht und mit gewöhnlicher Milch verdünnt. Die Zitzen der Kuh dürfen mit dieser Milch nicht in direkte Berührung kommen, sie werden deshalb mit Spreublatt bedeckt. Hat sich das Euter entzündet, so werden die erkrankten Teile mit einer Salbe aus Fett und dem Sporenpulver eines Pilzes (*°rhizoidâb*, d. h. Hyänenschwanz) bestrichen. Ist die Biestmilch geronnen, so wird sie, nach einem gallgrünlichbraungrünen Busch, *°dydigyorenkarni* genannt; ist sie weiß, heißt sie *°dambarni*.

β) Der Herdenbetrieb eines Viehbesitzers im Groß-Namalande, der aus den oben genannten Gründen sich über weite Strecken ausdehnen muß, wird anderseits durch die Trockenheit, die ihn so weitläufig machte, wieder eingeschränkt. Wasser steht dauernd nur an wenigen Lokalitäten, Menschen und Vieh wohlbekannten Stellen, und beide wissen auch, wo es vorübergehend nach guten Regen zu finden ist. Das sind die gegebenen Sammelpunkte der Zerstreuten.

Volle Wunderbarkeit hat jedoch nur das erwachsene Rind, da es weder Schutz noch Leitung braucht. Die Ochsen, *gumi-gu*, kommen je nach der Jahreszeit alle 1—3, zuweilen erst alle 2—3 Tage zum Wasser und sind hier, wenn sie zur Arbeit gebraucht werden, leicht einzufangen, während sie weiden. In seltenen Fällen müssen sie im Feld getränkt werden.

Der Mann, der diesen Auftrag hat, erkennt in den Spuren, die seinen Weg nach allen Richtungen kreuzen, mit Sicherheit die seiner Herde heraus, und in ihnen sucht er wieder die Spur desjenigen Ochsen, den er fangen will, unaufhaltig. Sinne, die Generationen hindurch geschärft und von Jugend ab geübt sind, dann das Bewußtsein, daß ein Irrtum zu tagelangen, entbehrungsreichen, fruchtlosen Umherschweifen führt, befähigen ihn hier zu Leistungen, in denen ihm kein Weißer gleichkommt.

Damara-Frühstück. Spannvieh der Hirten. (Art. 10.

Die Kühe, gemolken, werden frühmorgens in die Weide getrieben, dann sich selbst überlassen; abends kommen sie aus eigenem Antrieb zur Werft zurück; die milchenden Kühe wissen, daß sie dort ihr Kalb finden, und die übrigen sind gewohnt, mit den Mutterkühen zu gehen. Alte Kühe, die nicht mehr kalben, werden als Schlachtvieh in der Weise gemästet, daß sie den Ochsen zugesellt werden. Die gehen weiter als die alsbaldlich jedesmal trennenden Kühe in die Weide, finden daher besseres Gras und weiden länger, da sie keine Zeit mit dem Hin und Her verlieren. Eine starke, junge Kuh, ojóvo (auch gaurêxhi d. h. Festtag genannt), wird, weil sie

meist wohl gepflegt blühte und glänzendes Fell hat, gern als Schmuck bei der Herde gehalten.

Die Kälber (*thaiba*, so bis zur Entwöhnung genannt) werden des Abends nach dem Saugen von den Kühen abgesondert in den Kraal getrieben. Der Kraal, *khaxa* (↑ Torr. steig.), eine etwa mannshohe Umfriedigung unter freiem Himmel, wird von Hottentotten meist aus gekappten Dornästchen, seltener aus Steinen und Lehm hergestellt. Die Mutterkühe lagern frei in der Nähe; früh werden die Kälber wieder zu den Müttern gelassen, darauf in anderer Richtung als diese ins Feld getrieben, wo sie bis zum Abend unter ständiger Aufsicht eines Hirten bleiben. Nur wenn ein Kalb ernstlich abmagert, wird es der Mutter auf die Weide mitgegeben (*tsaxi, xoeb*).

„Kälberstube" in Jakobsdal.

Eine Zucht im Sinne einer Auswahl bestimmter Tiere oder einer Regelung der zeitlichen und örtlichen Verhältnisse bei der Fortpflanzung kennt der Hottentotte nicht. Der Bulle, *ngôb*, schweift im Feld um Wasser, beim Kraal willig frei über seinen Harem. Während der Regenzeit, von Oktober—November bis Februar—März, folgt er den Kühen auf Schritt und Tritt. Am Anfang der Trockenzeit, wenn er sie alle beigesprungen hat, sondert er sich ab und lebt bis zur Zeit der ersten Regen als Einsiedler im Feld. Nur wenn er dort nicht genügend Wasser findet, kommt er zur Tränke in die Nähe der Werft. Im übrigen „arbeitet" er (*tama*) draußen. Darum und seiner Stimmigkeit wegen wird er "Allgemeingültigkeit genannt; *ôkyamâ* ist die große gültige Gesetzlosenlichkeit (s. S. 130), der man, wie jenem, aus dem Wege geht. Dieser „Weisheit" fällt jedes unklare Reden und jedes ungerechtfertigte

Kalb an, verfolgt gelegentlich auch Menschen; man sieht ihn mit den Hörnern in den Erdboden stoßen.

Ist die Weide im weiteren Umkreis der Ansiedelung schlecht, so wird das Vieh für Wochen oder Monate ins Außenfeld geschickt unter der Aufsicht eines oder mehrerer Hirten, die den Viehposten halten (*khoreza* oder *tgaidisa*).

c) Während der Bulle das ganze Jahr über, zeitweise halb verwildert, ungestört seinen Wegen geht und die Kuh am Melkpfahl sich friedlich überlisten läßt, muß der junge Ochse bewältigt werden, soll er von Nutzen

Hottentottische Ochsenzeugung.
Der Treiber mit der langen Zwinge, der Tauleiter haltend, der Ochsenwärter auf dem Wagen.

sein. So lange der Ochse noch ungebändigt ist, heißt er **ekyangwaxaib*, Jungochse, mag er auch so alt sein.

Der Hottentott, der mit dem Einfangen des jungen ungestümen Ochsen beauftragt ist, bahnt sich schnell einen Weg durch das Viehhaus, in dem das Tier steht, und hält ihm einen Stock mit der quer aufgespaltenen Schlinge einer ca. 10 m langen Fangriemens so zwischen die Beine, daß das erschreckt davonspringende Tier mit einem Fuß, gleichviel welchem, sich fängt; 4—6 Mann halten das andere Ende des Fangriemens fest und warten, bis das Tier sich einigermaßen ausgetobt hat. Dann nähern sich zwei Männer vorsichtig dem Ochsen von hinten, der eine geht rechts, der andere links, einen langen Riemen quer über den Rücken des Ochsen haltend. Wenn der Riemen an die Hörner des Ochsen sich anlegt, geht der eine Mann in

respektvoller Entfernung vorn um das Tier herum, schleift die Schlinge und läßt den anderen Mann sie zuziehen. Während das Tier nun von den Männern am Fangriemen und von dem, der die Hörnerschlinge hält, nach der einen Seite gezogen wird, dreht ein Mann mit so kräftigem Ruck nach der entgegengesetzten Seite den Schwanz im Bogen über den Rücken des Tieres hinweg, daß der Ochse stürzt und dann allen Widerstand aufgibt. Die Herero wollen ebenso verfahren.

Wie die Hottentotten die Tiere kastrieren, *dabí-*, habe ich nicht beobachtet. Erkundigungen bei den Eingeborenen ergaben, daß ehedem reiche Hottentotten die glücklich beendete Arbeit eines Massenkastrierens mit dem Schlachten eines Kalbes feierten. Das Fleisch soll mit den Hoden der kastrierten Tiere zusammen gekocht und verstampft worden sein. Wenn die Hörner des Kalbes kleinfingerlang bis handlang geworden sind, sehen sie den Zeitpunkt für die Kastration gekommen: ein nachträglich noch geschnittener Bulle wird von den übrigen Ochsen als *'kyao-kyao-dabí-b* unterschieden, weil er durch das Hinausschieben des Kastrierens „stark gemacht" worden ist *(kyao-kyao-*, verb.). Er ist in der Tat stärker als die jung geschnittenen Tiere, aber bei weitem nicht so zumlaufend.

Nama-Ochsenschädel, Schädellänge 75 cm.

Wie die dem Reit- und Packochsen *(beide tgu-rub* genannt) schnell und den Zug- oder Trekochsen *(tgulgommab)* an das Joch gewöhnen, konnte ich nicht beobachten.

2. Das Schaf und die Ziege

haben im Laufe des letzten Jahrhunderts ihre Rollen im Herdenbestand der Hottentotten vertauscht. Das Fettschwanzschaf, *gûb*, nach Berichten aus dem Anfang des vorigen Jahrhunderts[1]) einst in ungeheurer Zahl vorhanden, tritt jetzt hinter der Ziege, *hî(ri)-b*, die ehedem fehlte, zurück.

[p. 2623]

Wie die ursprünglich von den Hottentotten gehaltene Schafrasse entstanden hat, ist nicht mehr anzugeben. Die nebenstehenden Abbildungen zeigen Schafe, wie sie heute von Ansiedlern und Eingeborenen als Nutztiere bezeichnet werden. Dasselbe gilt von der Ziege.

Landschaft.

Ziegen und Schafe werden, wie die Kälber, tagsüber im Feld gehütet und nachts im Kraal untergebracht. Einzelne Ziegen oder kleine Trupps bedürfen keiner Aufsicht; sie gewöhnen sich leicht daran, abends von selbst zurückzukommen. Ernstere Gefahren, die ihnen von wilden der Raubtiere drohen, und Diebstahl, während das Vieh lebt ist. Eine größere Ziegen- erweist als Schutzwehr bedarf aber stets eines Hirten. Ohne ihn (vor Gefahren und Diebstählen abgesehen) beeinträchtigen die Tiere sich gegenseitig beim Weiden oder entfernen sich zu weit. Eine wichtige Aufgabe des Hirten ist es, das Vieh in den heißen Stunden im Schatten eines Baumes oder Felsens zu sammeln, damit es ruht. Das Zusammenkommen des selbständig-handelnden Viehes ist charakteristisch für eine Hirtengesellschaft im Wirtschaftlichen.

Ziegenherde.

Die Lämmer (Ziegen vom Schaf, Kälber vom Ziegen) bleiben, so lange sie noch klein sind, dauernd in einem besonderen Kraal und werden

nur früh und abends zu den Müttern gelassen. Größere Lämmer gehen mit der Herde; um sie zu entwöhnen, werden die Euter der Muttertiere mit Mist eingeschmiert (*°khau-tle*, verb. *khau-rra* sagen).

Der Bockramm (*ŋâgaxa b(i)rûb*, d. h. Hodenbock) sowohl wie der Schaframm (*ŋâib*, d. h. der Stößige)[1]) weidet jederzeit frei mit der Herde. Der erstere aber verläßt zeitweilig die Ziegen, wenn er sie alle gedeckt hat, und sucht sich in eine andere Herde, meist nicht ohne Kampf, Eintritt zu verschaffen.

Die Ziege ist das Hauptmilchtier (¾ bis 1 Liter pro Tag) der ärmeren, d. h. der großen Mehrzahl der Hottentotten. Junge Böckchen werden kastriert, um später als fette Kapaune bei frohen Gelegenheiten geschlachtet zu werden. Da ihr Fleisch im Gegensatz zu dem der ungeschnittenen Böcke zart ist, werden die Kapaune *kaxa-b(i)rûpa* genannt. Das Schaf spielt im Herdenbetrieb der Hottentotten der Menge und der Verwertung nach eine untergeordnete Rolle. Die Milch wird nur gelegentlich, z. B. von den Tieren, die ihr Lamm verloren haben, abgemolken; die Wolle wird nur im Fell verwertet, das Fleisch aber wird dem der Ziege vorgezogen und durch Kastrieren der Widder verfeinert. Das Fett des Schwanzes ist seiner Weichheit (es hat ungefähr die Konsistenz von Gänseschmalz) und seines Wohlgeschmacks wegen mit das begehrteste Stück des Körpers.

Kapaun der Namaqualandrasse.

3. Die Unterscheidung der Individuen in einer Viehherde.

Als guter Hirt kennt der Hottentott natürlich jedes einzelne Tier seiner Besitzes. Da der Jagochse vor dem Buschwagen auf Ausruf antwortet, so gibt ihm auch der Hottentott einen Rufnamen und zwar einen kopfbezeichnenden, wie er ihn von ihnen her gewohnt ist. Nur zwei Fälle be-

gegnetes mir, in denen er dem Rind (Kühen) einen Namen in seiner eigenen Sprache gegeben hatte: *ǂkharu-s* und **gl-aas*. Der letztere Name besagt, daß die Kuh von ihrem jetzigen Besitzer einst im Feld gefunden wurde, als er in Kriegszeiten auf der Flucht war (**gl*).

Viel geeigneter zur Orientierung und Verständigung als Eigennamen ist eine Bezeichnung des einzelnen Stückes nach Farbe und Zeichnung. Wie reichhaltig die Skala ist, deren sich die Hottentotten hier bedienen, zeigt die folgende Liste, die ich in zahlreichen Gesprächen mit Hirten gesammelt habe.

Man ist hier gezwungen, einige Volgtrbezeichnungen etwas zu präzisieren. Gescheckt: wenige, große, unregelmäßige, oft miteinander verbundene Farbenpartien. Gefleckt: zahlreiche, nur mittelgroße, gesonderte Farbenpartien. Gesprenkelt oder getüpfelt: ungezählte, kleine, gesonderte Farbflecken. Von den einfachen Farbenbezeichnungen können wir hier absehen.

a) Ausschließlich für Rinder (wo nicht anderes vermerkt ist) gelten folgende Bezeichnungen:

1. **dzĭ̀nam:* bei beliebiger Gesamtfärbung ist je ein schwarzer Seitenfleck charakteristisch.

2. *ǂhi:* schwarz und weiß gescheckt; (auch für Schaf, Ziege und Hund).

3. *ŋgaxi-:* rotbraun und weiß gescheckt; (auch für Schaf, Ziege und Pferd).

4. **mĭ̀ŋgara-:* schwarz und weiß gesprenkelt, (auch für Schaf, Ziege und Hund). Die Zeichnung von Perlhühnern z. B. wird mit *ŋgara-* charakterisiert (vgl. dem Leoparden).

5. **ra-ŋgara-:* rot und weiß gesprenkelt.

6. **gaĭ̀khani-:* auf die grau-gelbbraune Färbung des Klippdachses verweisend; (auch für Pferd, Ziege und Hund).

7. **ǂarisigaĭ̀gu:* weiß um Maul, Nüstern und Ende des Nasenrückens.

8. *ra-ŋgaĭ̀gu-i:* rote Gesamtfärbung mit weißem Rücken (nicht umgekehrt, wie eine naheliegende, aber dem Sinn zuwiderlaufende Übersetzung vermuten lassen könnte).

9. *mĭ̀ŋgaĭ̀gu:* schwarze Gesamtfärbung mit weißem Rücken.

10. **mĭ̀ŋnaamari:* schwarze Gesamtfärbung, Bauch weiß bis zu den Flanken.

11. **ra-ŋnaamari:* rote Gesamtfärbung, Bauch weiß.

12. °*mkʒnâ*: schwarze Gesamtfärbung, Stirnmitte und Nasenrücken weiß; (auch für Pferd, Ziege und Hund).

Freiheitsdressur der in all. Beziehungen bekannten Schultzeschen

13. °*ŋ-ḥaŋnâ*: rotbraune Gesamtfärbung, im übrigen wie 12.

14. °*ǂhani-nâ*: gelbe Gesamtfärbung mit Blaß, d. h. weißen Streifen auf Stirnmitte und Nasenrücken.

15. *mkʒan*: Gesamtfärbung beliebig, um den Nacken aber einen schwarzen Ring.

16. °*ŋ-ḥaŋan*: wie 15, aber mit rotbraunem Nackenring.

17. °*mkʒkyan*: Gesamtfärbung beliebig, aber mit Weiß an den Hinterbacken, auch für Ziege.

18. °*ǂhani-xgani-*: gelb und weiß gescheckt; auch für Ziege.

19. °*mkʒnaf*: Gesamtfärbung beliebig, nur in der Leistengegend weiß.

b) Ausschließlich für Ziegen gebräuchlich:

20. °*mkʒnâra*: schwarz gefleckt.

21. °*ŋ-ḥaŋâ-ra*: rot gefleckt.

22. °*ǂganyan*: mit schwarzbraunem Band um den Hals.

Im übrigen Pelzwert und Temperament bekannter Freiheitsdressurakt. 3 Jahre alter Rammler.

23. °*ǂkaiga-r*: Oberschenkelinnenseite weiß.

24. °*ǂkyaŋgâ*: mit hellem Rückenstreif wie die Eland-Antilope.

15. *ǂgra-*: (von alten Hottentotten gebraucht) schwarz und weiß gesprenkelt.

c) Ausschließlich für Schafe gebraucht:

16. **ruqnam-*: schwarze Zeichnung um das Maul (das Schwarze fällt am Maul den weißen Schafen ähnlich in die Augen wie die schwarzen Kiefer an einer farblosen Insektenlarve *(ruqnî-ŋ)*.

17. **nuli-* oder *ra-ka-ŋi-b*: mit schwarzen oder rotbraunen Wangen.

18. **ap-rib*, von Kindern im Spott auch **b'(r)ûkûnd-gun* genannt wird ein Schaf oder eine Ziege mit rostfarbenen Stumpfohren.

4 Jahre alter Bastard deutscher einfarbschwarzer Fettschwanzschafe. (Schwarz weiß.)

Eine verfeinerte Liebhaberei der Hottentotten ist es, gleichartig gefärbte Tiere zu sammeln *(ǂgî, verb.)*. Sie benutzen zu diesem Zweck Rinder, Schafe und Ziegen gegeneinander aus. Durch bestimmte Einschnitte oder Ausschneidungen, Durchbohrungen oder durch Kappen der Ohren merkt der Hottentott sein Vieh.

4. Das Pferd

lebt wie das Rind frei im Feld und wird am Wasser leicht eingefangen. Zuweilen, so in den weiten Ebenen der Kalahari, liegt das Pferd so zu verwildern und flieht scheu, wenn es dem Menschen von weitem kommen sieht. Gewöhnen sich die zahmeren Pferde (allein leicht einzufangen) an die Führung eines wilden scheuen Tieres, so ist der Reiter in mißlicher Lage. In einem Fall war das Kinderwärterchen des zahmbleiben Pferdes das einzige Mittel, wieder in den Besitz der übrigen zu kommen.

Mutterstuten werden bevorzugt, und da das Füllen eine leichte Beute des Leoparden ist, steht es meistens im Kraal.

Auf die Manier der Hottentotten, ein Pferd zuzureiten, sei hier nicht eingegangen; denn sie steht an stark unter europäischem Einfluß, als daß sie uns etwas dem Volk eigentümliches kennen lehren könnte.

5. Der Hund

ist neben dem Rind und Schaf ein Hauptstück der Hottentotten von Alters her. Er hält das Raubzeug vom Vieh fern und ist durch Milch leicht an die Herde zu gewöhnen. Auf der Jagd leistet er besonders hinter den kunderartigen Raubtieren ausgezeichnete Dienste; die Oryx-Antilope holt er mit Erfolg. Über das Äußere des Hottentottenhundes vermag ich nichts auszusagen. Meine Bemühungen, ihn auf die Platte zu bekommen, scheiterten, ebenso mehrere Kaufangebote.

Der Hottentott macht das meist scheue Tier durch seinen Geruch an sich zu gewöhnen *(tame, verb.)*. Er schmiert zu diesem Zweck etwas von seinem Achselschweiß dem Tier um die Nasenlöcher oder er trägt ein Stück rohes Fleisch einige Stunden im Fellschurz und füttert es dann dem Hund. Hündinnen, die nicht trächtig werden sollen, brennen sie mit einem heißen Eisen die Schamteile. Die Tiere werden dann so empfindlich gegen Berührung, daß sie jeden Hund abweisen.

6. Die Jagd

der Hottentotten hat seit der Einführung der Feuerwaffen und des Pferdes europäischen Anstrich bekommen. Damit steht sie technisch der Jagd in unserer Heimat gleich, erhebt sich aber hinsichtlich über sie, wenn man unter einem Jäger nicht nur einen Jagdbeflissen, sondern einen Kenner des Wildes und seiner Naturgeschichte versteht. Waidgerecht auch insofern, als er im Wilde nichts wittet, ist der Hottentott schon deshalb, weil er im allgemeinen jede Tätigkeit scheut, die ihm seine und seiner Familie unentbehrliche Bedürfnisse hinzugeht. Die teilweise Geschütz-Ausrüstung der Buren imponiert und einige Sportsmarkskanonen anderer Nationen, der innerhalb kurzer Zeit auf weite Strecken das edelste Wild bis auf das letzte Tier unwiederbringlich zum Opfer gefallen ist, ist ein Schandfleck in der Erlebnisgeschichte Südafrikas. Klimatische Veränderungen und Seuchen haben gleichzeitig die Wildbestände gelichtet.

7. Das Wild[1]).

das der Hottentott heute noch jagt, ist nur ein kümmerlicher Rest des Reichtums seiner alten Jagdgründe. Alles jagdbare Wild wird erbeutet,

[1]) Es soll hier nur eine Aufzählung sein, wie sie bei Interesse der Ausbeutefähigkeit für diese Gebiete wünschenswert erscheint, aber keine Beschreibung der jagdbaren Tiere des Groß-Namalandes

ge-nanis, °*zaharas* oder *zamaras* genannt. Das Gewehr des Hottentottenjägers hat mit Ausnahme des Stoßens und des Zielens nur noch historisches Interesse. Wenn nicht

1. Der Elephant, *Elephas africanus* (Blumenb.), Olifant der Buren, b: *ekyuub*.

Obwohl mit zwei Mannschaften oder länger kein Hottentott mehr in seiner Heimat einen Elephanten gemieden hat, sind mir doch noch einige Erinnerungen aus der Zeit seiner Jagd lebgeblieben. Eine Hauptregel soll es gewesen sein, daß keiner der Jäger in der Nacht vor dem Jagen mit einem Weib Gemeinschaft haben durfte, der Elephant würde mit dem Rüssel auf sie gewiesen und Erde gegen ihn aufgeschaufelt haben. Der Schuldige durfte dann an der Jagd nicht länger teilnehmen.

Die Lage der Zitzen vorn an der Brust und die Gestalt der Vulva wurden die leicht erregbare Sinnlichkeit der Hottentotten. So erzählte mir ein Hottentott in einer Jagdgeschichte, wie zwei Schwäger zusammen und nach erfolgreichem Pirsch der ältere den jüngeren warnt, nicht von hinten an die erlegte Elephantin heranzutreten, wie dieser die Warnung in den Wind schlägt und mit einer unbeschreiblichen Erektion bestraft wird, die ihn lahm *(°ti)* gehen macht und ihn noch heute das Spottgelächter der Zeltvoll diesen Schwachs einträgt. Der Wortlaut der Erzählung war: *kyoi ninukye ga i gye gye nuke ekyuuna. ekya gye ekyuuna gye igun. ob gye guiba ge ti ta: „ti kyun ekyüb ai i°. ti ge ni. yuheb gye ekyuuna ge i ta ekyuun ti nuna ani ta ogüi ta i ge ikyi. ob gye guiba: „kuroi ti ta!" ob gye: „ai'n, gi kuroi!" ti ge ni.*

Heute ist der Elephant aus dem Kernlande für immer verschwunden; in die nördlichen Teile des Hererolandes will er langsam wieder vordringen.

In Südafrika war der Elephant ehedem weit verbreitet. In Transvaal, im Gebiet des Matabelekönigs Mosilikatze fand Kapitän Harris ermüdliche Mengen von Elephanten, in einem Tal allein, friedlich abgrasenden, Hunderte der Riesen. Heute kann ein Jäger das Matabele- und Maschonaland ein Jahr durchstreifen, ohne einen Elephanten zu Gesicht zu bekommen. Kaffraria, Natal und das Zululand, noch im vorigen Jahrhundert von reichen Elephantenherden bevölkert, sind für immer verödet. Im nördlichen Betschuanenland (im Gebiet der Bamangwato) und vor allem im Ondonga des

---

auch diese ungefähligsten Methoden gegeben werden. Näheres Beobachtungen über den Lebensweise und über Verbreitung der Tiere nach endgültigen Gesichtspunkten sollen später an anderem Ort Platz finden.

Ngamisees blühte das brutale Geschäft der Elfenbeinjäger. Man hat berechnet, daß der jährliche Verbrauch der Welt an Elfenbein einer jährlich zu stimmden Masse von 100 000 Elephanten entspricht[1]). Südafrika hat seinen Tribut gegeben und ist auf dem Elfenbeinmarkt jetzt bankerott. Nur als Naturdenkmäler werden einige Elephantenrudel in der äußersten Südostecke, im Addo-Busch, in den Knysna- und in der Zitzikammawildnis erhalten bleiben.

2. Vom Rhinoceros, — unentschieden ob *Rh. simus Burch.* oder *Rh. bicornis (L.)*, — Rhenoster, hat sich im Namaland nur eine verschwommene Erinnerung, an den Namen *gaiseb-ô* anknüpfend, erhalten. Der Name der S. 201 erwähnten Pflanze läßt darauf schließen, daß das Rhinoceros einstens im Namalande wohl bekannt war. Noch in der zweiten Hälfte des 18. Jahrhunderts war das *Rh. bicornis* in der Kapkolonie verbreitet (vgl. S. 168, No. 75). Das letzte soll im Jahre 1849 im Addo-Busch gestanden worden sein.

3. Das echte Quagga, *Equus quagga Gmel.*, ist völlig ausgerottet; nicht einmal sein alter Hottentottenname hat sich sicher erhalten; nur ein einziges Mal wurde hier von einem Eingeborenen auf meine Erkundigung nach dem verschwundenen Zebra, das nur an der vorderen Körperhälfte gestreift ist, der Name *gnu-gub* genannt.

Über die ehemalige Verbreitung des Quaggas in Südafrika haben wir nur wenig brauchbare Angaben. Sicher ist, daß es hier einst in großen Scharen lebte. In der großen Karroo und in den Ebenen der westlichen Kapkolonie, in Griqualand und im Oranjefreistaat war es meist in Gesellschaft des schwarzen Wildebeestes und des Straußes zu finden. Die Buren jagten das Quagga um ihre Hottentotten- und Buschmannsklaven zu füttern und so für Vieh zu sparen. Mit den Hirten handelten sie und rühmen nicht eher ab bis das letzte Quagga vom Erdboden verschwunden war. Das war um 1860 erreicht.

4. Das Zebra, *gnu-rib*, ist den Hottentotten in den beiden Arten bekannt, die wir als *Equus zebra L.* (= *E. montanus Burch.*, Bergzebra) und *E. burchelli Gray* (Steppe Quagga) unterscheiden. Das ausgesprochene Zebra, das er selbst als die kleinere, in den Bergen lebende Art bezeichnet, nennt der Hottentott *°ai-gnu-gnorib*, wahrscheinlich nach der Weißlichkeit (s. S. 130), mit deren Milchsaft er die Tiere an der Tränke vergiftet. Ein anderer Name für *E. zebra* ist *°hâ-gnorib*, d. h. das „schwarz-weiß gestreifte". Diese Bezeichnung, die an sich auf jedes Zebra passen würde, wird als diagnostische Bezeichnung erst durch den Gegensatz verständlich:

Die dunkle Streifung von *E. burchelli*, das die weisse Ebenen bewohnt, erscheint spärlicher als die bei der anderen Art, die weisse Grundfarbe des Körpers leuchtet entsprechend breiter hervor, daher nennen sie diese Art °*n-rigureb* oder das „weisse Zebra".

Das schwer zugängliche Gebirgsland im Westen des Fischflussbeckens und die östlichen Namibfächen im südlichen Gross-gebiet sind die letzten Zufluchtsstätten kleiner Zebratruppe im Groß-Namaland.

Ende der 1890er Jahre war *Equus zebra* in den gebirgigen Teilen der südlichen Kapkolonie noch zu finden. In den Bergen um Kapstadt °) 170 Meilen von Willemoet fiel um diese Zeit den Verfolgungen der Buren

Equus burchelli Gray.

und Eingeborenen eine Zebrastute zum Opfer, mit Annahme eines Hengstes. Vereinsamt, schloß sich das Tier den Pferden einer Farmerei an, die hier frei weideten, folgte ihnen auf allen Wanderungen, folgte ihnen sogar in den Kraal der Farm. Hier verbargen das Zebra, da es selbst das Futter, das ihm von seinen alten Weidegründen gebracht wurde, nicht annahm.

5. Das Nilpferd, *Hippopotamus amphibius L.*, Zorkoe, b: *Kyam* oder °*Kyam*, ehemals in allen Flußläufen des Kapstandes häufig, hat sich in einigen wenigen Exemplaren im Unterlauf des Oranje gehalten.

6. Die Giraffe, *Giraffa capensis (Lesson)*, Kameel, b: *ruuhâ*, wie ihrer Reisebeschreiber übereinstimmend angeben noch um die Wende des 18. und

19. Jahrhunderts im Groß-Namalande zu finden, ist jetzt dort ausgerottet und lebt nur in Sagen weiter.

3. Der Strauß, *Struthio australis L.*, vrut aurib, b: *aunib*, (Abbild. s. bei den Sagen) ist in allen diesen Teilen des Groß-Namalandes anzutreffen, am reichsten in der Übergangszone der Namib zum Hinterland. Ich sah ihn auch südlich des Oranje, im kleinen Bowbawenland.

Seines unvergleichlich scharfen Gesichts wegen kennt ihn der Hottentott auch *ǂgaiba mûti* (von *ǂgaiba* — scharf in die Ferne sehen, *mûti* — Auge). Unter den weiblichen Tieren unterscheidet der eingeborene Jäger eine vereinzelt im Trupp auftretende, leichter abzustreifende, zu Federbildungen geeignete Henne als *ǂâ-ǂes* vom gewöhnlichen Straußenweibchen, das er *ǂkai-ǂgare-s*, „die mit dem kahlen Hinterkopf" nennt, *naiba-b* (= Tier ewig) ist der junge Strauß.

Junge Straußenvögel.

Nächst dem Strauß sind die Trappen, *Eupodotis*-Arten, das auffallendste Vogeltier des Namalandes.

4. Der Löwe, *Felis leo L.*, Leone, b: *gaub*, ist heute auch aus der Namib und den angrenzenden Gebieten, seinen letzten Refugien, verschwunden und nur noch im Nordosten in der Übergangszone des Groß-Namalandes zur Kalahari anzutreffen.

5. Das Kudu, *Strepsiceros capensis (A. Smith)*, b: *gaib*, entführt die Reihe der Antilopen. Groß, stark und dabei von kurzhaarem Ebenmaß der Form gilt das Kudu mit Recht, wie in unseren Wäldern der Hirsch, dem

es auch in der Größe gleicht, als das schönste gehörnte Wild der südafrikanischen Savanne. Auch darin erinnert es an unseren Hirsch, daß nur das Männchen eine Kopfwaffe besitzt; es gibt keine schönere Trophäe als das in schöne Spiralen aufgerollte Gehörn dieses Kuhantilopen.

Die Farbe des Kudus ist ein wundervolles Gelbgrau; gegen 7 schmale weißliche Querstreifen ziehen über den Rücken und über die Keulen. Von der Schwanzwurzel bis zum Hinterhaupt steht in der Mittellinie des Rückens

Foto der I.

die Strähne etwas verlängerter Haare, so kurz, als daß man von Mähne sprechen könnte. Aber ein deutlicher Bart beginnt beim Bullen zwischen den Unterkiefern, schwärzt in der Mittellinie herunterreichend, die Vorderfläche des dunkler grauen Halses und setzt sich seitlich oberhalb der Schultern in eine schwache Halsmähne fort.

Das Kudu liebt dichtes Busch und ist im Innern des Groß-Namalandes auf die gebirgigen Teile beschränkt. Es schwärmt, wenn es den Feind bemerkt. Der nächste Verwandte dieser herrlichen Antilope,

10. das Eland, *Taurotragus oryx (Pall.)*, h: *ãyoms*, ist in seiner ganzen äußeren Erscheinung das Gegenteil des Kudus. Die kurzen, starken Beine mit den plumpen Hufen und die schwerfällige Last des umfangreichen, langgestreckten Körpers zeigen nichts antilopenhaftes. Die weit herunterreichende, dunkle Stirnmähne des Bullen, die stark entwickelte Wamme und die buckelige Erhebung des Rückens über den Schultern erwecken vielmehr die Vorstellung eines Rinderviehes. Der lange dünne Schwanz mit seiner schwarzen Endquaste ist ebenfalls rindähnlich. Das Gehörn besteht beim männlichen Geschlecht aus starken, kurzgedrungenen, beim weiblichen Geschlecht aus schwächeren und etwas längeren, aber schlankeren Zapfen, die schräg nach oben und hinten laufen, mit einem kräftig vortretenden Spiralwulst in der unteren Hälfte. 8—10 dünne weißliche Querstreifen des Rückens, die sich im unteren Teil der Flanken verlieren, erinnern wie das Graugelb der Gesamtfärbung an das Fell des Kudus. Das Eland scheint auf den äußersten Nordosten des Namalandes beschränkt und auch hier selten zu sein.

11. Der „Gemsbock", *Oryx gazella (L.)*, h: *ŋaib*, ist die Antilope der flachen Halbwüsten, das Grenzgebiet der Namib und des Hinterlandes in nur Zeit der besten Weide sein Lieblingsrevier.

Der Gemsbock hat die Größe etwa eines schwachen Hirsches. Nächst dem Springbock zeigt er die abwechslungsreichste Färbung unter den südafrikanischen Antilopen. Die Grundfarbe des Rumpfes und Halses ist ein helles Graubraun, das sich am Spiegel weißlich lichtet. Ein dunkelbrauner Streifen zieht über den Rücken, setzt sich vorn an die kurze Mähne des Rückens, hinten breit auf das Kreuz und in den langen, buschigen, zuweilen tiefschwarz erscheinenden Schwanz fort. Ein gleicher dunkler Streifen zieht vorn von der Kehle die Mittellinie des Halses herunter und gabelt sich zwischen den Vorderläufen. Die Gabeläste ziehen divergierend als breite Längsbänder am Bauch entlang und gehen auf die Keulen über. Das weiße, kalbrunige Feld, das sie auf dem Bauch zwischen sich fassen, setzt sich breit auf die Keulgegend der Hinterläufe fort. Ein breites dunkelbraunes Band endlich umschließt die Oberschenkel der Vorderläufe; die weiße Keul- und Hofgegend wird auf der Streckseite von einem langen, dunkelbraunen Fleck unterbrochen. Die schwarz-braune Zeichnung des Gesichts gleicht einer tief und reich eingeschnittenen Maske, die sich scharf von den freigebogenen, beschmutzweißen Gesichtspartien abhebt.

Junge Gemsböcke mit etwa halblangen, an den Spitzen ungeringelten Stangen, sind gleichmäßig hellbraun gefärbt. Nur das buschige

Schwanzende enthält reichlich schwarzes Haar, und ein dunkler Streifen, der vom Vorderrand des Auges gegen den Mundwinkel hin zieht, deutet (verschwommen über Stirn und Nase) die schwarze Gesichtsfärbung des erwachsenen Tieres an. Der Hottentott nennt ein Oryxkalb bis zu diesem Stadium *ākyo-reb*. Ein älteres Kalb, dessen Gehörn bereits die Länge eines kleinen Armes hat, ist *'nanib*. Endlich unterscheidet der Jäger das ausgewachsene Tier vor der ersten Paarung als *'nāxuadoreb*, d. h. „Schwarzhorn", weil das Gehörn noch frische, dunkle Farbe, noch nicht die graue, abgeschürfte Oberfläche des älteren Tieres zeigt. Den alten, aus der Herde ausgestoßenen Gemsbockbullen nennt der eingeborene Jäger *nanib*.

Antilopa oryx leucoryx Zimmerm. Junger Spießbock ♂.

Das Gehörn (beim Männchen stärker und gedrungener) stellt zwei kräftige, bis 1 m lange, in der unteren Hälfte geringelte Spieße *'dar*, die schwach divergierend in der Ebene der Stirn schräg nach hinten aufsteigen. Der Burenname „Gemsbock", der sich in Südafrika überall eingebürgert hat, zeigt, wie so viele andere Namen, mit welch kindlich verschwommenen Fabelerinnerungen der Bur an die Tierwelt seiner neuen Heimat herantritt.

12. Der Springbock, *Antidorcas euchore* Zimmerm., h: *ǂgûb*, ist in Bau, Zeichnung und Größe das Urbild der zierlichen, leichtfüßigen Gazelle. Er hat die Größe eines starken Rehes. Auf hohen, zarten Läufen ruht der ebenmäßige Rumpf, ein schlanker Hals trägt das Köpfchen mit dem Lyragehörn. Von der unteren Schultergegend zieht ein dunkelbraunes, breites Band schräg aufwärts nach hinten zur Hüfte und grenzt scharf das lichte Gelbbraun des Rückens vom Schneeweiß der Bauchseiten ab. Vorn setzt sich das Rückenbraun auf den Hals und auf die Streckseiten der Vorderläufe fort, hinten zieht es auf die

Außenseite der Keulen über, läßt aber dem ganzen vorderen Hälfte frei. Der Spiegel bleibt ebenfalls weiß, von da schneidet ein scharf gezogener weißer Streifen mitten in den Rücken ein und endet kurz vor der Körpermitte. Das Weiß der Bauchseiten deckt auch die Brust und zieht als schmales Band in der Mittellinie des Halses zur Kehle. Weiß ist auch das Gesicht des Springbocks. Ausdrucksvoll stehen darum die großen dunklen Augen hervor. Ein dunkelbraunes Band, das die Oberlippe mit dem vorderen Augenwinkel verbindet, belebt die Züge; ein Fleck über dem Auge und einer auf der Stirn vervollen, besonders bei jungen Männchen, über den ganzen Nasenrücken fortgesetzt; vollenden die einfache und doch so lebendige Zeichnung des Tierchens.

Der Springbock bewohnt in vielhundert-, zuweilen vieltausendköpfigen Rudeln die offenen Flächen. Seine auffallenden Bewegungen haben ihm den Namen eingetragen. Die Tiere springen so hoch, daß bei aller Geschwindigkeit jeder Bewegung doch ein endlanges Zeitmoment vergeht, ehe sie den Boden wieder berühren. Sie scheinen dann, wenn der Sprung annähernd senkrecht in die Höhe geht, eine Sekunde lang mit allen vier Beinen in der Luft zu stehen. Noch sonniger sind die Bewegungen, wenn die Tiere, plötzlich beunruhigt, wie von unsichtbarer Kraft in die Luft geschnellt, bald nach rechts, bald nach links in unberechenbaren halb Seiten-, halb Verwärtssprüngen ihre Erregung kundgeben. Dann setzen sie in voller Flucht davon. Aber auch dann sieht man sie zuweilen mitten im flüchtigsten Galopp steil in die Höhe springen, kängurnartig über die Büsche setzen. Dabei ist der Rücken gekrümmt, der Kopf gesenkt und der Rückenfächer, ein Bündel schneeweißer, langer, erektiler Haare, leuchtet breit entfaltet auf.

Das Springboklammen wird vom Jäger *tgu-tib* genannt, der aus der Herde ausgestoßene alte Rammen *°tgu-riseb* oder *°tgurimdi*, d. h. „der allein steht".

13. Der Steenbock, *Rhaphiceros campestris (Thunberg)* h: *ra-ris*, ist ein kleines (ebkitzgroßes), rotbraunes, meist einzeln äsendes Böckchen. Das Männchen ist mit einem geraden, dünnen, glatten, schwarzen, spitzen, stark aufragenden Spießgehörn bewehrt. Auf dem Nasenrücken fällt vielfach ein schwarzer Fleck auf, der bis halbwegs zum Auge zieht. Einen Hottentotten, der sich über die schmutzige Nase Jemandes lustig machen will, hört man deshalb gelegentlich sagen: *„aris kyoma tsi tgaise ti"*, d. h. „Du mit der Nase, die schwarz wie die eines Steenbocks ist".

14. Den Klippspringer (s. Abbild. S. 276), *Oreotragus saltator (Lapurd)*, Klipbok, h: *skyal-b* oder *skyal-ab*, können man die Gemse Südafrikas nennen. Er lebt in kleinen Rudeln ausschließlich in zerklüftetem Bergland. Sicher und graziös klettert er über die zerklüfteten Felsen; ohne Anlauf, nur kurz die hinteren Keine beugend, springt er fast senkrecht um die Höhe des eigenen Körpers die steilen Stufen der verwitterten Granit- und Granitblöcke hinan. So genau weiß er die Entfernungen und den nötigen Kraftaufwand abzumessen, daß er selbst nach kühnem Sprung auf einem kaum handbreiten Grat mit erstaunlicher Sicherheit Fuß faßt. Die Hufe des Tieres laufen nicht, wie die der anderen Antilopen, spitzdreieckig nach vorn zu aus, sondern sind zu scharfkantigen aufgerichteten, kräftigen Zylindern umgebildet. Das Tier steht auf den äußersten Spitzen dieser Hufe wie auf Krücken.

Oreotragus saltator (Thbg.). Groothoek. ♀.

Merkwürdig ist auch das Fell des Klippspringers: Dichte bewegliche Haare bilden eine weiche elastische Decke, die eigentümlich raschelt, wenn die Hand über sie hinwegstreicht. Die Spitzen der meisten Haare sind hellgelblich gefärbt, sie setzen sich scharf von den freiliegenden dunklen Partien der Haarschäfte ab; das Fell, von weitem einförmig graubraun, erweist sich so in der Nähe als lebhaft meliert. Das Männchen trägt ein Gehörn ähnlich dem des Steinbocks.

15. Der Duiker, Ducker, *Cephalophus grimmi (Gray)*, h: *°ño-s* oder auch *°duiño-s* genannt, lebt wie der Steinbock einzeln oder paarweise. Das Männchen, seltener das Weibchen, besitzt ein kurzes, gerades Spießgehörn. Der Duiker duckt sich zu Boden, sobald er einen Feind gewittert hat und kriecht eine Strecke weit fort im Schutze des dichten Gebüsches, das sein Lieblingsaufenthalt ist.

16. Das blaue Wildebeest, *Connochaetes taurinus (Burchell)*, h: *gnū-ab*, gleicht, wie das nahe verwandte, hier abgebildete Gnu, in der äußeren Erscheinung, besonders in der Bildung des Kopfes einschließlich des Gehörns, weit mehr einem kleinen Rind als einer Antilope. Die Grundfärbung des Körpers ist ein bald dunkleres, bald helleres Grau, das auf dem Kreuz und den Beinen in leicht bräunliche Töne übergeht. Der Hals und die Seitenteile des vorderen Rumpfes sind quer gebändert; bald sind es breite, braunschwarze, zusammenhängende, bald schmale, zerrissene Streifen. Der buschige schwarze Schweiß berührt fast die Erde. Eine langhaarige, bald längere, schwarze Mähne zieht vom Hinterkopf bis ungefähr zur Rückenmitte. Hinter dem Mundwinkel sprießt ein bartartiges Haarbüschel hervor, auch der Kehle zu geht es in eine dünne struppige Mähne über, die ein Stück weit auf der vorderen Mittellinie des Halses herunterwächst.

Connochaetes taurinus (Burchell). Junger Klippspringer, ♂.

Ich habe das blaue Wildebeest weder von Angesicht noch in Fährten im Groß-Namaland selbst, sondern nur in der Kalahari gesehen. Ob und wo es im Namalande heute noch zu finden sein mag, kann ich nicht angeben.

17. Das rote Hartebeest, *Bubalis caama (Cuv.)*, h: *ākyama-ǂ*, beschließt die Reihe der Antilopen im groß-namaländischen Jagdrevier; in

[illegible] nördlichen und westlichen Grenzgebieten (Kreuzbreitland, Rosenfeld und Neudegelow) ist es noch zu treffen.

Dicht über den starken Augenbrauenwülsten erhebt sich der turmartige Unterbau des Geweihes; vorn fällt er gewölbig in die Stirn und den stark vorspringenden, steil abwärts gerichteten Nasenrücken ab, hinten steigt er gewölbig in den Hals, der steil in den Schädelturm übergeht. So erhebt sich das Tier ein Hinterkopf ganz zu fehlen: Nacken und Stirnnasenrücken laufen in eine hohe Dreieckspitze aus; auf sie ist dann ein wundersam rückwärts gekrümmtes Geweih aufgesetzt, wenig im männlichen, schlank im weiblichen

Canadischer Elch (Zimmermann). Schwarze Wildform, Bulle.

Geschlecht. Der Rücken steigt sanft nach vorn an und erhebt sich buckelartig über der Schulterpartie. Die Gesamtfärbung des Haarkleides ist ein helles Kastanienbraun, das sich am Kopf und an der Streckseite besonders der Vorderbeine verdunkelt. Ein schwarzbrauner, breiter Streifen zieht über den Nasenrücken bis zur Stirn, und als dunklere vollendgrobe Warzen erheben sich schräg vorn unter den Augen zwei Haarwülste. Sie erheben, ebenso wie die Zeichnung des Kopfes, beim Männchen stärker als beim Weibchen ausgeprägt zu sein.

Der Schwanz ist unterhalten: „*tsuisi gye ôyaris saras !*“ „von seinem Trab (infolge seiner vielen schwanzschlenkernden Bewegungen) ist er so kleinschwänzig geworden“, sang eine Frau in einem Jagdlied vom Hartebeest.

Während die Antilopen in gleicher Weise ihres Fleisches und Leders wegen gejagt werden, gilt die Jagd auf Raubtiere, wo sie nicht einfach als Notwehr aufzufassen ist, ausschließlich dem Fell.

16. Von den Raubtieren den Gerd-Namalaiden ist der Leopard, *Felis pardus L.*, Tiger.fk: *garu-b*, das gefährlichste. Der Hottentott unter-

Bubalis caama (Cuv.) Das rote Hartebeest. *ǂ*

scheidet zwei Arten von Leoparden: die eine, *ǂkurdu-garu-b* genannt, soll kleinflockiger, in der Gesamtfarbe gelber sein als die zweite Art. Da dieser Leopard nicht allein raubt, sondern jedes Stück Vieh im Kraal tötet, dessen er habhaft werden kann, ist er besonders gefürchtet. Er bewohnt das flachere Land und die Täler. Die zweite Art: weniger blutdürstig, dunkler, schlechtweg *garu-b* genannt, wohnt in den Bergen.

Nach dem Jägerglauben der Eingeborenen springt der Leopard, wenn er nicht angegriffen wird, nur den Menschen an, der nach ihm hinsieht,

während er den, der ohne Schamhaft an ihm vorbeigeht, unbehelligt läßt. Will aber der Leopard nicht will (*ākyō* = sich weigern), daß er bemerkt (*khani*) wird (-*kx* Passivendung, -*ni* Adjekt.-Endung, *gye* Hilfszeitwort), nennen ihn die (alten) Hottentotten **khan-khangyenkyō-ā*. Offenbar ebenfalls ein alter Jägername des Leoparden (denn ich hörte ihn nur von betagten Männern) ist **ekkhaā*.

19. Der Gepard, *Cynaelurus guttatus Herm.*, Leipard, h: *ga-rab*, ist, von der Zeichnung seines Felles abgesehen (kleine, runde, ungeordnete, nicht gruppierte, weit auseinanderstehende, schwarze Flecken auf hellem Braungelb), auf den ersten Blick an dem hundeartig-schmächtigen Beinen zu erkennen, die mehr zum Lauf als zum Sprung und Taxusweibling geschaffen sind. Der Rücken erscheint in die Länge gezogen; man kann den Hottentott gelegentlich einen langen Menschen mit den Worten schimpfen hören: „*tarab kyama gaya gūba k*" d. h. „Du mit dem langen Rücken wie ein Gepard". Der Gepard ist ein seltenes Wild im Namaland, gegen die Kolonisation hin wird er häufiger.

20. Die Wildkatze, *Felis caffra Denn.*, Grauwolf, h: *ibbab*, ist die häufigste der kleinen Katzen des Groß-Namalandes. Sie erinnert am meisten an unsere Hauskatze, ist aber stärker und vor allem buschiniger als diese. Der Schwanz läuft schwach buschig aus. Die Grundfärbung ist grau, vermischt mit hellbraunen Tönen, die auf der Bauchseite bis zur Kehle hinauf reiner hervortreten. Die Bengelreife der Vorderbeine und die der Hinterbeine von der Ferse abwärts ist bald mehr, bald weniger zusammenhängend schwarz gefärbt. Die Streif- und Außenseiten der Vorderbeine sind schwarz gefleckt, die der Hinterbeine vom Knie abwärts schwarz quer gebändert. Unregelmäßig ist die reiche, schwarze Bänderung des Schwanzes. Am Bauch sowie an der Innenseite der Glieder und in der Kehlgegend hebt sich das Braungelb rosenlos bis zu reinem Weiß. An der Innenfläche der Vorderbeine treten schwarze Querbänder auf.

21. Der Luchs, *Felis caracal Guldenst.*, Rooikat, h: *ibbib*, ist nicht selten im Groß-Namaland. Die Haarpinsel an den Ohrspitzen lassen das Fell auf den ersten Blick als das einzige erkennen. Der Pelz ist unscheinbar, mit geringen Schattierungen gleichmäßig braunrot gefärbt, nur am Kopf, an Ohren und Oberlippe und auf einem Streifen zwischen innerem Augenwinkel und Nase tritt Schwarz hinzu.

Ob die übrigen im Südafrika bekannten Katzenarten, die sogenannte Tigerkat, *Felis serval Erxleben* und die kleine *Felis nigripes Burchell* im

Groß-Namaland angetroffen wurden, kann ich nicht sagen. Die Hottentotten, mit denen ich jagte, kannten sie nicht. Die erstere soll im nördlichen Namaland*) nicht selten sein, die letztere könnte von Osten aus der Kalahari hereinwechseln.

11. Ein belästigender Wild jagenden Jäger ist eine Viverride, das „Erdmännchen", eine Cynictis-Art, vermutlich *Cynictis penicillata (G. Cuv.)*, gnui Mouhat, h: *gurrib, in der Flucht einem Wiesel nicht unähnlich. Die Tierchen sind häufig aufrecht vor den Löchern ihrer Kolonie sitzend zu sehen.

Eine verwandte, etwas größere und dunklere Art, der *nadib der Hottentotten, scheint einer *Herpestes*-Art anzugehören.

Ob die Ginsterkatze, *Genetta*, im Groß-Namaland vorkommt, wie ich annehme, konnte ich nicht feststellen. Häufig scheint sie nicht zu sein, obwohl sie im Klein-Namaland, im südlichen Hererolande und in der Kalahari gemein ist, also von Süden, Norden und Osten her in unser Gebiet eindringen könnte.

13. Das Stinktier, *Zorilla striata (Shaw.)*. Stinkt ausnehmend, eine schwarz und weiß gestreifte Mustelide, nennen die Hottentotten *gurumûb*, den Stinker, dem Volksglauben entsprechend, daß das Tierchen in den Stinkdrüsen Jahr und Tag Stinkwasser zur Erde hält.

Aus der Familie der Marder sind noch zwei in ihrer Lebensweise extrem auseinandergehende Vertreter zu nennen, zunächst

14. der Honigdachs, *Mellivora ratel (Sparrm.)*, h: *tha-rebib oder *thaxrebib, ein Verwandter unseres Dachses, mit so dicker Haut ausgerüstet, daß er ungestraft die Bienenstöcke plündern kann. Das Weiß der Rückenmähne kontrastiert scharf mit dem tiefen Braunschwarz des übrigen Körpers. Die weiße Kappe, die den Schädel deckt und seitlich bis fingerbreit über das Auge, median etwas tiefer in die Stirn reicht, setzt sich breit über den Nacken fort und teilt sich in der Schultergegend in zwei Schenkel; die ziehen seitlich divergierend nach hinten und vereinigen sich wieder in der Schwanzwurzel; in der Mittellinie des Rückens gehen sie in ein mähnenartiges, im Gesamteindruck grau erscheinendes Rückenschild über.

15. Eine Fischotter, wahrscheinlich *cf. Lutra capensis Schinz* gelblich, ist auf die größeren Wassertümpel des Großen Fischflusses angewiesen. Die Hottentotten nennen sie wie die Ohrenrobbe der Küste *thurisi*.

Von mittelgroßen Raubtieren liefert die Familie der Hunde dem Jäger die zahlreichsten und besten Pelze. An erster Stelle steht hier

c). der Schabrackenschakal (Abbildung siehe bei den Tafeln). *Canis mesomelas Schreb.*, Fox. b: *gûrûb*, von allen Hottentotten auch häufig *gui-rub* genannt, abgeleitet von **gui* = durcheinanderringen: Die Schakale umzingeln beutelnd ein gefallenes Tier oder den Lagerplatz, an dem sie Fleisch wittern*).

Die lohgelbbraune Farbe seines Pelzes hat ihm auch den Namen Goldschakal eingetragen. Ein breiter, schwarzer, weißmelierter Streifen deckt wie eine lange Schabracke den Rücken vom Nacken bis zur Schwanzwurzel und die oberen Partien der Flanken. Die letzten zwei Drittel der langen schlanken Rute sind schwarz, die Kehle und ein Saum längs der Oberlippe sind weißlich gefärbt.

c). Einer der zierlichsten Schakale Südafrikas ist der Silberschakal, *Vulpes chama (A. Smith)*, b: *Ayamâ-b*. Die dreikantige, wolligweiche Rute ist stärker als der schmächtige Rumpf und kommt ihm an Länge ungefähr gleich. Der Rumpf selbst ist nicht stärker als der eines Kaphasen. Rücken und Nacken, Außenseite der Oberschenkel und der Schwanzwurzel sind silbergrau, mit feiner dunkler Melierung, der übrige Körper gelblichrau, verschieden schattiert. Das breite Ende der Rute ist schwarz, und schwarze Flecken zeichnen sie jedenfalls im ersten Drittel.

Der Jägerglaube sagt, daß, wer den Namen des Silberschakals auf der Jagd nennt, keinen Fang macht. Wer gezwungen ist, von ihm zu sprechen, bezeichnet ihn daher als **ngui-thittima-b*, als den, der *(-b)* nicht *(tima)* gerufen *(gui)* wurden *(-kr* Passivendung) ist.

d). Wie der Silberschakal, so ist auch der Löffelhund, *Otocyon megalotis (Desmar.)*, A-jackal, b: *ûkûb*, ein kleiner, harmloser Bursche, der nie in eine Herde fällt. Sein graubrauner Pelz ist lang und buschig. Der buschige Schwanz ist lang, aber schmächtig, sein Ende schwarzbraun gefärbt.

e). Im Gegensatz zu allen seinen südafrikanischen Familienmitgliedern ist der wilde Hund, *Lycaon pictus (Temm.)*, in höchstem Grade gefährlich. Er hetzt in Rudeln das flüchtigste Wild, bricht in Herden ein und greift selbst den Menschen an.

Der wilde Hund hat nicht die feine, spitze Schnauze des Schakals, auch nicht den breiten Schädel der Hyäne; man würde seinen Kopf viel-

*) Der Ableitung des Wortes von *ngûb* — Fettgeruch und demzufolge der Bezeichnung des Schakals als „Fettgeruch-Nachkömmling" kann ich nicht zustimmen, da die Bezeichnung für Fettgeruch nicht *ngûb* sondern *ngûb* lautet; **ngi-ori* — ein Stück Fett am Stäbchen über der Flamme braten.

mehr für den etwa unserer Hausbunde halten. Sein Fell ist schwarzbraun weiß und hellbraungelb gesleckt. Am Hals sowie über und hinter den Schultern fließt das Gelb zu einigen größeren Flecken zusammen; Gesicht und Kehle sind dunkelgraubraun gefärbt; ein dunkler Streifen zieht meist in der Mittellinie zwischen den Augenbrauen über den Scheitel und setzt sich schmäler werdend über den Nacken fort. Im Verhältnis zum Kopf ist der Rumpf und Hals sehr lang; unwillkürlich vergleichen wir eben das Tier mit einem Hausbund, deshalb erscheinen uns auch die Beine verhältnismäßig lang und stark. Der schwärzliche, schwach buschige Schwanz reicht etwas über die Ferse.

Weil die vordere schwarze Schwanzpartie den Tieren sich wie ein „Maskuart" von der helleren Färbung der benachbarten Teile abhebt, nennen die Hottentotten den wilden Hund *ǂgaub* (von *ǂgaub* — Spitze ringe um den Mund haben haben). Der Name den Tieren darf ebensowenig wie der des Löffelhundes auf der Jagd genannt werden.

30. Daß die **gefleckte Hyäne**, die *Hyaena crocuta* (E. vJ.), Tigerwolf, aus einer Kreuzung von Leopard und Hyäne entsprungen sei, ist bereits Sternglaube. Die dunkelbraunen oder schwarzen Flecken, die über den ganzen schmutzig gelbgrauen, kurzhaarigen Fell (mit Ausnahme des Kopfes und der Halsunterseite) gestreut sind, ferner die Raubgier und Kraft, mit der das Tier das Vieh bekämpft, erinnern in der Tat an den Leoparden. Im übrigen ist das Tier äußerlich sowohl als seinem inneren Bau nach eine echte Hyäne.

31. Die **braune Hyäne**, *Hyaena brunnea* Thunbg., Strandwolf, unterscheidet sich vom Tigerwolf, von dem sie geringere Größe abgesehen, durch die Einförmigkeit ihrer braunen bis grauen Färbung, die nur wenige verschwommene, größere dunkle Flecken aufweist. An den Füßen ist die Zeichnung etwas schärfer; dunkle Querbänder ringeln sich deutlicher um die Vorder- als um die Hinterbeine. Der Pelz ist langhaarig, nur den breiten Schädel mit der plumpen, stumpfen Schnauze deckt kurzhaariges Fell. Der Kopf sieht zuweilen wie aus einer Mähne hervor, denn dicht hinter den spitzen Ohren und den Kinnbacken ist der Pelz besonders dicht und lang.

Wie der Hottentott die beiden eben genannten Hyänen unterscheidet, kann ich aus meinen Aufzeichnungen nicht mit Sicherheit ermitteln. Nur so viel steht fest, daß die allgemeine Bezeichnung für Hyäne, *ǂâi-ǂâi*, weiter spezifiziert wird in **ǂâi-ǂâi-ra* und **ǂâi-ǂâi-roß*. Ich vermute, daß

die weitere Bezeichnung der dunkleren (nisi) = schwarz) *H. brunneus*, die zweite der *H. crocutta* gilt, deren Fleckenzeichnung den Jäger von ebendem an die Giraffe (*tsuidi*) erinnerte. Dem kommt die Konstanz des Geschlechtsunterschiedes beider Namen: Der erste hat stets die weibliche, der zweite stets die männliche Endung; das würde objektiv den Unterschieden in der Kraft und dem Charakter der beiden Tiere, subjektiv ganz dem Spannungsgefühle der Hottentotten entsprechen; doch sei dies nur als Vermutung geäußert.

32. Die Raubtierwelt des Wildes beschließt der *Erdwolf, Proteles cristatus (Sparrm.)*, h: *gûbi*. Dieses kleine Raubtier, ungefähr fuchsgroß, gleicht bei aller Zierlichkeit auffallend einer Hyäne: Der Schädel erscheint breit, der Rücken fällt stark nach hinten ab und geht in einen dunklen buschigen Schwanz über, ähnlich dem des Streifwolfs, aber der Besitz von fünf Zehen an den Vorderbeinen und Eigentümlichkeiten seines Gebisses entfernen das Tier von Hyänen wie von Hunden und räumen ihm eine Sonderstellung als Vertreter einer eigenen Familie ein.

Über den gelblichgrauen Rumpf ziehen 5—6 schwarze Querbänder. Sie ziehen eben in der Mittellinie zu einem schwarzen Längsstreifen, der sich da, wo der Rücken am höchsten ist, zu einem Fleck verbreitert. Die Beine sind ebenfalls quer gestreift. Im Nacken und Rücken sind die Haare länger und starrer, sie bilden hier einen aufrichtbaren Kamm; Stirn und Backen tragen kurzen, silbergrauen Pelz, der sich scharf von dem gleichmäßigen Schwarz des übrigen Gesichts abhebt.

33. Den Antilopen und Raubtieren gegenüber spielen die *Nager* jagdlich eine untergeordnete Rolle. Das Vorurteil, das die Hottentotten früher dem Hasen, *ǂâb*, als Wildpret entgegenbrachten[*], ist jetzt geschwunden. Sie unterscheiden drei Arten: der größte, *Lepus saxatilis Cuv.*, Felshase, Kreilhase, den sie *ǂkye-eib* nennen, gleicht in der Färbung noch am ersten unserm Feldhasen, da ein schwach bräunlicher Ton die Grundfarbe seines schwarzmelierten Pelzes bildet.

Kleiner ist der *Lepus capensis L.*, wilde Hase, h: *ǂkye-ras*. Die jungen Tiere werden ihrer an durchscheinenden Ohren wegen **ǂa-haragu-es* genannt. Ein leichter Grau mit schwach gelblichem Tönen und schwarzer Melierung bildet die Grundfarbe seines etwas rauhen Pelzes.

Während der Felse und der Kapsche Hase ein kleines Schwänzchen haben, das oben schwarze und unten weiße Wolle trägt, ist die letzte Art, *Lepus crassicaudatus Geoffr.*, Kliphase, h: *tsaxaro-s* oder *tsaxara-s*, leicht kennt-

sich an der gleichmäßig braunroten Farbe seines dichthaarigen, kräftigen Schwanzes.

24. Der Springhase, *Pedetes caffer* (Pallas), h.: *ge-rub*, ist im südlichen Gemsgebiet häufig. Wer an der dämmernden Tagesdämmerung vergeblich suchte zu sehen, sieht oft im Mondschein den kängeruartigen Tier zwischen dem Spurenmengewirr springen. Die Hinterbeine des Tieres mit ihren stark verlängerten Zehen sind zu kräftigen Sprungbeinen umgestaltet und nur als zwei kurze Ärmchen hängen die Vorderextremitäten dem Körper an. Der Körper ist oben gelblich graubraun, unten weiß gefärbt. Der lange, buschige, oben gelblichbraune Schwanz endet in seinem letzten Drittel schwarz.

25. Das Stachelschwein, *Hystrix africae-australis* (Peters), Sperrok. Zeigt einen schwarzbraunen Braun. Viererlei Haargebilde decken den Körper. Schmiegsame, kräftige Haare sind nur an den Gliedmaßen und auf der Bauchseite zu finden. Dicht hinter dem Ohr beginnen die erst etwa fingerlangen, schwachen, starren Stacheln, die sich über dem Körper noch als dunkelbraunes Pelz anlegen. Nach hinten gehen sie ohne viele Zwischenglieder in die weiß und dunkelbraun quer geränderten bis bleistiftdicken spitzen Stacheln über. Vom Nacken bis zum Anfang der Stachelwehr steht in der Mittellinie des Rückens ein Kamm langer, biegsamer Borsten, der mit den langen Stacheln dahinter aufgerichtet das Tier doppelt so hoch erscheinen läßt als es tatsächlich ist. Die Rasseln am hinteren Körperende vervollständigen die Schreckwaffen des Tiers.

Hystrix africae australis (Peters).

Der Hottentottenname des Stachelschweins, *gnuu-ǂ*, hängt vielleicht mit *nuǂ-* = ergrauen zusammen, im Tonwinkel und dem ausgeprägten Wortanfall können beide Worte übereinstimmen. *gnuu-ǂ* würde dann „Graukopf" bedeuten, ein Gesamteindruck entsprechend, den in der Tat das nächtliche Tier im nächtlichen oder im matten Licht des Sternenhimmels hervorruft.

36. Die mono- und rattenähnlichen Nager werden, wie von den arbeitsamen Bergdamara, so auch von halbwüchsigen Hottentotten gejagt und gegessen. Eine Untersuchung der eingebrachten Felle und Skelette wird zeigen, welchen der rattengroßen Tiere, die sie *ǂhaiǂ* nennen, *daros* (Tarsius spec.) ist eine Sammelnamen für verschiedene Mäusearten. Im Einzelnen unterscheiden sie unter anderem eine Nachtmaus, *ǂhi-gudaros* oder *ǂhi-ǂ*, und eine Art mit langgestrecktem Pelz, *ra-Arvicanthis* gelblich, als *gnuu-ǂ*.

37. Das Erdeichhörnchen, *Xerus capensis Kerr.*, wird *ᵍgu-ǂhi ǂaiǂ* genannt.

38. Das kleinste Huftier, sagenhaftlich im Gebahren, der Klippschliefer, *Procavia (Hyrax) capensis (Pall.)*, Dassie, h: *ǂaiǂ*, wandert oft in den Topf des Jägers. Die Jungen werden *ᵍgǂhâgu* genannt. Der Klippschliefer bedeutet in großen Scharen die Felshöhe in der Nähe von Wasserstellen.

39. Zum Schluß sind eine Anzahl Säugetiere zu nennen, denen der Hottentott mehr gelegentlich nachstellt, als daß er sie regelmäßig jagte. Er tötet sich ein Erdferkel, *Orycteropus afer (Pall.)*, h: *ǂgubu-ǂ*, nicht entgehen lassen, wenn er es einmal bei Tag im freien Feld antrifft. Aber der Jäger muß ihm selbst jagen, ehe er sich zu dem unsicheren und bewaffneten Nachtwesen vor der Höhle entschließt (s. Kalahari).

40. Die Jagd auf die Elephantenspitzmaus, *Macroscelides*, h: *hans* Khoin-Namaland *ǂgaurugaiǂ* genannt, ist ein Vergnügen der Knaben, unterscheiden, wie mir scheint mit Recht, zwei Arten: Eine trägt, die leicht einfangen läßt, „Schlafmaus", *"nun-hans*, und die „Klettermaus", *gaiǂ-hans*, die an den Felsen, im Leben rot durchscheinenden Ohren kenntlich ist.

41. Dem Pavian, *Papio porcarius (Bodd.)*, Bavian, h: *ǂaiǂ-ǂnâ*, wie ihn ähnlich Leute nennen, *ǂaiǂ-ǂnâ*, wird von den Hottentotten selber nachgestellt. Der Jäger kennt seine Lebensweise genau, unterscheidet Vorposten der Pavianherde als *ǂkyâ-ǂnâ*, „Späthemann", und das älteste Muttertier als *"ᵍgaro ǂaiǂnâ*, weil es als erstes zum Wasser drängt

(ganze) und keinen anderen der übrigen Hunde wittern läßt, bevor er sich selbst sein Teil geholt hat.

Als Parforcehund betrachtet der Hottentott einen kleinen langbeinigen, dem Affen der Gattung Cercopithecus, der im Busch den Ursprung kommen soll. Sie nennen ihn seiner Farbe wegen *°chai-tsiroab*, d. h. „Fuchspavian", oder *ao-ngyab*, Kobold (von *ao-ro* = Unfug machen).

Papio porcarius (Bodd.). Aus Wallace.

Bekannt ist jedem eingeborenen Jäger die Wut und Heimtückigkeit, mit der die Parforcehunde in corpore den Leoparden, ihren Hauptfeind, angreift und zerreißt.

Die Hirten behaupten übereinstimmend steif und fest, daß der Pavian Ziegen fängt und sich die Milch in den Mund melkt.

2. Die Jagdarten.

Den kleinen Tagesjagdausflug unterscheidet der Hottentott als *gâm* von einem größeren Jagdzug, *ǂkami*,' der mehrere Tage oder Wochen in Anspruch nimmt.

a) Auf der Pürsch zeigt der Hottentott seine Meisterschaft. Nur der Buschmann kann mit ihm in der Kunst konkurrieren, das Wild zu beschleichen (Khyeri, Gquam, etwa). Er achtet dem Wild zunächst auf große Bewegungen und erkennt es trotz aller Schutzfärbungen, die unser ungeübtes Auge täuschen, unfehlbar aus der Nähe. Im Spurenlesen hat er es zu einer Höhe der Sinnesschärfe und der verstandesmäßig kombinierenden Erfahrung gebracht, der gegenüber der Weiße blinde erscheint. Man sehe nur einmal einem Hottentotten einer Antilope folgen, die gewittert hat und krank geschossen abgegangen ist. Wo Schweiß und Fährten fehlen, ist das Spurensuchen Kinderspiel; aber wo wir rathos vor einem Gewirbelt stehen, dessen Kunst dicht gedrängt, einer wie der andere gleich blendend, vor uns liegen, da weiss er auf Einen unter den Hunderten hin: Der dreht kaum merklich eine seiner Unterlippen der Sonne zu, den wird also das flüchtige Tier mit dem Huf angestreift haben, der gibt also einen Fingerzeig nach der Richtung, in der weiter zu suchen ist. Dann nimmt dieser Durchsuch jeden Augenblick, der Boden ist auch so wie bewachsen, als daß er irgend einen Anhalt gäbe. Der Hottentott wandert die umwindenden Bäuche, schwenkt plötzlich ein Paar Schritte vor links und bringt ein Blatt, an dem zwei Grannenhaare hängen: Hier also hat das Tier angestreift; er nimmt die veränderte Richtung auf und mitgen Stunden vergehen, er findet die Stelle, wo das Wild verendet liegt.

Eine unübertreffliche Kenntnis der Lebensweise des Wildes und der Örtlichkeit fördert ihn die Pürsch. Es mag uns nicht waidgerecht erscheinen, aber dem eingeborenen Jäger, dem in der Einöde jede einzelne Patrone einen Wertgegenstand darstellt, ist es das Sicherste, an eine Oryx-Antilope sich anzuschleichen und ruhig zu warten, bis sie auch besonderer Äsung in den Bereich geht, um hier die tödlichen Mittgenommen zu verschießen. Der Hottentott folgt ihr dann lautlos und schießt das schießende Tier aus nächster Nähe nieder.

Der Hund ist für die Raubtierpürsch unentbehrlich.

Unter dem Schutze der Viehherde nähert sich der Hirt dem Steenbock, der arglos mit den Ziegen und Schafen äst, und tötet ihn mit einem sicheren Steinwurf (*tsuuri*), oder er jagt mit seinem Hund den Klippspringer in die Enge. Der Hund leistet auch bei der Pürsch auf die Oryx-Antilope gute Dienste; er stellt sie unter Umständen so fest, daß der Hottentott sie selbst mit dem Assagai, seinem „Wurfmesser", abfangen, erlegen kann. Ein besonders scharfer Hund hatte die Gewohnheit, sich dem

geeignetes Geschoß in die Nieren frei zu treffen, selbst das Tier sich nicht von der Stelle rühren kann. Der Hund ist willkürlich einem verwundeten Geschoß, dem er sich unvorsichtig nähern, zum Opfer gefallen; mit einer kurzen seitlichen Kopfbewegung des Nashorns stößt dies das bereits eingedrungene Tier eine Stange in den Leib.

b) Die Hetzjagd zu Pferd, *chasse*, scheint der Hottentott schon frühzeitig betrieben zu haben, wenn die Mitteilung eines eingeborenen Jägers, daß auf diese Art der Elephant gejagt worden sei, auf Wahrheit beruht. Der Elephant wäre dabei als Verfolger, indem ein Reiter nach dem anderen sich von ihm jagen ließ, so lange antrieb gehetzt worden, bis er zu überwältigen war.

Das Elend soll leichter zu bejagen sein.

Die Hetzjagd auf den Strauß ist ermüdender als die Pirsch, die der enormen Scharfsichtigkeit des Vogels wegen selbst für den Eingeborenen Schwierigkeiten hat.

Eine einzelne Oryx-Antilope ist an sich schon ein schöner Anblick, deshalb doch einen ganzen Hirschen; aber es fehlt jeder Vergleich mit Wild und Landschaft unserer Heimat, wenn man das Glück hat (wie es mir im Mai 1910 südlich von Kubub zu Teil wurde), einige Hunderte, etwa 150 Stück dieses kostbaren Hochwildes beisammenstehen zu sehen, keine Gefahr ahnend, die Köpfe tief im Gras gesenkt, von der Abendsonne so scharf beleuchtet, daß die Bewegungen jedes einzelnen Tieres klar zu verfolgen sind. Da plötzlich gewahren sie den Reiter: Die Unruhe der Nächststehenden teilt sich der ganzen Herde mit, in wenigen Sekunden ist die Schar im Galopp und bald zeigt nur noch eine hohe gelbe Staubwolke den Weg der Flüchtigen an. Ein gutes Jagdpferd, das selbst Passion hat, bringt den Jäger bald auf Schußweite heran. Dann heißt es schnell abspringen und ruhiges Blut zu einem sicheren Schuß haben.

Eine Eigentümlichkeit der Oryx-Antilope, die ihre Verfolgung erleichtert, ist die Gewohnheit, stets in der Richtung gegen den Wind flüchtig zu werden. Eine Oryx-Herde, der man sich z. B. von Osten her nähert, wird bei Nordwind sie nach Westen, niemals stets nach Norden fliehen. Man braucht in diesem Fall nur rechts zur Seite zu schwenken und wird, wenn das Pferd den scharfen Galopp lange genug aushält, das Wild aus nächster Nähe von links her schräg nach rechts hinüber an sich vorbeiflüchten sehen.

c) *Der Anstand* an der Wasserstelle ist die sicherste Art der Lauer auf größeres Antilopenwild und auf das Zebra.

Der Leopard schleppt, wenn er keine Jungen hat, die Beute meist nicht in seine Höhle, sondern verzehrt sie in einem Versteck nicht weit von der Stelle, wo er sie geschlagen hat. Der Hottentott verfolgt deshalb die frische Spur des Räubers vom Kraal, in den er eingebrochen ist, bis zu der Stelle, an der er gefressen hat, und schießt ihn, wenn er dahin zurückkehrt, um den Rest zu holen.

Den wühlenden *(Orycteropus)* oder in Felsspalten wohnenden Tieren (Klippschliefern) wird abends oder morgens vor der Höhle aufgelauert.

Die geselligen Antilopen, vor allem der Springbock und der Gemsbock, ziehen während der Trockenzeit aus dem Innern des Landes nach Westen in das Winterregengebiet und wandern hier langsam, bald auf gewohnten Wechseln, bald scheinbar ziellosen querfeldein, den regenbringenden Südwinden entgegen. Der Hottentott pflegt sich dann neben dem Wechsel *(°ego-rab)* im Schutz eines Buschkraals anzusetzen. Von den Wanderungen kleinen Stils, wie sie je nach der Jahreszeit und den lokalen Weideverhältnissen schwanken, sind jene ungeheuren Massenwanderungen zu unterscheiden, die der Springbock zu Zeiten der Dürre unternimmt. Der Strom der wandernden Springböcke *(trekbokken)* ist zuweilen so breit und so dicht, daß an ein Ausweichen vor menschlichen Ansiedelungen nicht zu denken ist. Die Tiere überrennen in der Tat die Gehöfte, Saaten und Gärten niedergetrampelt. Im Jahre 1892 [1]) mußte der Civil commissioner des Klein-Namalandes gegen 100 Gewehre amtlich an die Buren verteilen, um den Ansturm der Springbockherden abzuwehren. In einem Falle überfluten die Springböcke in so dichter und breiter Kolonne eine Farm, daß ein Teil von ihnen — da sie nirgends ausweichen konnten — wie eine Herde in einen Viehkraal gedrängt und dort niedergemetzelt wurde. Vor einem Ochsenwagen teilt sich der Strom, die Tiere scheuen so weit, als die nachdrängenden Massen erlauben, zur Seite, um wenige Schritte hinter dem Wagen wieder geschlossen weiter zu ziehen. Tage und Nächte kann sich ein Trekk ohne Unterbrechung dauern. Wie Hyänen und Schakale in früheren Zeiten auch Löwen und Leoparden, so folgt der Hottentott dem Springbockzug *(°dafigili)*. Noch im Jahre 1896 [2]) wurde in der nördlichen Kapkolonie ein Springbockzug von mindestens einer halben Million Köpfen beobachtet.

4) Treibjagd scheint früher (s. Erzählung No. XIII) die Art, Giraffen zu jagen, gewesen zu sein. Heute gilt sie nur noch dem Hasen. Die Einzeljagd auf den Hasen, die Suche mit Hunden, ist beschwerlich, denn

der Hund betrachtet den gebeizten, totgeschossenen Hasen meist als sein Eigentum, und der Jäger muß scharf hinterdrein laufen, will ihn der Hund nicht mit vollem Magen entgegenkommen. Lebendig ist die Hasenjagd im Kesseltreiben mit Kiris. Die Hunde töteten dann zu Hause. Ist ein Bezirk von einigen hundert Metern Durchmesser eingekreist, so schießt sich die eine Halbperipherie der Jäger gegen die andere, die andere bleibt, vor.

Kiri.
$^1/_{10}$ nat. Gr.

Bei diesem Halbkreisgange, *gâi*, wird *Zentrum*, *tgubi-a*, und Flügel unterschieden, letztere nach einem dem Heimweh entlehnten Vergleich, *mid-khya*, Hirnge, oder *ela-kya*, Arme, genannt.

Der aufgejagte Hase wird mit dem Kiri *(tsib-ti*, am besten am Taillenwirbel) geworfen. Das Kiriwerfen, *tgibi* oder *mami*, geschieht mit seitlich ausholendem Arme und so, daß das Holz annähernd horizontal durch die Luft wirbelt. Je nachdem das Stäbchen oder die Keule trifft, wird die Beute erwischen oder erschlagen. Dabei rufen die Leute: *„khyare tsisi, yam yam saisi, mid saisi, ali saisi, ayagu gaisi!"* Der Magen des Hasen wird im Feuer *gesengt* gebraten. Vorher wird das frisch erlegte Tier mit Kiris so lange gegen die Rippen geschlagen, bis die Leibeshöhle voll Blut gelaufen ist. Dann wird der ausgeweidete Hase (die Brustorgane bleiben im Leibe) mit Haut und Haaren in der heißen Asche gebacken. Der dicke Blutknochen im Innern ist ein Leckerbissen. So wird der oben genannte Treiber- und Schützenruf verständlich: „Kuru-Hase, du Brustorgane (*°gun gun* — schwammiges Gewebe) hervorrufen, von krumpligen Sachen gesagt, du Dickdarm (*°said, ali* — dick, *saib* — Blut), Dickdarm, du Liebling *(gu-ti* ist das heiratsfähige Mädchen) der Knaben!" *(a-ggu)* (die auf die letzte Anrede ist statt des Suffixes der 2. pers. das der 3. pers. comm. sing. *-i*, gebraucht).

Dem erlegten Hasen werden beide Oberschenkelknochen gebrochen; unterbleibt das, so wird der Hund dem Jägerglauben nach steif in den Beinen. Dem Hasen darf beim Zerlegen die Gurgel nicht durchschnitten werden.

α) Der Fallenfang ist gut ausgebildet und entspricht der Vorliebe des Hottentotten, sein Opfer, Mensch oder Tier, zu überlisten.

Fallgruben, die die Hottentotten von den Bergdamara gelernt zu haben scheinen, dienten zum Fang des Zebras. Im Wechsel des Wildes zum Wasser wurde, wie mir ein eingeborener Jäger berichtete, eine etwa

3 m lange und ebenso tiefe, 1 m breite Grube mit senkrechten Wänden ausgehoben und querüber mit schwachen Zweigen frischen grünen Buschwerks zugedeckt. Die Bergdamara nennen eine solche Fallgrube */gai-seb*.

Steinerne Kastenfallen, */nu-igu*, dienen zum Fang des Schakals und der Hyäne. Aus großen platten Steinen bauen die Hottentotten eine ca. $^3/_4$ m hohe Schakalsfalle mit einem Durchmesser von ca. 2 m, dem Unterbau eines kleinen runden Turmes ähnelnd. Beim Zubauen der oberen Öffnung wird eine Lücke gelassen, durch die man in den Fallenraum hineinsieht und das gefangene Tier mit einem Knüppel ins Rückgrat stößt. Durch eine Seitenöffnung gelangt der Schakal an den Köder, der im Mittelpunkt des Fallenraumes liegt. Sobald das Tier am Köder zerrt, wird eine einfache, mit Zweigstücken hergerichtete Stellvorrichtung ausgelöst, die einen schweren Stein vor die Eingangsöffnung, bald von oben herunter, bald schräg von der Seite her, fallen läßt.

Schakalsfalle, bei Aruguams (S. 167 No. 63).

Stärker als die Schakalsfalle ist die Hyänenfalle gebaut. Aus schweren platten Steinen, die lückenhaft, aber im eigenen Gewicht festruhend aufgeschichtet werden, bauen sie einen rechteckigen Kasten, dessen Binnenraum $1^1/_2$ m lang, reichlich $^1/_2$ m breit und $^3/_4$—1 m hoch ist. Das Dach bilden große Steinplatten. An der einen Schmal-

Hyänenfalle auf der Fläche nördlich von Chamis.

seite des Kastens ist die $^1/_2$ m hohe, $^1/_2$ m breite Eingangsöffnung freigelassen. Dicht hinter dieser Öffnung ist im Dach ein Querspalt ausgespart und von besonders starken Steinen umgeben, damit die Wand der Wucht des fallenden Steines standhält. Im Hintergrund des Fallenraumes liegt der Köder (Viehdärme u. dgl.), durch Stricke am Boden mit den beiden aufrecht stehenden Holzstäben verbunden, auf denen der zentnerschwere Fallstein lose aufsitzt. Durch Zerren am Köder zieht die Hyäne die Stäbe unter dem Fallstein fort, der im selben Moment stürzt und die Zugangsöffnung verrammelt. Ein breiter Wall unregelmäßig übereinander getürmter Steinklötze stützt die Seitenwände der Falle rings von außen; das Dach ist ebenfalls mit solchen Steinen beschwert, so daß die ganze Falle einen Steinbau von insgesamt $3^1/_2$ m Länge, 2 m Breite und reichlich $1^1/_2$ m Höhe darstellt. Eine solche Falle steht Jahre lang.

Schwippgalgen (s. Kalahari) kann man kurz den Fallentypus nennen, der zum Fang kleiner Antilopen, speziell des Klippspringers dient. Ein armstarker, mehrere Meter langer, frischer Ast wird mit dem dicken Ende fest in den Boden gesteckt. An seinem freien Ende wird eine Schlinge aus starkem Sehnengarn befestigt. Mitten durch die Schlinge läuft, an beiden Enden fest mit ihr verknüpft, ein Mittelfaden, auf dem das Lieblingsfutter des Klippspringers befestigt wird. Die Schlinge wird gestellt, indem man das dünne Astende bis etwa $^1/_2$ m über den Boden niederbiegt. Die Verbindung zwischen Ast und Schlinge stellt ein Sehnengarn her, das besonders kräftig sein muß, da es den ganzen Zug des Astes auszuhalten und später das gefangene Tier zu tragen hat. Die Schlinge wird von vier kurzen Pflöcken platt auf den Boden gehalten. Der Klippbock entwurzelt die Pflöcke, sobald er am Mittelfaden der Schlinge zerrt; der Ast schwippt in die Höhe, zieht dabei dem Tier die Schlinge über den Hals und reißt es mit nach oben; es hängt dann wie an einem Galgen.

Schlagfallen, *mō-agu*, dienen zum Fang des Stachelschweines und kleinerer Säugetiere, z. B. der Mäuse, die eine beliebte Speise der Bergdamara bilden. Der Einstellungs- und Abzugsmechanismus ist hier feiner als bei den vorhergenannten Fallen. Ein platter Stein *(a)* wird schräg gegen einen Stützstab *(b)* gelehnt. Dieser Stab ruht unten locker auf dem Boden auf; oben an der äußersten Kante des Steins drückt er ein Klemmholz *(c)* zwischen sich und den Stein. Seitlichen Halt gibt dem schrägen Stützstabe ein schwach aufwärts weisendes Horizontalstäbchen *(d)*, dessen eines Ende der unteren Steinkante fest anliegt, während das andere Ende frei

vorragt. Stützstab und Horizontalstäbchen werden durch das *ʃa-r(a)das*-Hölzchen *(e)* gegeneinander gedrückt; dieses Hölzchen endlich wird durch ein straffes Sehnengarn, das es mit dem Klemmholz verbindet, in seiner Lage erhalten. Sobald jetzt das Horizontalstäbchen von dem Tier, das sich am Köder *(f)* zu schaffen macht, niedergetreten wird, wird dem Stützstab der seitliche Halt entzogen, gleichzeitig schnippt das *ʃa-r(a)das*-Hölzchen aus seiner Zwangslage heraus und stört sowohl in loco als mittelst des Sehnengarns oben am Klemmholz das lose Gleichgewicht des ganzen Aufbaues. Die genannten kleinen Holzgeräte, die zur Herstellung einer Schlagsteinfalle notwendig sind, nennt der Berydamara **ǂhâiru-n.*

Schlagfalle.
a Stein, *b* Stützstab, *c* Klemmholz, *d* Horizontalstäbchen, *e* *ʃa-r(a)das*-Hölzchen, *f* Köder.

Capitulum IV.

Zusammenleben.

A. Familie.

1. Gründung einer Familie.

a) Der Eintritt in die Mannbarkeit, das Auftreten der ersten Menstruation, *kxaru-b* oder *ǂhaiba-b*, ist als erste Bürgschaft zukünftigen Familienglücks ein freudiges Ereignis und wird entsprechend gefeiert: Das Mädchen wird durch eine Mattenwand von den übrigen Bewohnern der Hütte getrennt. Sie legt ihren Schmuck an, Verwandte und Freunde bringen ihr Armringe und behängen ihre Brust mit Perlketten. Ein Teil davon bleibt als Geschenk zurück. Die Eltern schlachten und bewirten die Gäste mit Honigbier.

Ehe europäische Kleidung bei den Hottentotten Eingang fand, vertauschte das reife Mädchen ihren Kinderschurz mit dem der Erwachsenen; heute ist diese Sitte aufgegeben. Aber ein anderer Brauch hat sich noch hie und da erhalten, wo er den Blicken der Mission sich entziehen konnte: Männlichen Personen, vom kleinsten Kinde ab bis zum alternden Manne (Greise sind dispensiert), wird als Vorbeugungsmittel gegen Geschlechtskrankheiten von dem erstmenstruierten Mädchen das Scrotum mit Buchupulver eingerieben. Die Ausübung dieser Prozedur wird **ma-raǂxaira-* genannt *(ǂxairā-b* = der Hoden; **ma-ra* ist das sanfte Streichen über die Euter einer Kuh, deren Kalb verendet ist und die durch das Streichen veranlaßt werden soll, ihre Milch von sich zu geben; so zart wird also das Scrotum mit Puder bearbeitet).

Ist die erste Regel beendet, so wird das Mädchen von einer Frau vom Kopf bis zu den Füßen gereinigt mit nassem Kuhmist (besser Schafmist), der mit wenig Milch dickbreiig angerührt ist, (vergl. Körperpflege, S. 207). Diese Masse wird auf dem Körper in der üblichen Weise verschmiert und verrieben; sie trocknet dabei auf der warmen Haut schnell ein und fällt am Ende der Säuberung von selbst ab.

So gereinigt tritt das Mädchen aus ihrem Separatraum aus der Hütte heraus. Dieses Heraustreten des Mädchens, **xamsui* (*xam* ist die spezielle Bezeichnung für die genannte Art der Reinigung mit Mist; *su-i* = hinausgehen), ist das allen Werftbewohnern sichtbare Zeichen der vollendeten Mannbarkeit. Bis zur ersten Menstruation gilt das Mädchen als Kind, *ǂgŏ-as*. Von der ersten Menstruation ab bis zur Verheiratung wird sie als *o-aǂa-es* bezeichnet (nicht *ǂaǂais*[87]).

Die Eitelkeit der Mädchen ist häufig darauf bedacht, der Entwickelung ihrer Reize nachzuhelfen. Der Warzenhof fühlt sich zur Zeit beginnender Pubertät hart an. Aus der Warze läßt sich dann bei starkem Druck eine schwach fadenziehende Flüssigkeit pressen. Wenn die Brüste eben anfangen hervorzuknospen und die Umgebung der Warze fest wird, pressen die Mädchen den hellen Saft geflissentlich aus, um die Entwickelung der Brüste zu befördern. Die aus den Milchdrüsen zur Zeit des Pubertätsanfangs auspreßbare Flüssigkeit nennen sie **ŋgu-ruruheb*.

Die Menstruation tritt in der Regel zwischen dem 13. und 15. Lebensjahre zum erstenmal ein. Von da ab wird sie in ihrer regelmäßigen Wiederkehr **ǂxŏa-es(e)ni*, d. h. „Mondkrankheit", genannt: sie soll durchschnittlich

1: Schultze FX13 Hottentot

drei Tage dauern und wenig ergiebig sein. Häufig schminken sie um diese Zeit das Gesicht mit einer dunklen Fettsalbe (s. Körperpflege S. 210).

Menstruierende dürfen nicht in den Viehkraal gehen, geschweige denn melken. Über das Aufhören der Regel ist es schwer, zuverlässige Mitteilungen zu bekommen. Von zwei Frauen weiß ich, daß sie noch mit 47 Jahren geboren haben und von einer anderen, daß sie noch im 55. Jahre die Regel hatte. Im allgemeinen scheint der Eintritt des Klimakteriums nicht von den Normen unserer Rasse abzuweichen.

b) Die Heirat, *ga-meb*, ist nun das erstrebenswerte Ziel des Mädchens. Ich war erstaunt, wie sorgsam geregelte Bräuche sich versteckt noch da erhalten haben, wo das Sittenleben noch nicht verwildert oder noch nicht in christliches Gewand gehüllt ist. Zufällige Beobachtungen und gelegentliche Äußerungen meiner Begleiter brachten mich auch hier auf Spuren, die ich nur mit Geduld zu verfolgen brauchte, um den Rest ursprünglichen Volkstums noch gut erhalten unter der Tünche der Halbzivilisation zu finden.

Ein Mann, der sich das Eingeständnis der Gegenliebe holen will, reicht dem Mädchen seiner Wahl ein Stäbchen hin. Sind die Beiden einig, so zerbrechen sie das Stäbchen, jeder an einem Ende festhaltend, und werfen sich gegenseitig das abgebrochene Stückchen an die Brust. Der Mann ist jetzt der **taob* des Mädchens, das Mädchen die **taos* des Mannes. Sie treten damit, wie das Wort *(tao* = sich schämen*)* anzeigt und die alte Sitte es tatsächlich fordert, in ein Liebesverhältnis, das ihnen folgende Pflichten der Scham auferlegt: Die Liebenden dürfen kein Wort mit einander sprechen, nichts sich selbst reichen. Was sie sich zu sagen oder zu geben haben, muß ihnen ein Vermittler, Mann oder Mädchen, bringen. Übertretungen werden mit Bußgeschenken gesühnt — es sind im Grund Liebesbezeugungen und das ganze ein verliebtes Versteckspiel, das zur Sitte erstarrt ist.

So kann es monatelang, ein Jahr lang oder länger gehen, ehe das Verhältnis enger wird. Das kann dann auf zweierlei Weise geschehen: offenkundig durch die Werbung bei den Eltern, oder heimlich und abwegs auf Grund einer symbolischen Handlung, die das Einverständnis des Mädchens zu völliger Hingabe ausdrückt. Unter vier Augen zieht der Liebhaber einen seiner Fellschuhe aus und wirft ihn dem Mädchen zu. Läßt sie den Schuh unbeachtet liegen, so ist der Antrag vorzeitiger Vereinigung abgewiesen; will sie den Antrag annehmen, so gibt sie den Schuh zurück.

Bei Liebesintriguen ist wieder Zauberei im Spiel. Ein wirksames Mittel, Liebende auseinander zu bringen, ist nach der Auffassung sachver-

ständiger Zauberer in den Sprungbeinen der Heuschrecke enthalten. Ein Mädchen, das seinem Liebhaber abspenstig gemacht werden soll, wird — wie es ohne Harm im täglichen Leben oft geschieht — gebeten, einen Haufen trockener Buchukräuter zu Puder zu reiben. Zwischen den Blättern ist unbemerkt ein Heuschreckenbein verbröckelt. Wenn sich das Mädchen nach getaner Arbeit, wie üblich, die buchubestäubten Hände in den Achselhöhlen sauber reibt, reibt sie sich unbewußt das Zaubermittel ein, das ihre Liebe tötet. In anderen Fällen wurden die Heuschreckenbeine zu innerst in die Knochenpfeife gestopft, die Pfeife macht die übliche Runde und wenn es richtig so abgepaßt wurde, daß das Liebespaar von den Beinstücken zu rauchen bekommt, gilt die Zauberei als geglückt. Es ist mir auch ein Fall bekannt geworden, in dem die Eltern des Mädchens einen Berufszauberer konsultierten, der ein Stäbchen mit dem Inhalt seiner Giftbüchse beschmierte (s. Medizin S. 226), das Stäbchen zerbrach und die Stückchen mit den Worten auseinanderwarf: *„ǂâigu hã kχoëra gye nī ǂgoira"* d. h. „die Beiden, die einander lieben, sollen sich trennen".

Ehe die Einwanderung des Weißen überhand nahm und die alte Sitte umstieß, wurde uneheliche Liebe bestraft. Alte Hottentotten, die kopfschüttelnd mit ansehen, wie es heute zugeht, haben mir das vielfach und unabhängig von einander gesagt. Die Schuldigen wurden im Einverständnis mit den Eltern entweder beide verprügelt oder dem Liebhaber der Strafanteil der Geliebten mit versetzt. Die Strafe wurde auf Anordnung des Unterkapitäns vollzogen, war also ein Akt öffentlicher Sittenpflege.

Die Werbung übernehmen die Eltern des jungen Mannes. Ablehnung des Antrags, langes Hin- und Herparlamentieren und endlich sich Erweichen lassen gehört zum guten Ton: Der Mann soll nicht denken, daß man auf ihn gewartet habe.

Die Hochzeit wird mit großem Schlachten gefeiert. Der Bräutigam oder seine Eltern haben den Festbraten zu liefern (vergl. Erzählung No. XXXIV). An diesem Hochzeitsschlachten, *ǂgūitās*, beteiligen sich aber zuweilen auch beide Familien. Arme tauschen unter Umständen ihre einzige Milchkuh gegen ein Schlachttier aus, um ihrer Hochzeitspflicht nachzukommen.

Am Tage der Hochzeit schenkt der junge Ehemann und die junge Ehefrau, jedes seiner Schwiegermutter eine Kuh, *abagoimas*, in Erinnerung daran, daß die Alte einst den Geliebten resp. die Geliebte im *Aba*-Fell getragen hat (s. folg. Seite). Da sie ihnen auch die Brüste gereicht haben, wird jene Hochzeitskuh auch **samagoimas* genannt. Die Bezeichnung

kχāigoimas, die ich seltener hörte, besagt, daß den Müttern gleichsam etwas, worauf sie Anspruch haben, zurückerstattet wird *(= kχāi)*: Das Geschenk soll die Mütter für den Verlust der Kinder entschädigen.

Das Ankommen der jungen Frau, *tara-s*, im Dorf des Mannes wird wiederum mit Schlachten gefeiert, eine Begrüßung, auf die sie Anspruch hat (s. Erzählung No. LVIII).

Nur wenige Hottentotten würden sich heute bei der Verarmung des Volks einen Vielweiberhausstand leisten können, wie ihn die alte Sitte zuläßt. Zudem ist der Geschlechtsverkehr jetzt vielfach zu verwahrlost, als daß die intime Gemeinschaft eines Mannes mit mehreren Weibern ehelich sanktioniert zu werden brauchte.

2. Das Verhältnis der Familienmitglieder untereinander.

a) Im Verhältnis der Ehegatten unterscheidet die würdige Stellung der Frau die Familie der Hottentotten scharf von der der Herero: Die Frau gilt in allen häuslichen Angelegenheiten als die Herrin der Hütte; sie hat dementsprechend das Recht, dem Mann unter Umständen den Eintritt zu verwehren. Sie hat die Verwaltung der Vorräte unter sich, der Mann bittet um Milch und sie gibt ihm. Auch daß sie in erster Linie die wichtigste Handlung im Haushalt des Hirten, das Melken, vornimmt, unterscheidet sie vom Hereroweib. Die geachtete Stellung des Weibes in der Ehe schließt gelegentliche Zwistigkeiten, in denen der Mann von seiner physischen Überlegenheit ausgiebig Gebrauch macht, nicht aus.

Nur Unfruchtbarkeit setzt das Ansehen einer Frau dauernd und tief herunter.

b) Das Verhältnis der Eltern, *ǂgü-ǂra*, zu den Kindern, *ǂgō-an*. Die kleinen Kinder zu warten, *aba-*, ist selbstverständlich Sache der Mutter. Sie trägt das Kind auf dem Rücken in einem Lammfell, *ǂhani-b* genannt (s. Taf. X).

„ǂHaniba ǂkχara!", d. h. „Schlepp das Abafell hinter dir her!" ist ein Prositruf, der kleinen Kindern, wenn sie niesen *(sī)*, zugerufen wird. In anderen Fällen hörte ich die Mütter dem niesenden Kind wünschen *„ǂoiman kχaob"* d. h. „Stoß dir den Hintern!" (*-an* scheint Reflexivpartikel zu sein). Beide Wünsche beziehen sich auf die ersten, freudig erwarteten Gehversuche des Kindes: Das Kleine sucht sich aus der hilflosen Sitzstellung am Boden aufzurichten und fällt dabei zunächst immer wieder auf den Hintern zurück; wenn es dann gehen kann, schleppt es das Abafell, dem es nun entwachsen ist, als Spielzeug nach.

Jedem Kind, auch dem erwachsenen, wird von den Eltern eine bestimmte Kuh zur Nutznießung zugeteilt (*°maĩam*, d. h. dem Munde hinstellen); nur die Milch dieser bestimmten Kuh, *ãibes*, darf das Kind sich früh und abends melken. Tagsüber, wenn die Rinder auf der Weide sind, wird ihm aus dem gemolkenen Vorrat gegeben. Verheiratete bekommen von ihren Eltern bisweilen 4—5 Kühe in dieser Weise zugeteilt.

Von einer Erziehung der Kinder habe ich nur alltägliche Rügen augenfälliger Unarten oder Torheiten wahrgenommen. Ehedem erstreckte sich die Erziehung auch auf das spätere Knaben- und Jünglingsalter [83]), heute bleibt sie meist der Jugend unter sich überlassen (s. S. 309). Die Erziehungsgewalt der Eltern hat mit dem Überhandnehmen des Einflusses der Weißen viel eingebüßt. Während vorher der Sohn, *ǂgõ-ab*, so lange er halbwüchsig war, zum großen Teil von dem, was ihm der Vater zum Unterhalt gab, materiell abhing und dementsprechend sich auch moralisch abhängig fühlte, kann er sich heute im Dienste der Weißen frühzeitig selbständig machen. Die Tochter, *ǂgõ-as*, ehedem bis zur Verheiratung auf die Eltern angewiesen, kann sich heute mit ihren Reizen jeden Unterhalt und Kleinluxus selbst verschaffen, den sie begehrt.

Aber trotz dieser Erschütterung der Erziehungsgewalt ist das Ansehen der Eltern in der Familie doch gewahrt geblieben. Das spricht sich am deutlichsten im vorgeschrittenen Alter aus: Die Großeltern werden von niemandem in der Familie zur Arbeit angehalten und jeder hat die Pflicht, ihnen behilflich zu sein. Daß alte, hilflose Leute ausgesetzt werden, wie man gelegentlich im Land behaupten hört, ist meiner Überzeugung nach eine Fabel oder eine Verwechselung mit Notmaßregeln der Buschmänner. Denn eine solche Behandlung des Alters steht in schroffem Gegensatz zu den Anschauungen des Volkes, wie sie sich am deutlichsten in seinen Sagen und Erzählungen wiederspiegeln. Die Anrede *ti ǂnaoǂb* oder *ti ǂnaoǂosa*, d. h. „mein Großvater" oder „meine Großmutter", werden als Ausdrücke höchster Ehrerbietung auch Personen gegenüber gebraucht, die in keinerlei Verwandtschafts-Beziehungen zum Redenden stehen. Über die Kindespflichten im häuslichen Leben gibt uns die Erzählung Nr. XXIV ein Bild.

Die Bezeichnungen für Vater und Mutter sind verschieden, je nachdem es sich um die Eltern einer ersten, zweiten oder dritten Person handelt: Ein Kind redet den Vater nur mit *ti°dãb* oder *dã-tse*, die Mutter mit *ti ais* oder *aise* an: mein Vater! meine Mutter! Die Ausdrücke *dãda-b* und *mama-s* sind wohl dem Kapholländischen entlehnt.

Als grobe Sprachverkehrtheit empfindet es der Hottentott, daß die Kinder der Namib-Buschmänner ihre Eltern *saoib* und *saoios* anreden. Denn diese Bezeichnungen sind reserviert für den Fall, daß man von den Eltern einer zweiten Person spricht, mag man dabei ein Kind oder einen Greis anreden: *sa saoib*, dein Vater etc.

Handelt es sich um die Eltern einer dritten Person, so heißt es gewöhnlich *ǂ(e)ĩb di ǂgũib* (resp. *-s*) oder *ǂ(e)ĩb di ũb* (resp. *-s*), d. h. sein Vater (resp. seine Mutter).

Ohne die genannten Regeln zu durchbrechen, sind noch folgende Ausdrucksweisen, die ich ebenfalls häufig hörte, korrekt: *sa ǂgũib*, *sa ũb* dein Vater, und entsprechend deine Mutter. Ferner hörte ich *ǂ(e)ĩb di dãb(ais)*, sein Vater (seine Mutter).

Die Stiefmutter ist **ŏaǀgāǂgũis*, d. h. „die Mutter, die hinter der steht, die das Kind gebar".

Die Bezeichnung **abo-b* für den Vater ist mir nur in der Sagensprache, nie im Gespräch begegnet.

c) Im Verkehr der Geschwister untereinander fiel mir eine Mannigfaltigkeit der Anreden auf. Ich glaubte hier anfangs Kose- oder Spottnamen zu hören; als ich aber ihren Sinn zu ermitteln suchte, stieß ich auf feststehende Normen, die den starken Sinn der Hottentotten für Altersrangordnung auch innerhalb des Geschwisterkreises (*ǀgãb, -s, -n* = Bruder, Schwester, Geschwister) erweisen: Es ist das ausschließliche Vorrecht der älteren Geschwister, die jüngeren beim Namen zu nennen. Die jüngeren Geschwister bezeichnen (anderen gegenüber sowohl wie in der Anrede) ihre älteste Schwester, die erste Respektsperson unter den Geschwistern, als **ausis* (1 Terz fall.); die dann folgende oder folgenden werden **sirŏ-s* (1 Terz steig.) genannt. Den ältesten Bruder reden die jüngeren Geschwister **a-budib* an; der oder die dann folgenden nächstältesten werden **bi-dirob* genannt.

d) Über die Schwiegerverhältnisse habe ich am wenigsten ermitteln können. Das Verhältnis der vier Schwiegereltern zu den Schwiegerkindern ist in der Anrede, also in der zweiten Person, dasselbe wie zwischen Eltern und Kindern. In der dritten Person werden die Schwiegereltern *ǂui-b* und *ǂui-s* genannt.

Die Frau wird von den Angehörigen ihres Mannes in der Anrede mit Namen, wenn in der dritten Person von ihr die Rede ist, **ǀoaras* genannt. Mit allen weiblichen Angehörigen ihres Mannes, mit Ausnahme der Schwiegermutter, nennt sie sich ohne Rücksicht auf Altersverschiedenheiten: *χaĕ-s*.

ǂu-ǂiaob bedeutet Schwager; in dem Worte *ǂu-ǂigukχa*, das zur Bezeichnung zweier Schwäger gebraucht wird, scheint die Reziprokalpartikel, *-gu*, die Gleichheit des Ranges der Beiden einander gegenüber, dem einseitigen Respektsverhältnis den Schwiegereltern gegenüber, auszudrücken.

Ein kleines Streiflicht auf die Stellung des Schwagers in der Familie wirft die Redensart, mit der der Hottentott gelegentlich einen Wirbelwind beschwichtigt: *„ǂuiaob ǂgoē!"* Wie man in Gegenwart seines Schwagers die Kinder nicht durch Schlagen zum Schreien bringt und sich nicht zankt, kurzum sich gesetzt benimmt, so wird der Wind gemahnt, die Gegenstände, die er erfaßt hat, nicht so wild durcheinander zu werfen: „Der Schwager ist da!"

e) Neffen- und Vetternschaft (direkte und verschwägerte). Das Verhältnis der Kinder zu den Geschwistern und Schwägern der Eltern ist folgendermaßen geregelt: Die Kinder werden von Jenen beim Namen genannt, die Kinder aber nennen in der Anrede sowohl wie im Gespräch mit anderen:

1. Den älteren Bruder des Vaters und den Mann der älteren Schwester der Mutter: **gai-dāb*, d. h. wörtlich „großer (oder alter) Vater".
2. Den jüngeren Bruder des Vaters und den Mann der jüngeren Schwester der Mutter: **dā-daro-b*, d. h. „Väterchen" (*-ro* ist Diminutivpartikel).
3. Die ältere Schwester des Vaters: **mīgyi-s*.
4. Die jüngere Schwester des Vaters: **mi-gyiro-s*.
5. Den älteren Bruder der Mutter und den Mann der älteren Schwester des Vaters: **o-meb*.
6. Den jüngeren Bruder der Mutter: **o-mero-b*; den Mann der jüngeren Schwester des Vaters: *o-meda-b*.
7. Die ältere Schwester der Mutter: **ais gais* oder **gai mās*, d. h. gleicherweiße „große Mutter".
8. Die jüngere Schwester der Mutter: **ai-ros* oder **ma-maros*, d. h. „Mütterchen".

Als Neffe und Nichte, *ǂnuiri-b, -s*, bezeichnet der männliche Hottentott nur die Kinder seiner Schwester. Eine Hottentottin hat keinen *ǂnuiri-b* oder *ǂnuiri-s*; es gibt kein Wort, das ausdrückte, was ihr die Kinder ihrer Geschwister sind. Was sie selbst den Kindern ist, ist oben gesagt worden.

Geschwisterkinder nennen sich untereinander, wie es oben für die Geschwister angegeben wurde. Nur in einem Fall sah ich zwischen den Kindern zweier Brüder die sonst beobachteten Respektsbezeichnungen wegfallen.

Zwischen den Kindern eines Weibes und dessen Brüdern besteht ein Verhältnis, das (von den Beziehungen der Eltern und Kinder abgesehen) dem Hottentotten als das innigste gilt, das zwischen zwei Generationen einer Verwandtschaft existieren kann. Ob dieses Verhältnis einen erbrechtlichen Hintergrund hat, konnte ich nicht feststellen, ich glaube es nicht. Wie dem auch sei, — eine naiv-sympathische Annäherung des Mutterbruders und seiner Neffenschaft, hier das Bewußtsein einer Liebespflicht gegen die Kinder der Schwester, dort freundliche Abhängigkeitsgefühle gegen den avunculus sind das einzige was unmittelbar zu beobachten ist. Seinen Ausdruck findet dieses Verhältnis in einem eigenartigen Tausch-Rechtsverhältnis. Der Onkel (hier also der Bruder der Mutter) hat das Recht, einen schadhaften oder verunstalteten Gegenstand aus dem Besitz des Neffen sich anzueignen. Bei nächster Gelegenheit entschädigt sich der Neffe dadurch, daß er einen entsprechenden makellosen Gegenstand dem Onkel ausführt. So trieb einst ein junger Hottentott eine Milchkuh mit Kalb und 10 Ziegen als Entgelt dafür heim, daß ihm der Bruder seiner Mutter vor Jahren ein Pferd mit einem Hufschaden abgenommen hatte. Buskoprinder (hornlos oder mit Schlotterhörnern), Ziegen mit Stumpfohren, Rinder mit unsymmetrischen Hörnern, eine Felldecke mit Löchern, ein schartiger Holzeimer, eine Steinpfeife mit ausgebrochenem Rand etc. etc. darf der Onkel sich aneignen. Er sucht zuweilen die ganze Hütte des Neffen ab, um dergleichen zu finden. Kommt sein Besuch überraschend, so kann er manchen guten Fund machen; in anderen Fällen hat die junge Frau alles Zweifelhafte ihres Haushalts rechtzeitig beiseite gesteckt. Das Auswahlrecht des Neffen wird *ǂnuriǂgab*, das des Onkels **ǂigab* genannt. In keinem der mir bekannten Fälle hörte ich eine Klage über Mißbrauch dieser Rechte. Das Verwandtschaftsverhältnis ist im allgemeinen zu sehr auf gegenseitiges Vertrauen gegründet, als daß es egoistisch ausgebeutet würde.

Die bevorzugte Stellung des Bruders der Frau in der Familie erinnert an alte indogermanische Anschauungen [*].

3. Namengebung.

Wir haben zwei Hauptgruppen von Eigennamen, */o-inti*, zu unterscheiden, soll uns die Mannigfaltigkeit, die hier herrscht, nicht verwirren.

a) Die erste Gruppe mag die der Elternnamen heißen. Vorauszuschicken ist hier, daß jeder Hottentotten-Eigenname je nach dem An-

Stammbaum einer Topnaarfamilie zur Demonstration der Namensvererbung.

hängen des männlichen *(-b* oder *-ba)* oder des weiblichen *(-s* oder *-sa)* Personalsuffixes als Knaben- oder als Mädchenname verwandt werden kann.

Die allgemeine Regel ist nun, daß der Sohn den Namen der Mutter und die Tochter den Namen des Vaters als Hauptnamen erbt. Heißt also z. B. der Vater *gomarib* und die Mutter *ǂkχunibes*, so wird der Sohn *ǂkχunibeb* und die Tochter *gomaris* genannt.

Zu diesem Hauptnamen nimmt nun der Sohn, wenn er erwachsen ist, einen Nebennamen an. Als Nebenname des Sohnes dient der Hauptname des Vaters unter Einfügung der Silbe *-mā* vor das schließende Personalsuffix. Der Sohn der eben genannten Eltern heißt also mit vollständigem Namen *ǂkχunibeb-gomarimāb*. (Im weiblichen Geschlecht scheint von solcher Doppelbenennung weniger Gebrauch gemacht zu werden. Die Tochter der genannten Eltern würde mit vollem Namen *gomaris-ǂkχunibemās* heißen.)

Um mich zu überzeugen, ob diese Art der Namengebung auch über mehrere Generationen hinaus konsequent durchgeführt wird, habe ich mit Hilfe der Dorfältesten der Topnaaransiedelung in Rooibank hinter Walfischbai eine Familie, soweit das Gedächtnis der Gewährsmänner reichte, zurückverfolgt. Das Resultat ergab die Konstanz der genannten Regel der Namengebung.

Für das praktische Leben ergeben sich aus der Art, wie die Namen vererbt werden, Folgen, die leicht zu Verwirrungen Anlaß geben könnten, wenn nicht, wie wir sehen werden, eine zweite Gruppe von Namen Abhilfe schaffte. Die Regel, nach der die Kinder ihre Elternnamen erhalten, hat als nächste Folge die, daß alle natürlichen Brüder unter sich und alle natürlichen Schwestern unter sich völlig gleichen Namen haben. Eine einfache Überlegung am Beispiel der letzten Generation des zweiten Stammbaums ergibt ferner folgendes: Denselben Hauptnamen, *ǂkχu-nuχab*, den die Brüder führen, führen auch alle ihre Vettern, soweit sie die Söhne einer Tante mütterlicherseits sind, also alle Söhne von *ǂkχu-nuχas'* Schwestern. Verschieden von diesen und untereinander verschieden sind die Namen der Vettern, die von Vaters und von Mutters Brüdern stammen. Die Vettern, die von Vaters Schwestern stammen, heißen alle *sa-naχab*.

Analog liegen die Verhältnisse bei den Schwestern der Gebrüder *ǂkχu-nuχab:* Denselben Hauptnamen, den sie führen, *ǂnaĭ-χas*, führen auch alle ihre Kousinen, soweit sie die Töchter eines Onkels väterlicherseits sind, also alle Töchter von Vaters Brüdern. Die Töchter von Vaters Schwestern würden alle *sa-naχas* heißen. — Die Kousinen mütterlicherseits, soweit sie die Töchter eines Onkels (eines Bruders der *ǂkχu-nuχas*) sind, würden alle

gās heißen. Verschieden von diesen und untereinander verschieden sind die Namen derjenigen Kousinen, die von Mutters Schwestern stammen.

Mögen die Elternnamen über die Abkunft ihres Trägers einem Hottentotten auch meist so weit Aufschluß geben, daß sie zur Legitimation in einer fremden Werft genügen, so lassen sie doch keine genügende Unterscheidung innerhalb der engeren Verwandtschaft zu. Diese Lücken füllen Namen einer zweiten Gruppe aus, die wir

b) Beinamen nennen wollen.

Im einfachsten Fall geben diese Namen eine schlichte Charakteristik der betreffenden Person auf Grund irgend eines äußeren Kennzeichens oder eines Faktums. So wurde eine junge Hottentottin mit dünnem Kopfhaar kurzweg *ǂgāts* d. h. Glatze, Kahlköpfin, genannt. Ein Junge hieß **ǂgu·ruŋa·reb*, weil er linkshändig war. Ein Mann, der Kälte gut ertrug, war unter dem Namen **ǂkχai-t(o)mab* bekannt, als „Einer, der nicht *(t(o)ma)* kalt *(ǂkχai)* hat." Ein Anderer, seiner Unpünktlichkeit wegen berüchtigt, hieß **ǂaũ-ǁkχui-b*, „der vergeblich *(ǁkχui-*, vermissen*)* auf sich warten *(ǂaũt)* läßt." Ein gefürchteter Viehräuber im unteren Swakop-Gebiet hieß nach der Farbe seines Haares **ǂhaihāb*, das „Fahlpferd". Ein friedlicher Alter, der sich beim Wasser ein Tabaksbeet angelegt hatte, das immer grünte *(ǂam)*, hieß *ǂa·mχab* usw.

Bestimmte Ereignisse liegen zwei anderen Namen zugrunde: **hã·ǂgyeb*, d. h. „der da kam", denn der Betreffende wanderte einst von fremd her dem Orte zu, an dem er jetzt seßhaft war. Ein Junge, dessen Mutter kurz nach der Geburt starb, erhielt und behielt den Namen, mit dem ein Hottentott ein Neugeborenes, gleichviel ob Mensch, Lamm oder Kalb bezeichnet, das mit der Milch eines fremden Weibes oder Muttertieres aufgezogen wird: **hã·slb*.

Solche Namen können sich so fest einbürgern, daß sie zeitlebens den Rufnamen des Betreffenden bilden. Es ist nicht unwahrscheinlich, daß solche Beinamen einst die einzigen und ursprünglichen Eigennamen der Hottentotten bildeten und daß sie auch heute noch zu erblichen Hauptnamen werden, also in den Wortschatz der Elternnamen neue Elemente bringen.

Eine persönliche Beziehung auf eine Eigenart des Trägers gibt sich oft nur den Nächststehenden zu erkennen. So habe ich nicht ermitteln können, worauf einige Beinamen Hendrik Witboois, die ich mehrfach hörte, *ǂhu·iseb*, **ǂgã·mab* und **kχabu·b* anspielen.

Ein Teil der Beinamen erweist sich als Kose-Bezeichnungen, die nur für gewisse Zeit in Gebrauch sind, dann vergessen oder nur noch

1: Schultze

Verlag Gustav Fischer, Jena.

[p 306a]

TOPNAAR-KNABEN

gelegentlich angewandt werden. So nannte eine Hottentottin ihr Söhnchen **ǂkχa-ri/kχu-bib*, d. h. „die kleine Vlej"; sie wollte damit ausdrücken, daß sie der Anblick des Kindes so freudig stimme wie der eines Wasserspiegels in der trockenen Einöde. Eine andere Mutter hatte ihre naive Freude an den niedlichen („sauberen") Schamteilen des Töchterchens und nannte es deshalb *ǂa-nu+nüi-s*. Ein Hottentottenkind, das von Vaters Seite Negerblut und entsprechend dunklere Hautfarbe hatte, pflegte von seiner Mutter **+nü-ǂsagyeanu-s* genannt zu werden, d. h. „die du so nett schwarz bist".

Auch der Weiße bekommt hie und da seinen Schmeichelnamen. So sprach einst ein Hottentott in dankbarer Erinnerung an eine empfangene Wohltat von einem hochverdienten Missionar, der schwarze Bartkoteletts trug, in einem Bild, das dem Hirten nahe liegt und von keinem Hottentotten anders denn als Kosebezeichnung aufgefaßt wurde: **+nüi/χûgürsôatse*, „o, du Sohn des schwarzwangigen Schafs" (s. Abbild. S. 263).

Der ausgeprägte Sinn des Hottentotten für Satire ergeht sich frei und mit Behagen in Spottnamen für seinesgleichen und seine weißen Herren: **ǂkχa-nsab* hieß ein Junge mit vorgestrecktem Bauch (von **ǂkχan*, sich den Stuhlgang verkneifen); **ǂgo-res+nôa-tsoia-b* ein Junge von ungelenkiger Körperhaltung, dem „der Genickwirbel im After sitzt"; **/hoimχôs*, d. h. die „Bergwange", hieß ein dickbackiger Neger; **ǂkχôre-b*, d. h. „Knochenbold", ein magerer Bursche; **ǂgaorab* hieß ein Schmutzfink, „der ekelhaft schmeckt" etc.

Knaben in den Übergangsjahren mit ihrem Gemisch von kindlichen und männlichen Zügen fordern den Spott auch eines Hottentotten heraus. So wurde ein solcher Jüngling der besten Flegeljahre **a-ruǂgui-b* genannt: Das Wort *aru* bedeutet das Abjagen der jungen Lämmer von den alten Tieren, die auf die Weide gehen, während die jungen bei der Hütte bleiben; das Wort spielt also auf die kindlichen Züge des Flegels an. *ǂgu-i* bedeutet in der Hirtensprache: einem Vieh, das eigentlich kastriert werden sollte, einstweilen noch die Hoden lassen; das Wort weist also auf die erwachende Männlichkeit des Knaben hin.

Bezeichnend für die Abnahme der Vielweiberei ist, daß ein Mann, der diesen Luxus noch trieb, unter dem Spitznamen **a-mikχoma+gu-ita-raseb* bekannt war, d. h. als einer „der viele *(+gui)* Frauen *(lara-s)* wie ein Strauß *(ami-s)* Hennen hat."

Am Körper des Weißen findet der Hottentott noch leichter als am eigenen schwache Punkte heraus. Der Eine hat in seinen Augen einen zu langen Hals, er heißt also der „Halsige", **/ao-χab.*; dem Anderen hängt

der Schnurrbart über den Mund *(ams)* wie einem Hunde die Lefzen *(°ŋgaibu-b)* über die Schnauze, er heißt deshalb „*ŋgobu-χao-mi*.

Der wird nach dem eigenartigen Ausdruck seiner Augen nach einer gleichnamigen Gecko-Eidechse, einer *Pachydactylus*-Art, °*ǂna-nigyemûts*, jener seines Stampfganges wegen °*ǂnô-tarib*, der „Fersenmann", genannt. Einen auffallend langen Menschen nannten die Hottentotten in Kubub *ǂa-batomaǂnao-b*, d. h. „der nicht auf den Wagen zu klettern *(ǂa-ba)* braucht, um aufzuladen" *(ǂnaio-)*.

Einen anderen nannten sie, *ǂa-osaiǂ-batana-s* (mit weiblicher Endung), weil er den Kopf *(tana-s)* schlaff zur Seite hängen und mit jedem Schritt pendeln ließ, ihn gleichsam auf einem „nassen" *(iǂ* d. h. gleich einem jungsaftigen Blumenstiel noch weichen, haltlosen) Halse *(ǂaos)* trug. Sein Gegenstück, ein Mann, dessen Männerstolz sich in ständiger Überstreckung des Rückgrats aussprach, nannten die Männer: „den Hohlen", °*ǂnǂib*, die Weiber: °*ǂû-saχǂô-b*, weil sein Penis *(χâb)* neu *(ǂâsa)*, d. h. recht gebrauchsfähig war.

Daß der Obeinige *(°ǂkχô-aseb)*, der Dickbäuchige *(°ǂô-etob)*, der Rothaarige *(°ǂa-batana-s)*, ein jeder sein Epitheton schon eine Stunde nach seinem Erscheinen weg hat, ist selbstverständlich.

Andere Spottnamen spielen auf Begebenheiten an: Ein höherer Beamter, der ab und zu mitten im Marsch vom Pferde stieg, um einen Stein oder einen Käfer aufzulesen, hieß vom ersten Reisetag ab der „Lumpensammler", °*na-boreb*. Ein Anderer wurde °*ǂu-triǂa-ogorab*, „der weißhalsige Rabe", getauft, nachdem er, der sonst ruppig angezogen war, gelegentlich eines Empfanges im weißen Stehkragen und schwarzem Rock sich sehen ließ.

Ein Soldat endlich, der den ganzen Tag hartnäckig um die Gunst eines Bastardmädchens warb, das ihn abfahren ließ, hieß allgemein unter den Hottentotten seiner Station: °*ǂnû-soreiŋgâ-ib*, „der da sitzt *(ǂnû)*, auch wenn die Sonne *(so-res)* untergeht" *(iŋgâi)*.

4. Kinderspiele

habe ich vielfach beobachten können.

a) Wo sie eine Nachahmung der Tätigkeit Erwachsener sind, spiegeln sie die Doppelnatur des Hottentotten als eines Hirten und eines Jägers wider. So fangen sich die Knaben gelegentlich Mäuse lebendig ein (eine leichte Aufgabe, wenn sie das Nest gefunden haben), sperren sie als Milchvieh in kleine Lehmkraale und kastrieren die Männchen bis auf eines, das sie als Ramm bei der kleinen Herde halten.

Auf ihren Jagden, mit selbstgefertigten kleinen Bogen und befiederten *Eragr:stis*-Halmen als Pfeilen oder mit Steinen als einziger Waffe, sehen sie in den Eidechsen ihre Springböcke, die Rüsselmäuse (s. S. 287, No. 40) sind die Elephanten, ein rattenartiger Nager der Löwe, die Streifenmaus das Zebra. Das erbeutete Wild wird regelrecht abgehäutet und zerteilt. Wer einen Vogel erlegt hat, rupft ihn und macht wie mit Straußenfedern einen guten Handel.

Der Ochsenwagen der Buren ist auch im Namalande so populär, daß ihn die Kinder in ihre Spiele mit übernommen haben. Große flügellose Heuschrecken sind ihnen willkommene Zugtiere. Sie spannen die starken, halb fingerlangen Insekten vor einen kleinen Ochsenwagen, den sie sich selbst zurecht zimmern. An das Trekktau binden sie die Joche und spannen die Tiere regelrecht ein: zuerst den linken Hinterochsen mit der Jochstrippe außen, dann den rechten mit der Strippe nahe am Trekktau usw. Es scheint ihnen weniger darauf anzukommen, den wunderlichen Anblick eines 24köpfigen Heuschreckengespanns zu haben, als darauf, hier ihren Kräften entsprechend nach allen landesüblichen Regeln den Erwachsenen es gleich zu tun.

In ihren gemeinsamen Spielen liegt trotz alles kindischen Treibens im Einzelnen nicht selten ein Ernst von erzieherischem Wert. Die Knaben rotten sich keineswegs immer nur zu kurzem Zeitvertreib zusammen, um dann wieder auseinander zu stieben, sie organisieren sich häufig fest für ein Jahr und länger. Sie wählen sich ein Oberhaupt, Kapitän, der wählt sich einen Vormann; beide nehmen, wie alle älteren, einen jüngeren als persönlichen Diener. Ungehorsam wird nicht nur spielerisch mit Tribut von Tabak oder Kost bestraft, die Strafe ist für einen Jungen, der sich sein Brot selbst zu verdienen hat, oft empfindlich genug. Der Kapitän hat sich jeder Handgreiflichkeit zu enthalten; er beauftragt einen seiner Leute zur Strafvollziehung, wo er sie für angebracht hält. Die Erwachsenen überlassen ihre Knaben dieser Gerichtsbarkeit der eigenen Altersgenossen und stärken damit dieses System der Selbsterziehung der Jugend.

Bei der sinnlichen Frühreife des Volkes ist es nicht zu verwundern, daß Knaben oft schon Geschlechtsverkehr haben, ehe sie den Kinderspielen entwachsen sind. In einem Fall hatte der Liebhaber eine einmalige Abgabe an das Oberhaupt zu entrichten. In einem anderen Falle entschied der Kapitän sogar Streitfragen in Liebessachen, sprach ein Mädchen diesem ab und jenem zu und trat damit weit aus den Grenzen des Kinderspiels.

Wo keine Reibereien mit anderen Spielrotten den kriegerischen Sinn befriedigen, werden gelegentlich Kampfspiele veranstaltet. Hat z. B. einer

der Viehwärter einen Dornbaum mit Wespennestern gefunden, dann bewaffnet sich die Schar mit kurzen Steinschleudern, die sie sich aus einem Stückchen Fell und zwei Riemen herstellen. Etwa 20 Schritte vom Baum entfernt stellen sie sich auf. Es ist jetzt die Aufgabe des Vormannes, auf den Baum zu klettern, von einem der Nester ein Stück loszubrechen und dem Kapitän zu überbringen. Es ist keine leichte Probe auf den Mut des Jungen, nur mit einem Lendenschurz bekleidet, sich in den bösartigen Schwarm vorzuwagen. Hat er sich dieser Aufgabe entledigt, eröffnet die Bande ein Bombardement auf die Nester. In dem Fall, den ich hier in Erinnerung habe, gelang es den Knaben nicht, die Nester zu zerstören; zur Strafe dafür durften sie an diesem Abend nicht von der Milch ihrer Ziegen trinken, die ihnen wie üblich die Eltern oder der Brotherr zur Nutznießung überlassen hatten.

Das *nabi*-Spiel ahmt im Äußeren nur noch symbolisch, in der Vorstellung aber unmittelbar anschaulich, die Kriegsgebräuche Erwachsener nach. Ein Dorn der Giraffenakazie oder des Dornbaumes wird auf ein etwas über fingerlanges, dünnes Holzstäbchen gesteckt. Dieses pfeilähnliche Spielzeug wird in der Weise, wie die Figur zeigt, zwischen die Finger geklemmt und unter Abziehen des Daumens nach unten und vorwärts geschnippt, in ein Häufchen fingerlanger Binsenstücke hinein, die entweder offen daliegen oder mit Sand bedeckt werden, damit sie nicht wegspringen, wenn der Dorn zwischen sie fährt. Die gespießten Binsenstückchen sind in der Phantasie der Kinder Kühe, werden dementsprechend *gomati* genannt; die Kinder selbst fühlen sich als siegreiche Kriegsleute, die sich im Hazardspiel in ihre Beute teilen.

Haltung der Hand im Beute-Verlosungs-Spiel.

Die Nachahmungsspiele der Hottentottenkinder sind insofern noch spezieller beachtenswert, als sie das einzige Stadium im Leben des Mannes darstellen, in dem ein künstlerischer Trieb nach plastischer Betätigung sucht. Die halbwüchsigen Jungen, im Alter etwa zwischen 8 und 16 Jahren, formen sich aus Lehm ihr Spielzeug, brennen den Lehm auch am Feuer, um ihm außer der Härte auch Farbennuancen zu geben.

Den Mittelpunkt der ersten Gruppe nimmt die Figur eines weißen Mannes ein, der hinter dem Pferd steht. Dem Hottentotten mit seiner breiten,

niedrigen Nase fällt der schmale, hohe Nasenrücken unserer Rasse auf und reizt ihn, wie hier, zur Karrikatur. Rechts daneben steht ein rauchendes eingeborenes Weib mit Steatopygie; hinter ihr, bei den Schweinen, ein Junge am dreifüßigen eisernen Burenkochtopf. Am Reitochsen ist das Nasenholz

I.

II.

beachtenswert. Der Fettschwanzhammel stößt sich mit einem Ziegenbock. Der kniende Schütze im Anschlag, mit dem zugekniffenen Auge, ist gut beobachtet.

Fig. II zeigt links ein Straußenpaar, das Männchen durch natürlichen Federschmuck und seine Größe hervorgehoben. Die Giraffe hat der Künstler jedenfalls nicht im Namaland, sondern wohl gelegentlich in einem Tierpark der Kapkolonie gesehen. Die Oryx-Antilope ist an ihrem Stangengehörn, der Springbock an der Lyraform seiner Hörner kenntlich. Von den beiden Skorpionen mit dem drohend erhobenen Stachel ist der rechte der gelungenere. Paviane zu beobachten hat der junge Hirt reichlich Gelegenheit; die hier wiedergegebenen Vorgänge hat er sichtlich mit Aufmerksamkeit verfolgt. Die übrigen Figuren stellen einen Frosch, einen Leguan und eine Schildkröte dar.

Die letzte Gruppe der Lehmfiguren (Fig. III) stellt einen Ochsenwagen dar, den von der Vorkiste aus der alte Bur mit der langen Peitsche dirigiert,

III.

während der eingeborene Tauleiter den Weg sucht. Auf die naturgetreue Wiedergabe der Vorderochsen, die sich stark in die Joche legen, sei besonders hingewiesen.

Was überall in gleicher Weise in diesen plastischen Versuchen sich zu erkennen gibt, ist die Fähigkeit, das Charakteristische des Gegenstandes ohne Reflexion, nur aus lebendiger Anschauung heraus, wiederzugeben. Es ist das dieselbe Ursprünglichkeit, die die Zeichnungen der vorgeschichtlichen Menschen von denen unserer mehr denkend reproduzierenden Kinder (mit denen sie gerade jetzt wieder eingehend verglichen werden) unterscheidet.

Seltsam ist, wie die unzweifelhafte plastisch-nachbildende Fähigkeit des Hottentotten erlischt, wenn das Alter der Kinderspiele vorüber gegangen ist.

b) Wettspiele treiben die Knaben auf zweierlei Art mit Wurfhölzern. Ein armlanger Stock, *ǂa-rab* genannt, am besten aus dem Holz einer *Rhus*-Art oder einer *Grewia* geschnitten, wird am dicken Ende (von ca. 1 cm Durchmesser) gefaßt und mit kräftigem Anlauf so platt auf den Boden geworfen, daß er elastisch aufspringt und pfeilartig vorwärts schießt.

Verwandt ist das Spiel mit den etwas kürzeren **/kχaus*-Stöcken; sie werden etwas vor dem hinteren, spitz zulaufenden Ende gefaßt und, ebenfalls mit Anlauf, derart von unten gegen einen Busch geworfen, daß ihm die Zweige (besonders die glatten *Cyperus*-Büsche sind geeignet) eine feste Haltung im Flug geben. Der Stock fliegt dann in höherem oder niedrigerem Bogen mit dem schweren Ende voran über Strecken, die ich mit keinem Steinwurf erreichen konnte.

/kχaus- und *ǂa-rab*-Wurfstock.

Ihre Fingergewandtheit üben die Kinder hie und da in kleinen Taschenspielerkünsten. Sie nehmen z. B., am Boden hockend, in jede Hand drei Steinchen und werfen, gleichzeitig beide Hände senkend, zwei Steinchen symmetrisch vor sich hin, — wie jedermann glaubt, je einen Stein aus einer Hand. Dann öffnen sie die Hände und zeigen lachend drei Steinchen in der einen und ein Steinchen in der anderen Hand. Es erfordert immerhin einige Geschicklichkeit, aus der eben noch fest geschlossenen Hand zwei Steinchen so zu werfen, daß das eine gerade herunter, das andere seitwärts vor die Nachbarhand fällt.

Auf andere Weise messen sie sich in Gewandtheit, indem sie auf verschnörkelten Wegen, die sie in den Sand gezogen haben, so schnell als möglich daherzulaufen suchen, ohne einen Fehltritt zu tun. — Dabei rufen sie einen Bussardartigen Vogel mit den Worten an: *„hisaruse, ǂgama daose, hisabese, ǂgama daose“*, d. h. *„Hisarus*, der Wasserweg, *Hisabes* etc.“ (Warum sie gerade diesen Vogel anrufen, ob er ihnen wie der Taubenflug die Richtung des Weges zum Wasser anzeigt, ist unklar.)

Weit verbreitet in Südafrika und von Hottentottenkindern ebenso gern gespielt wie von Erwachsenen, ist das Grubenspiel, *ǂhûrs* genannt, bei dem ich den Eingeborenen mit besonderem Interesse zugesehen habe, da es Überlegung erfordert und mit Leidenschaft gespielt wird. Ohne Bezug

darauf zu nehmen, wie dieses weitverbreitete Spiel in anderen Teilen Südafrikas gehandhabt wird, seien hier nur kurz die Beobachtungen mitgeteilt, die ich über diesen Gegenstand unter Hottentotten gemacht habe.

α) Das Spiel wird ausgefochten von zwei einander gegenübersitzenden Parteien *(I* und *II)* mit beliebig vielen Teilnehmern. Die Parteimitglieder können jeden Zug gemeinsam beraten, einer führt ihn aus.

β) Das Spielfeld besteht aus 4 Reihen von je 16 bis 22 mit der Hand im losen Sande ausgehobenen Gruben, *ihũ-rti*, die sich gleichmäßig auf beide Parteien verteilen. In der ersten Reihe *(a)* jeder Partei wird jedes Loch mit zwei Marken besetzt, in der zweiten Reihe *(b)* nur die rechte Hälfte jeder Spielfront. Als Marken dienen kleine Steinchen, häufig auch Ziegenmist.

γ) Vier Anfänge sind möglich. Es kann gesetzt werden:

aus a^7 in b^6 und b^5
oder „ a^8 „ b^7 „ b^6
„ „ b^8 „ b^7 „ b^6
„ „ a^9 „ b^8 „ b^7.

δ) Das Setzen der Marken. Nur beim ersten Anziehen ist es erlaubt, aus der Mitte der einen Reihe in die andere zu setzen. Im übrigen erfolgt das Setzen, ohne ein Loch zu überspringen, nur gegen die Richtung des Uhrzeigers. Ein Übergang von einer Reihe zur anderen erfolgt für jeden Spieler nur an der rechten Ecke seines Spielfeldes (siehe Pfeil).

Das Setzen besteht darin, daß der Spieler die Marken einer seiner Gruben aufnimmt und einzeln auf die folgenden Gruben verteilt. Diese Marken aufnehmen muß jeder, der beim Setzen mit mehr als einer Marke in einer Grube endet. Die Marken dieser Grube werden also ausgenommen und weiter gesetzt. Kommt in das letzte Loch, das besetzt wird, nur eine Marke zu liegen, so spielt der Gegner weiter; kommen in das jeweilige letzte Loch, das benutzt wird, zwei oder mehr Marken zu liegen und hat gleichzeitig der Gegner in der entsprechenden (gleichzahligen) Grube seiner Reihe *b* eine oder mehrere Marken, so nimmt man die eigene Grube, in der man endete, nicht aus, sondern raubt dem Gegner alle Marken, die,

kurz gesagt, in der Flucht dieser Gruben liegen (d. h. alle Marken, die in den gleichzahligen Löchern der *a*- und *b*-Reihe des Gegners sich befinden).

Die geraubten Marken legt man sich nach den Regeln, die für das Setzen gelten, in die eigenen Gruben. Die Zahl der Marken in einer Grube kann beliebig steigen.

Gewonnen hat, wem es gelingt, dem Gegner auf dem angegebenen Wege alle Marken abzunehmen.

c) Als Phantasiespiel sei endlich eine Kurzweil der Kinder und Frauen genannt, die darin besteht, bestimmte rhythmische Geräusche zu erzeugen. Das eine Spielzeug wird *χa-bubu-s* genannt. Ein rechteckiges, flaches Stückchen Holz wird an zwei Stellen durchbohrt, durch die Löcher ein Riemenfaden gezogen und durch Schwingen die beiden Riemenfäden derartig überdreht, daß durch taktmäßiges Anspannen und Schlaffgeben das Hölzchen von den überdrehten und sich wieder abdrehenden Riemen in lebhaft schwirrende Bewegung versetzt wird. Je nach dem Rhythmus, den sie dabei anwenden, rufen sie sich die Vorstellung erst eines trabenden, dann eines galoppierenden, dann eines durchgehenden Pferdes wach. Durch Blasen gegen das Schwirrhölzchen lassen sie das flüchtige Pferd schnauben. Demselben Zweck dient ein dünnes Stäbchen, dessen Name, *ǂha-buhaib* (von *ha-bu* = Durchgehen scheuer Tiere) aus dem Vorhergesagten verständlich ist. Das Stäbchen oder der Halm einer bestimmten Grasart wird zwischen die Lippen genommen und mit dem Finger auf- und niedergeschlagen, daß es im Surren den drohend sich überstürzenden Hufschlag eines wild gewordenen Pferdes nachahmt.

Ehe wir die Kinder verlassen, ist darauf hinzuweisen, wie sie ihr gemeinsames Treiben in Freundschaft verbindet. Knaben unter sich und Mädchen unter sich, oder beide miteinander, betrachten sich, wenn sie gleichalterig (*ǂhāi*, verb.) und an einem Ort aufgewachsen sind, ihr Leben lang als Alterskameraden, *ǂguiǂhāin*. Jeder ist der **ǂhā-tsab* oder der **ǂhō-tsab* des anderen. Meist hörte ich sie nicht sich bei Namen nennen, sondern in einer besonderen Form von Vertraulichkeit mit *ao-tse* im männlichen und *a-χase* im weiblichen Geschlecht sich anrufen. Es ist nicht nötig, die Pflichten der Altersgenossen gegeneinander einzeln aufzuzählen; die Generalpflicht der Altersgenossenschaft, die alle anderen einschließt, ist: Zusammenhalten in allen Lebenslagen.

5. Auflösung der Familie

findet unter den heutigen Verhältnissen meist frühzeitig statt. Früher wird der große Herdenbestand, wie bei uns etwa ein großes Bauerngut, die Familie im Interesse ökonomischer Bewirtschaftung und voller Auswertung des Besitzes lange zusammengehalten haben. Heute ist der Hottentott frühzeitig auf Broterwerb im Dienst des Weißen angewiesen und so stieben die Kinder oft schon halbwüchsig auseinander.

Inwieweit der Tod eines der Ehegatten die Familienbande lockert, läßt sich ohne Kenntnis des Erbrechts nicht ermessen. Ich habe in dieser Richtung keine Studien angestellt.

Nur über die Totenbräuche konnte ich mich informieren. Wie sie heute gehandhabt werden, stellen sie ein Gemisch alter Traditionen, christlichen Einflusses und der auch hier fortschreitenden Degeneration des Volkstums dar. Dem Toten werden die Augen zugedrückt, der Leichnam von alten Frauen gewaschen und in Rückenlage gestreckt; die Arme liegen lang herunter neben dem Leib, die Hände sind, mit dem Rücken nach oben, im Schoß nebeneinander gelegt. Felle bilden das Leichengewand; mit der Haarseite nach innen und mit Buchupulver bestreut werden sie um den Körper gewickelt und zusammengenäht. Das Gesicht bleibt bis kurz vor der Beerdigung frei, dann wird ein ausgesparter Fellzipfel darübergedeckt und locker festgeheftet.

Der Tote bleibt allein in der Hütte, auf Decken am Boden liegend. Die Angehörigen, Nachbarn und Freunde bringen die Nacht außerhalb der Hütte gemeinsam mit Singen zu. Noch ehe die Leiche beerdigt ist, fängt der Totenschmaus an. Die Männer, die die Grube graben, essen schon, ehe sie an die Arbeit gehen. Wenn die Grube etwa $^3/_4$ m breit und knapp mannstief ausgehoben ist, wird in der Tiefe, der einen Längswand des Grabes folgend, eine niedrige enge Seitennische zur Aufnahme der Leiche gehöhlt. Meist am Nachmittag des Tages nach dem Tode findet die Beerdigung statt. Der eingenähte Tote wird auf Riemen heruntergelassen. Dann steigen zwei Männer nach und schieben die Leiche in die Nische stets so, daß sie die Grube zur Rechten hat und das Kopfende nach Westen gekehrt ist. Die Leiche, deren Beerdigung ich mit ansah, wurde in gestreckter Rückenlage gebettet; kauernde Haltung wird als ursprüngliche Sitte angegeben[68]).

Mit dichtem Buschwerk, das den ganzen Boden der Grube deckt, wird die Totennische geschlossen. Auf das Buschwerk folgt eine Steinschicht;

mit Erde oder Sand wird die Grube dann vollends gefüllt und der Hügel aufgeworfen. Den Abschluß bilden wieder Steine, die sich in mehrfachen Schichten über den Boden häufen. Ein großer Stein, senkrecht eingepflanzt, halb armlang aufragend, zuweilen auch eine Gemsbockstange, bezeichnen das Kopfende des Grabes. Die geschilderte Bestattungsweise bildet den besten Schutz der Leiche gegen Hyänen und findet wohl von diesem Gesichtspunkt aus ihre Erklärung.

Alle Angehörigen und Freunde bis zu den kleinsten Kindern, die sonst noch zu keiner Arbeit angehalten werden, helfen das Grab schließen. Wie wir Blumen niederlegen, so streuen sie wohlriechendes Buchupulver auf den Hügel.

Wer nach langer Abwesenheit zum Grabe zurückkommt, legt einen Stein oder ein Holzscheit oder einen Zweig dort nieder. Das gleiche tut jeder, der in den Ort kommt und einen Freund nicht mehr am Leben findet, als Symbol dafür, daß auch er ihn mit bestattet hat.

Wer sanft stirbt, lebt ebenso mild in den Träumen der Überlebenden weiter. Wer im schweren Kampf oder wild phantasierend starb, erscheint den Überlebenden nachts als Schreckgespenst. Die Frage aber, ob der Abgeschiedene an sich in irgend einer Gestalt noch eine Schattenexistenz fristet, habe ich nirgends erwogen gefunden. Ihre Phantasie endet hier in der Sage vom Hasen, dessen Feigheit die Menschen um die Unsterblichkeit, die ihnen der Mond verheißen hatte, betrog (siehe Sage No. XXX).

Regen, Sturm oder dichtes Gewölk, das etwa eine Woche nach dem Todesfall erscheint, gilt hie und da als Zeichen, daß die Galle aus dem verwesenden Körper fließt. Auch jeder Witterungswechsel, Windstille, Sturm, Kälte, Hitze, Gewitter, gelten als eine Sendung des Toten; so hielten die Hottentotten einst eine große Cirruswolke für die Totensendung eines verstorbenen weißen Mannes.

B. Stammesgemeinschaft.

Die Zerstreuung der Bevölkerung über weite Gebiete und ihre unstete Lebensweise, beides eine Folge der klimatischen Bedingungen des Landes, hat das gesellschaftliche und staatliche Leben der Hottentotten niemals zu festen Normen erstarren lassen. Zudem haben die Wirren der letzten Jahre, was sich von alten Einrichtungen noch bis vor kurzem erhalten hat, weggefegt, so daß eine geschlossene Darstellung des Zusammenlebens der Hottentotten in Staat und Gemeinde heute gegenstandslos wäre. Dem Reisenden

bleibt hier nur übrig, im Verkehr mit den Eingeborenen auf diejenigen Grundanschauungen zu achten, die vielleicht noch im Volke lebendig sind, auch wenn sie sich nicht mehr offenkundig ausprägen. Das wenige, über das ich hier zu berichten habe, bezieht sich auf die Anschauungen der Hottentotten in Fragen des Eigentums, des Geschlechtsverkehrs und der Macht.

1. Eigentum.

Im Nara-Buschfeld des Kuiseb-Gebiets hinter der Walfischbai liegen wohl die einzigen Fälle von Privatbesitz nicht beweglicher Güter vor. Die Hütte ist bewegliches Gut und die sogenannten Gärten sind dem Hottentottenbesitz etwas ursprünglich Fremdes, das hier nicht mitzählt. Die nutzbaren Strecken des Landes, die Weidegebiete, sind Allgemeinbesitz der Familien, die ihr Vieh auf ihnen stehen haben. Das Recht auf dieses Weidefeld besteht aber nur so lange als keine stärkere Gemeinschaft es streitig macht; Kämpfe um Weide und Vieh sind von den ältesten Zeiten ab zwischen den Hottentotten ausgefochten worden. Der Mangel einer Organisation, die über die engen Stammesgrenzen hinausginge, hat viel zur Zersplitterung nationaler Kraft beigetragen.

Innerhalb des Stammes (dem Weißen gegenüber gilt eine andere Moral) ist das Privateigentum an beweglichem Gut, also vor allem an Vieh, genügend geschützt. Diebstahl gilt hier als schweres Unrecht und wird auf das strengste bestraft (siehe Macht).

Die Tilgung einer Schuld (wieder nur unter ihresgleichen) gilt zwar als Ehrensache, wird aber oft genug leicht genommen: *„ǂaûs ga ǂareχa ota ni ra ma tsi,“* d. h. „wenn der Klippdachs einen Schwanz bekommt (also niemals), dann werde ich Dir's zurückgeben“.

Bei aller Strenge in der Wahrung seines Eigentumsrechts liegt dem Hottentotten doch Geiz fern. Er teilt nicht nur mit seinesgleichen sein Letztes, er ist auch (und war es vor allem, wie alle älteren Berichte bezeugen), von hervorragender Gastlichkeit dem durchreisenden Fremden gegenüber. Es wäre überflüssig, hier noch einmal zu beweisen, daß diese Gastlichkeit nicht lediglich in kluger Berechnung auf einen Vorteil gewährt wurde, sondern einem tief eingewurzelten Zug von Brüderlichkeit entspricht.

Dieser Charakterzug gibt sich auch in einer Art Liebesgaben-Verhältnis kund, für das wir im Deutschen keine Bezeichnung haben, das deshalb am besten bei seinem Eingeborenennamen **soregus* genannt wird. Die Soreschaft wird durch Zutrinken eingeleitet. Mit den Worten: *„ǂî soreb“* oder

„sore ǂgams", d. h. „das ist Sorewasser", wird dem oder der Erwählten ein Trunk gereicht, von dem der Geber selbst zuerst einen Zug getan hat. Ein Knabe, der auf diese Weise in ein näheres Verhältnis zu einem alten Hottentotten trat, bekam ein Pferd und etliche Stück Kleinvieh geschenkt; er überlebte seinen Wohltäter, fühlt sich aber noch heute verpflichtet, dessen Kindern später — darüber mögen 20 Jahre vergehen — einmal ein Gegengeschenk zu machen, wenn ihn auch niemand dazu zwingen könnte. Auch Frauen untereinander treten in dieses Verhältnis. Ohne nach einer Gegenleistung zu fragen, schenkte eine Frau ihrem kleinen Günstling, einem Mädchen, mehrere Ziegen; nach Jahren bekam sie dafür einen Sack Kaffee gelegentlich geschenkt. Charakteristisch für das Soreverhältnis ist, daß es keinerlei Rechtsschutz, wie etwa ein Tauschgeschäft, beansprucht, sondern lediglich auf gegenseitigem Vertrauen beruht. Eine Kritik der treibenden Motive gab mir in keinem Fall Anhalt zu der Annahme, daß Gewinnsucht im Spiele war: Gebefreudigkeit als ein Charakterzug des Volkes ist jedenfalls eine der Triebfedern des Sorebrauchs. Ob sie die ursprüngliche war oder ob hier geschlechtliche Neigungen von vornherein mitspielten (s. weiter unten), wage ich nicht zu entscheiden.

2. Der Geschlechtsverkehr

der Hottentotten wird nicht mehr wie früher im Interesse der Stammesgemeinschaft durch Sittenvorschriften geregelt. Heute stößt man sich — mit Ausnahme der treu zu den Lehren der Mission haltenden Familien — selbst an den freiesten Geschlechtsverkehr nicht mehr. Ehedem war Sittenstrenge auch unter den Hottentotten zu finden. Augenzeugen aus der Zeit vor 30—40 Jahren berichten, daß ein Mädchen, das sich vergangen hatte, in Gegenwart des Schuldigen von ihren Eltern mit Riemen gepeitscht wurde und daß sich dann der Mann in Gegenwart des Mädchens derselben Strafe unterziehen mußte. Ähnlich wurde mit einem Mädchen verfahren, bei dem die massierenden Frauen Striae als Zeichen einer alten verheimlichten Schwangerschaft fanden. Heute denken die Hottentottenmütter anders. Die Moral unter Verheirateten ist nicht besser. Das oben genannte Soreverhältnis, das zwar in einem großen Teil der Fälle durchaus ehrbar ist, bedeutet in anderen Fällen eine verschwiegene Übereinkunft zu intimem Verkehr außerhalb der Ehe.

Auch die Zauberei steht hier und da im Dienst der Unzucht; *ǂnarminaim* bedeutet das Behexen zur Sicherung der Liebe: Das Mundstück der Pfeife

wird unbemerkt mit dem Inhalt der Medizindose bestrichen; der Mann raucht an und reicht die Pfeife der Frau, deren Liebe er sich verschaffen will.

Vergewaltigungen werden natürlich trotz aller Sittenlosigkeit als schweres Unrecht empfunden; man würde das kaum erwähnen, wenn man nicht ab und zu einer gegenteiligen Auffassung bei den Weißen im Lande begegnete. Einem Hottentotten, der sich unverbesserlich nachts in die Hütten schlich, um allein schlafende Frauen zu vergewaltigen, wurde (dem Bericht eines alten Hottentotten nach) ein Hoden ausgeschnitten, mit der Drohung, im Rückfall auch den anderen lassen zu müssen. Der diese Halbkastrierung vorgenommen hatte, starb kurz darauf, und darin sahen die Hottentotten des Kraals einen Fingerzeig, daß ihre Methode doch nicht einwandfrei sei, und wandten sie seitdem nicht wieder an. Derartige Fälle haben vielleicht Anlaß zu der Vorstellung gegeben, daß halbseitige Kastrierung ein Brauch der Hottentotten sei.

Abtreibungen sind nichts ungewöhnliches. Ein heißer Aufguß von alten Klippdachsharn (s. Analyse im Anhang), wenn nötig, mehrere Tage hintereinander getrunken, gilt als wirksames Abtreibemittel. Die Prozedur selbst nennen sie bezeichnenderweise **ǂūnāt*, d. h. „Trinken und Fallen".

Um das wenig erfreuliche Bild zu vervollständigen, sollen die Flüche sexuellen Inhalts, die man häufig hört, nicht verschwiegen werden. Zuvor sei betont, daß selbst bei freiestem Geschlechtsverkehr (wahllos-handwerksmäßige Prostitution ausgenommen) das Schamgefühl meist nicht verloren gegangen ist. Die Tat ist frei, Blicke und Worte verletzen. Deshalb werden Schimpfreden, die das Schamgefühl laut beleidigen, wie das häufige *„gai-χāba ū"*, „Du mit dem großen Penis" auch von den wenigst Prüden als Herausforderung empfunden. Die Häßlichkeit des Bildes verstärkt dann weiter die Beleidigung: *„ǂara χāba ūts"*, „Du mit dem Penis gleich dem Schamwulst des Pavians". *(*ǂa·ras* ist die grell gerötete, periodisch dick anschwellende, nackte Hautwulstung im Umkreis der Scham des weiblichen Pavians*)*.

Am schwersten sind die Flüche, die außer dem Schamgefühl auch die Pietät verletzen, indem sie mit dem Beschimpften selbst gleichzeitig dessen Mutter oder dessen Schwester treffen: *„ǂhaǂ+nūisōats"*, „Du *(-ts)* Sohn *(ōab)* der Scham *(ǂnūis,* vulva*)*, ekelhaft wie die Milch-Kalabas-Schmutzkruste" *(ǂhaǂs)*. Der Fluch: *„sa ǂgāsa χaē"*, „Treib Schande mit Deiner Schwester", kann selbst den stumpfsten Hottentotten zur Wut stacheln.

Mehr darauf abzielend, den Beschimpften lächerlich zu machen, ist der Zuruf: *„ǂgûits go hã o“*, „ei, Du bist ja steif geworden“ *(ǂgûi*, Erektion haben*)*.

Die Zustände im Verkehr der Geschlechter dokumentieren den rapiden Verfall des sozialen Lebens der Hottentotten.

3. Die Macht

innerhalb der Stammesgemeinschaft lag noch zur Zeit meines Aufenthalts im Namalande wie von alters her in der Hand eines Oberhauptes, *gao-aob* oder **gao-b*, eines „Kapitäns“, und eines Rates älterer Männer, mit dem der Kapitän alle wichtigen Angelegenheiten, je nach der Persönlichkeit bald selbstherrlich führend, bald selbst geschoben, besprach. Das Recht, im Rat zu sitzen, ist nicht an bestimmte Bedingungen geknüpft: Fähigkeit, Erfahrung und Alter qualifizieren. Im einzelnen aber steht heute diese althottentottische Regierungsform schon stark unter dem Einfluß kapholländischer Vorbilder und christlicher Elemente (vergl. den Troß Hendrik Witbooi) [78]).

Sind die Werften der Hottentotten, die unter einem Kapitän stehen, weit voneinander entfernt, so setzt der Kapitän einen Mann aus seiner Verwandtschaft als eine Art Statthalter über die fernen Werften ein. Auf diesem Wege verzweigt sich die Herrscherfamilie in räumlich getrennte Sippen, die mit besonderem Namen (häufig einem ihrer Vorfahren entlehnt) unterschieden werden. So unterscheiden die Topnaars in der Verwandtschaft ihres Kapitäns: *ǀhai-begu, mũ‖(e)în* und *ǁnorabagu*.

Die Entscheidung über Krieg und Frieden, über Wanderzüge und Handelsbeziehungen, die Schlichtung von Rechtsstreitigkeiten und die Verhängung von Strafen waren noch bis vor kurzem die Machtbefugnisse des Kapitäns und seines Rats. Der letzte Auflehnungsversuch der Hottentotten gegen die weiße Oberherrschaft wird bald restlos mit der eingeborenen Regierungsform aufgeräumt haben. Mit Hendrik Witbooi ist ihr letzter, in seiner Art respektabler Vertreter dahingegangen.

C. Das Verhältnis der Hottentotten zu den fremden Menschenrassen in ihrer Heimat und Nachbarschaft

soll uns hier nur kurz und nur in seinem persönlichen Moment, soweit es zur Charakteristik des Eingeborenen beiträgt, beschäftigen.

Man nimmt unbestritten an, die Hottentotten hätten ihrem Selbstbewußtsein dadurch Ausdruck gegeben, daß sie sich über alle anderen

Menschen erhebend *K'χoĭ-kχoĭn*, „Menschen der Menschen", nennen, in demselben verherrlichenden Sinne wie wir etwa von einem „Buch der Bücher" reden. Diese Auffassung ist zu modifizieren. Fragt man einen Hottentotten: *„mā ǂhaos kχoĕtsa?"*, d. h. wörtlich „ein Mensch welchen Stammes bist Du?", so antwortet er entweder: *„na-ǂmata"*, „ich bin ein Nama", oder er setzt diese Kenntnis voraus und sieht dann in der Frage einen Zweifel an der Reinheit seines Menschentums; seine Antwort lautet in diesem Fall: *„kχoĕ-kχoĕta"*, „ich bin ein echter Mensch". Die Verdoppelung hat hier denselben Sinn wie in der Antwort eines Hottentotten, den ich auf die skeptische Frage: *„tarebe hāba?"*, „was für ein Pferd ist das?", erwidern hörte: *„hā-hāba g(u)mo"*, „ei, doch ein Pferd-Pferd", d. h. ein echtes Pferd. Mit der Verdoppelung der Bezeichnung „Mensch" drückt also der Hottentott im gegebenen Falle aus, daß er ein Mensch ohne fremde Zutat ist, kein Zwitterwesen wie etwa ein Buschmanns-Bastard oder wie der verachtete Bergdamara, der ihrer Auffassung nach mit dem Pavian verwandt ist (siehe Sage No. XV). In demselben Sinne würde der Hottentott die Antwort *„kχoĕ-kχoĕta"* auch aus dem Munde eines Weißen verstehen. Wenn also die Benennung *kχoĭ-kχoĭn* eine Sammelbezeichnung für sämtliche Hottentottenstämme war (sie scheint als solche heute nicht mehr im Volke lebendig zu sein), dann hat sie nicht den Sinn von „Menschen-Elite" gehabt, sondern ist nur der Ausdruck dafür gewesen, daß sich der Hottentott inmitten der Völker, die ihn umgeben, seiner „Echtheit", d. h. des rassenreinen Ursprungs seines Menschentums bewußt ist. Das schließt nicht aus, daß er das gleiche auch anderen Völkern zuerkennt. Im einzelnen bestimmt aber die Erfahrung seine Wertschätzung einer fremden Rasse. In seinem persönlichen

1. Verhältnis zu den übrigen Eingeborenen Südafrikas

a) nimmt der Buschmann die tiefste Stelle ein. Die Buschmänner sind wohl von allen südafrikanischen Menschenrassen dem Hottentotten am ältesten verbunden. Aber wann und wie sie seine Sklaven wurden, wissen wir nicht. Sie werden mit Verachtung und äußerster Strenge behandelt. Viehdiebstahl, den sie als besitzlos nicht mit Eigentumsstrafen büßen können, verwirkt meist den Tod. Das nomadisierende Jägerleben der kläglichen Buschmannsreste im Namaland läßt einen Anschluß ihrer Familien an die ihnen [illegible] meist nicht zu und läßt das Abhängigkeitsverhältnis lockerer erscheinen, als man gewöhnlich mit dem Begriff des Sklaventums verbindet.

L. S. phot. Verlag Gustav Fischer, Jena.

BUSCHMANN AUS DEM SANDFELD, VOM STAMM DER GOBANIN

[p 322a]

L: Schultze FX13 Hottentot

Es ist weniger auf Zwang begründet als auf freiwilliger Unterordnung des Schwächeren, in der Erwartung kleiner Vorteile im Lebensunterhalt, wenn auch mit dem Bewußtsein völliger Rechtlosigkeit im Hintergrunde. Enger sind

b) die Bergdamara oder „Klippkaffern" der Hottentottenfamilie angegliedert. Auf den rätselhaften Ursprung und die ethnologischen Merkmale dieser tiefschwarzen, gedrungenen, mittelgroßen Menschen gehen wir ebenso wenig wie auf die der Buschmänner ein, auch hier interessiert uns nur die Stellungnahme der Hottentotten.

Die erste Berührung der Hottentotten mit den Bergdamara reicht über die Zeit zurück, aus der uns geschichtliche Daten überliefert sind. Denn schon Pieter Brand, der Begleiter des entdeckungsfreudigen Willem van Reenen [16]), der im September 1791 eine Expedition in das Groß-Namaland führte, fand bei den Bergdamara die Sprache der Hottentotten im Gebrauch; die eigene Muttersprache schien damals schon wie heute vergessen gewesen zu sein. Obwohl die Bergdamara unter deutscher Schutzherrschaft ihre Freiheit erhalten haben und wie vom Joch der Herero, so auch von dem der Hottentotten befreit sind, sind sie doch bei den letzteren wie die Buschmänner vielfach in freiwilliger Abhängigkeit als Hausgesinde geblieben.

Obwohl allgemein als gutartig und anleitsam bekannt und dementsprechend vom Weißen geschätzt, ist dem Bergdamara der geringschätzige Name, den seine Unterdrücker ihm gegeben haben, doch geblieben. Der Hottentott nennt die Bergdamara *ǂau-daman*, d. h. „Scheißkaffern", ich hörte sie auch als *ǂhau-/kχoĩn* bezeichnet werden, d. h. (nach Angabe der Hottentotten selbst) „Mistmenschen" *). Eine freundliche, halb scherzhafte, auch für den Pavian gebrauchte Anrede, mit der der Hottentott sich gelegentlich an einen Bergdamara wendet, ist **/no-ro /kχo-nibetse*, mit einer mir unklaren Anspielung auf eine eßbare Pflanze; oder er nennt ihn ebenfalls wie den Pavian, **/hu-nitsi /hai-tse*, spottend, er sei so fahl *(/hai)* wie der */hunis*-Baum (eine *Boscia*-Art).

---

*) Abgeleitet von **ǂhaub* — Mist. Krönlein [17]) kennt dieses Wort nicht und leitet die gesamte Bezeichnung, die sich nach ihm die Bergdamara selbst gegeben haben sollen, von dem Wort für „richtig sein" ab, das aber für mein Ohr nicht *ǂhau!* sondern mit getrennter Aussprache der beiden Vokale und steigendem (Terz) Wortionfall *ǂhau-* lautet. Ich kann der Krönleinschen Anschauung die meinige nur als nacktes Resultat meiner Aufnahmen ohne Entscheidung, welcher von beiden der Vorzug gebührt, gegenüberstellen. Schinz [18]) schreibt irrtümlicherweise */haukhoin*, und sein Setzer verwechselt den Schnalzer noch weiter im Register.

c) Von den Stämmen, die man auf Grund ihres gemeinsamen Sprachbaues als Bantu zusammenfaßt, können wir die Ovambo, *ǂnabe-n*, und die Betschuanen, *b(e)rin*, d. h. Ziegen, als nur gelegentlich mit den Hottentotten in Berührung gekommen, übergehen. Nur mit einem Bantustamm haben die Hottentotten in Jahrhunderte alter Feindschaft ihre Kräfte gemessen, mit den Ovaherero, die vor etwa 100 Jahren von Nordosten in die Länder südlich des Kunene eindrangen[70]. Vom Hottentottenstamm der Roten Nation und dem Anhang Jonker Afrikaaners wurde um die Mitte des vorigen Jahrhunderts die Macht der andrängenden Herero gebrochen. Von Anfang der 60'er Jahre ab wandte sich aber das Blatt und nach blutigen Kämpfen unterlagen die Hottentotten endgültig. Zu einem Abhängigkeitsverhältnis der Sieger und Besiegten, ähnlich dem der Hottentotten und Bergdamara, ist es nicht gekommen.

Herero von 17 Jahren mit geöffnetem Munde, zur Demonstration des Zahnzeichens: Ausbrechen der 4 unteren und Anfeilen der oberen mittleren Schneidezähne.

Der reiche Viehbesitz, um den sich die ganzen Kämpfe drehten, hat dem Herero den Namen *goima-damab*, d. h. „Rinderkaffer" gegeben. Eine andere spöttische Bezeichnung für die Herero ist **ǂna-ǂntomagyeǂhabo- kχoĩsõ-an* d. h. „die Menschen- *(kχoĩs*, fem.*)* Kinder *(õ-an)* mit Fellschuhen *(ǂhabo-)*, die sich nicht *(ǂoma)* umsehen *(ǂnain)*": Der verschlagene Hottentott, der nie einen Platz verlassen wird, ohne zurückzusehen, um sich zu orientieren, was hinter seinem Rücken vorgeht, gibt der Achtlosigkeit seines Gegners mit diesem Spitznamen Ausdruck.

2. Das Verhältnis der Hottentotten zur weißen Rasse.

a) Die erste Berührung des Hottentotten mit dem weißen Mann, *Khîb*, fällt in das Ende des 15. Jahrhunderts, in die Glanzzeit der Portugiesen. Neugierde und Wissensdurst auf der einen, Furcht auf der anderen Seite waren die begreiflicherweise vorherrschenden Empfindungen bei der ersten Begegnung. So mußten Vasco da Gama's Leute[14]) die Eingeborenen, die sie im November 1497 am Fuße eines Hügels in der St. Helenabai entdeckten, umzingeln und wie ein Stück Wild einfangen, um überhaupt mit ihnen Fühlung zu gewinnen. Die gute Behandlung des einen glücklich Gegriffenen und reich beschenkt wieder Entlassenen lockte andere seines Stammes zum Schiff; auch sie kamen auf ihre Rechnung und so war man beiderseits im besten Einvernehmen.

Mißtrauen, in der Unmöglichkeit begründet, sich ausreichend zu verständigen, zerriß bald das eben geknüpfte Band. Der Soldat Fernão Veloso war auf dem Weg, die Eingeborenen zu ihrem Dorfe zu begleiten, als er Verdacht an ihrer rechtlichen Gesinnung schöpfte und eilig zum Schiff sich zurückwandte. Die Hottentotten folgten ihm — wie es schien, nicht in feindlicher Absicht, denn es wäre ihnen leicht gewesen, ihn niederzumachen; — die Mannschaft an Bord wurde mobil gemacht, Bewaffnete an Land gesetzt, und mit blutigen Köpfen trennten sich die Parteien, ohne offenbar zu wissen, was denn der Grund des ganzen Auftritts gewesen war. Mißtrauen scheint auch die Ursache einer Plänkelei gewesen zu sein, die um 1503 Saldanha mit den Hottentotten in der Nähe des Tafelberges bei Kapstadt hatte.

Der heißblütige Entschluß, eine anscheinend selbstverschuldete Prügelei zwischen Hottentotten und Schiffssoldaten mit einer Strafexpedition zu rächen, trieb dann am 1. März 1510 über 60 Portugiesen ins Verderben. Es erscheint uns heute unfaßlich, wie um einer Lappalie willen, die kein Menschenleben gefordert, nur den Stolz verletzt hatte, der durchreisende Vizekönig von Indien, Francisco d'Almeida, diesen Rache- und Viehraubzug, bei dem selbst Kinder aus dem friedlichen Kraal entführt wurden, nicht nur dulden, sondern in eigener Person leiten konnte. Er fand dabei mit einem Dutzend Würdenträgern unter Stock- und Steinschlägen und Assagaistichen seinen Tod.

Die Nachfolger der Portugiesen am Kap, die Engländer (s. S. 24) machten gute Erfahrungen mit den Hottentotten. Der Handel ging gut (für ein Messer wurde ein Schaf, für zwei Messer ein Ochse eingehandelt)

und Reibereien fanden nicht statt. Aber auf die Dauer werden die Beziehungen der Weißen zu den Eingeborenen unter der Gewohnheit der Portugiesen sowohl wie der Engländer gelitten haben, Verbrecher am Kap auszusetzen, Männer, die in der Heimat Leben oder Freiheit verwirkt hatten, aber als Spürhunde gegen Hottentotten noch verwendbar schienen. Obwohl uns über das Schicksal dieser Deportierten wenig, über ihr Treiben im Einzelnen fast nichts bekannt ist, so spricht doch alle Wahrscheinlichkeit dafür, daß sie den Eingeborenen weder Respekt noch Vertrauen unserer Rasse gegenüber eingeflößt haben.

So trafen die Holländer zu Anfang des 17. Jahrhunderts schon übel vorbereiteten Boden an: sie trugen selbst nichts dazu bei, ihn zu verbessern[48]), bis Johann van Riebeeck in der klaren Erkenntnis, daß die Erschließung der natürlichen Hilfsmittel des Landes nur mit Hilfe der Eingeborenen eingeleitet werden könne, System in den Verkehr der gelben und weißen Rasse brachte.

Für die Zeit der ersten näheren Anknüpfung zwischen Holländern und Hottentotten ist das Tagebuch van Riebeeck's ein um so wertvolleres Dokument, als es nicht nur Tatsachen, sondern in den täglichen kleinen Entwicklungsphasen der Handlung, die alle kurz und klar eingetragen werden, auch die Motive und Ziele der Beteiligten registriert. Hier kommt nicht nur der Geschichtschreiber, sondern auch der auf seine Rechnung, der mit psychologischem Interesse die Begegnung zweier extremen Menschenrassen verfolgt. Wir müssen uns hier mit Hinweisen begnügen: Im ersten Stadium herrschte gegenseitig freundliches Entgegenkommen, und beiderseits befriedigende Geschäfte wurden abgeschlossen. Kupfer und Tabak, daneben Spirituosen, bildeten die besten Tauschartikel. Drei Pfund Plattenkupfer und $^1/_2$ Pfund Tabak war der Preis einer Kuh, ein Pfund Plattenkupfer und etwas Tabak wog ein Schaf, $^1/_4$ Pfund Kupferdraht und etwas Tabak ein Lamm auf. Wildpret, hie und da Elephantenzähne und junge Strauße, wurden wohlfeil eingehandelt.

Im zweiten Stadium führt ein Erlahmen der Nachfrage nach Kupfer zu Preissteigerungen von Seiten der Hottentotten. Die Hottentotten wollen, nachdem ihr Kupferbedarf gedeckt ist, ihr Vieh, von dem sie leben, nicht weiter veräußern. Frisches Schlachtvieh ist aber unentbehrlich für eine befriedigende Proviantierung der Indienfahrer, und da diese Proviantierung der einzige Zweck der weißen Ansiedlung in Südafrika ist, so ist der Viehbesitz für den Holländer am Kap nicht minder eine Lebensfrage wie für

1: Schultze FX13 Hottentot

den Hottentotten. So treten die ersten Verstimmungen ein und mit ihnen wird wieder das alte Mißtrauen wach — nicht ohne Grund, auf beiden Seiten. Der Hottentott kann der Versuchung, sich mühelos wieder in den Besitz des veräußerten Viehes zu setzen, nicht widerstehen und stiehlt. Was er weiterhin noch veräußert, ist minderwertige Ware; er nährt dabei bei den Weißen Hoffnung auf guten Nachschub und täuscht sie am Ende.

Auf der anderen Seite hat auch der Holländer, durch dieses Verhalten der Hottentotten gereizt, keine sauberen Hintergedanken. Er wartet nur auf den geeigneten Augenblick, seine Interessen brutal durchzusetzen und verbirgt sie bis dahin geschickt. Wie man vorher in England die Verwendung von Verbrechern als Avantgarde gegen die Hottentotten mit der Begründung anführte, es sei das für diese Sträflinge „eine sehr barmherzige Tat und ein Mittel, sie zu Gott zu führen, indem man ihnen Zeit zur Buße ließe, Vergebung für ihre Sünden zu erflehen etc.", so wurde der holländischen Indien-Handelsgesellschaft von ihren Berichterstattern (26. Juli 1649) im Anschluß an gut kaufmännische Kalkulation der Bau einer befestigten Station am Kap auch mit der Begründung empfohlen, daß damit durch Heidenbekehrungen „viele Seelen zu Gott gebracht würden, — sicherlich die ausgezeichnetste Tat, den Namen des Allerheiligsten zu verherrlichen und sein heiliges Evangelium zu verbreiten. Auf diesem Wege wird auch Ihr Unternehmen in Indien mehr und mehr gesegnet werden." Van Riebeeck glaubt auch ohne daß man dem lieben Gott Aktienanteile anbietet, zum Ziele zu kommen. Er hofft, die Vertrauensseligkeit der Hottentotten zur rechten Zeit zu einem Viehraub großen Stils und einem ergiebigen Sklavenfang für Indien ausbeuten zu können (Tagebucheintragung vom 13. Dezember 1652). Daß er zu diesem Zweck, seinen Verdruß herunterkämpfend, überall Nachsicht und Freundlichkeit an den Tag legt, wird ihm von Seiten der Hottentotten als Schwäche gedeutet. Gleichzeitig wächst die Erbitterung auf dieser Seite in dem Maße, als sich der Eingeborene durch die Fremdlinge von wertvollen Strecken seiner alten Weidegründe verdrängt sieht.

So kommt es im dritten Stadium zum offenen Ausbruch der Feindseligkeiten, kompliziert durch Verräterei eines einzelnen einflußreichen Hottentotten, der mit den Holländern und mit seinesgleichen doppeltes Spiel trieb. Viehraub und Mord hüben und drüben schienen jedes Einvernehmen für immer zu vereiteln; aber mit der Zeit bahnen sich friedliche Beziehungen neu an und der Tauschhandel blüht wieder. Dieser unberechenbare Wandel von Freundschaft und Feindschaft kennzeichnet den Verkehr der Weißen

mit den Hottentotten von Anfang an, kennzeichnet ihn bis in unsere Tage, in denen die Beziehungen der beiden Rassen über gelegentliche Reibereien hinaus immer ernster in das Stadium bewußt tiefgreifender Interessenkollisionen eintraten.

Wir wollen hier keine Geschichte der Hottentottenkämpfe geben; wer sie schreiben will, müßte im einzelnen verfolgen, wie aus der kleinen Feste und dem Gemüsegarten der holländischen Indiengesellschaft die Kapkolonie des britischen Weltreichs wurde. Uns kommt es nur darauf an, die Typen kennen zu lernen, die in den Kämpfen der folgenden Jahrhunderte auf weißer Seite ausschlaggebend waren. Wir haben hier an van Riebeecks Gründung anzuknüpfen. Sie erhielt in erster Linie aus Holland, nach Aufhebung des Edikts von Nantes auch aus Frankreich neuen Nachschub, den Stamm der heutigen Burenbevölkerung.

b) Der Bur ist der Kulturpionier Südafrikas geworden. Ein wetterharter Körper, im neuen Klima ungeschwächte Fruchtbarkeit, Beharrlichkeit und ein Minimalmaß körperlicher und geistiger Bedürfnisse befähigten ihn, mit den wenigen Kulturmitteln, die er aus der Heimat mitbrachte, dauernde Ansiedlungen zu gründen und sich immer tiefer ins Innere des Landes vorzuschieben. Die Geschichte zeigt ihn uns hier als brutalen Egoisten. Um zu verstehen, wie der Hottentott sich zu ihm gestellt hat, muß man den Buren heute in den entlegenen nördlichen Teilen der Kapkolonie aufsuchen. Hier begegnet man noch einem starken Rest jenes Selbstherrenwesens, das dem Buren im 17. und 18. Jahrhundert auf seiner einsamen Vorpostenlinie der Zivilisation zur zweiten Natur geworden ist; das läßt ihn nur da sich heimisch fühlen, wo im Umkreis vieler Meilen kein Weißer in den Bereich seiner Hütte kommt, wo nur er sich selbst, seiner Familie und vor allem den Eingeborenen, die in seiner Gewalt sind, Recht und Sitte vorschreibt. Nur mit Murren fügt er sich heute dem Gesetz, vor dem der Eingeborene ein Wesen mit Menschenrechten ist. Der Sinn für Nächstenpflichten, wo sie zum Wohle des Ganzen mit irgend einer ernsten Verzichtleistung für den Einzelnen verknüpft sind, ist diesem Familieneinsiedler im nördlichen Klein-Namaland noch kaum wieder aufgedämmert, weder auf politischem, noch socialem, noch religiösem Gebiet. Selbst eine formale Eheschließung gilt ihnen vielfach für unnötig; daß ihre Kinder vor dem Gesetz illegitim sind, kümmert sie nicht; daß sie ungetauft aufwachsen, tut dem Ansehen der christlichen Familien unter ihresgleichen keinen Abbruch. Ende der 90er Jahre deckte ein englischer Geistlicher solche paradiesischen Zustände

in dem Landstrich zwischen der Oranjemündung und Port Nolloth auf. Da wurden dann bärtige Männer getauft und Großeltern getraut, um die Enkel ehrlich zu machen. Der einzige soziale Instinkt, der in diesen Buren noch lebendig ist, ist ihre Gastlichkeit.

Dieser Mangel eines politischen Zusammenschlusses degradiert den Buren des Namalandes in den Augen der Hottentotten. Ihm ist die erbliche Kapitänschaft der stolze Ausdruck seines angestammten Landbesitzrechts sowohl als eines (nach seinen Begriffen) geordneten Nationallebens. Von diesem Standpunkt aus verachtet der Hottentott, von seinem Haß gegen den Eindringling abgesehen, noch heute den einsiedelnden Buren als zugelaufen und herrenlos, weist zum Vergleich auf die Deutschen, die doch, wie er selbst, einen Oberkapitän hätten und eine Nation seien, wie die ihrige.

Weit stärker als solche nationale Empfindungen sind die rein menschlichen Gefühle, die dem Hottentotten den Buren für immer entfremdet haben. Der Bur ist dem Eingeborenen von vorn herein mit jener prinzipiell jeder Verständigung unzugänglichen Verachtung der farbigen Rasse, die auch dem Kaukasier auf der niederen Stufe seines Rassen- und Nationalitätsbewußtseins eigen ist, unverhohlen gegenübergetreten. Noch heute bezeichnet der Bur den Hottentotten schlechtweg als „schepsel", d. h. als ein Geschöpf im Sinne eines Wesens, das nun einmal neben ihm noch existiert wie so manches andere Unverständliche oder Überflüssige in der Welt. Oder er nennt den Hottentotten „geel goed", „gelbe Ware", die man wie Vieh einspannen oder verhandeln kann. Die Gewohnheit, Hottentottenkinder aufzugreifen und aufzuziehn, „groot maak", ist heute weniger lohnend als früher, da der Hausherr noch über Leben und Tod seiner Leibeigenen frei verfügte und Ungehorsam oder Entlaufen kurzerhand mit Erschießen bestrafte. Daß ihm die nachdrängende Kultur diese alten Gewohnheitsrechte genommen hat, ist dem Burentypus, den ich im Klein-Namaland kennen lernte, ein Hauptmotiv, die englische Herrschaft (die ihn im übrigen so frei als nur denkbar gewähren läßt) zu verabscheuen.

Diese Buren waren komisch enttäuscht, als sie erfuhren, daß auch auf deutschem Gebiet, in das sie auswandern wollten, der Hottentott Rechte habe. Näher mit den Buren bekannt geworden, suchte ich mir im Gespräch Aufklärung darüber zu verschaffen, wie wohl in ihren Augen der Gott, vor dem sie dreimal am Tage auf den Knieen liegen, ihre Auffassung der Nächstenliebe farbigen Menschen gegenüber ansehen möge? Man verwies mich auf die Bibel. Ich würde ihre Argumentation aus dem alten Testament

nicht ernst genommen haben, wenn sie mir nicht so ernst vorgetragen worden wäre und sich in der Tat, auch an anderem Ort, als Richtschnur ihres Handelns erwiesen hätte: Im neunten Kapitel der Genesis verflucht Noah den Sohn Ham's, Kanaan, und seine Nachkommen zur Knechtschaft. Der Bur dehnt diesen Fluch auf alle Hamiten aus, den Hottentotten rechnet er dazu, sieht also in ihm einen geborenen Sklaven. Wer ist nun der Herr, den Gott über sie gesetzt hat? Was das Volk Israel im alten Bunde war, das ist der Christ im neuen. Im 7. Kapitel des 5. Buches Mose wird die Austilgung der Kanaaniter geboten. So hat Gott den christlichen Buren als den Erben Israels zum Herren über Leben und Tod der verfluchten Nachkommen Kanaans bis in ihr jüngstes Glied (das sind die Eingeborenen Südafrikas) gesetzt. An dieser Auffassung hängt der Bur um so fester je beschränkter und rassenstolzer er ist. Den freier Denkenden ist diese Art Evangelium ein Deckmäntelchen, das selbst am klarsten zeigt, was es verbergen soll: den maßlosen Egoismus des Buren, der bald dem Hottentotten nichts anderes übrig ließ, als den langsamen Würgekrieg auch seinerseits schonungslos zu führen. Wer in der gegebenen Situation die Oberhand hatte, handelte und handelt noch jetzt, wo das Gesetz nicht hinreicht, nach diesem Grundsatz.

c) In ein extrem entgegengesetztes Verhältnis trat der Hottentott zu einer anderen Klasse weißer Männer, zu den Vertretern der christlichen Mission, die heute im Groß-Namalande von den Sendboten der rheinischen Missionsgesellschaft zu Barmen ausgeübt wird. Wer die älteren Berichte dieser Gesellschaft liest, ermißt den Abstand der heutigen Nama-Mission von der vor 50 Jahren. Damals war die Tätigkeit unter den Hottentotten im herrenlosen, von Kämpfen der Eingeborenen untereinander heimgesuchten Land ein Opfer ersten Ranges. Ohne jeden Schutz einer Regierung lieferte sich der Missionar dem Volk auf Gnade und Ungnade aus, folgte den ruhelosen Stämmen auf ihre Wanderzüge, teilte mit ihnen Hungersnot und Durst. Um in engster Fühlung mit dem Volke zu bleiben, scheute der Missionar selbst vor der Ehe mit einer Eingeborenen nicht zurück. Allmählich führte die Erschließung des Landes zur Anlage fester Missionsstationen; der Schutz des Reiches gab Leben und Eigentum neue Garantien, und heute sind die Missionshäuser dank der vorzüglichen Handwerkerschulung der Missionare die besten und schmucksten Bauten im Lande, Stätten nicht nur der Arbeit, sondern zugleich auch der Behaglichkeit und, wie ich mit aufrichtigem Dank hervorhebe, auch liebevoller Gastfreundschaft

I: Schultze FX13 Hottentot

für den Reisenden. Dieser Umschwung zum Besseren in den äußeren Lebensbedingungen der Mission hat sicherlich nicht wenig zur Festigung ihres Ansehens unter den Hottentotten beigetragen. Aber auch hiervon abgesehen bringt der Hottentott dem Missionar in der Erkenntnis, daß er in ihm den besten Vertreter seiner geistigen und leiblichen Interessen hat, ein großes Maß von Ehrfurcht und (wo er religiösen Anstoß nicht zu scheuen hat) auch Vertrauen entgegen.

Nur ein blinder Missionsfeind wird die Bedeutung dieser Brücke, die das Christentum hier zu friedlicher Verständigung zwischen zwei heterogenen und doch aufeinander angewiesenen Menschenrassen schlägt, in ihrer Tragweite für die kulturelle Entwicklung des Landes verkennen. Aber ebenso sonnenklar ist, daß die Mission zum Fluch des Landes wird, wo sie in einseitiger Verfolgung geistlicher und hierarchischer Ziele das politische oder kolonialwirtschaftliche Wohl des Landes aus dem Auge verliert. Daß dieses Wohl zum großen Teil davon abhängig ist, wie weit der Interessenkampf der eingeborenen und der eingedrungenen Rasse nach Maßgabe der wirtschaftlichen Leistungsfähigkeit der Konkurrenten auf friedlichem Wege sich regulieren läßt, ist eine alte, aber von Humanitätsutopisten wie von brutalen Kraftaposteln gleich oft beiseite geschobene Wahrheit. Man muß sich die Kalamitäten der Eingeborenen-Arbeiterfrage in der Kapkolonie vergegenwärtigen, um einzusehen, welche Ersparnis es bedeutet, seine Interessen mit denen der Eingeborenen (und sei es auch nur der verachtete Hottentott) verknüpfen zu können. Die erste Bedingung dazu ist selbstverständlich eine genaue Kenntnis der Daseinsbedingungen und Anschauungen der Eingeborenen; und solange bei uns die Missionare mit wenigen Ausnahmen die einzigen im Lande bleiben, die es der Mühe für wert halten, diese Fühlung auf Grund eingehender Studien herzustellen, solange hat die Mission einen hohen weltlichen Trumpf in der Hand. Sie hat ihn mit Erfolg in den 80er Jahren im Herero- und Namalande ausgespielt, indem sie den englischen Einfluß zugunsten des deutschen lahm legte[75]).

Wie steht es nun auf geistlichem Gebiet? Darf die Mission mit den Erfolgen der Christianisierung der Hottentotten, wie sie heute vorliegt, zufrieden sein?

Ältere Missionare, die ich sprach, verneinten die Frage: Die Arbeit fast eines Jahrhunderts hätte andere Früchte zeitigen müssen. Inwieweit überhaupt ein Hottentott imstande ist, den Geist des Christentums so aufzunehmen, daß er nicht nur sein Lassen, sondern auch sein Tun bestimmt, könnte ein vorurteilsfreier Missionar am besten beurteilen. Meine eigenen,

wenig ermutigenden Erfahrungen in diesem Punkte haben sich mir immerhin zu oft bestätigt, als daß ich sie alle für zufällig ungünstig ausgefallene und deshalb das Gesamturteil einseitig bestimmende Eindrücke halten könnte. Obwohl ich vorwiegend mit solchen Hottentotten zu tun hatte, die nicht zur Missionselite gehörten, so hütete ich mich doch, jenes tiefe Niveau, aus dem sich mit Leichtigkeit jedes pessimistische Urteil begründen ließe, der Beurteilung zugrunde zu legen.

Der Durchschnitts-Hottentott sieht im Christentum nicht zum Geringsten ein Vorzugsattribut des weißen Mannes. Wie er sich in dessen Joppe und Hose oder Buntdruckrock mehr dünkt als sein Bruder oder seine Schwester im Fellschurz, so sieht er auch in seiner Zugehörigkeit zur christlichen Kirche eine standesgemäße Errungenschaft des modernen Hottentotten. Diese Anschauung ist meist mit Verachtung alter Volkssitten verbunden, auch da, wo sie mit der neuen Religion nicht in Konflikt stehen. Als Übereifer eines tatkräftigen Vorsatzes, sich auf neuer Grundlage hoch zu bringen, würde man diese Selbstverstümmelung hinnehmen. Aber der Hottentott ist zu träge und überdies zu gewitzigt, sieht im sozialen wie im Privatleben des Weißen zu klar den Gegensatz von christlicher Theorie und Praxis (s. Erzählung No. XXVIII), als daß er für gewöhnlich andere ethische Anforderungen an sich stellte als im besten Falle die, die ihm als soziale Normen des eigenen Volkslebens aus der Heidenzeit an sich noch einleuchten: Die Nächstenliebe der Hottentotten im Sinn steter gegenseitiger Hilfe, ihre Ehrfurcht vor dem Alter, Enthaltsamkeit fremdem Eigentum gegenüber (wenn auch nur gegenüber dem Eigentum der Stammesgenossen untereinander) sind solche autochthonen Gebote, die sich mit denen des nachträglich eingeführten Christentums decken.

Die Sagen und die übrigen Phantasievorstellungen der Hottentotten boten vielleicht zu wenig Berührungspunkte, um die christlichen Ideen, ähnlich wie sie in unserem Volk mit dem germanischen Heidentum verwuchsen, so auch hier organisch anzugliedern. In der Tradition der Volkssitten wurzelte, was man von guten Grundsätzen und Lebensregeln der Hottentotten kennen gelernt hat. Der Verlust dieser volkstümlichen Grundlage im Zusammenhang mit einer vollständigen Umwälzung der wirtschaftlichen Grundlage ihrer Existenz seit Überhandnehmen des weißen Einflusses hat das Hottentottenvolk auch sittlich verwahrlosen lassen. Mit Bibel, Katechismus und Gesangbuch, Kirchgang, Sonntagsschule und Abendmahl, Lese-, Schreib- und Singstunden läßt sich ein solcher Ruin nicht aufhalten.

Daß man versucht hat, auf diesem Wege zum Ziel zu kommen, wird niemand dem einzelnen Missionar, der seine Lebensarbeit an das Volk ge-

setzt hat, zum Vorwurf machen wollen. Im System liegt der Schaden: Den Namen des Stifters, dessen Leben ein einziges großes Sichselbstopfern war, darf doch nur der führen, der wenigstens des kleinsten Opfers im Dienste der Mitmenschen, der Arbeit, sei es auch nur für sich und seine Familie, fähig ist. In diesem Sinne sind wenig Hottentotten Christen geworden. Die systematische Erziehung der Eingeborenen zur Arbeit ist wirtschaftlich oft genug gefordert worden. Sie scheint mir aber auch eine unabweisliche religiöse Forderung an die christliche Mission zu sein. Arbeit stellt im Namaland, wie in jeder Kolonie, die einzige Möglichkeit für den Eingeborenen dar, in dem hereinbrechenden Kulturstrom wirtschaftlich sich über Wasser zu halten. Und die Erfahrung hat weiter gezeigt, daß ein wirtschaftlich verkommenes Naturvolk auch sittlich sinkt, weil es um des täglichen Brotes willen zu jedem Dienst der überlegenen Rasse feil wird. So mutet also die Forderung der Arbeitserziehung des Eingeborenen dem Missionar keine programmwidrige Verweltlichung seiner Aufgaben zu, weist nur auf einen Weg zur sichereren Fundierung seiner religiösen Aufgabe hin. Die weiße Bevölkerung andererseits wird der Mission für einen geschulten Arbeitschristen dankbarer sein als für 99 bibelfeste, aber arbeitsscheue Himmelskandidaten.

Ob es sich bewähren wird, nach englischem Vorbild einen eigenen Beamten für Eingeborenen-Angelegenheiten zu bestellen, ob ein solcher Beamter bei Ausübung seiner Pflicht auch in der genannten Richtung einer systematischen Arbeitserziehung der Eingeborenen, eines organisierten Arbeitsnachweises und einer Arbeiterfürsorge, mit der Mission zusammen arbeiten könnte, müßte ein Versuch lehren, womöglich ehe die englischen Arbeiterwerber uns die besten Kräfte über die Grenze gezogen haben. Dann wird sich auch zeigen, ob die protestantische oder die katholische Mission sich in diesem Punkte als die lebensfähigere erweist. Die Entscheidung darüber kann einmal weit über die Grenzen der Mission Tragweite erlangen.

d) Das Verhältnis des Hottentotten zu seinem deutschen Herrn. Der Hottentott lernt unsere Sprache schnell, wenigstens verstehen, er beobachtet den Fremden scharf und hat die Klugheit, mit seinem Ergebnis zurückzuhalten. In allen drei Punkten unterscheidet er sich vorteilhaft von der Mehrzahl unserer Landsleute. Daß der Ansiedler und Kaufmann der schwierigen Sprache kein Interesse entgegenbringt, ist ihm nicht zu verübeln. Daß der Beamte seinen Einfluß auf die Eingeborenen verdreifacht, wenn er ihre Sprache beherrscht, ist eine alte Weisheit, aus der die Lehre

zu ziehen in hottentottischem Sprachgebiet auf abnorme Schwierigkeiten gestoßen haben würde, hätte man je daran gedacht, sie zu beherzigen.

Man hat draußen für die Sprache der Hottentotten ihrer Schnalzlaute wegen gewöhnlich nur Spott. Daß mag an sich harmlos sein; aber ein großer Teil unserer Landsleute begnügt sich überhaupt damit, am Hottentotten das Lächerliche herauszufinden, und das ist bedenklicher. Kommen dazu dann die hundert kleinen Verstimmungen, die Niemandem erspart bleiben, der bei seiner Arbeit auf Eingeborene angewiesen ist, dann kombinieren sich bald diese Empfindungen unter dem äußeren Eindruck der zerlumpten, schmutzigen Gestalten zu einem Gesamturteil, dessen Ergebnis unverhohlene Verachtung ist. Mag diese Verachtung nun je nach den Erfahrungen und der Anlage des Einzelnen humoristischer oder erbitterter Natur sein, meist paart sich jedenfalls mit ihr auf unserer Seite ein Bewußtsein gewaltiger Überlegenheit, das jede nähere Beschäftigung mit dem Hottentotten als überflüssig erscheinen läßt; man glaubt eben, auch so mit ihm fertig zu werden.

Dabei treten dann die größten Gegensätze im Verkehr zutage. Demselben Kapitän, der bei Gelegenheit als „Spitze" vom Beamten ins Haus geladen wird, bietet der Händler mit den Worten „Willst Du einen Schnaps haben, altes Schwein?" auf seine Weise Gastfreundschaft an. Hier wird ein Weißer bestraft, weil er einen naseweisen Hottentotten handgreiflich vom Hofe gejagt hat, dort teilt einmal der Beamte selbst in begreiflicher Erregung blaue Striemen aus. Die Züchtigung an sich ist nicht das Verwerfliche, sondern der Widerspruch in der Behandlung. Man mag das rücksichtslose Vorgehen der Buren im einzelnen mißbilligen; die Konsequenz aber, mit der auch der milder denkende Bur, in voller Übereinstimmung mit seinesgleichen, seine strengen Grundsätze dem Hottentotten gegenüber wahrt, ist der gute Kern dessen, was man an der Fähigkeit des Buren, mit Eingeborenen umzugehen, rühmen muß.

Eine solche Einheitlichkeit in der Behandlung der Eingeborenen läßt sich nicht durch Verordnungen erreichen, sie muß der spontane Ausdruck übereinstimmender Beurteilung des Eingeborenen-Charakters und der Situation werden. Alle Kenner der Hottentotten stimmen darin überein, daß zweierlei im gedeihlichen Verkehr mit ihnen unentbehrlich ist: In ungezählten Fällen habe ich die Erfahrung gemacht, daß ein Hottentott die Strafe, die er seiner eigenen Überzeugung nach verdient hat, auch erwartet. Es ist in seinen Augen ein Zeichen von Schwäche oder Beschränktheit, wenn ihm die Strafe dann geschenkt oder irgendwie umzuckert verabfolgt wird. Er mag sich für

glimpfliche Absolution noch so gerührt bedanken und wenn er Christ ist, den Lohn des „Heere Jezus" herabwünschen, — wer hinter die Kulissen sieht, weiß, daß er sich über diese Art der Behandlung nur lustig macht (vergl. Sage Nr. XLI), er will streng angefaßt sein. Die Forderung der Gerechtigkeit ist gleichfalls schon im Interesse der Auktorität zu erheben, auch da, wo es sich nicht um empfindliche Strafen handelt. Das harte und blinde Abkanzeln einer Anzahl Hottentotten durch einen oberen Beamten, der sich nicht einmal holländisch mit ihnen verständigen konnte, hörte ich einen der Hottentotten (der nur seinesgleichen verständlich zu sein glaubte) mit der Mahnung an seine Begleiter abschneiden: *„ǂkχaui hã χuigye tã kχom"*, „er ist verrückt, darum sprecht nicht". Solche Situationen können sich selbst bei der Kürze der Gastrolle, die man bisher den einzelnen Beamten in Südwest spielen ließ (vgl. die Chronik des Bezirksamts von Keetmanshoop), öfter wiederholen als es zur Stärkung unseres Ansehens förderlich ist.

Auch der Mann, der kein Amt bekleidet, sollte sich bewußt sein, daß sein privater Verkehr mit den Eingeborenen im halbzivilisierten Lande keine reine Privatangelegenheit ist. Jeder einzelne trägt unmittelbar einen Teil der Verantwortung für die guten oder schlechten Beziehungen der beiderlei Rassen. Das Ergebnis dieser direkt verantwortlichen Konfrontierung ist die schärfste Probe auf die Reife eines Volkes im Völkerverkehr. Hier zeigen wir uns deutlich als Anfänger. Wir schwanken innerhalb zu weiter Grenzen zwischen auktoritätsloser Fraternisiererei und amtlich posierendem Herrentum. Der Mittelweg: Verständnis der fremden Eigenart bei ruhig fester Wahrung der eigenen Überlegenheit, liegt uns noch nicht. Der Vetter jenseits des Kanals ist weltmännischer.

Einstweilen müssen wir also offen bekennen, daß der Hottentott uns besser kennt als wir ihn. Schon im Bewußtsein seiner Schwäche verliert er niemals das Interesse am Studium des weißen Eindringlings. Seit Generationen und von Jugend auf geschult, mit List zu Werke zu gehen, läßt er den Weißen nur in den seltensten Fällen in die Ergebnisse seiner eigenen Menschenbeobachtungen blicken. Wir haben in der Verkennung dieser Sachlage viel preisgegeben: Was ist nicht in der kritischen Zeit nach Ausbruch der Warmbader Unruhen an der Bierbank der Verkaufsläden in Gegenwart von Hottentottenmännern für Kriegspolitik getrieben worden!, unaufhaltsam, wenn jenseits der sechsten Flasche der Patriotismus seinen Höhepunkt erreicht hatte. „Was können denn die Kerle machen?" war der Refrain auf den Hinweis, daß unberufene Zuhörer da seien. Und denen entgeht nichts;

sie kommentieren sich solche wahnwitzig unbesonnene Reden eindringlicher als jeden Erlaß des Gouverneurs. Wer glaubt, für Tabak und Fusel von einem Hottentotten jeden Dienst fordern zu können, sollte in kritischen Zeiten wenigstens so viel Familienkenntnis des „Lumpengesindels" haben, daß er den Spion gegen einen Bandenführer nicht gerade aus einer verschwägerten Familie wählt.

Aber wir wollen hier nicht weiter exemplifizieren. Es wird sich auch ohnedies die Überzeugung Bahn brechen, daß die Unterschätzung des Hottentotten in den kleinen Fragen des täglichen Lebens, wie in solchen, die seinen Lebensnerv berühren, ein Grundfehler in unserem Verkehr mit den Eingeborenen war. Wir haben diesen Fehler mit so viel teuerem Blute bezahlen müssen, daß es die Pflicht jedes Zeugen ist, auf ihn zu weisen, damit er vermieden werde.

Wer den Hottentotten als Krieger nicht ausschließlich nach Gardemaß und nach den Paragraphen der Genfer Konvention mißt, wird ihm Anerkennung in mehr als einem Punkte nicht versagen können. Es gehört freilich kein Feldherrnblick zu der Erkenntnis, daß im Kampf mit den Hottentotten nicht Hendrik Witbooi unser Hauptgegner war, sondern sein Bundesgenosse: das Land, das immer wieder zwischen den Feind und uns wasserlose Einöden, unwegsame Gebirge oder unübersehbare Flächen schiebt. Mit seinem ganzen Troß verschwindet hier der Feind. Sein Proviant ist das lebende Vieh, das die Kinder treiben und die Weiber melken. In entlegenen Revieren oder Felshöhlungen, die nur der eingeborene Hirt und Jäger kennt, finden sie Wasser, im offenen Buschkraal nächtigen sie wie sonst auch, wenn sie mit Kind und Kegel für Wochen und Monate auf die Weidesuche gehen. So fühlt sich der Oorloghottentott, mag es ihm gelegentlich noch so schlecht gehen, doch stets in seinem Element. Solchen Gegnern gegenüber sahen wir uns vor die Aufgabe gestellt, mit einem Schlag und mit der Forderung augenblicklicher Leistungsfähigkeit unsere ganze kulturelle Übermacht in ein Land zu verpflanzen, das im normalen Laufe der Dinge Jahrzehnte brauchen würde, um der Kultur gewonnen zu werden. Jetzt alle Hilfsmittel moderner Kriegführung hier mobil machen bedeutete — lange ehe es mit der blanken Waffe an den Feind ging — einen Kampf mit der Natur, der heute noch ungeheure Anforderungen an jeden einzelnen Mann stellt.

In diesem Kampfe ist uns der Hottentott überlegen, nicht deshalb allein, weil er von Fleisch und Wurzeln leben kann, — Erfahrung gibt

m das Übergewicht. Unsere Truppe ist dem Hottentotten ein Wild, auf
s er um so zuversichtlicher Jagd macht, als er seine Gewohnheiten aus
üheren Kämpfen kennt. Während unsere Soldaten immer von neuem
utiges Lehrgeld zahlen, übt jener seine alte Praxis aus: Er lauert dem
eind an der Wasserstelle auf, wie ehedem dem Zebra an der Vlej; er
uert aus seiner Felsenschanze auf eine vorbeiziehende Abteilung, wie er
ch auf ein Rudel wandernder Springböcke in den Hinterhalt legte; er
rscht sich an eine schwache Patrouille heran wie an eine Oryx-Antilope
Morgengrauen; er umzingelt einen Transport, wie er in seinen Kessel-
eiben die Hasen umstellt, um sie mit dem Kirri zu werfen.

Und wenn er selbst im Kesseltreiben saß, wie kam es, daß er immer
eder entschlüpfte? Unsere Truppe hatte während der ganzen Kämpfe
ermüdlich das Kriegsfeld nach allen Winden mit Patrouillen beschwärmt,
tte mit bewunderungswerten Opfern das Land mit einem Netz von Tele-
aphen und Heliographen übersponnen und mit drahtloser Telegraphie
ber unüberwindliche Schwierigkeiten des Raumes und der Zeit bewältigt[76]).
ß uns der Hottentott trotzdem im Nachrichtendienst oft gemeistert hat, bringt
s in unliebsame Erinnerung, was wir im Stolz unserer Kulturhöhe leicht
rgessen: Die Tatsache, daß einfache Übung der nackten Sinne eines
turvolks und primitive Verstandestätigkeit, nur an alltäglichen Dingen ge-
härft, zu solcher Vollkommenheit gesteigert werden können, daß sie dem
gestrengten Aufwand modernster Technik einer numerisch und intellek-
ell unvergleichbar überlegenen Macht erfolgreich Stand halten.

Die Stärke des Hottentotten seinem Feind gegenüber, der von Haus
s in vorschriftsmäßigem Zusammenarbeiten geschult ist, liegt in der Selbst-
ndigkeit jedes Einzelnen, und da ergibt ein Vergleich mit dem deutschen
ldaten bald, wieviel uns Gehirnmenschen an primitiven Fähigkeiten im
ekten Verkehr mit der Natur verloren gegangen ist.

Dazu kommt, daß der Hottentottenkämpfer vielfach schon im reifen
nnesalter steht; das jugendliche Alter unserer Soldaten fällt ihm auf und
ngt ihm die genannte Überlegenheit auch von dieser Seite her zum Be-
ßtsein. Eine Bezeichnung für den deutschen Soldaten, die sich noch aus
r Zeit unserer früheren Hottentottenkämpfe erhalten hat, ist **!gaĕkχaosa
aū-saχarob*, d. h. „das Jüngelchen *(a·χab*, Knabe; *-ro*, Diminut.*)*, aus dem
nden Ort *(ǂgaũs)*, dessen Kleid (der fest im Kreuz anliegende Uniform-
k) am Hintern *(kχaos)* festgemacht *(!gaĕ)* ist". Aber wenn er sich auch
r über seinen Gegner etwa wie ein alter gerissener Wilderer über einen

jungen Forsteleven lustig macht, so hat er doch auch zur Genüge die starken Seiten unserer Soldaten gefühlt. Er gibt seiner Anerkennung in der Bezeichnung *ǂhuniǂoim Ausdruck: ǂoim ist ein sog. Buskop-Rind. Diese Tiere sind ihrer Hornlosigkeit wegen schwerer als gewöhnliche Ochsen zu behandeln: Sie ziehen den Kopf aus der Schlinge, wenn sie in der sonst üblichen Weise an das Joch gebunden werden; sie stecken ihren Kopf ohne Scheu durch Hindernisse, die vor einem gehörnten Tier sonst Schutz geben würden, kurzum, man ist ihrer nicht sicher. Mit dieser Anerkennung der Schlagfertigkeit verbinden sie im Namen, ohne aus dem Bilde zu fallen, unsere ihnen auffallende blonde (*ǂhuni*, gelb) Haarfarbe.

Kriegspfeife der Hottentotten.

Über die Kriegsgewohnheiten der Hottentotten im Einzelnen habe ich von Hottentotten selbst nur wenig erfahren können: Um sich zu seinem blutigen Handwerk zu stählen, soll, wer noch keinen Menschen getötet hat, vor dem Aufbruch gegen den Feind das rohe Blut des Schlachtviehs trinken.

Über die Taktik werden die Gefechtsberichte der Truppen die beste Auskunft geben. Signale werden vielfach auf einer Pfeife gegeben, die aus einem weiblichen Springbockhorn geschnitten ist. Da diese Signalpfeife, *ǂgiis, wie das Tanzried angeblasen wird, heißt sie auch das Ried- oder Blashorn, χaĩnnāis oder *ǂnaĩnnāis.

Eine der Aufgaben des Unterkapitäns ist es, festzustellen, ob der Ort oder die Wasserstelle, dem sich der Trupp nähert, vom Feind besetzt ist oder nicht. Er reitet spionierend ein, während seine Leute rings versteckt liegen; erst wenn ein lang gezogener Pfiff ertönt, erscheinen sie. Auf diese Art sollen die Hottentotten im Jahre 1893 der Wasserstelle ǂAos sich genähert haben, um am folgenden Morgen Kubub zu überfallen. Kurz hintereinander ausgestoßene Pfiffe, die

von den gegenüber oder abseits Liegenden beantwortet werden müssen, sind häufig das verabredete Zeichen zu gemeinsamem Angriffe gewesen.

Auch im Kriege sucht der Hottentott in mystischen Vorstellungen Anhaltspunkte, wo ihn sein Wissen im Stich und die Ungewißheit nicht zur Ruhe kommen läßt. Da gibt ihm unter Umständen ein Orakelholz, **go-bo go-bos* genannt, Beruhigung; es ist ein etwa bleistiftlanges und -dickes Hölzchen, um das ein runder Riemenfaden so aufgerollt wird, wie die Figur *a* zeigt. Nachdem das Hölzchen auf diese Weise in der Mitte dick umwickelt worden ist, wird es wie ein Quirl in den flachen Händen gerollt und im Takt dazu die Frage gestellt, die man beantwortet haben will. Z. B.: *„go-bo go-bo a-maĕ-, kχo-egu go ǂno-aĕ?“*, d. h. „Goboholz, Goboholz, ist es wahr, haben die Männer geschossen?“ Dann wird der Faden zurückgerollt. Liegt er nun dem Hölzchen noch ebenso lose auf wie vorher, so ist der Wunsch, der in der Frage lag, nicht in Erfüllung gegangen; er ist erfüllt, wenn sich der Faden, wie die Figur *b* zeigt, über das Hölzchen gelegt hat.

Ein Hof um den Mond, **aoǂgāib*, (der Mond ist gleichsam in den Farbring hinein-, *ǂgāi*, geworfen, *ao*) gilt, wie mir ebenfalls ein Hottentottenkämpfer mitteilte, als Zeichen, daß eine Entscheidung irgendwo gefallen und das Vieh der Besiegten weggetrieben worden ist. Plötzliches Ohrenklingen oder das Hineinfliegen eines Insekts in den Mund gilt als Unglücksbotschaft.

Die Fähigkeit, im Traum zukünftige oder räumlich fern sich abspielende Ereignisse zu sehen *(ǂga-barab)*, hat wohl manchen Führer, auch wenn er weniger orakelhaft als der alte Hendrik Witbooi veranlagt war, zu einem entscheidenden Schritt angetrieben.

Capitulum V.

Geistestätigkeit.

A. Zur Sprache der Hottentotten.

Aus älteren Aufzeichnungen wissen wir, daß die Sprache der Hottentotten in viele Dialekte gespalten war. Sie sind bis auf einen, wie die

Stämme selbst, die sie redeten, untergegangen. Reste stauben in Manuskripten der Greyschen Bibliothek in Kapstadt[77]). Ob die von Lichtenstein, Burchell und Wuras veröffentlichten Bruchstücke des *!Kora*-Dialekts, ferner die eines östlichen Dialekts, den Sparrmann, Thunberg und Barrow gehört haben, ob endlich die Aufzeichnungen Herberts, Ten Rhines und Witzens aus dem Dialekt der Kapland-Hottentotten des 17. und Anfang des 18. Jahrhunderts sich so verarbeiten lassen, daß sie uns wenigstens ein Schattenbild der verlorenen Sprachen geben, hat noch kein Versuch gelehrt. Die Stämme des Groß-Namalandes bilden jetzt mit den Flüchtlingen aus dem Süden eine sprachlich einheitliche Gruppe. Ihre Sprache ist die der alten Naman oder Namaqua, wie ältere Autoren im Anschluß an die ehemalige Endung des pluralis mascul. schreiben.

Die Sprache der Hottentotten war mir im ersten Reisehalbjahre das schwerste Hindernis, dem Geistesleben des Volkes näher zu kommen. Im zweiten und dritten Jahre wurde sie mir die ergiebigste Quelle meiner Studien. Wo kriegerische Verwickelung oder die Ungunst der Jahreszeit meinen zoologischen Arbeiten Halt gebot, wandte ich mich dem Studium der Sprache zu. Eine kleine Schrift von Theophilus Hahn[78]), ferner eine übersichtliche, aber vielfach irrtümliche Darstellung der Sprache von A. Seidel[79]) und vor allem Kroenleins Wortschatz[57]) gaben mir den ersten Anhalt und später die Grundlage zu eingehender Kontrolle der eigenen gegen ältere Resultate.

Bei meinen Aufnahmen selbst habe ich mich streng an die Eingeborenen gehalten. Wenn ich jede Vermittelung eines sprachkundigen Weißen im Lande vermieden habe, so ist das keine Unterschätzung der Hilfe, die mir von dieser Seite hätte zuteil werden können, sondern ist nur dem Wunsch entsprungen, ausschließlich aus der Quelle zu schöpfen. Deshalb habe ich auch Eingeborene vermieden, die lesen und schreiben konnten, denn die sahen ja ihre Sprache schon durch die Brille des Weißen an, der ihren Lauten nach seiner Weise, zum Teil im engen Anschluß an das Holländische, erst Schriftzeichen gegeben hat. Mir kam es auf das gesprochene Wort des sprachlich noch originalen Hottentotten an. Die Schwierigkeiten einer Verständigung mit Analphabeten hatten den Vorteil, daß sie alle Aufmerksamkeit auf das Gehör konzentrierten und bei dem Versuch, das Gehörte phonetisch korrekt wiederzugeben, eine viel strengere Rechenschaft forderten als eine Einigung auf dem Papier auf Grund konventioneller Zeichen je angeregt hätte. Auf diese Weise habe ich zunächst für die Tiere

und dann für die Pflanzen, die ich sammelte, die einheimischen Namen festgestellt. Aus diesen Studien erwuchsen immer neue sprachliche Anregungen, auf welchem Wege, mag ein einfaches Beispiel illustrieren. Ein Hottentott, den ich fragte, ob er schon einmal den großen südafrikanischen Ameisenfresser, das schwer zum Schuß zu bekommende Erdferkel, gesehen habe, versprach mir zu meiner größten Verwunderung, ein Exemplar noch am selben Abend zu bringen. Er brachte eine Wurzel, denn ich hatte die hottentottische Bezeichnung für Erdferkel nicht mit Stärkeakzent auf der letzten Silbe und mit steigendem Worttonfall *(ǃkχubu·s)*, sondern mit stark akzentuierter erster Silbe und sinkendem Worttonfall *(ǃkχu·bus)* ausgesprochen. Solche Mißverständnisse sind mir im Laufe des ersten Jahres reichlich begegnet. Sie wiesen immer wieder auf die Notwendigkeit hin, die phonetische Seite der Sprache nie außer Acht zu lassen und jedes neu aufgenommene Wort schon in der Vorerwartung, es später von einem ähnlich lautenden unterscheiden zu müssen, von vornherein mit diakritischen Zeichen zu versehen.

Die Gegenprobe darauf, ob man zur Unterscheidung ähnlich lautender Worte genügend Zeichen angewandt und die richtigen ausgewählt hat, ist einfach: Nach einigen Tagen sprach ich die nachzuprüfenden Worte unter genauer Wiedergabe der gewählten Sprachzeichen einem Eingeborenen zu und sah alsbald, ob er den Begriff in dem Sinne, den die gewählte Schreibweise fixieren wollte, eindeutig auffaßte oder nicht. Die Resultate dieser Analysen verglich ich dann mit der bisher üblichen Schreibweise und kam bald zu der Überzeugung, daß die jetzt im Gebrauch befindlichen Zeichen nicht genügen, die Lautverhältnisse der Namasprache so wiederzugeben, wie es vom rein phonetischen Gesichtspunkt aus wünschenswert, im Interesse einer klaren Unterscheidung ähnlich lautender Begriffe notwendig ist.

Indem ich auf die später folgenden Erzählungen verweise, in deren Texterklärungen Beiträge zur Formenlehre und Syntax des Hottentottischen gegeben sind, beschränke ich mich hier darauf, die Resultate meiner Untersuchungen zur Lautlehre mitzuteilen.

1. Die Schnalzer

oder Klixe, diese auffallendsten Laute der Namasprache unterscheiden und aussprechen zu lernen, gehört zu den ersten unumgänglichen ABC-Studien; an ihnen scheitert bei vielen der gute Wille, Nama zu lernen. Hat man die vier Klixe mit dem Gehör unterscheiden gelernt, so kann man sich die

Aufgabe, sie nun selbst wiederzugeben, dadurch erleichtern, daß man einen Eingeborenen bestimmt ausgewählte Klixworte langsam sprechen läßt und ihm dabei so tief als möglich in den Mund sieht, ohne durch irgendwelche Eingriffe die Stimmgebung zu beeinflussen. Man sieht und hört dann, daß Form, Ansatz und Abzug der Zunge den Charakter jedes Klixes bestimmen.

Die Schnalzlaute der Hottentotten sind als „Inspirata" den Konsonanten oder „Exspirata" gegenübergestellt worden [78]), mit Unrecht meiner Überzeugung nach. Die Frage, ob überhaupt In- und Exspirationen an der Bildung der Schnalzer beteiligt sind, kann jeder Schnalzende an sich selbst prüfen. Man halte den Atem fest an und versuche zu schnalzen: Die Laute kommen mühelos kräftig und typisch zustande. Dasselbe gilt für alle vier Laute, gleichgültig ob sie bei einer Inspiration oder bei einer Exspiration gebildet werden. Die Atmung spielt also hierbei keine Rolle. Die Klixbildung ist vielmehr ausschließlich eine Wirkung des energischen Abzuges der Zunge von ihrer Ansatzfläche. In den dabei entstehenden leeren Raum dringt dann die Luft ohne physiologische Beihilfe mit vierfach verschiedenem Geräusch ein. Sie nimmt dabei ihren Weg auch durch die Mundöffnung, aber dieses Einströmen ist keine Inspiration: Die Unabhängigkeit von Zwerchfell und Lunge ist meiner Auffassung nach das Charakteristische der Schnalzlautbildung.

Der Gebrauch klixartiger Laute in der Sprache anderer Völker als der der Hottentotten-Buschmanns-Gruppe Südafrikas ist noch nicht systematisch untersucht worden. Der dentale und der zerebrale Schnalzlaut scheint am wenigsten modifiziert in die Sprache einiger südafrikanischen Bantustämme übergegangen zu sein; ihre Verwendung bei der Wortbildung soll aber der im Hottentottischen nicht entsprechen. Ich selbst hatte keine Gelegenheit, die schnalzartigen Laute der Zulu, Basuto etc. mit denen der Hottentotten zu vergleichen.

2. Die musikalischen Modifikationen der Namalaute

glaubt man mit drei Zeichen genügend unterscheiden zu können. Die Kroenleinschen Zeichen werden vom Autor selbst nicht präzisiert. Büttner sagt von ihnen im Vorwort zum „Wortschatz", vermutlich in Anlehnung an Th. Hahn oder ältere Autoren, daß sie den „mittleren, tiefen und hohen Ton" bezeichnen. Ein Vergleich mit der lebenden Sprache selbst ergibt aber, daß sie nur in einer Anzahl von Fällen reine Tonhöhen angeben; in der Mehrzahl der Fälle werden sie vielmehr zur Bezeichnung solcher Laut-

Übersicht des verschiedenen Verhaltens der Zunge bei der Bildung der Klixe.

Name und Zeichen des Klixes.	Form der Zunge beim Schnalz-Ansatz.	Ansatzstelle der schnalzenden Zungenteile.	Verhalten der nicht-schnalzenden Zungenteile während des Schnalz-Ansatzes.	Richtung des Abzuges der schnalzenden Zungenteile von der Ansatzstelle.
Dentalis. /	Flach und breit.	Der Vorderrand der Zunge legt sich der Innenfläche der oberen Schneide- und Eckzähne an.	Die Seitenränder der Zunge liegen, während der Vorderrand zum Schnalzen ansetzt, den Innenflächen, z. T. auch den Kauflächen der seitlichen Zähne derart an, daß ein Einblick in die Mundhöhle nicht gegeben ist.	Tief nach unten, dicht hinter die Schneidezähne.
Lateralis. //	Kegelförmig gerundet, so daß zu beiden Seiten der Zunge, auch während ihres Ansatzes zum Schnalzen, die Mundhöhle sichtbar ist.	Der größte Teil des Zungenrückens legt sich dem Gaumendach an.	Die Zungenspitze liegt ruhend dem vordersten Gaumendach, z. T. auch der Innenfläche der oberen Schneidezähne an. Die Seitenränder der Zunge legen sich an die Innenfläche der oberen Backzähne.	Senkrecht nach unten, aber nur soweit, daß der Zungenrücken beträchtlich über dem Kauflächen-Niveau der Unterkieferzähne stehen bleibt.
Cerebralis. /	Napfförmig gehöhlt und breit.	Das Vorderende der Zunge legt sich in einiger Entfernung von den Schneidezähnen dem vorderen und dem mittleren Gaumendach an.	Die Seitenränder des hinteren Zungenabschnittes liegen den Innenflächen der seitlichen Zähne an, deren Kauflächen nur berührend.	Nach unten und hinten.
Palatalis. ǂ	Flach und breit.	Die Zungenspitze legt sich dem vorderen Gaumendach dicht hinter den Schneidezähnen an.	Die Seitenränder des hinteren Zungenabschnittes liegen den Innen- und Kauflächen der seitlichen Zähne an.	Nach unten und so weit nach hinten, daß zwischen dem Vorderrand der Zunge und den Schneidezähnen das Zungenbändchen sichtbar wird.

verhältnisse verwandt, die sich als Kombinationen aus sehr verschiedenen musikalischen Elementen darstellen. Die üblichen drei Zeichen geben also in den meisten Fällen nicht einfache, sondern komplexe Lautverhältnisse wieder, geben sie unvollkommen wieder, da die Lautelemente an sich nur zum Teil, die Art ihrer Kombinierung überhaupt nicht beachtet wird — und geben sie vieldeutig wieder, da sie ohne Rücksicht auf die jeweilig verschiedenartigen Lautkomponenten ähnlich Lautendes zusammenfassen.

A. Seidel, der die Namasprache nie selbst gehört hat, also rein theoretisch vorgeht, unterscheidet zwar als „Intonationen" die üblichen drei „Tonhöhen", sieht jedoch als entscheidenden Charakter nicht verschiedene Tonhöhen an sich, sondern Steigen und Fallen der Töne an. Dieses Steigen und Fallen des Tones ist mit der Tonhöhe nun vollends dadurch auf das Unglücklichste verquickt worden, daß der Einsatz der Stimme in mittlerer Tonhöhe durchgreifend als Ausgangspunkt statuiert wird. Das steht einfach mit den Tatsachen in schroffem Widerspruch. Die Voraussetzung, daß die Stimme, wenn ihre Höhe wechselt, immer über der mittleren Tonhöhe steigt oder fällt, ist tatsächlich falsch und damit fällt das ganze darauf aufgebaute Lautsystem.

Klarheit läßt sich hier eben nicht abstrakt durch Aus- und Angleichungen alter Begriffe, sondern nur aus einem erneuten Studium der lebendigen Sprache selbst gewinnen. Ich habe deshalb, rein empirisch vorgehend, alle phonetischen Elemente, die die Tonhöhe und ihren Wechsel betreffen, neu aufgezeichnet, sobald ich sie in einem Wort konstant wiederkehren hörte. Eine besondere Berücksichtigung des Stärkeakzents erwies sich später als notwendig und forderte eine Revision der Aufzeichnungen speziell nach dieser Richtung. Die Resultate meiner Beobachtungen, die mehrfach und in gewissen Zeitabständen auf jede Einzelheit hin durchkontrolliert wurden, sind folgende: Der musikalische Charakter der Laute wird in der Namasprache nicht durch drei isoliert auftretende und mit dem Stärkeakzent zusammenfallende, sondern im ganzen durch acht Lautmodifikationen bestimmt, die untereinander sowohl als mit dem 9. Faktor, dem Stärkeakzent, in mannigfaltiger Weise sich kombinieren.

Der Umstand, daß die Zeichen Krönleins schon in zwei verschiedenen Definitionen in Umlauf sind, von denen die eine zu allgemein ist, die andere mit den Tatsachen in Widerspruch steht, bestimmt mich, nach mehrfachen und immer wieder verworfenen Anlehnungsversuchen diese Zeichen in meine Orthographie nicht aufzunehmen. Es könnte das nur geschehen, wenn sie abermals umdefiniert würden. Ihre Anwendung würde dann der in Krön-

eins Wortschatz nicht entsprechen und damit wäre nur Mißverständnissen Vorschub geleistet. Die im folgenden unterschiedenen neun musikalischen Modifikationen der Namalaute verteilen sich auf drei Gruppen*).

a) Der Ton-Einsatz. Darunter verstehe ich die Höhe, in der die Stimme regelmäßig beim Aussprechen gewisser Worte einsetzt, verglichen mit dem Einsetzen der Stimme in anderen Worten.

Es sind drei Arten des Ton-Einsatzes zu unterscheiden; die Lautzeichen, die ich dafür wähle, sind in Klammern beigefügt:

α) Der mittlere Ton-Einsatz ist dadurch gekennzeichnet, daß die Stimme weder tiefer noch höher als durchschnittlich einsetzt. Was unter dem „durchschnittlichen Tonniveau" eines Menschen zu verstehen ist und wie es nach Alter, Geschlecht und individueller Eigenart schwankt, braucht dabei nicht in Schwingungszahlen festgelegt zu werden. Man ist auf das Organ auch seines hottentottischen Gegenüber bald so eingestimmt, daß einem ein Abweichen der Stimme nach der Höhe oder nach der Tiefe ohne weiteres auffällt. Der mittlere Ton-Einsatz bedarf keines Lautzeichens. Er ist (wenn im Übrigen die Tonhöhe-Bezeichnungen vollständig sind) überall da gegeben, wo ein solches Zeichen fehlt.

β) Der hohe Ton-Einsatz (Zeichen: / hinter dem Laut) ist dadurch gekennzeichnet, daß die Stimme höher,

γ) der tiefe Ton-Einsatz (Zeichen: \ hinter dem Laut) dadurch, daß sie tiefer als normal einsetzt.

Wenn bei einem Wort Zweifel über die Art des Ton-Einsatzes bestehen, dann ist ein Vergleich des fraglichen Worts mit anderen von der gleichen Laut-Zusammensetzung entscheidend. So könnte man zweifeln, ob das Wort für „grün" *ǂam* oder *ǂa/m* zu schreiben ist, so nahe an der Grenze von mittlerem und hohem Ton-Einsatz liegt hier die Stimme. Für den Hochton (hier kombiniert mit sinkendem Ton-Ausklang) entscheidet ein Vergleich mit dem deutlich tiefer ausgesprochenen Wort *ǂam* „aneinanderfügen". Daß wiederum in diesem Wort die Stimme in der Tat mittleren und nicht etwa tiefen Toneinsatz hat, lehrt die Bezeichnung für „Glasperle", das Wort *ǂ\m*, denn erst bei dessen Aussprache tritt die Stimme in ihre tiefste Lage.

*) Die Terminologie, die ich mir zur Benennung der neun unterschiedenen Lautelemente der Namasprache gebildet hatte, hat Herr Professor Eduard Sievers in Leipzig freundlichst durchgesehen und, wo es im Interesse einer einheitlichen Nomenklatur**) nötig war, verbessert. Auch bei der Aufgabe, die phonetischen Elemente im Druck so wiederzugeben, daß sie dem Satz nicht allzusehr erschweren und in ihrer Kombination sich nicht unübersichtlich häufen, habe ich entscheidende Ratschläge erhalten. Ich wiederhole Herrn Professor Sievers an dieser Stelle meinen aufrichtigen Dank.

Die musikalischen Modifikationen der Namalaute treten in ihren Unterschieden und in ihrem Verständigungswerth in der Sprache am klarsten hervor, wo ihr Wechsel zwei sonst gleichlautende Worte begrifflich scharf voneinander trennt*. Um diese Bedeutung der drei unterschiedenen Ton-Einsatzarten zu illustrieren, seien folgende Beispiele angeführt:

1. *ǃaba-* = rot.
   ǃaǀba-s = der Norden.
   **ǃaǀba-b* = der Blutgeschmack im Munde.
2. *ǃaǁ* = prüfen.
   ǃaǁ = springen.
3. *ǃaɪm* = grün (als Verb: umherleuchten).
   ǃaɪm = aneinanderfügen.
   ǃaɪms = die Glasperle.
4. *ǃaǂ* = huren.
   ǃaǂǂ = lauschen.
   (aǂ = bespritzen.)
5. *ǃgaɪm* = warm sein.
   ǃgaɪm = zwei.
6. *ǃgǖ* = Perlenketten um den Hals hängen.
   ǃgǖ = dünn sein.
   (ǃgǖ = zum Krieg aufbrechen.)
7. *ǃgaɪru-s* = das Fellsäckchen.
   ǃgaɪru-b = das Wassersammelloch im Felsen.
8. *ǃgaɪra-b* = das Hindernis.
   **ǃgaɪra-b* = die beerenartige Frucht vom *Rhus lancea L. f. (Anacardiacee)*.
9. **ǃgaǀba-b* = Name einer *Rhizogum*-Art *(Bignoniacee)*.
   ǃgaǀba-b = der Wassersack.
10. *ǃgǖǂ* = ein Fell zum Trocknen ausgespannt auf den Boden pflöcken.
    ǃgǖǁ = etwas auf seinem Weg kreuzen.
    ǃgǖǂ = etwas durch Kappen gleich machen, beim Gehen die Knöchel aneinanderstoßen.
11. *ǃgǖǂ* = Zuckerbier bereiten, einpflanzen.

---

*) Die hier und im Folgenden aufgeführten Lautzeichen fehlen noch einigen wenigen der Worte, die auch auf den vorhergehenden Bogen im Text eingeschaltet, gemacht waren. Für sie ist die Schreibweise, die in den folgenden Listen angewandt ist, die maßgebende.

ŋgŏ! = kahlköpfig sein.
12. *ŋgu!* = sich verstecken.
ŋgu! = fett werden.
13. *ŋgum* = borstenhaarig.
ŋgom = Blut saugen.
14. *ŋgau* = dem Säugling eine andere Milchmutter geben.
ŋgau! = im Dunkeln tappen.
15. *ŋgoo* = fleben.
ŋgoa- = drohen.
(ŋgo-a = hell werden.)
16. *ŋgoa-b* = der Lehm, der Bodensatz des Zuckerbiers.
ŋgoa-b = das Bettfell.
17. *ŋgoma-b* = der Bodensatz einer Flüssigkeit.
**ŋgoma-b* = die Streifenmaus (s. S. 287, No. 36).
18. *ŋgũ!* = mit der Faust von sich stoßen.
ŋgũ! = anecken, anstoßen.
19. *ŋgũb* = der Vater.
ŋgũb = der Springbock.
ŋgũb = der Zahn.
20. *ŋhai-* = fliehen.
ŋhai- = Haare von einem Fell schaben.
21. *ŋhaib* = die Knochenpfeife.
ŋhaib = das Zerschneiden einer Frucht.
22. *ŋhaĩb* = der Riemen.
**ŋhaĩb* = das Eisen am Kieselstein-Feuerzeug.
23. *ŋhom* = fettig sein.
ŋhom = vom Asche-Gebackenen das Verbrannte abklopfen.
24. *ŋhu-mi* = lügen.
ŋhu-mi = sich fertig halten.
25. *ŋhui-* = aufdecken, bloß legen.
**ŋhui-* = Luft ausblasen, fauchen (von der Hornviper).
26. *ŋhui-* = das Sichaufrichten der Schlange.
ŋhui- = etwas zum ersten Mal tun.
27. *ŋkyam* = fassen.
**ŋkyam* = sich den Stuhlgang verknoten.
28. *ŋkyã!* = schielen.
ŋkyã! = Kleinvieh sich heimlich in den Mund melken.

29. *ǀkχari·* = die Spur verfolgen.
ǀkχairi-b = das Honigbier.
30. *ǂkχaim* = jung.
ǂkχaim = totkalben.
ǂkχaim = die Ohren zurücklegen.
31. *ǂkχairi·* = ausgleiten.
ǂkχari· = klein.
32. *ǂkχai* = erwachen.
ǂkχaiǀ = blinken.
33. *ǀkχo-ǂmas* = das Flehen.
ǀkχo-mab = das Hügel- oder Gebirgsland, das Komas-Hochland im südlichen Hererogebiet.
34. *ǂkχõǁ* = begraben.
ǂkχũǁ = grob sein.
35. *nairu·* = einen Bogen machen, umgehen.
naru-s = der Klumpen.
36. *ǀnaiǂn* = umbinden.
ᵒǀnaiǂn = die Urinblase übervoll haben.
37. *ǀnaiǂs* = das Suchen.
ǀnaiǂs = die Niere.
38. *ǀnoibo·* = sich häuen.
ǀnobo· = schaben.
39. *ǀnoa·* = ergrauen.
ǀnoia· = durchgehen (scheue Tiere), erwachen.
40. *ǀnõ-ǂas* = die Schlappheit.
ǀnõ-ǂas = die Ferse.
ǀnõǂa-s = das Straucheln.
41. *ǂnoa·* = streiten.
ǂnoia· = werfen.
42. *õ-a* = suchen.
õ-ia = zunehmen.
õa· = kalben, lammen, Junge werfen.
43. *o-re* = Milch erbrechen (vom Säugling), als Substantiv *(-s)* auch: Die Milch im Magen junger erlegter Wildkälber.
o-ire = vom Raubtier: hinlaufen, um die eingescharrte Beute zu holen.
(ore· = losmachen).

44. *joim* = stoßen.
joim = hornlos sein (vom Vieh).
joim = hart werden, Dorn ausziehen.
45. *saos* = deine Mutter.
saos = die Verfolgung.
46. *sĭ* = niesen.
sĭ = senden.
47. *uru-* = Wild beschleichen.
°uru- = auf ein ungesatteltes Pferd springen.
48. *tsabi-* = die Gewohnheit die Augen lauernd umherzubewegen.
tsaibi-s = der Schwarzebenholzbaum.

b) Der Ton-Auslang. Darunter verstehe ich den Unterschied der Stimmhöhe beim Anklingen und beim Ausklingen eines und desselben Vokals oder Diphthongs eines einsilbigen Wortes.

Es sind drei Arten des Ton-Ausklangs zu unterscheiden.

α) Der ebene Ton-Ausklang ist dadurch gekennzeichnet, daß die Stimme in derselben Höhe ausklingt, in der sie einsetzte. Dieses Sichgleichbleiben braucht durch kein Lautzeichen markiert zu werden; es ist als gegeben anzunehmen, wo ein derartiges Zeichen fehlt.

β) Der steigende Ton-Ausklang (Zeichen: ˀ hinter dem Laut) ist durch ein Ansteigen,

γ) der sinkende Ton-Ausklang (Zeichen: ˋ hinter dem Laut) durch ein Absinken der ausklingenden Stimme gekennzeichnet.

An diese Unterschiede muß sich das Ohr des Weißen langsam gewöhnen. Dem Eingeborenen sind sie so unzweideutig wie uns das Steigen der Stimme in der Frage oder ihr Sinken am Ende eines Aussagesatzes. Beispiele:

1. *ǂî* = weinen.
ǂì = trinken.
ǂîr = ja! (wird im Tonausklang leicht durch Affekte modifiziert.)
2. *ǂû* = auswinden.
ǂûˋ = scharf sein.
3. *ǂû* = naß sein.
ǂûˋ = entwenden.
4. *ǂams* = der Mund.
ǂamˋs = der Braten.
ǂam = rechts.
5. *ǂgaiˋn* = Kuchen in der Pfanne backen.

ǂgoin = den Kopf einziehen.
(ǂgoin = verb. das Zurücklassen des Lammes an einer bestimmten Stelle von seiten des Muttertieres.)
6. *ǂgoim = den Tripper haben.
*ǂgoim = tief.
(ǂgoim = sich bücken.)
(ǂgoim = töten.)
7. ǂgē = gleichfarbiges Vieh sammeln.
*ǂgē = sein Letztes nicht weggeben wollen.
(gē = Zwillinge bekommen.)
8. ǂgōi = spitz sein.
ǂgōi = eine Tierscheuche aufstellen.
(ǂgōi = ausweichen.)
9. ǂgūis = die Schüssel die aus dem Brustbein des Straußes hergestellt ist.
ǂgūrb = der Zwang.
10. ǂgūib = die lange Binsenmatte.
ǂgūrb = das Verfolgen einer Spur.
ǂgūi = einen Hinterschurz tragen.
ǂgūi = jemand auf den Schultern reiten lassen.
11. ǂhoim = verschiedene Speisen gleichzeitig kauen.
ǂhoim = einschenken.
12. ǂhāib = die Fläche.
ǂhārb = das vor sich Herstoßen oder Schieben.
13. ǂhāib = die Not.
*ǂhāib = ein schwarzes Gestein (wie es z. B. bei Aar in der Umgebung von Kubub vorkommt).
14. ǂhōis = das Ausgießen.
ǂhōis = der Knappsack.
15. ǂhōi = auf die Ellbogen niedersinken (gesagt vom kleinen Kind, das auf Knien und Händen kriecht).
ǂhōi = verspotten.
16. ǂhu-ǂmi = der Berg.
ǂhu-ǂmi = die Robbe (s. S. 41).
17. ǂhoim = lahm sein, auch: Ochsen in den Jochen vom Trekktau loskoppeln (um sie vor einen anderen Wagen zu spannen).
ǂhoim = Heißes einschlürfen.

18. *kχũi* = etwas aufblähen.
kχũĩ = sich aufblähen, aufgeblasen sein.
19. *ǂnãi* = lassen.
ǂnãĩ = füllen.
(ǂnã = dort.)
20. **/nãib* = der weiße Bleßstreifen über Stirn- und Nasenmitte.
/nãĩb = der Unterleib.
(/nãib = eine große Land-Schildkrötenart.)
21. **ǂnaĩm* = platt und dünn.
ǂnaĩm = pfeifen.
22. */nõib* = der Stein unter dem Kochtopf.
/nõb = die Ruhe.
23. */ð* = lärmen.
/ði = aufhören Milch zu geben.
24. *sãib* = das Ausruhen.
sãĩb = der Buchupuder.
25. *saĩm* = Baumrinde abziehen.
saĩm = Honig ausnehmen.
(saĩm = einen Vogel mit einem Wurf so einschüchtern, daß er sich zu Boden duckt.)
26. */ũĩs* = die Klaue, der Huf.
/ũĩs = die Stirn.
(/ũĩs = Pflanzen).
27. *tsãib* = die Gelenkschmiere.
tsãĩb = das Lecken.
28. */nũĩb* = die Ferne.
/nũĩb = die Staubwolke.
(/nũĩb = die Buschhütte, der Buschschirm).

c) Der Wort-Tonfall. Darunter verstehe ich den Unterschied der Stimmhöhe zwischen Anfangs- und Endsilbe eines Wortes. Von dreisilbigen Wörtern können wir hier ganz absehen, da nie mehr als zwei Silben den charakteristischen Höhenunterschied zeigen, die dritte vielmehr der einen oder der anderen betonten Silbe sich angleicht. Es sind zwei Arten des Wort-Tonfalles zu unterscheiden.

1. Der steigende Wort-Tonfall ist dadurch gekennzeichnet, daß die Stimme in der Endsilbe höher als in der Anfangssilbe ist.

2. Der sinkende Wort-Tonfall ist umgekehrt durch die tiefere Stimmlage der Endsilbe charakterisiert.

Bei steigendem sowohl wie bei sinkendem Tonfall ist zuweilen unabhängig von individuellen Schwankungen ein großes und ein kleines Intervall zu unterscheiden. Das große beträgt eine kleine Terz bis Quart, das kleine nur einen halben Ton. Unter den folgenden Beispielen sind solche enthalten, die zeigen, daß auch schon dieses Ausmaß des Wort-Tonfalles begriffs-unterscheidende Bedeutung haben kann.

Ein besonderes Zeichen für die Unterschiede des Wort-Tonfalles habe ich, um die Buchstaben nicht weiter mit diakritischen Zeichen zu bepacken, nicht eingeführt. Das ist ohne weiteres gerechtfertigt, wo diese Unterschiede des Wort-Tonfalles Hand in Hand mit solchen in der Lage des Stärkeakzents gehen, der sein eigenes Zeichen erhält. Wo es sich aber, wie in den folgenden Beispielen, bei gleicher Lage des Stärkeakzents und bei gleichsinnigem Wort-Tonfall um eine Präzisierung reiner Intervall-Unterschiede handelt, sind folgende Abkürzungen in Klammern beigefügt:

$^1/_2$, st. bedeutet . . . um $^1/_2$ Ton steigenden Wort-Tonfall.
3, st. „ . . . „ ca. 1 Terz „ „
$^1/_2$, f. „ . . . „ $^1/_2$ Ton sinkenden (fallenden) Wort-Tonfall.
3, f. „ . . . „ ca. 1 Terz „ „ „

Beispiele:

1. *igairi-b* (3, st.), Name eines Ufergrases.
   igairi-s ($^1/_2$, st.) = das Blutgeschwür.
2. *igoia-b* (3, st.), Name einer sukkulenten eßbaren Pflanze.
   **igoia-b* ($^1/_2$, st.), der Ruf der sitzenden *ihanos*-Eule.
3. *igoiro·* (3, st.) = zurückbleiben.
   igoiro· ($^1/_2$, st.) = brüllen.
4. *iguiru-b* (3, st.) = das Gift.
   iguiru-b ($^1/_2$, st.) = der Donner.
5. *ihaina·* (3, st.) = langsam sein.
   ihaina· ($^1/_2$, st.) = nach Pisse riechen.
6. *ihaira·* (3, st.) = zusehen.
   ihaira· ($^1/_2$, st.) = schnauben, hart ausspucken.
7. *ihaira-b* (3, st.) = die Warze.
   ihaira-b ($^1/_2$, st.) = der Panseninhalt bei den Wiederkäuern.
8. *iharu-s* (3, st.), Name einer *Cyperus*-Art.
   **iharu-s* ($^1/_2$, st.), Name von *Mesembrianthemum*-Arten.

9. *ǀhaiu-b* (3, st.) = der Ziegenbart.
ǀhaiu-b ($^1/_2$, st.) = der sichtbare Atemhauch.
10. *ǀhoibo-* (3, st.) = das Gesicht bemalen.
**ǀhoibo-* ($^1/_2$, st.) = ein Neugeborenes herrichten.
11. *nairi-* (3, st.) = verdickt sein.
nairi- ($^1/_2$, st.) = heute früh.
12. *ǂnaiba-b* (3, st.) = der Flicken.
ǂnaiba-b ($^1/_2$, st.) = das Nashorn.
13. *ǂnoira-b* (3, st.) = die Tabaksrolle.
ǂnoira-s ($^1/_2$, st.) = die schwarze Mistkugel der kleinen Wiederkäuer.

d) Der Stärkeakzent (Zeichen: · hinter dem Laut) sei hier als rhytmischer Bestandteil den musikalischen Lautmodifikationen angereiht. Eine Verquickung der Akzentbezeichnung mit den Zeichen der „Tonhöhe"-bestimmenden Elemente (wie sie Kroenlein versucht hat) ist nicht durchführbar. Ein ausschließlich dem Akzent gewidmetes Zeichen halte ich für eine erschöpfende Lautanalyse des Nama für unentbehrlich.

Bei der Aussprache der einzelnen Vokabeln kann in vielen Fällen nicht zwischen betonten und unbetonten, sondern nur zwischen mehr und weniger betonten Silben unterschieden werden. Besonders wenn der sinkende Tonfall eine Terz beträgt, liegt der Akzent meist so gleichmäßig auf Anfangs- und Endsilbe, daß eine Akzentunterscheidung nicht möglich ist. In solchen und ähnlichen Fällen kann das Zeichen weggelassen werden.

Im Allgemeinen liegt in zweisilbigen Worten mit steigendem Wortonfall der Akzent auf der letzten, bei solchen mit sinkendem Tonfall auf der ersten Silbe. Wie

e) Kombinationen der vier vorhergenannten musikalischen Elemente den phonetischen Charakter und damit meist auch die Bedeutung der Worte bestimmen, sollen die folgenden Beispiele zeigen:

α) Kombination von Unterschieden in Ton-Einsatz und Ton-Ausklang. Die Kombination von hohem Ton-Einsatz und sinkendem Ton-Ausklang wird mit ˊ, die Kombination von tiefem Ton-Einsatz und steigendem Ton-Ausklang mit ˋ bezeichnet.

1. *ŧâi* = aufplatzen.
ŧâi = schlachten.
2. *ǂaiⁿ* = stöhnen.
ǂaiⁿ = rauchen (vom Feuer).
3. *ŧaiⁿm* = sich mit Kuhmist reinigen.

ǂaim = das Setzen der Steine beim Lochspiel (s. S. 314), in die Hände klatschen.
ǂaim = ausschalten.
*ǂaim = verheimlichend zudecken.
4. ǂain = wohnen.
ǂain = reifen.
ǂain = fest aneinander halten.
5. ǂain = wissen.
ǂain = einen Hieb versetzen.
6. ǂāi = jubeln, sich belustigen.
ǂāi = jemand feind sein.
7. ǂāi = verloren sein.
ǂāi = klug sein, jemand überlisten.
8. ǂgāi = bersten.
ǂgāb = das Wiederaufleben, das Wiedererscheinen der Mondsichel.
ǂgāib = das Gift.
ǂgāib = der Knecht.
*ǂgārb = Name einer *Euphorbia*, die wohl mit der auf S. 260 identisch ist.
9. ǂga-ni = das Kinn.
ǂga-ni = der Weg.
(ǂgani- = drücken).
10. ǂgāi = hereingehen.
*ǂgāi = steil sein.
11. χoim = abstäuben.
*χoim = eine Schlinge zuziehen.
12. ǂgaim = Zerbrochenes zusammenbinden.
ǂgaim = umherspringen.
13. ǂgain = zudecken.
ǂgain = fragen.
14. ǂgāi = geizen.
ǂgāi = Felle zum Lager ausbreiten.
15. ǂgēi = erwürgen.
ǂgēi = ausscheiden.
16. gōi = verweigern.
gōi = sehen.
17. ǂgoim = schwanger sein.

/goɪm = das Brummen des Straußes.
18. ǂgoɪm = eintunken.
ǂgoɪm = glauben.
19. /gūɪ = nahe.
/gūr = schmutzig.
20. /gaɪm = beugen.
/gaɪm = töten.
*/gaɪm = tief.
21. /gauɪ = übrig bleiben.
/gauɪ = hinwerfen.
22. /hāɪb = das Auswannen.
/hārb = der Luchs (s. S. 281).
/hāɪb = der Eckzahn des Pferdes.
23. ǂhaūɪ = sich mit etwas Süßem beschmieren.
*ǂhaūr = die Tsamma-Frucht (s. S. 200) stampfen.
24. /hārb = der Skorpion.
/hūɪb = die Beklemmung, Erstickung.
25. /hūɪb = der weiße Mann.
/hūrb = der Bockgestank.
26. ǁhūɪ = durchbohren.
ǁhūɪ = bellen.
27. /hūɪ = fliehen.
/hūrb = das Land.
28. /hūt = verknüpfen.
/hūɪ = gekochtes Fleisch stampfen, mit der Faust aufwärts von von sich stoßen.
*/hūɪ = Mark aus den Knochen saugen (vgl. S. 212).
29. /kχaɪm = pissen.
/kχaɪm = durchsickern.
*/kχaɪms = die eßbaren Weichteile der Meeresschnecken (s. S. 31).
30. kχoɪm = fein stampfen.
kχoɪm = sprechen.
31. ǁkχoɪm = am Topf festgebackene Reste auskratzen.
ǁkχoɪm = eine Leiche einbinden (s. S. 316).
32. /kχūɪ = zittern.
/kχūɪ = herausziehen.
33. ǂnāɪ = gießen.

ǂnăi = trocken sein.
34. ǂnaiŋ = Feuer schlagen.
ǂnaŋ = sich umdrehen.
35. ǂnoim = buckelig-verwachsen.
ǂnoim = Bienen ausräuchern (s. S. 205).
36. ǂnaui = schlagen.
ǂnaui = helfen.
37. ǂoim = atmen.
ǂoim = abwischen.
38. săi = sich wärmen.
săi = in der Nase kribbeln.
39. sĭ = hinkommen.
sĭi = pforzen.

β) Unterschiede in Ton-Einsatz und Wort-Tonfall.

1. ǂabi· (½, st.) = regnen (vgl. S. 237 Anmerkung).
ǂaibi· (3, st.) = zu Heilzwecken die Haut einritzen.
2. χore· (½, st.) = losmachen.
χoire· (3, st.) = scherzen.
3. ǂgaiǂi·b (3, st.) Name heiner Eidechse, der *Mabuia acutilabris Ptrs.*
ǂgaiǂi·b (½, st.) = das Tanzen.
4. ǂguini· (3, st.) = Wild beschleichen.
ǂguini· (½, st.) = am geschlossenen Auge oder im Ohr sich jucken.
5. ǂguru·s (½, st.) = der Quarzstein.
*ǂguiru·b (3, st.) = der Bergrücken.
6. ǂhaimi· (3, st.) = jagen.
ǂhaimi· (½, st.) = beleidigt sein.
7. ǂhuri·b (3, st.) = der Schrecken.
ǂhuiri·b (½, st.) = das Rückgrat.
8. ǂnaru· (½, st.) = rösten, an einem Knochen kauen (vom Rind gesagt).
ǂnairu· (3, st.) = in Reihen aufspießen.
9. ǂnairu·s (½, st.) = der Schwarzebenholzbaum (Synonym s. S. 144).
*ǂnairu·s (3, st.) = Name eines Rochens.
10. u·iri (½, f.) = Knochen abnagen.
u·rib (3, f.) = die Laus.

γ) Unterschiede in Wort-Tonfall und Stärkeakzent.

(Wo nichts besonderes vermerkt, beträgt der Wort-Tonfall $^1/_2$ Ton.)

1. *a·bu* = zusammenfalten.
   abu·s = das leere Straußenei.
2. */a·ob* = das Blut.
   /ao·b = die Schlange.
3. *ǂa·ru* = heimkehren.
   ǂaru· = schwarz-weiß getüpfelt.
4. *ǂaba·* = bersten.
   ǂa·ba = aufschneiden.
5. *ǂabi·* = Schmutz fegen.
   ǂa·bi = sich langweilen.
6. *ǂa·bo* = bemörteln.
   ǂabo· = jemand überrumpelnd ergreifen.
7. *go·a* = halb trocken sein.
   goa· = loben.
8. */goa·* = mit der Peitsche knallen.
   **/go·a* = tief liegen.
9. *gu·ri* = Knochen abnagen.
   guri·b = das Jahr.
10. **ǁgaba·* = scharf und weit sehen.
    **ǁga·ba* = aus Versehen auf etwas treten.
11. *ǁha·ob* = der Windschirm der Feuerstelle.
    ǁhao·b = das Aufsteigen des Gewitters.
12. */hari·* = Nähte auftrennen.
    /ha·ri = in Nachbarschaft wohnen.
13. */kχa·reb* = der Trippelgang des Pferdes (Reitart der Buren).
    /kχare·b = das Kalb der Oryx-Antilope. (Akzentuierung auf S. 275 verdruckt).
14. */kχa·rus* = Name einer Hasenart (s. S. 285).
    **/kχaru·s* = Name einer Euphorbia-Art, *E. cervicornis Boiss* (s. Taf. VI).
15. */kχa·bu* = Wasser aus dem Munde spritzen.
    /kχabu·s = die Sandale.
16. *ǁkχa·eb* = das Zurückjagen.
    ǁkχaĕ·b = der Sand des Rivierbettes.

17. *ǂkχara·* = strafen.
ǂkχa·ra = groß sein.
18. */kχa-erab* (3, f.) = Name einer Hasenart (s. S. 285).
/kχaĕra· (3, st.) = nachlässig.
19. */kχa·ru* = schnarchen.
/kχaru· = durchschießen.
20. *ǂkχoro·b* (3, st.) = die Aschenschaufel.
**ǂkχo·rob* (½, f.) = der Honigsack aus Leguanhaut (s. S. 205).
21. *ǂkχuru·b* = die Dürre, die Säure.
ǂkχu·rub = der Grassamen.
22. **ǂkχuru·b* = die heiße Erde um die Feuerstelle.
ǂkχu·rub = die Ader.
23. */naimi·* (3, st.) = ein Kind auf dem Arm tragen.
/na·imi (½, f.) = die Seite; als verb: mit einwärts gesetzten Füßen laufen.
24. *ǂnaio·b* (3, st.) = die Bienenwabe.
**ǂna·iob* (½, f.) = ebener oder schwach geneigter, am Berghang entlang führender Weg.
25. */oro·* = sich auf die Fußspitzen stellen.
/o·ro = brüllen.
26. *saru·* = Kleinvieh am Bein einfangen.
s[illegible]ru (3, f.) = verfolgen.
27. *s[illegible]res* = die Sonne.
sore·s = die Sore-Partnerin (s. S. 318/319).
28. *tara·s* = die Frau.
**tă·ras* (3, f.) = die (vom Hottentotten besonders betonte) Liebespflicht des Bruders zur Schwester und deren Kindern (s. S. 303).
29. *to·rob* = der Krieg.
toro·b = eine feinkörnige, rote, harte Bodenart.

δ) Unterschiede in Wort-Tonfall, Stärkeakzent und Ton-Einsatz (nur die Terz im Wort-Tonfall ist vermerkt, im übrigen ist ½ Ton anzunehmen).

1. *ta·rab* (3, f.) = der Ärger.
tara·b = die Rippe.
ta·trab = der Riß.
2. *ǂa·ri* = gestern, morgen.

ǂatri· = pulverisieren (in der Sprache der Namibnomaden: *ǂoitn*).

3. *ǀa·ba* = hinaufklettern.
ǀaiba· (3, st.) = kratzen.

4. *χoa·* = schaben.
χo·ia = schreiben.

5. *χuru·b* = das Kohlenpulver.
χuiru· (3, st.) = herausziehen.

6. *χu·bu* = Tabak zerreiben.
χuibu· (3, st.) = abtrinken.

7. *gara·* = kühl sein.
ga·ira = die Röteln haben.

8. *gairo·* (3, st.) = biegen, beugen.
ga·ro = ausdörren, mager werden, hart sein.

9. *ǀga·bi* = bespritzen.
ǀgaibi·s (3, st.) = der Becher.
(ǀgabi. = hoch sein*)*.

10. *ǂga·ie* = nachahmen.
ǂgač· = kauen.

11. *ǂga·mi* = das Wasser.
ǂgaimi· (3, st.) = den Kopf beugen.

12. *ǂga·nas* = die Giraffenakazie, der „Kameelboom".
ǂgaina·s = Name eines bei Kubub in den Felsen häufigen feigenbaumähnlichen Gewächses, dessen innere weiche Wurzelrinde roh gegessen wird.
ǂga·ina = das Vieh einzeln oder truppweise tränken.

13. *ǂgara·s* = die *Aloë dichotoma L.* (s. S. 112).
ǂgaira·s (3. st.) = das Schulterblatt.
ǂga·ra = Striche kritzen.

14. *ǀga·os* = das Schneiden.
ǀgaio·s (3, st.) = der Baumstamm.

15. *ǀgaira·b* = die Magerkeit.
ǀga·rab = die männliche Scham.

16. *ǀga·ro* = öde sein.
**ǀgairo·* = Herbeieilen des durstigen Viehes zum Wasser oder des Muttertiers zum Jungen.

17. *ǀga·mi* = zwei Frauen haben (vgl. S. 307).
ǀgaimi· = ein Auge zukneifen.

18. */go·e* = fluchen.
/goie· = einen Armbruch schienen.
19. */goire·b* = die Bitte.
/go·reb = der Schröpfeinschnitt in die Haut.
20. *gu!nu* = sich durch Eindrängen Platz verschaffen.
gu!nu· (3. st.) = verfaulen.
21. */gu·i* = Eins.
/gu!i· (3. st.) = jemandes überdrüssig werden.
22. *‖ga·ma* (3. f.) = Wasser holen.
**‖gai!ma·* = sich dicht an das Feuer legen.
23. *goira·b* (3. st.) = Name einer Krähenart, des *Corvus scapulatus Daud.*
**go·ra* = Feldzwiebeln aus den Hüllen pellen.
24. */gu!i·* (3. st.) = etwas umschleichen.
/gu·i = Klopfen einer Wunde.
25. */gu·ri* = jemand mit Fett einreiben.
/gu!ri· = hochmütig sein.
26. */gu!bu·* (3. st.) = klopfen.
/gu·bu = rund sein.
27. *≠gu·i* = viel sein.
≠gu!i·s (3. st.) = die Nase.
28. *hai!ra·* = weit sein.
ha·ra = schlucken.
29. */hai!mi·* (3. st.) = sich dick kleiden.
/ha·mi = sich fertig machen.
30. *‖ha·ru* = vor freudiger Rührung weinen.
‖hai!ru· (3. st.) = hineinkriechen.
31. */ha·e* = schnell sein.
/hai!e· = zu Pferd jagen (s. S. 290).
32. */ho·a* = erzählen.
/hoi!a· = krumm sein.
33. */hoi!ba·b* = die Umkehr.
/ho·bab = der Eingeweidewurm.
34. */hui!ru·* (3. st.) = Trockenkochen mageren Fleisches.
/hu·ru = spielen.
35. */hui!i·b* (3. st.) = die Trappe (s. S. 272).
/hu·ib = der frische Geruch des feuchten Holzes der Giraffenakazie.
36. */hu·nu* = naß werden.

ǂhuinu· = das Mark aus den Knochen saugen (vgl. S. 355, No. 28).

37. *ǂkχa·rab* (3, f.) = der Walfisch (s. S. 37).

ǂkχaira·b = der Hoden.

38. *ǂkχo·ab* = der Patronengurt.

**ǂkχoia·b* = das Eis.

39. *ǂkχo·a* = beschwichtigen.

ǂkχoia·b = der Elephant.

40. *ǂkχu·bi* = lärmen.

ǂkχuibi· = lallen (von kleinen Kindern).

41. *na·ǂmi* = die Zunge.

naimi· = flackern.

naimi· = um eine Ecke biegen.

naimi·b = die Fläche, die Namibwüste.

42. *na·ba* = blitzen.

naiba· (3, st.) = hinter etwas verschwinden, herunterfahren.

43. *ǂnaie·* = schlichten.

ǂna·eb = der Nabel.

44. *ǁna·e* = hinweisen.

ǁnaie· = singen.

45. *ǁnāǂi·* (3, st.) = sich mit Riemen umgürten (Herero).

ǁnā·ǂi = steif sein.

ǁnā·i = wohlan!

46. *ǂnaie·* = traben.

ǂnaē· = warm werden.

ǂna·ie = geboren werden.

47. *ǂna·rab* = die *Acanthosicyos horrida Welw.* (s. S. 146, 197.)

**ǂnaira·b* (3, st.) = Bezeichnung der Namibbuschmänner für „weißer Mann".

48. *ǂno·ro* = ein Fell gerben.

ǂnoiro· (3, st.) = fahl sein.

49. *ǂoiro·* = wenig sein.

ǂo·ro = verbraucht, alt sein.

50. *ǁo·ǂa* = nicht können.

ǁoia· (3, st.) = Quatschen des Wassers in nassen Schuhen.

(ǁo·a = küssen.*)*

51. *ǂo·a* = begegnen.

ǂoia· = traurig sein.

52. *sa·mi* (3, f.) = die Brüste, die Euter.
sa/mi· = mit der Peitsche hantieren.
sa·/mi = beim Verschlucken in die „falsche Kehle" geraten.
53. *sao·* = das Vieh zeichnen.
sa·o = folgen.
54. *so·as* = das Faß.
so/a·s = die Ritze.
55. *to·a* = aufhören.
to/a· (3, st.) = zerreißen.
56. */u/i·b* = der Schwager.
/u·ib = der Stein.
57. */u/i·* = Fett vom Fleisch schneiden.
/u·i = Abend werden.
58. */u/bu·b* = das Ei.
**/u·bu* (3, f.) = jemand abwehren.
59. */ū·i* = hüten.
**/ūi/i·* (3, st.) = nahtlos sein.
60. *tsa/o·* (3, st.) = das wütende Scharren des Bullen oder des Wildebeests.
tsa·ob = die Asche.
61. *tsa/ma·b* = der Tsamma-Kürbis (s. S. 200).
tsa·mab = der Ameisen-Vorratshaufen, „Mierkost".
62. *tso·as* = das Läuse-absuchen.
tso/a·s (3, st.) = der After.

e) Unterschied in Wort-Tonfall, Stärkeakzent, Ton-Einsatz und Ton-Ausklang.

ǂga·/ni ($^1/_2$, f.) = Fleisch.
ǂgani· ($^1/_2$, st.) = braunweiß gescheckt.

f) Aufhebung von Lautcharakteren ist zuweilen zu beobachten, wenn das Einzelwort Bestandteil eines Kompositums wird. Ich habe aber in dieser Richtung keine systematischen Aufnahmen gemacht, sondern nur einige wenige Beobachtungen verzeichnet.

Am häufigsten wird der Stärkeakzent in Kompositis aus seiner ursprünglichen Lage im Einzelwort verschoben. So lautet die allgemeine Bezeichnung für Katze */hõa·b*, in der zusammengesetzten Bezeichnung für „Feldkatze", */ga·roihõ·/ab*, rückt der Stärkeakzent deutlich auf die vorletzte Silbe. Dasselbe gilt für */ore·b*, die Schüssel, **/nu·bi/o·reb*, die Wannschüssel

(S. 201). Meist ist damit zugleich ein Wechsel des Wort-Tonfalls (s. Stärkeakzent, S. 353) verbunden.

Auch der charakteristische Ton-Ausklang des Einzelworts kann im Kompositum verschwinden: *ǂhôts*, der Sack, */na-maǂhôts*, der Sparsack (S. 238). Auffallend ist in einem zusammengesetzten Wort das Auftreten eines steigenden Ton-Ausklangs, der den Bestandteilen als Einzelworten fehlte: */naǀm*, lieben, aber */natm/naǀm*, zur Liebe bringen.

Wie weit sich die Lautcharaktere des einzelnen Wortes unter dem musikalischen Einfluß der Satzbildung und unter dem Einfluß des Affekts verändern, habe ich nicht verfolgt. Der Ton-Einsatz scheint mir bei weitem der beständigste Lautcharakter eines Wortes zu sein.

3. Die Orthographie,

deren ich mich in diesem Bericht bei Nama-Worten bediene, schließt sich eng an das allgemeine linguistische Alphabet in der Darstellung an, die Steinthal[88]) gibt. Ich kann mich daher hier auf kurze Bemerkungen zur bequemeren Orientierung des Lesers und zur Begründung einiger Abweichungen von der Schreibweise Kroenleins beschränken:

ā bezeichnet die Länge eines Vokals. Wo das Längenzeichen fehlt, ist der Vokal kurz.

ã bezeichnet die Nasalierung. Individuelle Neigung zur Nasalierung von Vokalen, die auf ein *m* folgen *(toma*, nicht, *goima-b*, Ochse, *ma*, geben, etc.*)* habe ich mehrfach beobachtet, aber in der Schrift nicht berücksichtigt.

(a) bezeichnet, daß der betreffende Vokal nur flüchtig ausgesprochen, fast unterdrückt wird.

y ist auszusprechen wie im Deutschen das „j" in Jena.

a|o und analog alle Vokale, die durch ein Lautzeichen getrennt sind, sind nicht diphthongisch, sondern getrennt zu sprechen.

aĕ, aĭ und *oĕ* etc. ist stets unter Trennung beider Vokale zu sprechen, mit Betonung des ersten, wenn kein Stärkeakzent-Zeichen gegeben ist.

ai ist auszusprechen wie im Deutschen in „Kaiser", „Eile", „einerlei" etc. Der Diphthong *ei* in der Aussprache, wie sie das linguistische Alphabet fordert, existiert im Hottentottischen nicht. Der linguistischen Schreibweise gebührt hier unbedingt der Vorzug. Wo Kroenlein *ai* schreibt, liegt in vielen Fällen eine naheliegende Verwechslung mit *aĕ* vor.

au ist auszusprechen wie im Deutschen in „Auge", „auch" etc. Der Diphthong *ou* in linguistischer Aussprache existiert im Hottentottischen

ebenso wenig wie im reinen Deutsch. Wo Kroenlein *au* schreibt, liegt in vielen Fällen eine nahe liegende Verwechslung mit *ao* vor.

ao ist mit Betonung des ersten Vokals und mit so schnellem Übergang in den zweiten zu sprechen, daß der Laut wie ein Diphthong klingt.

b wird am Anfang eines Wortes wie unser *b*, in der Mitte eines Wortes meist weich nach *w* hin, am Ende eines Wortes hart, nicht ganz so hart wie unser *p* gesprochen.

χ ist auszusprechen wie im Deutschen in „lachen", „Bach" etc.

kχ entspricht dem *kh* von Kroenlein, das „etwas härter, aber nicht viel" als *k* sein soll. Ich habe diesen Laut stets als *k* mit nachfolgendem *χ* gehört und schreibe ihn dementsprechend.

r ist das mit der Zunge gerollte, nicht das vom Zäpfchen geschnarrte *r*.

s wird am Ende des Wortes schwach wie unser deutsches *sch* in „Busch", „Bresche" etc., am Anfang des Wortes dagegen wie das *s* in „Salz", „Sonne" etc., vielfach scharf wie im Französischen in „salon" ausgesprochen.

ts ist auszusprechen wie im Deutschen das *z* in „Zahn", „Zunft" etc.

f u. *l* fehlen der Namasprache. Wo man ihnen in seltenen Fällen begegnet, sind die Wortstämme dem Holländischen entlehnt: *gurla-bigis*, Schmetterling; *ǂa-la-migob*, der Flamingo, *fi-lsib*, die *vuilziekte* der Buren (Lues).

B. Naturkenntnisse.

Was wir bei der Betrachtung der Ernährung und Medizin, des Handwerks, der Viehhaltung und der Jagd sowie bei der Schilderung des Landes und Klimas von Einzelkenntnissen des Hottentotten aus den drei Reichen der Natur kennen gelernt hatten, war mehr oder minder direkt materiellen Bedürfnissen erwachsen und dauernd mit ihnen verknüpft. Es erhebt sich die Frage, ob diese Kenntnisse auch losgelöst von den Sorgen des täglichen Lebens Bestand haben, d. h. wie weit sie als freie Äußerungen geistiger Regungen angesehen werden könnten. Es wird sich zeigen, daß trotz aller geistigen Beweglichkeit des Hottentotten die Naturkenntnisse des Volks sich nirgends zu einer wenn auch noch so einfachen Form von Naturanschauung erheben. Nur auf zwei Gebieten läßt sich wenigstens das Streben nach einer gewissen weiteren Durchführung der Anfänge oder nach Zusammenordnung des tatsächlich Gegebenen erkennen: auf biologischem Gebiet (das dem Jäger und Viehbesitzer noch heute am nächsten liegt) und — schon fast wieder in Vergessenheit versunken — auf dem Gebiet der Zeiteinteilung, dessen Daten in ihrem jahreszeitlichen Wechsel und tiefgreifenden Einfluß auf die belebte Natur gleicherweise dem Hirten zu denken geben.

1. Die Tier- und Pflanzenkenntnis

der Hottentotten soll hier nicht besprochen werden. Die zoologische und botanische Bestimmung des mitgebrachten Materials muß erst abgeschlossen sein, ehe wir eine klare Übersicht gewinnen können. Mit einer Liste einheimischer Namen allein wäre nichts gewonnen. Die guten anatomischen Kenntnisse der Hottentotten werden ebenfalls besser erst dargestellt, wenn die biologische Grundlage ausgearbeitet ist.

2. Himmelskunde.

Von Kindheit an ist der Hottentott gewohnt, draußen im Weidefeld sich selbständig zurecht zu finden. Als Kind hält er sich dabei an naheliegende Dinge, an Buschgruppen, Bäume und Felsformen. Wenn er später mit der Familie auf der Weidesuche längere Wanderungen antritt, ist er bei der Regenarmut des Landes gezwungen, von einer Wasserstelle zur andern sich weiter zu helfen. Seine Wanderungen setzen sich dementsprechend aus Trekks zusammen, deren jeder ein verhältnismäßig nahes, von lokalen Umständen bestimmtes Tagesziel hat. Deshalb hat der Wanderer nicht nötig, außer der Sonne noch Richtpunkte am Himmel für seine Reise zu suchen.

a) Der gestirnte Himmel ist dem Hottentotten daher wenig bekannt; ob es immer so war oder ob mit dem Untergange alles Volkstums auch hier Überlieferungen verblaßt sind, sei dahingestellt.

α) Die Sonne, *so-res*, gibt auch dem Hottentotten die Anhaltspunkte zur Unterscheidung der Himmelsrichtungen: Der Osten wird **soresta-ǂhai-//kχāb* genannt, d. h. „die Seite, an der die Sonne aufgeht". Der Westen ist **sorestaǂgā-//kχāb*, „die Seite, an der die Sonne untergeht".

Für Norden und Süden lernte ich eine gemeinsame Bezeichnung kennen: **soresχō-ǁnab;* denn wenn man in eine dieser Richtungen sieht, scheint die Sonne in *(ǁna)* die Wange *(χôb)*. Die Worte */kχa-bagab* und */aba-s* habe ich nur zur Bezeichnung des Süd- und des Nordwindes kennen gelernt; sie mögen in anderen Teilen[37]) des Landes auch zur Bezeichnung der abstrakten Himmelsrichtungen dienen. Doch halte ich dies für eine spätere Übertragung. Ein näherer Verkehr mit den Hottentotten zeigt, wie fern ihnen überhaupt abstrakte Begriffe liegen, wo die Sinne ausreichen. Die Sonne selbst, wie sie auf- und untergeht, der Wind, der von da oder dort her weht, der Ort, nach dem sie ehedem gewandert sind, das sind die Elemente ihres geographischen Vorstellungskreises; und sie genügen zur Verständigung.

Über den Mond soll im Zusammenhang mit der Zeitrechnung gehandelt werden.

β) Von den Sternen, *!gaimiroti*, sind ihnen zunächst die beiden Planeten bekannt, deren Sonnennähe und regelmäßig wechselnde Stellung am Morgen- und Abendhimmel eine Beobachtung von selbst nahe legt: der Merkur und die Venus.

Der Reisende im Namaland, der im Freien nächtigt, dem der Merkur von keiner langen Dämmerung wie in unseren Breiten überlichtet oder vom Morgennebel verschleiert wird, kennt die beiden Vorboten der aufgehenden Sonne und ihre Stellung zu einander. Den Fernerstehenden mag die kleine Tabelle unten orientieren, die mir Herr Professor Otto Knopf in Jena freundlichst zusammengestellt hat*). Die Erscheinungen, die hier als die

sinnfälligsten die Bezeichnungen der Eingeborenen bestimmt haben, sind durch ein * hervorgehoben:

Die Venus, *ǂkyo-aes* genannt, geht 1½—3 Stunden vor der Sonne *auf*, sie wandelt *(/güng)* ihr voran *(ai)* und heißt daher auch **ai/güns*, die „Vorläuferin", der „Voorlooper" der Buren, unser Morgenstern. Eine andere Bezeichnung der Venus ist **nagurushâ-b*, d. h. der Stern, bei dessen Aufgang die Männer *(nagu)* davonlaufen *(shâ, -ru* Part. d. fortschreit. Handlung) d. h. ihr eigenes Lager aufsuchen, damit sie der Tag nicht im unrechtmäßigen Liebeslager überrascht. Noch deutlicher drückt das die synonyme Bezeichnung *shâ-nagu(gu/mirob* aus. *(shâ)* bedeutet den außerehelichen Geschlechtsverkehr).

Der Venus folgt, bald früher, bald später, der Merkur nach; er ist dem Tagesanbruch *(ǂgo-as)* am nächsten und wird daher der „Tagesanbruchstern", *ǂgo-aigo-mirus* genannt, der „Dagbreker" der Buren. Ein anderer Name des Merkur ist **ǂgo-aikxaâ-ris;* das würde besagen, daß dieser Planet kommt, wenn früh die Euter des Viehs (das abends und morgens gemolken wird) wieder voll sind.

Der Hottentott, der nach dem Spätnachthimmel im Osten sieht, um rechtzeitig vor Tag aufzubrechen, achtet in erster Linie auf die Venus; den kleinen Merkur, der seine Stellung zur Sonne viel häufiger wechselt und daher häufiger vermißt wird, wo man ihn erwartet, übersieht er leicht, gerade in den Zeiten, in denen er der Hauptregel entgegen vor der Venus aufgeht; um so skrupelloser übersieht er ihn, je später die Venus dann selbst erscheint und je entbehrlicher und unkontrollierbarer im hereinbrechenden Morgengrauen das Abwarten ihres vermeintlichen Nachzüglers wird. Man muß diese Verhältnisse berücksichtigen, um dem Eingeborenen astronomisch leicht herauszuklügelnde Widersprüche, und dem anständigen Weißen Unklarheiten in diesen Fragen zugute zu halten.

Daß der Merkur auch als Abendstern auftritt, beobachten die Hottentotten nicht, da er ihnen nur als Tagesbote von Bedeutung ist.

Die Venus ist auch am Abend *(/u-ǂb)* nicht zu übersehen; sie wird vom Hottentotten als dasselbe Gestirn wie der Morgenstern erkannt. Weil sie als Abendstern nie lange am Himmel steht, gleichsam davoneilt *(ikyo-e)*, hat sie den Namen **/u-i/kyo-eb*, d. h. „der Abend-Flüchtige" erhalten.

Der Jupiter ist den Hottentotten ebenfalls bekannt. Sie identifizieren ihn zuweilen mit der Venus, indem sie sagen, daß dieser Stern im Laufe

der Wochen wie der Mond durch den Himmel wandere. Wie aber die Beziehungen der beiden Planeten zu einander vom Einzelnen auch aufgefaßt werden mögen, in jedem Fall sieht der Hottentott den Jupiter, im Gegensatz zur Venus, außer im Osten und Westen auch „in der Mitte" *(ra-egub)* des Himmels und der Nacht. Dieser Vorstellung entsprechend nennt er den Jupiter den „Mittelstern", *°ra-egu-gurairob.*

γ) Im Fixsternhimmel auch der südlichen Halbkugel ist der Orion das markanteste Sternbild. Der Hottentott faßt von diesen Sternen unter Ignorierung derer erster Größe nur die sechs zusammen, die dem Gürtel und Schwert unserer Phantasie entsprechen. Er nennt diese Gruppe *gu-regu*, d. h. die „Zebras": Die Sterne *δ*, *ε* und *ζ* stellen ihm drei flüchtige Zebras vor, auf deren mittelstes der Jäger, *ι*, seinen Pfeil, *θ* und *ϵ*, abschießt.

Die Plejaden hörte ich ihrer dichtgedrängten Sterne wegen *°ihûseti (ihûi = zusammenkommen)* genannt werden; verbreiteter ist ein anderer, von ersterem mehr als nur dialektisch verschiedener Name: *ikyûseti.* Die Plejaden werden für einen Beobachter auf dem 25. südl. Breitengrade Mitte Juni, also in der ersten Hälfte der kalten Jahreszeit sichtbar. Einem Eingeborenen des oberen Auobgebietes hörte ich die Plejaden *°nu-gurûroti*, d. h. „Reifsterne", nennen, weil zur Zeit ihres Sichtbarwerdens die Nächte schon so kalt sein können, daß es frühmorgens Reif gibt. Das Erscheinen der Plejaden soll den Buschmännern des genannten Landstrichs das Zeichen zum Aufbruch in das Tsamaríb sein.

Der Schimmer der Milchstraße und der Magellanischen Wolken erinnert die Hottentotten an den schwachen Schein der verglimmenden Asche ihres Herd- oder Lagerfeuers. Die Milchstraße nennen sie daher *°hanab*, d. h. die Asche (mit der männlichen Endung, ihrer großen schlanken Gestalt entsprechend), die beiden Lichtwolken dagegen werden *°hanoa* genannt (ihrer klumpigen Form und Kleinheit entsprechend, mit der weiblichen Endung im Dual). Die Magellanischen Wolken werden auch „die beiden Löwenhoden", *gamiǂ-arukye*, genannt.

Von einzelnen Fixsternen habe ich nur den Sirius aus Hottentottenmunde nennen hören, er wurde *°ra-ra-gurairob*, zuweilen auch *°ra-ra-gurase*, d. h. „Sohnesstern" genannt. Die Bedeutung dieses Wortes konnte ich nicht mit Sicherheit ermitteln, nur eine Vermutung läßt sich vielleicht begründen: Der Hottentott nennt, wie wir früher (S. 61) gesehen haben, den Ostwind *ra-ra-ab*, weil er von „vorn" kommt. Wenn ihm somit der Osten als Sonnenaufgangspunkt die Vorderseite der Welt ist, dann würden Norden und

Süden die Seiten sein. Aus dieser Vorstellung heraus würde es verständlich werden, daß der Sirius, als der hellste Stern des Nordhimmels der Südhalbkugel, als „Seitenstern" angesehen wird. Sein Partner am Südhimmel würde der Canopus sein.

b) Die Zeiteinteilung der Hottentotten ist auf den Wechsel der Jahreszeiten, der Mondphasen und des täglichen Sonnenstandes begründet.

α) Sie kennen wohl den Begriff des Jahres, *guri-b*, als einer einmaligen Periode des Jahreszeitenwechsels, aber sie rechnen nicht in diesem Sinne nach Jahren. Das Alter ihres Viehes haben sie, wie es mir schien, nach Kalbe- und Lamm-Perioden im Gedächtnis; ihr eigenes Alter interessiert sie nicht, und wenn sie einmal etwas weiter zurückdatieren wollen, so geben ihnen landesbekannte Ereignisse (der Einbruch der Rinderpest, Feindseligkeiten mit Nachbarstämmen oder mit den Weißen, Einwanderungen etc.) genügend allgemeine Anhaltspunkte, von denen aus sie sich dann mit der Geburt oder der jeweiligen Größe der damaligen Kinder im Einzelnen über einen Zeitpunkt verständigen können.

β) Bestimmend für die Einteilung des Jahres im Großen ist der Wechsel der Jahreszeiten, *ga-magu*. Sie unterscheiden:

1. Einen Frühfrühling. Wenn mit zunehmender Wärme *(ǀo-ba*, verb., auch von der Frühsonne gesagt, die nach kalter Nacht die Ostseiten der Felsen und Büsche erwärmt*)* unabhängig vom Regenfall Bäume und Büsche ausschlagen, in guten Jahren zugleich winterliche Frühregen oder frühe Frühlingsregen (siehe Klima, S. 154 ff.) die Grasflur neu beleben, ist die Blütezeit, **ǀkχâiuaŏ*, oder der Frühling, *ǀaba-b*, gekommen. Er beginnt schon im August und endet im Oktober.

2. Die Jahreszeit, die der Hottentott *ǂkχū-nab* nennt (im Bergdamara-Dialekt **ao-reb*, d. h. die Sonnenzeit), umfaßt die erste Hälfte der heißen Periode, in die, wenn das Jahr gut ist, die sogenannte kleine Regenzeit fällt. Bleiben diese Regen aus oder sind sie, wie gewöhnlich, spärlich, dann bleibt das Land weithin öde, ohne Gras- und Krautwuchs. Diese Zeit der Dürre wird, wie die Dürre selbst, *ǂkχuru-b* genannt. Der *ǂkχū-nab* der Hottentotten reicht vom Oktober bis Dezember (einschl.), entspricht also astronomisch dem Frühling der Südhalbkugel.

3. Die Jahreszeit, von deren Ergiebigkeit in erster Linie das Wohl des Hottentotten abhängt, wird *ǂhaio-b* (3. st.) genannt; wir können sie (da das Wort auch in demselben konkreten Sinn wie *tŭb* = Weide gebraucht wird) die Weidezeit nennen. Sie umfaßt die sogenannte große

Regenperiode des Jahres und die Zeit unmittelbar nach ihr, in die noch die Vegetationsfrische der Futterpflanzen reicht. Sie fällt, reichlich gerechnet, in die Monate Januar bis April, also in den Südsommer und den Anfang des Herbstes.

4. Der Winter der Hottentotten, *soo-b*, umfaßt die kalte Jahreszeit vom Mai bis August, schließt also die letzten zwei Drittel des Herbstes und die erste Winterhälfte astronomischer Rechnung ein.

7) Eine weitergehende Gliederung des Jahres beruht auf der Beobachtung des Mondwechsels. Wenn nach dem Neumond die Sichel am Westhimmel wieder erscheint *(ǂkχani-*, verb.), lassen sie den Monat, *ǂkχôb*, beginnen. Die Mondphasen sind den Hottentotten Sinnbilder des eigenen Werdens und Vergehens (vergl. Sage No. XXX): Die eben auftauchende, noch kaum erkennbare Sichel nennen sie **ǂkχaimaǂkχôb*, *ǂkχaim* in der Bedeutung von *unreif*, wie das Wort auch zur Bezeichnung einer vorzeitig geborenen Frucht gebraucht wird.

Die schmale, leuchtende Sichel, in der der Mond gleichsam aufleht (das ist der ursprüngliche Sinn von *ǂgô*), wird **ǂgô-goaǂkχô-b* genannt.

Die beiden ersten Viertel haben zwei, für beide gemeinsame Namen. Der eine ist **gui-ǂkχôgui-ruaǂkχôb*, „der Mond, der groß oder alt *(gui)* wird". Der andere Name lautet **gûui-ruaǂkχôb*, „der Mond, der klug *(gûui)* wird".

So lassen sie ihn also zunehmen an Alter und Verstand bis zum Vollmond, **ǂgaiǂkχôb*.

In den letzten Vierteln wird nur die schmale Sichel als **ǂkχuaǂkχôb*, „der sterbende *(ǂkχu, -ra*, Part. d. fortschreit. Handlung) Mond" unterschieden.

In dem Maße als unsere 12 Monate und die Daten der christlichen Feste Eingang finden, schwindet den Hottentotten die Erinnerung an die Zeitrechnung ihrer Vorfahren. Daß sie den einzelnen Lunationen eines Jahres in engem Anschluß an den Wechsel der Jahreszeiten Namen gegeben haben, steht fest. In Kroenleins „Wortschatz"[11]) sind für neun unserer Monate hottentottische Bezeichnungen zu finden. Den September-Namen habe ich als ein Wort des Bergdamaradialektes nicht übernommen. Kroenlein's hottentottischer Februar entspricht dem Januar meiner Rechnung. Nur in der Auffassung des Juli-Namens, den ich für den Oktober in Anspruch nehmen muß, weichen unsere Rechnungen erheblicher ab.

Von den vier hier neu hinzukommenden Monatsnamen habe ich den unter VII. angeführten seines klaren astronomischen Hinweises wegen zum festen Ausgangspunkt einer Parallelisierung der hottentottischen mit unseren

Monaten genommen. Die hottentottischen Monate, denen doch sicherlich die naive Mondphasen-Beobachtung, also der Zeitraum eines synodischen Monats (29 Tage, 12 St., 44 Min.) zugrunde gelegen haben wird, lassen sich im Einzelnen natürlich mit einem Monat unseres Kalenders nur annähernd zur Deckung bringen. Die Etymologie der Namen, die Hinweise auf den meteorologischen Charakter der Jahreszeit enthalten, gibt eine wertvolle Kontrolle, ob der Versuch einer solchen Angleichung im gegebenen Fall gerechtfertigt ist.

Der Platz für die Monatsnamen ohne solche etymologische Hinweise auf ihre Stellung im Jahre gründet sich mir lediglich auf die eingeborene Tradition, d. h. in diesem Fall auf die Angaben einer alten Frau, die sich als zuverlässig erprobte. Nach vielen vergeblichen Bemühungen, den unklaren Kalender-Vorstellungen der Eingeborenen meiner Bekanntschaft irgend etwas Brauchbares zu entnehmen, gelang es mir endlich unerwartet bei einer 60—70 Jahre alten Hottentottin, die vergessenen Monatsnamen noch in frischer Erinnerung anzutreffen. Ohne zu stocken wiederholte sie mir in stets übereinstimmender Reihenfolge 12 Namen. Befragt, woher sie diese Kenntnisse habe, verwies sie auf ihre Kindheit. Daß diese 12-Zahl der damals unterschiedenen Monate und ihre Reihenfolge bereits von Vorstellungen Weißer beeinflußt gewesen ist, ist nicht von vornherein auszuschließen. Es ist also vielleicht bereits endgültig zu spät geworden, hier in die originalen Vorstellungen des Volkes einzudringen. Dann mag das folgende wenigstens als letzt-erreichbarer Rest des Verlorenen aufbewahrt werden. — Die 12 Monde der Hottentotten und die Parallelmonate unseres Kalenders sind also die folgenden:

I. *ǂkʒo-esaoskʒâb* (oder *ǂkʒo-esaos*): „Der Mond, der auf den *ǂkʒo-e*-Busch folgt." Dieser wichtige Weidebusch, eine *Salsola*-Art (s. S. 80), soll im Frühling seine Hauptblütezeit haben. Der erste Monat des südlichen Sommers folgt *(saos)* ihm also nach. . . . . Januar.

II. *°gaisa- tsâb* . . . . . Februar.

III. *°ǂkʒai tsâ/b*: „Da es anfängt *(tsâ/* = *tsoai,* intransit.*)*, kalt *(ǂkʒai)* zu werden." Der Name bezeichnet eine Lunation in der Übergangszeit vom Sommer zum Herbst. Der angenommenen Reihenfolge nach entspräche er unserem . . . . . März.

IV. *ǂgoro ǂnâ-tsab* deuteten mir übereinstimmend und unabhängig voneinander ältere Hottentotten als den

Monat zunehmender Kälte: da man sich so nahe an das Feuer setzt, daß die Beine *(ǀnūt-)* Brandblasen ziehen *(ǂgo-ro)* . . . . . April.

V. *ǂnū-ǂkχâsa*, „der schwarze Monat". Im südlichen Winter, als der Dürrezeit, gibt das schwarze Geäst der entlaubten Büsche dem Landschaftsbild den Charakter [37]). Mai.

VI. *ǀhai-ǂkχâsa* . . . . . Juni.

VII. **ǂkχū-ǂkχâsa*, d. h. der Monat des Siebengestirns. Die Plejaden werden für einen Beobachter auf dem 25. südl. Breitengrad in der zweiten Hälfte des Juni sichtbar. Das Erscheinen der Plejaden ist, wie früher bemerkt (s. S. 368), für die Wanderungen der Tsama suchenden Eingeborenen von Bedeutung. Es ist daher erklärlich, daß sie die Lunation um die Wende des Juni und Juli nach diesem Sternbild benennen . . . . . Juli.

VIII. *hôaǂri-b* . . . . . August.

IX. *ǀhoia-ǂga-eb*, der Monat, „da die Blätter *(ǂga-e-)* krumm (vom Winter verkrunkelt) *(ǀhoia-)* sind" [37]) . . . . . September.

X. *gai-ǀkχa-ni* . . . . . Oktober.

XI. **ǂgô-aǀkχa-ni* . . . . . November.

XII. *ǀhô-ǂga-eb*. Wenn nach dem ersten ergiebigen Regen aus den alten dürren Grasstümpfen das junge frische Grün sproßt, dann erscheint die Grasflur *(ǂga-eb*, Blattwerk*)* wie gescheckt *(ǀhôi*, mit schwarzweißer Schecken-zeichnung, s. S. 265,*)* . . . . . Dezember.

δ) Die Wochen-Einteilung der Zeit hat der Hottentott erst im Tagelohndienst des Weißen kennen gelernt; er mußte sich über Lohntermin und Feiertag orientieren. Sein Kalender dabei ist ein ca. 10 cm langes, 2 cm breites, dünnes Brettchen, in das sieben Löcher gebrannt werden. An dem einen Ende ist ein Riemen befestigt, dessen unteres Ende der Reihe nach durch eines der Löcher gesteckt wird, deren jedes einen bestimmten Tag der Woche bezeichnet. Mit dem oberen Ende des Riemens befestigen die Weiber das Kalenderholz an der Halskette, die Männer tragen es gern auf dem Hut neben der flatternden Straußenfeder. Der primitive Kalender wird *kê-kgye-hais* genannt, das „Wochenholz" (dem holländischen *Week* = Woche entlehnt).

e) Das kleinste Zeitmaß der Hottentotten ist der Tag, *tsẽs*, und die Nacht, *tsũ·χub*. Nach Tagen und Nächten geben sie die Länge einer Reise an. *ǂa·ri* bedeutet morgen und gestern zugleich.

Was sie sonst noch unterscheiden, sind nicht Zeitlängen, sondern nur Tageszeiten. Dabei fällt die reiche Gliederung der Tag- und Nachtgrenze auf, während am Tage selbst nur der Mittag, *tsẽǀgäːb*, hervorgehoben wird. Das wird verständlich, wenn man bedenkt, daß die Sonne mit verschwindenden Ausnahmen das ganze Jahr über von früh bis abends sichtbar ist. Der Hottentott versteht es, Zeitpunkte sowohl als eine Zeitdauer durch Hinweise auf den Sonnenstand sicher und verständlich auszudrücken.

Nur für die Zeit am Anfang und am Ende des Tages werden besondere Bezeichnungen angewandt.

1. **ǂgo-aǀa·roam* ist die Morgendämmerung.

2. **ǀu·itsũ·χubab* ist die Abenddämmerung.

3. Die Morgenhelle, d. h. die Zeit der Tageshelligkeit kurz vor Sonnenaufgang wird, da diese Zeit des Tagesanbruchs *(ǂgo-ab)* am empfindlichsten kalt *(ǀkχai)* zu sein pflegt, **ǀkχai·ǂgo-agab* genannt.

4. Die Abendhelle, d. h. die Zeit der Tageshelligkeit unmittelbar nach Sonnenuntergang, wird **ǂa·baǀho-bob*, d. h. „das rote Zwielicht", genannt.

5. Als „Kleinkinder-Zwielicht", **ǂkχa·ǀmiǂgõaǀhobob*, wird hie und da die Zeit der ersten merklichen Lichtabnahme nach Sonnenuntergang bezeichnet, dem Glauben entsprechend, daß um diese Zeit die meisten Kinder, *ǂgõ-an*, geboren werden.

6. Unserem Nachmittag entspricht der **ǀu-iab* der Hottentotten,

7. ihr *ǂgo-agab* deckt sich ungefähr mit unserem Vormittag.

8. Vom Abend, *ǀu-ib*, wird der Spätabend, der sich bis lange nach Sonnenuntergang ausdehnt, als *ǀo-es* unterschieden.

9. Die Mitternachtsstunde nennen sie **tsũ·χubǀgäːb*, den „Rücken der Nacht".

C. Kunst-Anfänge.

Wir sahen die Anfänge plastischer Kunst in Knabenspielerei stecken bleiben (s. S. 311 f.). Aber die Freude an Darstellungen, an phantasiefreier Versinnlichung nachhaltiger Erinnerungs-Eindrücke ist im jungen und alten Hottentotten gleich lebendig. Ihre Nachahmungs-Freude und -Fähigkeit findet dabei in der Pantomime, ihr musikalischer Sinn in Riedblasen und Gesang,

ihre feinere Erotik im Tanze Ausdruck. Nur in wenigen Fällen finden wir Anfänge dieser Kunstformen rein ausgeprägt; meist greifen sie noch wie die Regungen, die ihnen zugrunde liegen, vielfach ineinander. Sie lassen sich also nicht auf unsere Musen verteilen, nur in eine Reihe vom Einfachen zum Komplizierten ordnen.

Musikbogen. 1/8 nat. Gr.

1. Die Musikpantomime.

Während wir auf einer kindlichen Vorstufe (siehe Kinderspiele S. 315) schon rhythmische Geräusche bestimmte Phantasievorstellungen erwecken sahen, treten in der Musikpantomime der Hottentotten zum ersten Mal musikalische Töne auf.

Als Musikinstrument dient ihnen ein Holzbogen, *kχārib*, am liebsten aus dem Dornbaum geschnitten, mit einer Saite aus Rückensehnen der Ziege (besser aus Schafdärmen) bespannt. Die Frauen sind hier die ausübenden Künstler. Sie sitzen beim Spielen am Boden. Das obere Ende des Bogens ruht in der linken Schulter, das untere Ende wird gegen einen fellbedeckten Napf, der als Resonanzboden dient, gestemmt und mit dem rechten Fuß (der zwischen Bogen und Saite tritt) in seiner Lage festgehalten. Die rechte Hand der Spielerin schlägt — wenn es nicht die umsitzenden Frauen tun — die Saite mit einem Holzstäbchen an, die linke greift wie die eines Violinspielers. Auch das Kinn nehmen sie beim Greifen zu Hilfe, indem sie den Kopf halb nach hinten einen Moment gegen das obere Ende der Saite anlehnen. Meist schlagen mehrere der umsitzenden Frauen mit Holzstäbchen im Takt auf die Saite.

Außer dem Bogen sah ich selbst kein Saiteninstrument mehr bei den Hottentotten. Die Gora mit der Federspule[66]) traf ich nur bei Betschuanen. Wohl aber sprachen Hottentotten von einem Guitarre-artigen Instrument, das sie wohl in Anlehnung an europäische Muster herstellen; sie nennen es *ramgyib* oder */gū-itsib* [von */gūi* = zudecken, in diesem Fall: das Resonanzgefäß mit einem Fell überspannen. (Siehe auch Sage XLV, Anm.)]

TOPNAAR-HOTTENTOTT

1: Schultze FX13 Hottentot

[37/42]

Im Rhythmus liegt musikalisch die Hauptcharakteristik der Handlung, die in der Musik-Pantomime dargestellt werden soll. Er bringt in Jagdszenen die verschiedenen Gangarten des Pferdes und des Wildes zum Ausdruck: Das Aufspüren des Hartebeests, die erste Verfolgung im Galopp, die Flucht des krankgeschossenen Tieres und seine Überwältigung, alles gibt der Takt der Holzstäbchen wieder. Das Anspornen des hetzenden Pferdes, den Todesstoß und das Röcheln des verendenden Tieres wird mit Gebärden und inartikulierten Lauten markiert. Die eintönigen Intervalle, die auf der Saite gegriffen werden, sind nur Begleitung.

Ähnlich wird der Lauf eines Wagens dargestellt, das Einspannen der Ochsen, das Ausschalten eines lahmen oder schlappen Tieres, das Niedersausen des Vorschlags usw.

Die Gewohnheiten der Tiere der Wildnis werden mit Vorliebe nachgeahmt. Mit großer Beweglichkeit und Hingebung in ihre Rolle sah ich eine Frau einen Pavian darstellen: Wie er Insekten vom Boden aufliest, sich über das Wasserloch zum Trinken beugt, die nachdrängenden durstigen Tiere eifersüchtig abwehrt, wie er sorglos trottet, wie er schreckt beim Wittern einer Gefahr und flieht, wenn er sich überrascht sieht.

Die Musik steht in allen diesen Unterhaltungen im Hintergrund, wenn auch Saite und Holzstäbchen immer in Tätigkeit sind. Die Töne ordnen sich zu Melodien erst im

2. Riedtanz-Lied.

Hier treten die uralten Musikinstrumente der Hottentotten, die Riedpfeifen, *ǂâ-ti*, in ihr Recht. Die Pfeifen werden meist, wie ihr Name sagt, aus Ried geschnitten; wo aber in trockenen Landstrichen Schilfbestände fehlen, werden sie aus den Wurzeln der *Acacia horrida Willd.* gefertigt. Das stabförmig zugeschnittene Wurzelstück wird entweder durch Abziehen in toto entrindet *(a)*, oder wird längsgeschlitzt und die Rinde vom Holz geschält. Mit einem Rindenstück wird dann das längs geschlitzte, wie mit einem Band spiralig fest umwickelt *(c)*. Die so hergestellte Röhre wird an einem Ende verschlossen und mit Milch aufgefüllt, damit sie nicht eintrockne. Gestimmt werden die Pfeifen durch Verschieben des festen Graspfropfes, der das Röhrenende

a *b* *c*

Riedpfeifen aus Wurzelrinde, mit Stimmstäbchen *(b)*. 1/4 nat. Gr.

Ein vollständiges Riedpfeifen-Orchester setzt sich aus mindestens 9 Musikanten, jeder mit seinem eigens abgestimmten Ried oder Riedsatz, zusammen. Wie wir erste und zweite Geige etc. unterscheiden, so unterscheidet der Hottentott erste bis neunte Riedpfeife, nur, daß er sie nicht zählt, sondern einzeln benennt. Er unterscheidet:

Riedpfeifen-Satz.

1. **ǂkχa-ritā-ti*, d. h. „die Kleinriede", alle gleich gestimmt, 4—6 in jeder Hand nebeneinander gelegt.

2. **ǀnona-gu*, die Drillinge, oder kollektivisch **ǀnona-b*, der Dreier genannt, zu dritt gleich gestimmt in der Hand gehalten.

3. **ǀnani-gu*, die Sechslinge oder kollektivisch **ǀnani-b*, der Sechser, zu sechst gleich gestimmt in die Hand genommen.

4. **ǁhū-ǂirob* oder *ǁhū-ǂirokχa*, je nachdem der Bläser nur eines oder zwei in der Hand hat.

5. *ai-ās*, „die *(-s)* voran *(ai)* weint (*ā*, hier in der Bedeutung: klagend tönen)". Nur 1 Mann im ganzen Orchester hat diese eine Pfeife, während mit weiterer Ausnahme von 6. alle anderen Riedstimmen doppelt oder dreifach besetzt sein können. Dieses Ried gibt den Ton an, nach welchem alle anderen Riede abgestimmt werden. Von diesen stimmt sich zuerst

6. die Riedpfeife ein, das *ā|gāts* genannt wird, d. h. „die hinterher *(|gāts*, Rücken*)* weint". Dann erst erfolgt das Abstimmen der anderen Pfeifen:

7. **goǂma-s*, „die Kuh".

8. *ǂa-rob*, endlich

9. **ǁhūǂi-b*, das tiefst gestimmte Ried.

Der Stimmstock, **ǂkχa-ehaib*, mit dem der Gras- oder Bastpfropf im

Innern des Rohres verschoben, gleichsam „zurückgejagt" *(ǂkχaĕ)* wird, um die Tonhöhe festzulegen, vervollständigt die Instrumentalausrüstung.

Die Riede werden zwischen dem Daumen und den gestreckten übrigen vier Fingern so gehalten, daß ihre angeblasenen Enden im Niveau des oberen horizontalen Zeigefingerrandes liegen. Ein vollständiger Riedsatz umfaßt etwa zwei Oktaven. Nur in einem Fall konnte ich einen vollständigen, frisch abgestimmten Satz auf die Tonhöhe der einzelnen Riede untersuchen. Das Resultat ergab die in nebenstehender Figur dargestellte Tonverteilung.

Die Musik jedes Riedpfeifers besteht aus einzeln hervorgestoßenen Tönen, die mit einem oder mehreren gleich-rhythmischen Tönen der anderen Pfeifer zusammenklingen. Diese Riedtöne sind die Taktanhalte für die Tänzer und Sänger, die die Melodie führen. Ein Text fehlt vielen Riedliedern (ob von vornherein oder ob er vergessen ist, sei dahingestellt). Der Gegenstand wird im einfachsten Falle durch Geberden angedeutet, die Melodie auf einige wenige Laute gesungen.

Die Tanzbewegungen der Männer sind ein niedriges, mit beiden Beinen gleichzeitig ausgeführtes Hüpfen, mit schwach gebeugten Knieen und voreinander gestellten Füßen. Der Tänzer schreitet auf diese Manier ruckweise und langsam vorwärts, vornüber gekrümmt, den Kopf auf die Brust gebeugt, die Lippen am Rohr. Die Frauen chassieren in kleinen, oft äußerst zierlich gesetzten Schritten vorwärts, das Gesäß mäßig herausgestreckt, den Rumpf in den Hüften wiegend, die Hände vor dem Gesicht leise zusammenschlagend, mit lauter Stimme, zuweilen mit dem Ausdruck höchster Erregung singend. Die Zahl der Tanzenden ist nicht bestimmt.

Die Freude der Hottentotten am Tanz kennzeichnet eine kleine Geschichte, in der sie sich selbst persiflieren: Sie hatten an einer Wasserstelle Bergdamara umzingelt; als die Kaffern sahen, daß sie in der Falle waren, fingen sie an, einen Tanz aufzuführen; tanzend entfernten sie sich immer weiter und waren, als die zuschauenden Hottentotten sich endlich auf ihren Mordplan besannen, entschlüpft.

Jedem Riedtanz-Lied liegt ein bestimmtes Thema zugrunde. So soll z. B. in dem hier folgenden Beispiel das Ankommen des Bullen zur Wasserstelle versinnbildlicht werden. Wie das bösartige, nach der Brunstzeit einsam im Weidefeld hausende, schwerfällige Tier langsam zur Wasserstelle wandert, kurz in sich hineinbrummend, den Kopf von einer Seite zur anderen wiegend, — so hat ihn der Hottentott im Sinn, wenn er, von Riedtönen (oder von der Zieh- und Mundharmonika) begleitet, zum Tanz mit einigen wenigen Lauten

Das Lied vom Weidebull

singt:

Das folgende Riedtanzlied begleitet eine lebhafte pantomimische Darstellung des Pferdebeschlagens und heißt daher das Lied vom Hufbeschlag, **ǂnaũǂais.*

Der Mann, der das Pferd markiert, hat einen Riemen im Mund und wird daran von einem vor ihm stehenden Mann wie am Zügel festgehalten. Einem anderen, hinter ihm stehenden, reicht er einen Fuß zum Beschlagen. Ein vierter spielt den Blasebalg: liegt platt auf dem Bauch, streckt die Unterschenkel in die Luft und läßt sie von einem fünften Mann, der hinter ihm steht, nach dem Takt der Musik im Kniegelenk abwechselnd nach vorn und rückwärts bewegen. Vor ihm steht der Schmied, einen Stein als Hammer in der Hand, und wartet, daß das Eisen warm wird. Alle Übrigen, mit Einschluß der Riedbläser, tanzen im Kreis um diese Gruppe und singen, ohne Worte, aber im Rhythmus unverkennbar den Takt der Hammerschläge nachahmend:

An Stelle der Pantomine finden wir in anderen Tanzliedern die Situation, die besungen wird, durch ein Stichwort angedeutet. So gab ein Hottentott, der sich ab und zu nachts in den Viehkraal einer Nachbarwerft schlich, um sich die Ziegenmilch in den Mund zu melken, seiner Freude darüber daß er noch nie erwischt worden war, in einem Liede Ausdruck, dessen einzige Worte *B(e)ridaise, b(e)ridaise,* „Du Ziegenmilch, Du Ziegenmilch" er zu einer ebenso anspruchslosen, aber von seinen Freunden gern zum Tanz geforderten Melodie sang:

B(e)ri-dai-se etc.

Auf derselben niedrigen Stufe steht ein Lied, dem folgendes Ereignis zugrunde liegt. Der Sänger hatte seinen Ochsenwächter, der ihm auf der Reise ein wertvolles Tier hatte weglaufen lassen, mit dem Schambok derart verprügelt, daß der Mißhandelte seinen Herrn beim Kapitän Paul Frederik in Bethanien anklagt. Der schickt einen seiner Leute zu Pferd hinter dem Schuldigen her und läßt ihn festnehmen. Die einzigen Worte, die refrainartig in dem sonst unartikulierten Gesang wiederkehren, beziehen sich auf die Farbe des genannten Pferdes, das einen weißen Stirnstreif und weiße Füße und daher den Burennamen Witvoet hatte. Der Freundeskreis wußte bei diesem Worte, um was es sich in dem Liede vom Weißfußpferde handelte. Die Melodie lautet:

Während den vorhergenannten Tanzmelodieen ein geschlossener Text noch fehlt, ist er wenigstens als Anhalt dem folgenden Gesang lose angegliedert. Im Bruderkriege um die Herrschaft über die Bethanier-Hottentotten hatte Paulus Frederik die wichtigsten Wasserstellen des Landes besetzt und Cornelius mußte, in die Enge getrieben, schließlich seinen Bruder um Wasser bitten. Der Text*) des Liedes, das diesen Bruderstreit besingt, gleichsam ein Programm für die Musik, lautet:

„Ti ǀgätse, ǂnäti göse ǀgaĭ ēta ǂgami āre!“
›ǀabuti ätsa ǂgui ēts ǂgami ā‹
„ǂguita tite“.

„Du mein Bruder, sei gut, sei soweit freundlich und laß mich Wasser trinken!“
›Leg deine Gewehre nieder und dann trink Wasser.‹
„Ich werde sie nicht niederlegen.“

*) In allen folgenden Texten und ihren Erläuterungen habe ich mit wenigen Ausnahmen (z. B. wo es sich um neu aufgezeichnete Worte handelt) davon abgesehen, die Zeichen für die musikalischen Modifikationen der Nama-Laute (s. S. 342 ff.) einzufügen. Bei der ausführlichen Analyse der später folgenden Sagentexte ist die rein phonetische Betrachtung für das Verständnis des Zusammenhanges entbehrlich und damit eine große Ersparnis für den Druck ermöglicht. Ein theoretischer Grund für eine vereinfachte Schreibweise der Texte ist S. 363 (oben) angegeben.

Die zugehörige Tanzmelodie lautet:

Ebenso frei wie in diesem Kriegslied verbindet sich Text und Melodie im Lied von Kaukaussib. Kaukaussib ist eine Wasserstelle in der Namib, auf der südlichsten der drei Routen gelegen, die für den Ochsenwagenverkehr zwischen Angra Pequena und dem Hinterlande in Betracht kommen. Der Weg über K. ist der beschwerlichste, die Wagen bleiben oft tagelang im Sande stecken. Ein Hottentott mit dem Beinamen *ǂnau-bas/e/n-nā-ib*, d. h. „der sich selbst zum Tanz aufspielt", hat sich als Text die einfachen Worte gewählt: *„!Gaokza-osetse, hā-ta ǂo-are!"* „Kaukaussib, laß mich doch herauskommen!" Die Melodie, mit der der Text in ewiger Wiederholung verbunden wurde, lautet:

Enger schließt sich der Text an die Melodie im Hyänen-Lied. Die Hyäne ist dabei gedacht, wie sie nachts um den Viehkraal schleicht und entdeckt wird. Die pantomimische Darstellung dieses Themas mit seiner Riedmusik, seinem Gesang und Tanz ist sehr ergötzlich: Die Männer gruppieren sich in einem Halbkreis, ebenso ihnen gegenüber die Mädchen. Der so gebildete Kreis mit den zwei gegenüberliegenden Öffnungen (da, wo die Männerreihe an die Mädchenreihe stößt) stellt einen Viehkraal dar, die Mädchen das Vieh. Unter dem Gesang und den Tönen der Riedmusik aller im Kreise Stehenden tritt einer der Männer aus der Reihe und schleicht mit tief gebeugten Knieen, in Kauerhaltung, in das Innere des Kraals, mit den Gebärden einer blutdürstigen Hyäne an der Mädchenreihe entlang. Nach einer Weile begeben sich drei andere aus der Männerreihe wie reitend an dieselbe Öffnung des Kraals, wo die Hyäne hereingekommen war. Sie binden in Haltung und Gebärden ihre Pferde fest, entdecken die Spuren der Hyäne und folgen ihnen, bis sie das Tier plötzlich bemerken. Dann eilen sie zurück zu den Pferden und nehmen die Verfolgung auf. Die Hyäne hat inzwischen das Weite gesucht, wird aber außerhalb des Kraals eingeholt und getötet. Während dieser Pantomime wird nach dem Takt

der Riedbläser ununterbrochen als Warnung an das viehlüsterne Raubtier gesungen:

ǂHĭ - ra - se, kχoĭn χũn gye, ǂgo - be - se, kχoĭn χũn gye.

„Hyäne (Beiname siehe später), das (scil. Vieh dieses Kraals) ist des Menschen Gut!"

3. Das Lied allein.

Die Freude der Hottentotten an der Musik an sich (losgelöst von Tanz und Pantomime) lernte ich frühzeitig kennen. Es war am Abend eines schweren Arbeitstages für unsere Hottentotten; sie hatten von früh ab Spieren zum Bau der Seezeichen auf die Felshügel der Steilküste geschleppt und hockten nun nach längst beendetem Nachtmahl noch um ihr Feuer. In den Zelten der Weißen war es schon still geworden und auch die Kameruner Matrosen schliefen in ihren warmen Segeltuch-Kojen. Da ertönt aus der elenden Gestrüppumfriedigung des Hottentottenlagers, in das der kalte Winterhimmel sternklar scheint, rein und ernst vielstimmiger Gesang. Ein junger Bursche steht aufrecht inmitten der zerlumpten sitzenden älteren Gestalten und führt, unbekümmert um den Rauch des flackernden Feuers, der ihm die Augen beizt, mit lauter Stimme den Chor. Der Text wurde immer in kurzem, schnellem Satz von einem älteren Mann den Singenden vorgesprochen; es war ein holländischer Choral, vom Missionar in ihre Sprache übersetzt. Ich habe lange dem Gesang des „verkommenen Gesindels" gelauscht, bis sie fröstelnd unter ihre Decken krochen, eng aneinander gedrückt, die nackten Füße bis dicht an die glimmende Asche vorgestreckt.

In ihren eigenen Liedern hat der Text nicht immer streng fixierten Wortlaut und die Singenden führen im Chorgesang oft eigene Motive weiter, die sie nach beliebig langen oder kurzen Pausen mit geringen Variationen immer von neuem wiederholen bis der Text zu Ende ist. Dabei wissen sie aber ohne Dissonanz ihr Motiv in das Stimmengewoge der anderen einzuflechten.

Den meisten (vielleicht allen) Liedern liegt ein bestimmtes Ereignis zugrunde. So hatte vor Jahren ein weißer Frachtfahrer bei dem Bruder

der alten *!E·ris* ausgespannt und sich zur Ruhe begeben. Eine Menge Hottentotten fanden sich, wie üblich, ein, um zu betteln und zu handeln. Sie vergriffen sich dabei an den Vorräten des schlafenden Händlers. Der Witbooi-Hottentott, der zum Schutze des fremden Eigentums einschritt, wurde von dem Weißen in der irrtümlichen Annahme, daß er der Anstifter sei, im Jähzorn niedergeschossen. Das Schicksal des Getöteten lebt in der Familientradition fort und die Frauen singen: *„!Uri lendetse, ǂhai daos ai go ǂgabi ǂoatse, gai χūē ditsī, ǂaoba ditsī! tariē kχa nī nē kχoī ǂaoba ǂeream?“*

„Du Weißtuch (Anspielung wohl auf den Hutschleier oder das Halstuch des Reisenden), der du auf frevlem (wörtl. fahlfarbenem, nichtigem) Wege ausgeritten bist, Untat verübt hast (i. particip praeter., wörtl. ein großes Ding getan hast), Blut vergossen hast! Ach wer wird das Blut jenes Mannes rächen? (wörtl. beantworten).“

Nach einem kurzen Vorspiel auf dem Bogen setzten die Stimmen mit folgendem Motiv ein:

Ein Liebeslied denkbar einfachster Art lautet:

Hō-ta ti-te se, hō-ta ti-te se, hō-ta ti-te se. etc.

Der klagende Text besagt: „Ich werde dich niemals bekommen!“

Halbwüchsige Jungen und junge Männer sangen in Lüderitzbucht und um Keetmanshoop, wenn sie Mädchen foppen wollten:

Ti χō - se he, ti χo - se, ti χō - se he, ti χō - se.

Die Neckerei liegt in der Zweideutigkeit des Textes. Die Worte an sich: „Du meine Wange *(χōse)*“ sind unverfänglich. Aber gemeint ist nicht

χõs, sondern χũs, d. i. ein Gut, ein „Ding" (irgendwelcher Art), hier: das am sorgfältigsten gehütete Gut des jungfräulichen Körpers, das jene dreist ihr Eigentum nennen.

4. Tanz allein,

d. h. ohne Musikbegleitung ist mir nur einmal begegnet. Es war ein nächtlicher Tanz mit Namen **tsũ·χu tsa·ıbe — da·ıba tsa·ıbe.* Das sind zugleich die Worte, die die Tanzenden immer zum Takt der Füße wiederholen. Der Tanz wird von Jungen und Alten, selbst Ältesten beiderlei Geschlechts getanzt. Drei Personen gehören dazu: zwei, die gegeneinander feindlich anrücken, und eine dritte, die die Streitenden zu trennen sucht, indem sie immer zwischen sie hineintanzt, sobald sie einander nahe kommen.

Die Tanzbewegung selbst ist einfach: Der rechte Fuß wird in kurzen Schrittchen vor- und wieder halb rückwärts geschlürft. Unmittelbar nach jeder solchen Tändelbewegung wird der linke Fuß, mit der ganzen Sohle aufstampfend, nachgesetzt; dabei sinkt der Körper in schwache Kniebeuge. Die Bewegung schreitet langsam ruckweise fort, ist aber nicht schwerfällig, ist sogar anmutig, wenn sie ein junger Körper geschmeidig ausführt. Die Bewegung des rechten Fußes begleitet die Worte *tsũ·χu-* und *da·ıba-*, auf die erste Silbe des dazwischen liegenden *tsaıbe* fällt das Stampfen des linken Fußes.

D. Keime einer Literatur.

1. Ausgang.

Außerhalb des engen Kreises seiner alltäglichen Lebensbedürfnisse ist nächst dem Interesse an seinesgleichen die Tierwelt der beliebteste Tummelplatz der Phantasie des Hottentotten. Mit den Tieren des Feldes kommt er vom Tag seiner Verwendung als Hirtenjunge ab in nächste Berührung. Tagaus tagein, von früh bis abends sich selbst überlassen, in seinen Wächterpflichten und zu seiner Unterhaltung ausschließlich auf die Beobachtung der Natur angewiesen, lernt er bald jeden Vogelruf, lernt die Gewohnheiten des Wildes und Raubzeugs so gut wie die Verstecke aller der kleinen Lebewesen kennen, die sein kärgliches Mahl würzen. Das alles tritt in einem Alter an ihn heran, wo kindlicher Wissenstrieb und Spielereilust ihn für alles um ihn her empfänglich hält. Später ist die Jagd seine Lehrmeisterin in Naturgeschichte. An Muße, die Eindrücke nachwirken zu lassen, fehlt es dem Hottentotten nie, und so spinnt er das Geschene und

Gehörte weiter und legt es sich menschlich aus. In der bescheidensten Form geschieht das dadurch, daß er in

a) Tierstimmen

Worte*) hört: So ruft eine wilde Taube *(Stictoenas phaeonotus Gray,* h: *ǂnabu-s)* wohl noch aus der Zeit, da ihr mit dornbespitzten Pfeilen nachgestellt wurde, dem Menschen zu: *„ǀHai- ᵏχoētse͡, ǂhai- ǂhuru-, ǂgaba ǂkχūb gom ǂkχaī χūba o!"* „Du nichtswürdiger (wörtl. fahler) Mensch, ein nichtswürdiges Spiel treibst du, der Gabadorn ist gar ein giftiges (verbotenes) Ding!"

Eine Lerche, *ǂhurīd-b* genannt (ich kann nicht mehr entscheiden, ob es sich um *Calandrella cinerea (Gm.)* oder um *Clothilauda semitorquata A. Sm.* handelt), hat einen auf- und absteigenden Zickzackflug, knattert auf der Höhe ihres Zickzackwegs mit den Flügeln und läßt einen langgezogenen ansteigenden Ton hören. In diesem Ruf hört der Hottentott die Worte *„Om͡ dire!"*, d. h. „Macht die Hütte zurecht!", eine Mahnung an die Frauen, die Binsenmatten der Hütte dicht zu machen, denn dieser Vogelruf soll besonders beim Anzug eines Gewitters zu hören sein: ich hörte ihn bei jedem Wetter.

Eine Mahnung an säumige Eltern legt der Hottentott in den Ruf des *ǂkχu-ririseb*-Vogels (wie es scheint einer *Pycnonotus*-Art angehörig): *„ǀGu-rub ǂkχa-rib, ǂgu-ri ǂgoē-, hī-diros ǂgu-ri ǂgoē-!"* „Der Gurub liegt allein, die Hudiros liegt allein!"

Die schwarze Kornlandkrähe, den *Corvus capensis Licht.*, nennen die Hottentotten *ǂhō-rab*, von *ǂhō-ra* = den Boden durchstöbern, um Abfälle aufzulesen. In ihrer lärmenden Stimme hört der Hottentott zuweilen das Frohlocken eines glücklichen Waidmanns: *„Xu-rigye go ǂa-os gye, hō-gye go ǂhā-eī gye!"* „Wir *(gye,* Suff. d. 1. pers. plur. masc.*)* haben Blut *(ǂaos)* geschöpft *(χuri)***), wir haben einen Springbock *(ǂhāeī,* comm. sing.*)* gekriegt! *(hō)*."

Auch Zwiegespräche der Vögel hört der Hottentott. So läßt er die weißbrüstige Krähe, h: *goira-b* (3. st.), den *Corvus scapulatus Daud.*, der in der Wahl seines Futters sehr wenig wählerisch ist, der eben genannten Kornlandkrähe zurufen: *„ǂHō-rab, ǂhō-rab, ǂkχī- ē-kχ(u)m χau-sa ǂkχū- ǂū-gu!"*

---

*) Die lang auszuziehenden Silben sind mit einem Fermate-Zeichen versehen. Wo bei der Nachahmung der Tierstimme der Rhythmus besonders markiert ist, ist das Stärkeakzent-Zeichen gesetzt.

**) Der eingeborene Jäger pflegt das Blut aus der Leibeshöhle des frisch erlegten Wildes in den ausgeweideten Magen zu füllen und nach Hause zu tragen.

', Rab', komm und laß uns beide miteinander Scheiße zerpicken!" (wörtl. en, *ǂkχā*, und auseinanderlegen, *ǂā*.)

Aber die Angeredete bleibt bei ihrem Geschmack und antwortet: *ra-b, goira-b, kχī- ĕ-kχ(u)m ǂha-nsa ǂkχā- ǂā-gu!*" „Komm, laß uns mit- der Feldgerwiebel zerpicken!"

Eine eigene Bewandnis hat es mit dem Girren der Turteltaube *nari-s*). Die Hottentotten erzählen sich, daß die Turteltaube einst eine chtigte Viehdiebin war. Vom Sandhuhn, *Pterocturus namaqua (Gmel.)*, *aus*, mit dem sie zusammenlebte, wollte sie sich ein Beil borgen, um Knochen eines gestohlenen Kalbes zu zerlegen. Aber das ehrliche schlug es ihr ab. Seitdem flucht ihm die Taube mit den Worten*): *„ǂhau-s ǂga-rrrase, ǂhau-s ǂga-rrrase, ǂôba ǂkχu-bi te, ǂ-ta tsaû-ba ǂna-n a-naba ǂhû-i si!*" „Du Schmutzvieh (*ǂgarab* ist die männliche Scham, fluchwort gebraucht), borg *(ǂkχubi)* mir *(te)* das Beil *(ǂôba)*, laß *(ǂ)* *(-ta)* das Kalb *(tsaûba)* zerlegen *(ǂnanǂâ)*!" „Den Kopf *(tanaba)* spalte ich dir *(si)*!"

Es liegt nahe, daß wer die Sprache der Tiere versteht, auch seinerseits

b) Zurufe

an der Unterhaltung beteiligt.

Der Name eines Spechtes (wahrscheinlich des *Dendropicus cardinalis l.)*), h: *ǂī-ǂī-ses*, ahmt den gedehnten Ruf des Vogels nach. Die Hotten- meiner Begleitung hörten darin stets eine erotische Lockung und sie spöttisch an einen fingierten Buschmann weiter, indem sie riefen: *askχum gaitse, nē gye ǂǂises si ǂaiba ra ûba!*" „Du alter Nurukum nname), dieser Specht ruft darnach, daß du ihn vögeln mögest!"

*) Hier tritt besonders klar hervor, wie die Wahl der Worte, ihre Folge und Akzentuierung Nachahmung der Tierstimme abzielen.

In der Frage, wie der Mensch einst dazu kam, seinen Worten bestimmte Rhythmen zu wenn er sie von drückender Alltäglichkeit loslösen und zu freierer Phantasieschöpfungen ver- will, scheinen mir Beobachtungen aus den primitiven Stadien einer aufkeimenden Literatur, die Hottentotten vergegenwärtigen, nicht gleichgültig zu sein. Es ist keine Hypothese sondern eine Feststellung des Tatbestandes, daß in der Naturgeräusche die sinnliche Freude, gemeinsam mit Worten nachzuahmen, einen Weg zur Rhythmik darstellt.

Ein anderer Weg ist aus der Freude abzuleiten, die, wie wohl jedes Volk, so auch den empfindet, wenn er die Bewegungen seines Körpers verfeinert zum Ausdruck seiner dungen macht. So sind die natürlichen, an sich schon rhythmischen Ortsbewegungen der zu Tanzbewegungen geworden. Und da wir Tanz und Musik und begleitenden Liedertext Hottentotten in engem Zusammenhang finden, so tritt hier ungezwungen eine zweite Quelle r Rhythmik der Sprache zutage.

Kinder besprechen wie bei uns die Tiere, mit denen sie spielen. So suchen sie die *!kyaobus*-Eidechse dadurch zum Stillliegen zu bewegen, daß sie ihr zusingen:

han - sib snao - se, sib t(u)mi xgoi re.

„Du Hansib's (fingierter Eigenname) Großmutter, duck dich doch nieder!" (wörtl.: leg dich doch hin wie ein Pfeil.)

Ein Mistkäfer, den die Kinder spielen, um sich am Gesumm der schwirrenden Flügel zu freuen, wird mit den Worten gelockt:

snao - ba, snao - ba o xgru ai sib - re.

„Nachtkäfer, ach setze dich doch auf den Mist!"

Das Chamaeleon suchen die Kinder mit den Worten zu bannen: *„no-mtsi /no-mebe, o-ma /nu-rubus ŏ-ab!"* „Buckeliger Buckelmann, Kind der Großmutter (*"amas)* Nurubus!"

Einer besonders ausführlichen Anrede erfreut sich der Pavian. In einem tiefen Rivier in der Nähe des Oranje hörten wir die Affen auf den umgebenden Höhen bellen. Dem ersten, der sichtbar wurde, rief einer meiner Hottentotten folgende im Volksmund*) verbreitete Begrüßung zu:

„her!-tse, hi-retse!
tku-mi tka-rutse,
so-retse, so-re !kyŏ-hoitse,
/no-ohe gye xgu-ns s(e)i tno-os/e)n!
enabo- /nani-b ai gye mŏ-tse
enabo- o-multse!
tsoo-ba gye xgui-s!"

„Ei Potztausend**)! Du Fettglänzender***)! Du Linkser, Links-

*) Vgl. Bleek's Übersetzungen von Widdysamen aus den Handschriften der Grey'schen Bibliothek in Kapstadt.

**) Eigentlich etwa: „ach du lieber Gott!" heißt, die holländische Bezeichnung für Herr, mit der hottentottischen Vokativendung des masc. sing.

***) Das Haben der *tku-/nukkara o-Biene* (s. S. 109) glänzen heißt; ein glänzendes Fell gilt als Zierde des jungen Pavians. Die vorgeschlagene Anrede, die ich ebenfalls hörte, lautet: *„tsoo-ro !kyo-nikotse"*; *!kyo-nikoŏ* ist eine offene unterirdische Kanäle mit hohen Uferlöcher.

iger*)! Der du aufgeladen wirst, dein Fleisch selbst stückweise auf-
st**)! Der du auf dem Taubenrande stehst***), du Taubenmündiger†)!
r du dein Hinterloch nachschleppst!"

2. Sagen der Hottentotten.

**Albe-gum-oa-ǂgûs-gûm.*

Wie sie dem Horizont des offenen Meeres den „Rücken des Wassers", ǂamigdû, nennen, so nennen sie die Urvergangenheit, die fern wie jener erscint ist, den „Rücken der Zeit", *ǂaǂgdû. Damals gab es noch keine nschen, aber Sonne und Mond waren Erdbewohner und das Feuer lebte, Tiere hatten menschenähnliche Gestalt und fühlten und handelten wie n. Im Rahmen dieser allgemeinen Vorstellung verarbeitet die Phantasie Hottentotten alle Beobachtungen aus der Tierwelt und die Erfahrungen eigenen Lebens zu Sagen, die sich ohne Aufzeichnung durch Genenen erhalten. Da hocken sie abends im Kreis um das Feuer der Hütte r des Lagers im Feld, die Reihe geht herum, Jeder erzählt seine Gechte. Nicht aus Aberglauben wohl, sondern aus der Stimmung jener cklichen Stunden selbst hat sich ihnen das Gebot ergeben, nur am Nachter die Sagen-Gestalten aufleben zu lassen. Wer bei Tageslicht von ihnen ählt, könnte die Dinge *(ǂû-as)* von ehedem *(albe-gum)*††) heraufchwören und damit heillose Verwirrung anrichten; erst nach Sonnenergang heißt es „*ǂo-as*", „erzähle!"

Obwohl schon die Reisenden des 18. Jahrhunderts die Vorliebe der ttentotten für Sagen kannten, sind bis jetzt doch nur vier Erzählungen der Sprache der Hottentotten selbst bekannt; sie sind nach Aufzeichngen G. Kroeseleins und des Bastards J. de Vries von Theophilus hn[28]) mitgeteilt worden. Was sonst über diesen Gegenstand veröffentt ist, sind Übersetzungen und Inhaltsangaben in europäischen Sprachen. r Gouverneur der Kapkolonie, George Grey, veranlaßte den Kurator ner Bibliothek, W. H. J. Bleek, zu einem Rundschreiben an die Missionare südafrikas mit der Bitte, ihm alles, was als Anfang einer Literatur der

*) Der Gebrauch der linken Hand gilt als Zeichen von Geringschätzung.

**) Zur Charakteristik des schleppend vorwärts rückenden Ganges des Perlsim.

***) Der Stolzheit der Taubenbrust ist eine Lieblingsvergleichung dieser wilden Tauben (s. S. 384).

†) Vorgestellt der langen Schnauze des Perlsim, die in den Augen der Hottentotten wie Schmutz vorspringt.

††) Die Etymologie des Wortes *gum* habe ich nicht ermitteln können. Es wird vor *albe* *ǂgûbe* — ebenso im Sinn einer Demonstrativpartikel gebraucht.

Eingeborenen gelten könnte, zuzusenden. Das Ergebnis hat Bleek veröffentlicht — leider ausschließlich Übersetzungen, obwohl sich unter den 40 Erzählungen seiner Sammlungen 24 im Urtext von Kroenlein aufgenommene (auch später leider nicht veröffentlichte) befanden. Nur in der Erzählung des Mond-Mythus ist durch Th. Hahn's Mitteilung des Originals eine direkte Kontrolle der Übersetzungen Bleek's mit dem Urtext Kroenlein's ermöglicht worden: An Stelle der Überschrift, die worttreu lautet „Der Mond und die Laus und der Hase", setzt Bleek „Der Ursprung des Todes", und die unanständige Laus, die auch den folgenden Text verunreinigt, knickt er, indem er statt ihrer nur von einem „Tierchen" spricht. Man würde solche Kleinigkeiten unbeachtet lassen, wenn hier nicht eine Prüderie die andere nach sich zöge und schließlich ein Endresultat zustande käme, das auf die Art und Weise der Hottentotten, sich zu geben, wie die Faust aufs Auge paßt. Wie mag die Zensur, die so früh einsetzt, vorgehen, wo sich das Volk einmal wirklich ohne Feigenblatt zeigt? Da ich das Kroenlein'sche Manuskript nicht kenne, kann ich mich nur an einen Vergleich des Stils und Inhalts meiner Texte mit denen Bleek's halten. Der Übersetzer hat „Auslassungen und Veränderungen, ohne welche die Fabeln in europäischen Augen zu nackt erschienen wären", für notwendig gehalten, „um diese Hottentotten-Fabeln dem größeren Publikum zugängig zu machen", und glaubt damit den Geist der Fabeln nicht anzutasten. Die hier mitzuteilenden Texte mögen selbst antworten: Ihr Ausdruck zeigt die Urwüchsigkeit eines Naturvolkes, in der kein Sinn zu kurz kommt, kein Körperteil ist hier, wo alles eine Freistatt hat, anstößig. Und gerade kleine psychologische Züge, in denen die treibenden Motive für Urteile und Handlungen der Sagenfiguren enthalten sind, sind oft an die kräftigsten Ausdrücke gebunden. Die gemeine Wendung der alten Elephantin (s. Sage No. LVIII) charakterisiert mit einem Wort die rohe Auffassung des Familienlebens, dem die junge Frau (in Gestalt einer Fliege) entfliehen will. Die Anrede des Löwen an die Tiere (Sage No. LVII) und sein Ansinnen illustrieren in bezeichnender Form die Widersinnigkeit einer würdelosen Scheinautorität.

Bei der Beurteilung der geistigen Höhe eines Volkes scheint mir gerade in den Anfangsstadien einer ungeschriebenen Literatur die Form der Darstellung ebenso viel wie der Inhalt zu wiegen. Man wird sehen, daß der Hottentott nie vorgreifend mit einem alles enthaltenden abstrakten Eigenschaftswort einen Charakter oder eine Situation in seiner Erzählung von vornherein festlegt. Nie sprach einer der Hottentotten, der mir erzählte,

von „einer einfältigen, alten Hyäne", wie Bleek es tut, nie handelt ein Tier „aus Boswilligkeit" etc. — Der Hottentott entwickelt vielmehr die Situation, läßt uns die Tiere im Zwiegespräch belauschen und vor unseren Augen handeln, daß sie selbst zeigen, was Geistes Kinder sie sind.

Daß in den Erzählungen eines Hirten- und Jägervolkes Tiere eine Hauptrolle spielen, ist nicht wunderbar. Aber man darf darum noch nicht von „Fabeln" reden. Was man in den Tiersagen der Hottentotten nach Analogie äußerlich verwandter einheimischer Dichtungen als moralische Lehre gesucht hat und gefunden zu haben glaubte, ist in der Mehrzahl der Fälle nichts anderes als der Ausdruck einer reflexionslosen, nichts weniger als moralisierenden Empfindung: Haß gegen den Unterdrücker — nicht Lob der Nächstenliebe (Sage LIX), Spott über schwächliche Anmaßung — nicht Lob der Selbsterkenntnis und Bescheidenheit (Sage LVII), Schadenfreude über das Mißgeschick eines alten Betrügers (Sage XLII) — nicht Abscheu vor Lügen. List und Betrug feiern ja in anderem Zusammenhang Triumphe! Wo zartere Empfindungen mitspielen, wie Geschwisterliebe (Sage LVIII), Mutterschmerz (Sage LI), Freundestreue (Sage XXVI), steht die Schilderung in ihrer Naivität hoch über jedem dozierenden Hintergedanken. Auf erotischem Gebiet läßt die Phantasie mit ihren zuweilen bizarren Ausschweifungen (Sage XLIX) vollends keinen Platz für den Sittenrichter.

Wenn daher Bleek von den Tier-Erzählungen der Hottentotten sagt: „Kinder sowohl als auch Erwachsene, die schlichten Sinnes geblieben sind und deren Geschmack nicht durch das Gift überreizender Lektüre verdorben ist, werden sich stets an den artig ausgedrückten moralischen Lehren erfreuen, die sie durch eine jede gute Fabel erhalten; und der tiefer gehende Literaturfreund wird sich gleichfalls an diesen ersten unschuldigen Spielen der erwachenden menschlichen Phantasie ergötzen. Allen solchen werden die hier gebotenen Hottentotten-Fabeln wohl nicht unwillkommen sein" etc. etc., so sehe ich nur drei Möglichkeiten der Erklärung: Entweder die Übersetzung ist unrein. Oder die Manuskripte enthalten nur eine Auswahl solcher Erzählungen, die bestimmten Anforderungen christlicher Moral genügen. Oder der Hottentott, dieser raffinierte Menschenkenner, hat seine Fabeln, wohlwissend, wem er sie erzählte, von vornherein in diesem Sinne stilisiert. Wie dem auch sei, die Sagenreferate Bleeks zeigen mir den Hottentotten nicht, wie ich ihn kennen gelernt habe; ich nehme deshalb und weil ich aus der Quelle schöpfen konnte, im Einzelnen nicht weiter Bezug auf

sie. Dagegen lassen die Übersetzungen des Missionars J. Olpp[88]) überall Naturtreue und ein Verständnis erkennen, wie es nun einmal ausschließlich der intime Verkehr mit dem Volk selbst zeitigen kann.

An dem autochthonen Ursprung der im folgenden mitzuteilenden Erzählungen ist in zwei Fällen sicher zu zweifeln: Die Erzählung XLVIII erinnert im Gang der Handlung an eine Wolofische Sage, die Bollat mitgeteilt und Bleek übersetzt hat. Der Schakal der Hottentotten ist hier durch den Elephanten, die Schlange durch die Hyäne, das Stachelschwein durch einen Ochsen, der Stein durch eine Grube vertreten; aber die Rollen jeder einzelnen Person sind ihrem Sinne nach in beiden Fällen die gleichen. Ferner stimmt die Erzählung der kleinen Tauschhändler (No. XII) in mehreren Einzelheiten mit einem Märchen der Herero überein, das J. Rath in der Ursprache aufgezeichnet und wiederum Bleek aus dem Manuskript übersetzt hat. Welchem Volk hier die Priorität gebührt, wage ich nicht zu entscheiden.

Im übrigen kann ich hier nur was ich dem Munde der Hottentotten abgelauscht habe, wortgetreu wiedergeben und muß die Frage, ob und welche Anklänge die hier mitgeteilten Sagen an die Sagenkreise anderer Völker erkennen lassen, Andere beantworten lassen. Der exakte Nachweis von Entlehnungen scheint mir gegebenenfalls als ein Lichtblick in die dunkle Vorgeschichte der hottentottischen Rasse nicht minder interessant als eine Bestätigung der Originalität der Sagen zu sein.

Von der Überzeugung ausgehend, daß für das Verständnis der Geistestätigkeit gerade eines tiefstehenden Volkes die Art seiner Begriffsbildung und die Regeln, nach denen es die Begriffe zu Vorstellungen und Urteilen kombiniert, grundlegend sind, habe ich jedem Text eine vokabular-grammatische Erläuterung beigegeben; sie soll den Leser gleichzeitig in den Stand setzen, die Übersetzung Wort für Wort zu kontrollieren. Denn diese Texte sollen Urkunden des Hottentottengeistes sein, die entziffert werden wollen. Wer zur ersten Übersicht eine Erzählung in zusammenhängendem Deutsch lesen will, wird sich bald daran gewöhnen, über die kursiv gesetzten und eingeklammerten Erklärungen hinweg dem deutschen Text im Zusammenhang zu folgen.

In rein sprachlicher Beziehung sind den Texten noch folgende Bemerkungen vorauszuschicken:

Der Schakal wie der Pavian figurieren in den Erzählungen vielfach als mit einem Sprachfehler behaftet und erzielen allein damit schon einen Lacherfolg beim hottentottischen Zuhörer. Entweder läßt man diese Tiere (wenn

man sie zu komischen Figuren stempeln will) überhaupt keine Schnalzlaute zustande bringen, sondern mit regellos unartikulierten Lauten die betreffenden Worte radebrechen, oder läßt in ganzen Sätzen einen und denselben Schnalzer, gleichgültig ob an rechter oder unrechter Stelle, wiederholen. Solche absichtlich verkehrten Stellen habe ich mir stets in korrektem Nama wiederholen lassen und gebe sie hier in dieser Form wieder.

Um in den Text-Analysen Wiederholungen, wo es ohne der Deutlichkeit zu schaden, angeht, zu vermeiden, seien folgende Punkte hier ein für allemal im voraus erledigt:

a) Das Subjekt wird im Hottentottischen häufig (siehe z. B. die Sage XVI) nur durch die Personalsuffixe der 3. Person angedeutet. Wo sich ein entsprechender Behelf mit Fürwörtern als unklar oder umständlich erwies, wurde in der Übersetzung meist ohne weiteres das Hauptwort des vorhergehenden Satzes wiederholt. Die Personalsuffixe der 3. Person lauten im Nominativ:

	Singular.	Dual.	Plural.
Masculinum	*-b, -l* (hinter *m* u. *n*)	*-kχâ*	*-gu*
euphonisch	*-bâ, -â*		*-gu*
Femininum	*-s*	*-ra*	*-ti*
euphonisch	*-sa*		*-te*
Commune	*-l*	*-ra* (♂ u. ♀)	*-n*
euphonisch	*-le*		*-na*

b) Die häufigsten Hilfszeitworte, auch Verbalpartikel genannt, sind:

i in allgemeinster Anwendung.

a und *gye*, alleinstehend, bezeichnen die Gegenwart.

go und *gye gye* bezeichnen die nähere und die weiter zurückliegende Vergangenheit.

ni bezeichnet die Zukunft.

ra (euphonisch *ta*) kennzeichnet eine fortschreitende Handlung.

hâ einen Zustand.

c) Eine Einführung der direkten Rede wird im Hottentottischen vielfach nur durch *tsi* mit angehängtem Personalsuffix des Redenden gegeben. Am Ende der Rede stehen dann die Worte *ti go mi*, d. h. „so sagte er" (sie, es etc.). In der Übersetzung werden diese Worte meist besser voran gestellt, oft mit dem Hauptwort, nicht bloß dem Fürwort, als Subjekt.

d) Die alltäglichen Konjunktionen *o* und *tsi* habe ich je nach dem Zusammenhang mit: und, nun, dann, darauf etc. übersetzt.

Wo der Hottentott eine Anzahl Gegenstände oder Personen aufzählt (und seien es nur zwei), so fügt er stets am Schluß, zusammenfassend, die Konjunktion *tsĭ* mit dem Personalsuffix der aufgezählten Personen im Dual oder Plural und im mascul., fem. oder commune an. Also: *ǂgîrib tsĭ ǂami tsĭ thîras tsĭna*, d. h.: Der Schakal und der Löwe und die Hyäne und sie. Diese Zusammenfassungsfloskel habe ich in der Übersetzung nicht wiedergegeben.

e) Eine Eigentümlichkeit des hottentottischen Erzählungsstils schlage ich vor als Passivum narrativum zu bezeichnen. Statt zu sagen *tsĭs gye go ǂnā*, d. h. „und sie tanzte", sagt der Hottentott im Zusammenhange der Erzählung gern: *tsĭ gye go ǂnāhe (-he*, Passivendung*)*, d. h. „und es wurde getanzt", wobei das Subjekt des vorhergehenden Satzes (obwohl im Passivsatz selbst durch kein Suffix angedeutet) doch mit aller Bestimmtheit persönlich vorgestellt wird.

Stellt das Subjekt des Satzes ein Hauptwort dar, so folgt ihm in passivisch-narrativer Konstruktion häufig (aber nicht immer!) das Wort *ǂa*. Man kann in diesem Fall *ǂa* als das Verhältniswort „von" ansehen und würde demnach den Satz: *ǂgôati ǂa i gye gye sarihe* wörtlich übersetzen: „Von den Mädchen wurde spazieren gegangen". Wo aber dieses *ǂa* wegfallen kann und durch ein demonstratives Personalsuffix ersetzt wird, da ist auch diese notdürftig-formale Angleichung des Deutschen und Hottentottischen nicht möglich.

Ich habe alle Konstruktionen des Passivum narrativum in aktivischer Ausdrucksweise mit bestimmtem Subjekt übersetzt.

f) In eckige Klammern [] sind die Worte der Übersetzung geschlossen, die zu besserem Verständnis oder zur Vermeidung unnötiger Härten in die Übersetzung eingefügt wurden, ohne daß ihnen ein eigenes Wort im hottentottischen Text entspräche.

Die Sagen der Hottentotten lassen sich in fünf Gruppen ordnen:

a) Abenteuer in der Wildnis.

Weit im Innern des Landes lebt in der Sagenwelt ein Fabelwesen, das die Hottentotten **tsi(gd/mārǂab* nennen, weil es seine Augen *(mārti)* nicht im Gesicht, sondern auf dem Rücken *(/gd/b)* der Füße *(satti)* hat. Das Wesen wird in menschenähnlicher Gestalt, aufrecht gehend, also mit himmelwärts gerichteten Augen, gedacht. Will es sehen, was auf der Erde vorgeht, muß es sich vierfüßig, vorn auf die gestreckten Arme, hinten auf

die Kniee niederlegen; dann hebt es das eine Knie hoch und beugt es so weit es kann, bis der Fußrücken mit dem Auge horizontal rückwärts sieht. Diese Fabelwesen leben gesellig beisammen und machen auf Menschen, die sie für Zebras halten, Jagd, um sie mit ihren fingerlangen, spitzen, raubtiergebißartig ineinandergreifenden Zähnen zu zerfleischen. Sie werden daher auch **kχoĕ-oren* genannt (*kχoëb* Mensch, **o-re* hinlaufen um den eingescharrten Raub zu fressen). Das Menschenfresser-Weib führt noch besonders den Eigennamen **ǂgaũ-ǂbes*. In den Abenteuern mit dem Aigamucha-Volk (Sage I bis VI) hält sich der Hottentott im Einzelnen nicht streng an die oben genannten Charaktere, die er diesen Menschenfressern gibt; er läßt sie meist so menschenähnlich auftreten, daß sie ihre Opfer über ihre wahre Natur so lange täuschen können bis ein Entrinnen unmöglich scheint. Die Entdeckung der Fußaugen des *Aigamuchab* ist des Schakals Verdienst (Sage VI).

Die mannigfachen Erlebnisse auf der Wanderschaft (Sage VII bis XII) sind ohne Kommentar verständlich.

Jagdabenteuer (Sage XIII und XIV), die als volkstümliche Sagen beachtet zu werden verdienten, sind mir nur wenige zu Ohren gekommen. Das eine Jagdabenteuer (Sage XIV) knüpft an den Namen des *ǂgu-rikχoĕseb* an, jenes „Einzig-Menschen“[**], der als Erster seinesgleichen die Erde bewohnte.

Ich begegnete unter Hottentotten einer anderen, vielleicht erst später entstandenen Auffassung des *ǂgu-rikχoĕseb:* Er wurde mir als Jäger bezeichnet, der allein mit seiner Frau und seinen Hunden in der Wildnis hause; man würde ihn dann als einen, der sich allein abseits angesiedelt hat, kurzweg den „Einsiedler“ nennen. Das Wort *ǂgu-rikχoĕseb* wäre dann analog dem Worte *ǂgu-riseb* gebildet, einer Bezeichnung für den einzeln lebenden, aus der Herde ausgestoßenen Springbock-Ramm.

Übersetzung von I.

Die Mädchen, die zur Werft der Aigamucha-Frau spazieren gehen.

Mädchen *(ǃgōati Töchter)* gingen zur *(ǁga)* Werft der Aigamucha-Frau spazieren *(sari, i. pass. narrativ.)*; und als sie hinkamen *(sī, m. d. Pers. suff. d. Subj.)*, ist eines *(ǃgui)* von ihnen *(ein Mensch kχoĭs, fem.)* schwanger *(ǃgom)*; das wird von *(χa)* der Aigamucha-Frau so angeredet *(mī sagen)*: „Komm *(ǃkχī)*, laß dich *(wörtl.: und ĕ [imperativisch], ich -ta, knete dich -si)* kneten!" *(ǃguri, s. Hautpflege, S. 207, 215)*. Und sie wird geknetet. Dann wurde ihr *(ū, Stamm d. pron. poss., -sa Pers. suff. d. Besitzerin)* Vorschurz *(ǃgaĕb)* mit *(ǃkχa)* dem Vorschurz jener *(ǁ(e)ĭs, pron. pers.)* zusammengebunden *(ǃgai binden, ǁare vereinigen)*, und die anderen *(hier nur durch d. Pers. suff. ausgedr.)* gingen heim *(ǂaru, verb.)*.

Das eine *(nau, wörtl.: andere)* Mädchen aber wurde festgehalten *(ǃkχō fangen, maī hinstellen)* und ihr geheißen *(gai)*, sich zu legen *(ǁgoĕ)*, und sie legte sich. Da wird [ihr] das Steißbein *(Spitze ǂams, des Gesäßes ǂare-)* abgeschnitten *(ǃgao ǁnā)* und das Fett ausgebraten *(aira)**). Dann setzte *(ǂnūl)* die Frau die Fettstückchen *(gaub Fett, -ro,*

*) Das Folgende ist alles in der Form des passiv. narrativum ausgedrückt. Man könnte das echte Passivum hier eingewandt sehen, wenn nicht die Formen *ǂnūlhe* und *bēhe* für das erstere entschieden. In der Übersetzung werden diese Perioden hier wieder aktivisch, mit bestimmtem Subjekt wiedergegeben.

Dimin.) einzeln *(ǃgui ǃguibe)* in *(ǃna)* Schildkrötenschalen *(ǃgabiti)* und goß *(ǂnā)* den Schmalz *(ǂnuina, comm. plur.)* darüber *(ai)* und stellte *(mal)* sie hintereinander *(saogu)* in *(am ǃna)* den Weg *(daob)*, den ihre Söhne *(angedeutet durch das Suff. d. 3. pers. plur. -gu)* kommen mußten *(nī, Verb. part. d. Fut.)*. Dann tanzte *(ǂnā)* sie und [sang]: „Wer *(-ba Suff. d. 3. pers. sing. masc.)* zu Haus *(ǃhaĩs Werft, ai in)* bleibt *(hā)* [macht] trotzdem *(χabe)* einen Speise-Fund!“ *(ǂūba hōs)*. So *(tumi)* tanzte sie davon *(bē)*. Als aber die Frau davongegangen war, nimmt *(ǁī)* [das Mädchen] einen Stein *(ǃuiba)* und legt *(ǁgui)* ihn hin, wo *(-ba)* sie gelegen hatte, und läuft weg.

Da kamen [die Söhne] herzu wo die Schildkrötenschalen standen *(mā)*, leerten *(abu)* sie und eilten *(ǃkχoē)* heran. Und die Frau kommt [ihnen] entgegen *(ais ai)*. Der Stein aber, so *(ti)* denkt *(ǂaī)* sie, ist das Mädchen, und als sie die Söhne*) herankommen *(ǃgoaχa)* sah *(mū)*, deckt *(ǃgū ǃgā)* sie [ihn noch mehr] zu. Und sie kamen. Da sagte sie zu dem einen: „Nimm das Beil *(ǃōsa)* und *(ē, mit d. Suff. d. 2. pers. sing. masc., -ts)* lüfte *(ǃhui)* die Decken *(ǂnamte)* da *(ǁnā)* und zerhau *(ǁhā)* das Ding *(χūē, comm. sing.)*, das da *(ǁnāba)* liegt!“ Und er haute zu, doch die Schärfe *(am ǃnaba Mundteil)* des Beils zerbrach *(*kχōia)*. Da sagte er: „Wie *(matisa)* ist das, Mutter?“ *(ais)*. Und sie erwiderte: „Das [ist] kein *(toma nicht, I, Suff. d. 3. pers. sing. comm.)* Ding, das so *(ti)* klingen *(*ǃnaū)* soll *(nī, verb. part. d. futur.)* [wenn es] redet“ *(mī)*. Da entblößten sie es und sahen, daß *(ǃkχaiē)* es ein Stein war. Dann töteten *(ǃgam)* sie die Frau *(tarasa)* sogleich *(ǂūse)* und fraßen *(ō)* sie auf.

Übersetzung von II.

Die beiden Frauen, die von Aigamuchab mitgenommen wurden.

Und es begab sich so (*wurde gemacht hīhe*): Zwei (*ǀgam*) Frauen (*kχoēra*) hatten sich verirrt (*ǀkχoē eilen, ǂari verlieren*). Und sie kamen (*ǀkχī*) an (*ai*) die Stelle (*ǀkχaib*), wo Aigamuchab Rindenkost (*ǂūna, comm. plur.*)*) abschlug (*ǂhā, ta = ra*). Da [riefen] sie: „[Du] Mensch, der (*-ē Suff. 3. pers. sing. comm.*) da (*nēba*) hämmert (*ǀgōǀgō*), nimm (*ū*) uns**) zur (*ǂga*) Werft!" (*ǂgaûs, S. 232*).

Da sah (*gō*) Aigamuchab auf und sagt: „Laß (*ha*) mich (*-te*) dir (*si*) die Werft zeigen!" (*ǂgau*). Und sie gingen. Aber die fette (*gausa*) Frau bleibt (*hā*) zurück (*kχaus ai*); derart (*ǂnā tumi*) gehen die beiden hin (*bē*), gehen [immer weiter], doch die eine (*nau*) Frau kehrt um (*oa*).

So sieht (*mū*) der Mann [Aigamuchab], als (*o-*) er zurückschaut, nur eine (*ǀgui*) einzige (*ǀguisa*) Frau. Da fragt (*tī*) er, und die

*) Die glatte, glänzende, gelbliche, innerste Faserschicht der Rinde des Dornbaumes, die südlich schmeckt, ausgezogen und dann zu Seick gedreht wird.

**) Wörtlich: „einer", *kχoēē* — Rasch im comm. sing., unserem „man" entsprechend. Diese unbestimmte Ausdrucksweise wird dem persönlichen Fürwort der 1. pers. vorgezogen, wenn die Bitte, wie einem Fremden gegenüber, ehrerbietig sein will. In dieser Form bittet ich Fremde Hottentotten um Tabak bitten.

Frau [antwortet]: „Ich weiß nicht *(ūta)*, sie ist zurückgeblieben." Er aber [fluchte]: „Komm vorbei, *(hā ī)* du *(-sa)* Kind *(ōas)* der großen *(gaib)* Schmutzkrustenscham! *(ǃgarab männl. Scham, vgl. S. 320).* Zwillings-Pack *(ǃgēǃgōab Zwilling. χūba Ding, verächtlich)* soll doch wohl *(gom---o)* miteinander gehen!" *(sao folgen, -gu Reciprocalpartikel).*

Dann kamen *(sī)* sie zur *(doba)* Werft des*) Aigamuchab. Und als *(o)* er ankam, sagte er: „Was? *(tareč)* Niemals *(huga von jeher, toma nicht)* wird das Ding schmecken! *(ūkχoa).* Schneidet [ihr] *(ǃgao)* die Kehle *(tomi)* ab! *(-χa).* Laß *(ē und, imperat.)* uns *(-gye)* [wenigstens] die Suppe *(surosa)* [davon] schlürfen!" *(ǃhum)* so rief er:

Da ergriffen *(ǃkχŏ)* sie *(-gu)* sie *(si)*, schnitten ihr die Kehle ab. Und als sie sich *(s(e)n)* bescheißt *(χau)*, rufen sie: „Fangt auf *(χaba)* das Hinterloch-Fett!" *(tsoaunuiba, euphem. Bezeichnung für Kot.)* Und sie fressen *(ŏ)* sie auf *(toa beenden).*

Er aber suchte die Spur; *(stand mā, auf ai, ihrem Fuß taib)* und er kommt dahin, findet die Fährte *(daoba)*, nimmt sie auf *(ǃkχŏ)* und holt die Frau ein *(sao folgen, sī hinkommen, ūare zusammenkommen).* Da gab die Frau einen fauligen *(tsau weich)* Gestank *(ūŏ, verb.)* von sich, [als ob] sie von selbst in Verwesung zerfiele *(°nora)* wenn *(?)* er sie finge. Er aber sagt: „[Du] stinkst süß, *(ǂkχun)* du *(-s in ǂguis)* wirst gerade in *(ǃna)* meinen *(ti)* Topf *(sūs)* hineingehen, *(ǂgū)* so *(kχoma)* riecht *(tsā schmecken)* es!"

Und er sucht *(ōa)* eilig *(ǃkχoĕ, verb.)* den Topf. Da steht die Frau auf *(kχaī)* und entflieht**) nach Hause *(ūaru heimkehren).* Und während die Frau enteilte, kommt *(ǃkχī)* er [mit] dem Topf angeschleppt *(ǃkχara)*, kommt herzu *(hā)* und sieht enttäuscht *(ǂkχui vermissen)* drein und rief: „Süßstinkchen, wo *(maba)* bist du hingegangen?" *(ī).* So *(tumi)* [trug es sich zu].

Übersetzung von III.

Die Menschenfresserin, die eine Tochter hatte.

Die Menschenfresserin *(kχoē-oresi)**) hatte (*passivisch und genetisch ausgedrückt: Übernehmen od. bekommen, hā bleiben, i drückt mit hā einen Zustand i. d. Verg. aus*) eine Tochter, [hatte auch] Vieh *(ǂgoan)* und sie hütete *(ǂūi)* das Vieh. Und Männer stellen sich ein *(ǂkχī)* um *(nī drückt die Absicht, ga die Möglichkeit aus)* die Tochter (*dem Pers. suff. des Obj. ist das des Subj., -ga, angehängt*) zu heiraten *(ǂgame)*. Sie aber kommt *(hā)*, wenn *(o)* die Männer schlafen *(ǂom)*, und erschlägt sie *(ǂhāǂan, m. d. Pers. suff. d. Obj.)*.

Da brach eines Tags *(ǂgui tsē)* ein Mann auf *(ǂgūng verb.)*, der (*wörtl.: nachdem er, -tsī part. d. partic. praeter.*) zwei Löwenhündinnen *(χam-arira)* mit sich genommen hatte, auch einen Stein *(ǂuiba)* nahm er und legte *(ǂgui)* ihn an *(ai)* die Stelle *(ǂkχais)*, wo er *(ǂ(e)īb)* sich selbst hinlegen wollte. Und während *(hā)* er wartete, kam sie und schlachtete *(ǂō)* ihm *(bi, Suff.)* zu Liebe *(-ba)*. Dann gingen sie schlafen. Sie aber kommt Nachts *(tsūχuba)* mit (*wörtl.: genommen habend*) dem Beil *(ǂōba)*. Doch die Hündinnen wehren *(ǂkχai)* sie ab. Und während die Hunde sie so *(ǂnāti)* zurückjagen, erwachte *(ǂkχai)* der Mann, nahm den Stein, legte ihn an die Stelle, wo er selbst gelegen hatte, und entfloh *(bē)*.

---

*) Das *-i* in *oresi* ist Determ.-Wurzel, die gelegentlich auch dem Suff. der 3. pers. sing. masc. *-b*, angehängt wird. Dieses *-i* wird in der Erzählung häufig durch die Wurzel *gē* ersetzt.

Nun kam sie und ging daran *(ǂhā herkommen)*, den Stein zu zerhacken. Dann eilte *(ǀkχoĕ)* sie hinter *(ǀgon)* ihm her und holte ihn ein *(sao folgen, ǂare zusammenkommen)*. Er aber kletterte *(ǀaba)* auf einen Baum *(hais)*. Da kappte sie *(ǂhą̄ ǂnā)* die Äste *(ǂnaūga)* mit *(ǀkχa)* dem Beil. Als *(o)* aber nur noch ein einziger *(ǂgui/guib)* Ast übrig war *(ǀgau)*, winkte *(ǂgui rufen)* er den beiden Hunden mit dem Schweißfeger *(ǀnabes-s. Hautpflege S. 211)*, und die Hunde kamen herzu und fingen *(*/kχō)* sie.

Da entfloh der Mann, und als er in seine Werft *(ǂgaūs)* kam *(sī)*, schlachtete er drei *(ǀnona)* Kühe *(gomate)*. Als aber die Hunde daran gingen, an *(doba)* der dritten *(ǀnona ǂ(e)ĭs)* Kuh zu fressen *(ō)*, schlug er sie tot*) *(ǂnoaǀan)*.

Das Mädchen, das in die Busch-Springer heiratet.

Ein Mädchen *(ǂgõas Tochter)* hatte in *(ǂna)* das Volk *(ǂhaos)* der Busch- *(hai)* Springer*) *(uri, verb.)* geheiratet *(ǂgame, i. pass. narr.)* und zog fort *(ǂã Übersiedeln d. Mädchens aus dem Elternhaus i. d. Wohnort des Mannes);* und die beiden *(-ra, Suff. d. 3. pers. dual. masc.-fem.)* kamen *(sī)* zur *(ai)* Werft *(ǂgaĩs)* des Mannes *(kχoĩb).*

Und als *(tsī in hãtsĩti, Participialconstr.)* sie *(-s in tsīs)* einige Tage *(tsẽĩ)* [dort] ist *(hã bleiben),* holten die Buschspringer-Frauen *(angedeutet durch -ti in hãtsĩti)* Wasser *(ǂgama, verb.)* eines Tages *(ǂgui tsẽ):* Da sprangen sie [über] die Büsche und kamen zu schöpfen *(ǂuri).* Dann, als *(o)* sie fertig *(toa aufhören)* geschöpft hatten *(tsĩ, Part. d. partic. praeteriti)* und umkehrten *(oa),* springen sie wieder *(ǂkχaba)* heran *(ǂgoaχa, verb.)* und kommen *(hã)* hergesprungen und sagen *(mĩ, mit objectivir. part. -ba)* dem Manne: „Um deiner *(tsa, Stamm d. pron. person. 2. pers., unter Weglassung der Genitivpartikel di als pron. possess. gebraucht)* Frau *(ǂaras)* willen, mit der du *(sãtsa, volle Form d. pron.*

*) Ein Volk von Sagenwesen, die nicht zwischen den Büschen gehen, sondern in hohen Sprüngen mühelos über sie hinwegsetzen.

pers. 2. pers. masc.) verheiratet bist, um *(ǀama)* ihretwillen *(ū(e)ts, prou. pers. 3. pers. sing. fem.)* wirst du *(-ts, Suff. d. 2. pers. sing. masc., nī verb. part. d. fut., beide zu tsī verschmolzen)* noch umkommen!"*) *(ūb)*. So sagten sie.

Da fing *(ǂkχō)* er sie *(si)* und ihre *(ū, Wurzel d. pron. possess. wird mit d. Pers.-Suff. d. Besitzers zum vollen pronom. possess.)* beiden *(-kχa, Suff. dual. masc.)* Unterschenkelknochen *(ǀhai sich eilen, ǂkχōb Knochen)* schlachtete *(sū)* er aus *(tui)* und zwei Giraffen- *(ǀnaīb)* Felle *(kχūra, dual. fem.)* und Chena-Dornen (*collectivisch m. d. Suff. d. masc. sing.*), all die Sachen *(tsī und, -na Suff. comm. plur.)* gab *(mā)* er ihr. Dann trug *(tani)* ihre Tochter die beiden Felle und sie trug die Dornen. Und sie gingen und gingen bis Sonnenuntergang *(soresgū)*. Dann machten sie Halt *(tsī kinkommen)* und schliefen *(som)*. Als der Morgen *(ǂgoasa)* anbricht *(ǂgoa)* sehen sie einen Löwen *(χama)* herankommen *(ǀgoaχa)*. Da ließen *(ūnā)* sie ein Giraffenfell fallen *(χu liegen lassen)* und gingen. Und als [es] der Löwe fertig gefressen *(ō)* hatte, setzte er [ihnen] wieder nach *(ǀgōa ǀgūng)*. Und sie sahen ihn *(-bi Suff.)* ankommen und ließen wieder ein Giraffenfell fallen und gingen. Dann liefen sie fort, aber als er [es] fertig verschlungen hatte *(tsī, part. d. particip. praeter.)*, kam er heran. Sie aber sahen ihn wieder ankommen und ließen die Chena-Dornen fallen und gingen. Und während *(hīa)* er dort *(ūnāba, mit Pers.-Suff. d. Subj.)* steht *(mā)*, die Dornen sich auszuziehen *(ǀora, mit reflexiv. part. s(e)n)*, kommen sie zu einem Fels *(ǂuib)* und sagen: „Du *(-tse)* Stein *(ǂui-)* meiner *(ti)* Ahnen *(ǂnoaχan)*, eine große *(gai)* Rotte *(ǂgūs)* ist hinter mir *(ǂgū te)* im Anmarsch *(ǀgoaχa)*, darum *(χuigye)* öffne *(ǂū)* mir *(te, -ba)* deine Flanken *(?)* doch!" *(re)*. Da öffnete sich *(ǂkχoba ams(e)n)* der Fels und sie gingen *(ī)* [hindurch]. Dann kam der Löwe hintennach *(kχaos ai)* und sagte: „Du Stein meiner Ahnen, eine große Rotte ist hinter mir im Anmarsch, darum öffne mir doch deine Flanken!"

Da öffnete sich der Fels nur *(ǂgui einzig)* ein ganz klein wenig *(ǂkχari klein, -ro Diminutiv-, -si Adverbialendung)* und sobald *(°ǂnuin ai)* [der Löwe] mit *(ǂkχa)* dem Nacken *(ǀaos)* eben hereintritt *(wörtl.:*

*) Weil sie nicht springen kann und es, als sie für gebärig, im Falle einer Verfolgung leicht stranchelnd wäre.

nî im Begriff ist, °igui ti gô wie eins zu sehen, d. h. in gleicher Flucht zu sein scil. mit der Felsöffnung), schließt er sich *(igan ama(e)n)*. Da hüpfte *(jai)* sein *(ûba)* Kopf *(tanas)* allein *(iguri)* und dort verendete er.

Und die Frau kam nach Haus *(saru, verb.)*. Da wurde ihr *(durch d. objectivir. Part. -ba ausgedr.)* ein Kalb *(tsaûba)* geschlachtet *(sâ)* und [dessen] beide Unterschenkelknochen [ihr] eingesetzt *(igû)*. Dann setzte *(snâ)* sie sich [ruhig] hin und als sie geheilt *(saru)* war, wurde sie zu *(iga)* den Kälbern laufen *(ikxoê)* gelassen *(gai)*. Da aber brach *(°tson)* sie in einem Bein *(insê)* zusammen. Da ließ man sie wieder ruhig sitzen und sie setzte sich. Darauf wurde sie wieder laufen gelassen. Da brach sie nicht zusammen und war gesund *(igau)*.

Übersetzung von VIII.

Die Mädchen, die in die Garabeeren gingen.

Mädchen gingen *(ŋgûng, 3. pass. narr.)* nach *(ŋga)* Garabeeren *(comm. plur.)*, und sie kamen *(ti)* hin und pflückten *(hare)*. Doch alle *(hoaîs = -ti)* anderen *(°saoti)* pflückten saure *(ekxara)* Beeren *(-hâ, collectivischer Suff. masc. sing.)* und nur eines *(ŋgoî)* der Mädchen pflückte gute *(ŋgoî)* Beeren. Und als *(o)* es Abend wurde *(mî)*, gingen sie heim und während *(hâa)* die Sonne *(sares)* untergeht *(ŋgâ, lit hinter ? ausgeh. für ris)*, sagen sie: „Laßt *(hî)* uns *(-si, Suff. 1. pers. plur. fem. im Dat.-Acc.)* doch *(o)* die Beeren kosten" *(hâ tsâ)*, und kosteten die Beeren. Und aller *(di, Genitivpart.)* Beeren sind *(ŋa Praesenspart.)* sauer. Da sagen sie zu der *(-sa, Pers. suff. im Akk.)*, die da *(mâ)* süße *(ekxam)* Beeren hatte *(ŋ nehmen, hâ, Part., einen Zustand ausdr.)*: „Deine *(ta, Stamm der pron. pers. 2. pers., unter Weglassung der Genitivpartikel di als pron. possess. gebraucht)* Beeren sind nicht gut, darum *(gnigye)* kehr um *(oa)* und *(ŋ, mit d. Pers.-Suff. d. Subj.)* geh *(ti)* pflücken, wo *(-ha im harotha)* wir *(tsîs, pron. pers. 1. pers. fem. plur. exclusiv)* gepflückt haben!"

Da kehrte sie um und ging pflücken. Und Kot *(gumma)* war für *(-ha, objectiver Verh. part.)* sie geschissen worden[*], und als

[*] Um für den Zwischenkiefer zu schützen.

sie*) herzukam (hā), wo jene stehen geblieben waren (ī gehen, hā hinüber), rief (ŋui) sie. Da antwortete (aē) der Kot: „Hier!“ (°ha, allgemeine Antwort eines Angerufenen); so (ham) antwortet er, aber sie sieht (mā) bei alledem (ǂabe) Niemand (ǂkoē Mensch, sing. comm., tama nicht) und geht vorbei (ŋūŋ ī). Da kam sie hin, wo (adverb.: während hin) der Hase (ǂhm) saß (°mba) um Wasser zu schöpfen (ǂuri), und sagte: „Schöpfe (ǂkā) mir!“ (ha, verstärkt durch d. objectivir. -ha). Darauf der Hase: „Meines (hi) Großvaters (maob) und mein eigener (hīa, pron. pers., ich. Das Genitivverhältnis wird hier durch schlichte Anfügung des Besitzes an den Besitzer ausgedrückt), einzig (ŋui, mit dem Suff. d. 3. pers. dual. masc.-fem. -ŋ) unser beider (hī und, mit dem genannten Suff.) Schildkrötenbecher (ŋuhi der Rückenschild der Schildkröte) [ist das]“, so sagte er Da entriß (ā nehmen, ihama rauben) sie ihm (-si, Suff. fem., auf ihn bez.) den Becher und trank (ā).

Der Hase aber eilte (ǂkoē) zum Löwen**) und sagte: „Mein Großvater, wenn (a) ich (-ha, Suff.) dir (-ti, Suff. 2. pers. masc. sing. i. Dat.-Acc.) wohl (ga, Concessivpart.) melde (mība), was (ǂhī) ich (hīa pron. pers.) gesehen habe, wirst du (-ti Suff. 2. pers. masc. sing., al Verb. part. d. fut., beides kontrahiert zu ti) mir (-ti Suff.) einen Vorschurz (ŋum ŋuiti) und einen Hinterschurz (ŋum ŋūi), die beiden, anfertigen?“ (ŋuru, mit obj. Part. -hu). Darauf sagte jener: „Ich werde [sie] dir anfertigen.“ Darauf [der Hase]: „Während ich sage, daß der Schildkrötenbecher der meines Großvaters und mein eigener, einzig der von uns beiden ist, ist [mir] der Becher entrissen worden.“ Da eilte [der Löwe] fort und holte das Mädchen (durch d. Pers.-Suff. -si ausgedr.) ein (hā kommen, nun hinübergehen, nun zusammenkommen). Und die beiden jagten sich im Kreis (ǂkoē und ihama) um einen Baum (ǂuiŋ). Da fiel (ǂnā) der Löwe und sie warf sich (adverb.: setzte sich auf) auf (ai) ihn (-hi, Suff.). Er aber rief: „Steh (ǂkui) mir auf, bitte!“ (-ro). Und sie stand ihm auf, und wieder jagten sich die beiden im Kreis. Da fiel das Mädchen (ǂkoēsa Mensch, fem.) und er warf sich auf sie. Sie aber rief: „Steh mir auf, bitte!“ Doch er sagte: „Kein Tag heute (ŋuna der Morgen) zum gegenseitig (-ga Reciprocal-, -he Adverbial-Part.) sich zu Liebe Auf-

*) Durch das vorhin. Pron.-Suff. -a in hā und hā eingeklammert. Das -a in ham (= ma) stammt aus hāhi = ma und entspricht der Wiederholung des Prädikats im Vordersatz.

**) „Kuib-Rücken“, gui ǂgūi, ander Sagenname der Tiere.

stehen!" und tötete sie. Dann zog er [ihr] die Haut *(kχôba)* ab *(thau ena)*, kroch *(tgû hineingehen)* in *(ina)* die Haut hinein und fraß *(ô)* das Mädchen und fraß fertig *(toa aufhören)* und ging.

Und er kam zur Werft *(tgaûs)* des Mädchens, zur Zeit als *(hâa)* die Kühe *(gomati)* gemolken *(tao)* wurden *(Passivendung he mit d. Pers.-Suff. d. Subj.)*, kam er hin. Und alle Milch *(daû, comm. sing.)*, die hingestellt *(mai)* wurde, trinkt er aus *(tkχabe)*. Da sagen die Leute: „Ei *(kχa)*, nie *(huga von jeher, toma nicht)* trinkt doch *(gomo)* das Mädchen so!" *(ti)*. Dann kam die Schlafen- *(nom)* Zeit *(taiba, nicht taiba wie auf S. 407)*. Und als *(ô)* er *(-b hinter tgû sich legen)* sich hinlegte, legte sich das jüngere Schwesterchen (*wörtl.: das junge tkχam, Töchterchen tgôaros*) dort *(anâba)* nahe *(tgûse, adv.)* zu *(doba)* ihm *ti(e)b, pron. pers.)* hin. Da tastet *(tsâ)* er nach dem Nabel *(tsuntsa)* der Kleinen [um hier die Kralle tödlich einzustechen], aber die Kleine stößt *(shâ)* seinen *(ã Wurzel des pron. poss., -ba Pers.-Suff. d. Besitzers)* Arm *(tôab)* fort *(bê)* und nachher *(tχga)* steht sie auf *(kχûi mâ)* und fragt *(ti)* bei der Mutter *(tgûs)* an: „Warum *(tarî tama)* ist denn *(gum - - - o)* diese nicht meine Schwester?" *(°ausi, Pers.-Suff. an die Negat.-Part. angehängt; s. übr. z. S. 301)*, so fragte sie. Darauf die Mutter: „Morgen *(tsri)* werde ich nachsehen, aber *(°hũ gye)* lege dich hierhin *(nîba)* [zu mir]."

Und die Sonne stieg hoch *(tgabi)* auf *(thai aufgehen)*, dann *(tgoasi)* lag er aber noch im Schlaf *(passivisch ausgedr.)*. Da entblößten *(thui aufdecken, tkχûb Leib)* [ihn] die Menschen, und als *(o mit d. Pers.-Suff. d. Subj. s. Nachsatz)* sie hinsahen *(gû)*, ist es ein Löwe. Da häuften *(tgubo)* sie Feuerholz *(taêna, comm. plur., nicht taina)* auf *(°tgû)* ihn und steckten [es] in Brand *(tkχû und thubi)*. Und das Herz *(tgoasa)* des [getöteten] Mädchens sprang *(uri)* hoch heraus *(noa)*. Da nahmen sie es und setzten *(tgû)* es in eine Kalabas *(obas)*. Dann gossen *(tai)* sie die Milch einer Jung-Mutterkuh*) hinein. Da wurde sie wieder jenes *(tnî, pron. dem.)* Mädchen, wurde lebendig *(tîtsaba)*.

Übersetzung von X.

Der Giraffenbaum, der die Menschen getötet hat.

Ein Giraffenbaum *(ŋgoaas, mit d. alten Demonst.-Part. -i)* hatte [schon manche] Menschen *(kγoāha, comm. plur.)* getötet *(ŋgam, i. pass. narr.)*. Da ritten *(ŋgaāi)* zwei Männer *(-kγa, Pers. suff. dual. masc.)* daher und sattelten dort *(naāha)* ab *(kamen zi, absolicia °are ŋgā)*. Und der eine *(ŋgui)* Mann schlief *(tam)*, der andere *(ŋgui, m. Pers.-Suff.)* aber blieb *(hā)* wach *(ikγai guri dabei sein etwa zu tun)*, und auf *(nama)* dem Rücken *(ŋgā)* liegend *(ŋgoē, mit d. Endg. d. particip. praet.)* betrachtete *(gi)* er [die Äste]. Da rührte sich *(gum)* der Giraffenbaum. Und der Mann *(durch d. Pers.-Suff. -b ausgedrückt)* nahm *(ā)* einen Dorn *(ikγāba)* und stach *(ikγā)* ihn. Da zuckte der Baum zusammen *(ŋgā auszudrücken)*. Der Mann aber hatte seinen Patronengurt *(ikγoasa)* in *(ai an)* den Giraffenbaum gehängt°). Nun nimmt er den Gurt herunter *(ā nau)*, der Baum aber ergreift *(°ikγi)* ihn *(hi, Pers.-Suff.)* am Patronengurt und faßt den Gurt.

Da sattelten die beiden auf *(°ŋgui ŋgā)* und ritten ab. Aber obschon *(ŋgabe)* sie davonritten *(hi, m. Pers.-Suff. d. Subj.)*, blieb der Giraffenbaum nahe *(ŋgāse)*, und während *(hāi)* er so *(ināā, m. d. Pers.-Suff. d. Subj., der Erzähler hebt den Arm so hoch er kann)* groß *(gui)* wird, kommt *(hā)* er über ihre *(ā, Wurzel d. pron. poss., mit d. Pers.-Suff. d. Besitzer)* Scheitel *(namǂnaā, masc. sing.)* und stürzt sich *(ŋgoē)* auf sie. Und den einen, der ihn dort *(ināā)* betrachtet hatte *(mā, ge Part. d. Praet. mit d. Pers.-Suff. d. Subj.)*, tötete der Baum samt *(ikγa)* seinem Pferd, der andere aber entkam *(ikγoē eilen, dā jem. sich rühren, eilig schnell sein, ai ist Objekt. d. Doppelwerbs, Pers.-Suff. auf ŋgoanse bezogen)*. Da ging der Baum zurück *(ao, verb.)*.

Dann kamen *(ikγi)* wiederum *(ikγaiha)* zwei Wagen *(ŋgaŋiru, dual. fem.)* und die Männer *(-ga, Pers.-Suff.)* spannten dort aus *(hāā nai)*.

°) *ŋgā* transcendere, *mail* agitare. *Mā* dando den heutigen Instrumentalis an, im Unterschiede wie *ŋgā* der Gen., *mā* den Indigitativ bezeichnend, nur mit dem Pluralgenetiv wiedergegeben.

Sobald *(igui, wörtl.: eins mit)* nun einer [der Wagen] fertig *(loo aufhören, m. Pers.-Suff.)* ausgespannt hatte *(-ti, Part. d. particip. praet. hinter M tun)*, zerteilten *(thi)* die Männer Fleisch *(igunî, comm. sing.)* beim Giraffenbaum. Da sahen sie Blut *(tsoba)* und ließen das Fleisch im Stich *(tsidzu)* und riefen: „Kommt, treibt die Ochsen *(gomagu)* heran *(ti nekmen)* und *(ti, imper.)* laßt uns *(-gye)* einspannen!" *(igui tsi)*. Dann spannten sie ein und fuhren ab *(tsari)*.

Doch der Giraffenbaum wurde groß, und als er genau *(°igui ti gû, wie eins zu sehen)* über ihren Scheiteln war, fiel *(tsi)* er auf sie. Und Wagen und Ochsen und Menschen, sie samt und sonders *(loo fertig machen)* tötete er.

Übersetzung von XII.

Die beiden Brüder, die Kälber ins Feld jagen.

Zwei *(ǂgum)* Knaben-Brüder *(aχa-ǂgũgukχa)* jagen *(ikχaĩ)* Kälber ins Feld. Da finden *(hã)* sie die Goas-Pflanze, und während sie da *(tsã)* mit *(ikχa)* der Goas-Pflanze sind *(hã bleiben u. Hilfszeitwort, einen Zustand ausdr.)*, trafen *(hã)* sie eine Frau *(ŋnaosa)*. Und die Frau gab *(mã)* ihnen *(kχã, Dat.-Acc. 3. pers. masc. dual.)* einen Pfriemen *(torosa, altmodische Bezeichnung für ŋamnaos, d. h. Nähspitze)* und nimmt *(ã)* die Goas-Pflanze. Dann gingen die beiden.

Und sie kommen *(tí)* zu *(doba)* einem Mann *(aob)*, dem Mann, der sich *(-s(e)m, Reflexiv-Verbalpartikel)* mit dem Glied *(ǂoab, eigentlich: was man verbirgt, ǂoa, d. h. penis)* einen Dorn auszieht *(ǂam)*. Da sagen *(hier nur durch das Hilfszeitwort gye angedeutet)* die beiden: „Wir *(sikχ(u)m, Exklusivform d. 1. pers. dual. masc.)* haben da *(Doppelverb.: ũ nehmen, hã bleiben)* einen Pfriemen, während Vater*) sich mit dem Glied einen Dorn auszieht." Und sie gaben dem Mann den Pfriemen, und der Mann gab ihnen einen Spazierstock *(tkχuibas(e)n haib, altmodische Aussprache des jetzt üblichen tgaibas(e)n haib)*.

Da kamen die beiden zu Knaben, die Honig *(daniba)* [aus einem Baumstumpf] mit einem Stein losschlugen *(tkam)*. Und die Knaben baten *(ŋgan)* die beiden um den Stock. Und sie gaben den Stock und bekamen *(mã gaben, ke Passivendung)* Honig. Dann gingen sie.

Da kamen sie zu Perlhühnern *(ikχinaĩ)*, die da *(°ha, Demonstrativpartikel d. Orts)* Feldzwiebeln *(ǂhoma)* aßen *(tã)*, und sagten:

*) Aus dem Hottentotischen und — ob. und dem Namaquanischen dadaĩ — Vater gebildet.

„Wir haben Honig, während ihr *(-so, Suff. d. 2. pers. fem. plur.)* Feldzwiebeln eßt." Darauf sagen jene: „Nun gib uns *(-se, Dat.-Acc. d. 2. pers. fem. plur.)* denn *(ǂnai)* doch!" *(-re)*. Da gaben ihnen *(ǁi)* die beiden und gingen fort. Jene aber hatten ihnen Federn *(ǁamga)* gegeben.

Da kamen die beiden zu Knaben, die mit Schaf- *(gǁ)* Haar *(ǂâb)* Pfeile befiederten *(°aguiri)* und [sagten]: „Wir haben Federn, und dennoch *(ǂabe)* befiedert ihr *(-go)* die Pfeile mit Schafhaar?" Darauf sagen jene: „Nun gib uns *(gye, Suff. d. 3. pers. plur. masc.)* denn doch!" Dann gingen die beiden, die Knaben aber hatten ihnen Milch *(ǂaina, comm. plur.)* gegeben.

Da kamen sie zu einer Mutterhündin *(tora gebären, aris Hündin)*, zu einer, die da Kot *(ǂaub)* frißt. Und sie sagten: „Wir haben Milch, während du Kot frißt." Darauf die Hündin: „So gebt mir *(-ke)* denn doch!" Da gaben ihr *(ki)* die beiden. Als *(o ra okya)* aber die Zeit *(saiba)*, da sie fortzugehen hatten *(ni, Verb.-Part. d. Fut.)*, gekommen war *(roll war, ros)*, da denken *(sai)* sie: Was *(ǂâi)* wird [uns] beiden gegeben werden? und [sagen]: „Wir hatten von *(ǂa)* den Knaben Milch bekommen [und haben sie dir gegeben, nun] gib uns beiden gefälligst *(re)* [etwas dafür]!" °)

Übersetzung von XIV.

Der Einsiedler und der Löwe.

Der Einsiedler sagte zu *(ŋgu)* seiner Frau *(tarun)*, während *(khi)* sie miteinander *(-gu, reziпr.)* das Grubenspiel *(ǂkhaa, s. S. 314)* spielten *(nam)*: „Wenn *(ti, mit d. Pers.-Suff. der Subj. d. Nachsatz, -i, 2. pers. fem. sing.)* der Pavian kommen *(ǂxui)* sollte *(gu, Präsentialpart.)*, dann mußt *(ki, fut. part.)* du dich schlafen stellen" *(*xommm(e)ya)*.

Und als *(ti)* der Pavian kam, stellte sie sich schlafen; der Mann *(daiba)* aber nahm *(ti, i. partic. prael.)* die männlichen *(aore)* Hunde und ging *(ŋũng)*. Da wurde der Pavian *(durch d. Suff. -b ausgedr.)* von *(ŋu)* den weiblichen *(tarusti)* Hunden gebissen *(ki)*, und [erst] als *(ti, mit d. Pers.-Suff. d. Subj. d. Nachsatz)* ihm flau wurde *(ǂkxaba, vorh.)*, stand die Frau auf *(kxui, vorh.)* und wehrte die Hunde ab *(wörtl.: vorbei ǂkxui, für -ba, cha ki)*. Als er dann Milch *(daiti)* bekommen hatte *(partic. praeti.*, ging er dahin *(ti)*, wo die Männer das Grubenspiel spielten.

Da [sagte der Löwe]: „Was ist dir *(ki)* geschehen *(ti)*?" Und er antwortete: „Die Hündinnen haben mich *(ke, Suff.)* gebissen." Darauf der Löwe: „Morgen *(kari, mit d. Suff. der dual. masc.)* wollen *(ki, fut.)* wir beide nach der Vley *(ǂkxaiti)* lustwandeln gehen!"[1])

Und als es noch dunkel *(ǂkxui)* über *(ti)* dem Land *(ǂâãã)* war, ging der Löwe weg; und während er auf einen Baum *(haiti)* kletterte *(tsiba, kā herumkommen)*, der im *(ma)* Wasser *(ŋgumu)* stand *(mi)*, kam

[1]) **ti-ǂxui*, wörtl.: zur Weide laufen. Auch das Forttreiben der Kinder zum Spielen und Toben kann ǂxui so bezeichnet werden. Der Löwe bildet in dieser möglichen humorvollen Weise die Absicht der Hunde.

der Einsiedler. Die Hunde aber sahen *(mā)*, als sie saufen *(ā)* gingen, den Schatten *(somsa)* im Wasser, und ein jeder *(hoaba)* Hund, der herabkommt *(ŋgōaŋa)*, knurrt *(wörtl.: wird bös, xaiŋa)* und steht.

Er *(ŋ/eiīb)* aber, der Einsiedler, trank. Da sprang *(uri)* [der Löwe] herunter *(ŋgonaŋa, verb.)*, doch jener wich aus *(ŋgō)*, und die Hunde bissen [den Löwen] zu Tode *(nāŋa)*.

b) Von den Bergdamara oder Klippkaffern

hat der Hottentott, wie wir früher sahen (S. 323), keine hohe Meinung. Das spricht sich auch in der kurzen Sage aus, in der er sich über die Paviane-Ähnlichkeit seiner schwarzen Hörigen lustig macht (Sage XV).

Nur eine Eigenschaft erkennt er rückhaltlos an ihnen an: die frühreife Selbständigkeit und Furchtlosigkeit des Bergdamara-Kindes, die im Kriegsbilde der XVI. Sage und in den Löwen-Begegnungen der Sage XVII und XVIII gefeiert wird.

Auf der anderen Seite fällt dem Hottentotten mit seinem starken Sinn für Familienzucht der Mangel an Eltern-Autorität und kindlichem Respekt bei den Bergdamara auf. Wer die Erzählungen XIX und XX aus dem Munde eines Hottentotten hört, sieht klar, daß hier nur eine Verspottung der degenerierten Familienverhältnisse beabsichtigt ist. Auch die gemeine Zote in XXII läuft da hinaus.

XV.

ǂNtragu gye ǂhao ŋgui damaba.

Übersetzung von XVI.

Die Klippkaffern und die Hottentotten.

Die Klippkaffern *(-s, explos. -as, Pers.-Suff. d. 3. Pers. plur. comm., hier Männer, Weiber u. Kinder einschließend)* wohnen *(hâb, m. Passivendung)* einsam *(igurî)*. Da *(o mit d. Pers.-Suff. der plur. masc. gu = gu, da es sich nur um streitbare Männer handelt)* gingen *(igûŋ)* die Hottentotten *(namagu)* zu *(igu)* der Kaffern-Werft *(igudi)*, die Kaffern zu töten *(igum)*. Und an *(ai)* dem Tag *(hâi)* [an dem] sie *(hi/igu)* dahinkommen *(ti)* wollen *(ti, verb. Part. d. fut.)*, lassen jene den kleinen Klippkaffern [als Wächter] zurück *(igura)* und *(hî)* suchen Feldzwiebeln *(ǂnami Feldzwiebel, -re gibt dem Wort verb. Char.)*. Und während *(hâa)* der kleine Klippkaffer als einziger *(igaiti)* da bleibt *(hî)*, kommen *(ǂkyî)* die Hottentotten *(durch das -gu in hâgu ausgedrückt)*.

Da sagen die einen *(mîga)*: „Laßt *(hî)* uns *(-gye)* den Kaffern töten!“ So sagen sie. Darauf die anderen *(mîga)*: „Ach *(ao)*, was *(tare)* wird *(ti)* so ein *(-i, Pers.-Suff. d. comm. sing., im Sinne d. unbest. Art.)* Kaffer ausrichten *(tsi)* mit dem Hinterloch in Zwiebelschalen?“ *) Darauf die anderen: „Laßt uns — [denn] ausplaudern *(ǂna)* wird der Kaffer — den Kaffern töten!“ Darauf sagen wieder die einen: „Jung *(ǂkyam)* [ist] der kleine Kaffer, [er] wird nichts *(tîte, Verb.-Part. d. fut. negat.)* erzählen.“ Dann ließen sie ab *(ǂâ, ga Verb.-Part. d. prät.)* und gingen daran, eine Schanze zu *(ǂkyaiti, Lauerhütte auf Wild, tgnû hagen)* machen *(ǂâ)* und legten sich hin.

Während aber jene liegen, kamen die Kaffern, kamen als jene schliefen *(tsim)* liegen. Und der kleine Klippkaffer liest *(tsiba)* weiter *(ti, Verb.-Suff. d. fortsetz. Handlung)* Zwiebeln auf und [singt]:

„Laßt uns ihn doch stechen“ so sagen die einen,
„Was wird der machen, der mit dem Hinterloch in Zwiebelschalen?“
so sagen die anderen.

*) gewöhnl. Schelte, -gye Adjekt.-Endung, ǂnamîb Adam, für Passivendung. Die anderen Worte des Streitlieds sind zum Teil unverständlich.

»Ausplündern wird ja der Kaffer!« so sagen die einen.
»Er tötet doch den Kaffern nur!« so sagen die anderen.
»Groß ist ja doch der Kaffer!« so sagen die einen.
»Dumm ist ja doch der Kaffer!« so sagen die anderen."

Da [fragt] die Mutter *(tgûsa)*: „Was *(tsî, Abkürzung von tarî)* sagt da so *(ti)* der Kleine?" *(daorubi: i. Klippkaffernialekt statt damaroba).* Aber der liest weiter auf. Da warf *(tsi, –hi hebt die Beziehung zum Objekt hervor)* ihm *(hi)* die Mutter Zwiebeln zu; nun erzählte er, und die Mutter erzählte es den anderen *(°nuu)* Kaffern. Und die einen *(Frauen, Kinder; Genus: -a, comm.)* gingen alsbald *(zur Zeit da)* weg *(hî),* während die anderen *(tsî)* Männer *(°aoregu junge Männer, im Gegensatz zu aigu)* da bleiben *(hî).* Diese aber *(tsûgu)* gehen [dann zur Schanze] und stecken einen Brand an *(Doppelverb. ikxû und shubi).* Und alle *(hî, s. Anmerkung S. 424)* Gewehre *(von ||aba pafen)* und alle Patronen *(von khî stoffen)* brannten sie an, und die schossen los *(thui).* Da kamen alle Hottentotten um *(tû vergehen, tso zu Ende gehen).*

Übersetzung von XVII.

Der kleine Klippkaffer, der zur Wildladung des Löwen klettert.

Der kleine Klippkaffer suchte Brennholz *(tsẫĥ. Suffix -re tritt an Stelle der Geschlechtsendung und gibt dem Wort Verhältnischarakter)* mit *(ikya)* der Mutter *(tgûa)*, und die beiden *(-re, dual. masc. fem.)* trafen *(hâ)* auf die Wildladung*) des Löwen *(guigûĥ, „Großdrücker", Sagename d. Löwen)*. Da kletterte**) der kleine Klippkaffer auf *(ui)* den Baum *(hain)* und warf *(oa)* der Mutter [von der Beute] herunter *(tsa)*, kleine *(-re Diminutiv-Part.)* Fleischstückchen *(tgum Fleisch. -ai Endg. d. comm. plur.)* warf er herab.

Als aber die Zeit *(tsûba)*, da sie gehen *(tgâg)* sollten *(ui Verb.-Part. d. fut.)*, erfüllt *(tsa)* war, hieß *(gui)* sie ihm *(hi)*, herunterzusteigen *(tgûaga, die ältere Form ist tgomaga, S. 400 oben)*. Er aber will *(tgue)* nicht *(!kama)* heruntersteigen. Da sagt sie: „Gleich***) kommt *(ikyi)* der Löwe, steig herunter!" Doch der kleine Klippkaffer will nicht herunterklettern. Da [lockt sie ihn so]: „Geh her *(ikyi)*, komm *(hâ)* stiehl *(mari)* deinem Vater *(tsoĥ)* etwas Schönes†)!" Aber er weigerte sich *(ikya)*. Da ging sie.

Während nun der kleine Klippkaffer dableibt *(hâ)*, kommt der Löwe und sagt: „Ist das *(ĥ, Fragepart.)* eine Jagdbeute für Kinder *(tgûa-)*?" und ruft *(tgui)* alle Hyänen *(ikûru)*, alle Schakale *(tgûi-)*, alle Silberschakale *(ikyama-)*, alle Löffelhunde *(hâ-)* zusammen††) *(ihm)* und hetzt sie auf den Baum hinauf *(gui kerâre, zahn aufsteigen)*. Aber die können nicht *(tsa)* aufsteigen.

Da brannte *(kyau)* der Schakal, als *(a)* die Hyäne aufkletterte, ein Feuer *(tsâna)* an†††). Und die Hyäne kam hin *(ui, mit Pers.-Suff.)*

---

*) *gumui*, von *gûi* aufladen. Um den ganzen Wild von Hyänen- und Schakalfell zu schützen, bringt er der Jäger, wie er in diesem Fall der Löwe getan hat, einstweilen auf einen Baum.

**) *ûka*. Die Verbal-Partikel *°gû* weist auf ein besonderes Tief der Handlung hin, z. B. *ĥakwigû* — schleichen (auf dem Wagen, etwa um einen Wildgegenstand herumschleichen) im Gegensatz zu *ĥaka* — schleichen, wenn der Wagen bereit ist abzufahren.

***) *kgû* kam, kommen, gleich; z. B. *ûnâkhe kgûte ge*: du bist bestimmt gleichgeben worden.

†) *°gûga* ist offenbar die alte Form für das heutige *°kya* — reich. Vergleiche Ähnlichkeit und Schlichtheit. Der Hottentotte macht sich auch hier über die herumgeschwenzte Moral der Buschmänner lustig.

††) *hâ-*, Partikel zum Ausdruck der Zusammengehörigkeit mehrer; z. B. *Hûnâkwenâ* (David Christian) und seine Leute: *Hûnâkwenâ hâkya*.

†††) Sie darf sie nicht verlieh kommen, sondern bestrafen mußte.

zum kleinen Klippkaffern [und] bekam *(hõ)* [ihn] und sagte: „Fängt an *(tkoe tkoe. gum ju)*. [hübsch fett zu werden!"]. Da biß *(nã)* sie *(ti)* der kleine Klippkaffer, und sie fiel *(ma)* herunter *(tgumaga)* in *(ma)* das Feuer. Da entflohen sie *(kxuẽ gokxu, tã Fut. part., drückt die Erwartung der Verfolgung aus)*.

---

*) Der Erzähler ahmt hier das knackende Schnauben des Tieres nach. Der Alte knackte nicht das Schnauben des Tieres, hält es für ein. Der Kleine schnaubt die Gefahr, schwebig aber, um dem Vater damit einen Streich zu spielen.

**) Hier in ungehörlicher Form mit dem Demonstrativpronomen *tsī* und dem weiblichen Vokativsuffix gegeben, um auch damit die Respektwidrigkeit der verwandten Silben gegen den Eltern (die in dieser Erzählung grundsätzlich vermieden wird) zum Ausdruck zu bringen.

Übersetzung von XX.

Der kleine Klippkaffer und seine Mutter.

(ǂâa gebären, gu Verb. part. reciproc., ra dual. masc.-fem.)

Der kleine Klippkaffer war mit *(ǃkŋa)* der Mutter *(ǂgûs)* gegangen *(ǂgûng, im pass. narr.)*, [Feldzwiebeln] zu graben *(kŋao)*. Da trafen *(hâ)* sie auf eine Hyäne *(shirasa)* und die Frau *(tarasa)* steckte die Hyäne, die schlafen *(tom)* lag *(ŋgoë)*, fest ein *(ŋkŋam)* in *(ma)* das Netz *(ǂûib, s. Beschreibung S. 243, Schnalzer daselbst verdruckt)* und trug *(tani)* [sie] fort.

Während sie nun gingen *(ǂgângra go)* [fragte] der kleine Klippkaffer: „Mutter! *(aise)* mag *(ga, Verbalpart. hier des Potentialis)* das Hinterloch*) mein *(ti, mit d. Pers.-Suff. d. Subj.)* sein?“ »[Das] fällt [nicht Kindern] zu *(di, Genit.-Part.)* [sondern] Vätern«**) [antwortet die Mutter]. Darauf er *(-b)*: „Mögen wohl die Füße *(ǂâ'i)* [der Hyäne] mein *(tite = titi)* sein?“ Und sie antwortete: »[Die] gebühren Vätern.« Darauf er: „Gleich *(tâse)* werde *(ni)* ich *(-ta)* diesen *(n²)* Stock *(haiba)* da abschneiden *(ǂgao)* und [der Hyäne] das Hinterloch ausputzen!“***) und fuhr fort: „Mutter, mag die Leber *(aisa)* wohl mein sein?“ Sie aber entgegnete: »Die gebührt Vätern.«

Da schnitt der kleine Klippkaffer einen Stock ab und putzte [der Hyäne] das Ding, das Hinterloch aus. Da wurde sie wach *(ŋkŋal)* und biß *(nâ)* die Kaffernfrau *(damasa)* zwischen die Schultern *(ai in, shu Loch, Vertiefung, sai zusammenkommen: Vertiefung wo, scil. die Schultern, zusammenkommen)*. Und die Kaffernfrau [rief der Hyäne in ihrer Angst zu]: „Du da *(h², hier absichtlich verstümmelt aus ni pron. dem., ǃ Suff. d. comm. sing. 3. pers.)* warte *(tnam)* doch *(re)*, daß ich *(-ta)* dich *(si)* losmache *(shi)*!“

---

*) *tsoma:* Der After und das Endstück des Mastdarmes eines frisch erlegten Tieres wird ausgekneipelt und in der Asche gebraten.

**) *aaob* Vater. Das Suffix *ŋan* drückt nicht wie die Pluralendungen die Mehrzahl Gleichartiger, sondern die Gleichartigkeit einer Mehrzahl aus: *aaoŋan* sind alle, die die Stellung eines Vaters haben. *ǂnaoŋan* alle Ahnen etc.

***) *kaara.* Der Junge weiß, daß die Hyäne nicht tot ist, wie die Mutter irrtümlich glaubt, und sucht nun durch Drohungen etwas zu erreichen. Die Worte *hî, ǂî* und *ǂîs*, die letzteren unserem „Dingsda“ entsprechend, werden dem Klippkaffern als Unbeholfenheit des Ausdrucks in den Mund gelegt. Ein Hottentott würde sie so sprechen.

XXI.

Die Leute, die Binsen suchen.

Ein Mann (ǂgaub) hatte eine Frau genommen (ǂgama, c. pass. corr.). Und der Mann nebst seinem Bruder (ǂgaub ǂgiǂgaǂgu) und die Frau, die drei (tãĩ und, mit d. Pers.-Suff. d. plur. comm.) suchten (ha c. pass. narr.), damit (ga) das Paar (ǂgaǂgoã Menschen, dual. mascul.) sich (-ha objectiv. Part.) [Hausmatten] nähen (tama) sollte (ni). Binsen (haruma), mit (ǂgu) zwei (-ǂgu suff. dual. masc.) Tragochsen (ǂgaro-) [ausstehend]. Und bei (daba) dem Wasser (ǂgoma) sattelten sie ab ("vor hinten, gabl d. Rückens). Dann gingen (ǂgãĩ) die beiden Männer fort, Binsen zu schneiden (ǂgua), aber die Frau ging zum Wasser, um sich (ba, Reflexivpart.) zu waschen (ni). Und als sie daran ging (ki), sich zu waschen, da kam ein Froschweib (ǂgãĩaǂgãĩsa) hervor (ǂgaaǂa, verä.) und zog die Kleider (haruma, comm. plur.) der (di Genitivpart.) Frau an (ǂama, verä.). Da sagte sie: „Frosch, leg hin (mãĩ, verä.) die Kleider!" Aber der Frosch sagte: „Nein (kam'm) Schwester ("amis s. Familie S. pos), ich (ha Suff.) tue (ki) [sie ja] nur (ǂgaiba) ausprobieren!" (ǂama amaisa, bã schmecken). Und als (bã Part. d. part. praet. hinter ihn anfügen) die Frau sich fertig gewaschen hatte, sagte sie: „Gib (mã) mir (ha Suff.) die Kleider, Frosch!" Aber der entfloh (ǂgaǂ- ni) und geht hin (ti), wo (-ha) die Menschen abgesattelt haben. Die Frau aber schämte (ha) sich und ging in (ma) das Gebüsch (hai) hinein (ǂgã, verä.). Und der Mann (durch d. Suff. -b ausgedrückt) nahm das Froschweib zur Frau im Glauben (tai denken im Partizip. praeter.), es sei sein (b'ã'ãĩ, pron. poss. 3. pers. sing. masc., di Genitivpart.) Weib (haruma).

Doch wenn (o) die Leute (durch d. Suff. der comm. plur. -a ausgedr.) nach den Binsen gingen (ha euphon. für ta), kommt (ǂgã) jene (-a in hã, die rechtmäßige Frau) und säubert (ǂama ǂama) die Hütte (ǂamma), säubert das Geschirr (ǂgahama, comm. plur.) und zermahlt (ǂgoa) Buchu (hãĩ, comm. sing.) und macht Butter (ǂnaba, verä.) [in der] Kalabas (ǂkhoma) und schenkt der [alten] Frau (der Mutter ihres Mannes, die blind gedacht ist) Milch (ǂkaiĩ, comm. sing.) ein (tsã, -ha objectiv. Part.) und geht. Da sagte eines (ǂgui) Tages (hã) die Alte zu ihrem großen (ǂgaĩ) Sohn (ǂgǂoh): „Versteck dich (ǂgoã kincia) in dieser (ni)

Biesenmatte (*!kharuß*) und (*ll. mit dem Suff. d. 3. pers. sing. masc.*) lieg (*tgui*) darin (*°tgoma*) und sieht zu (*tam saiseng*), welcher Mensch (*kgoe*) hier (*mßa*) umgeht" (*hã sain, khaiheng*). Und während (*hã ñkeri, wie die Konjunktion a, zumal dem Vorder- als dem Nachsatz ein und hat hier d. Pers.-Suff. d. Subj. i. Nachsatz*) er dalag, kam sie. Und sie ging (*hã*) daran, sich hinzusetzen (*mã*), und nimmt die Kalebas, und während sie buttert (*ña = mã*), spuckte (*sara*) er auf (*ni*) sie (*ti, Suff.*), [um sich bemerkbar zu machen]. Da entfloh (*thai- ni*) sie und er fing (*!Kyi*) sie, sie aber sagte: „Geh zum Frauchweib, der du (*tsã, pron. pers. masc.*) das Frauchweib geheiratet (*s. Partic. praeteriti*) hast und mich im Stich ließ!" (*tsã yã*). Doch er fing sie und will (*ti daran gehen*) sie zur Hütte hineinnehmen und will sie fassen.

Indessen kamen das Frauchweib [und der Bruder des Mannes], die beiden an. Da sagte das Frauchweib: „Nimm mich herunter!"*) (*ã ama*). Jedoch niemand spricht (*ihna*) mit (*ã*) ihr. Dann nahm er die Nilpferdpeitsche (*mañuhu*) und kam hervor (*sarya, verb.*) und schlug (*ttama*) sie. Da sprang (*tari*) sie herunter (*ngama*) vom (*ya*) Reitochsen und [rief]: „Ich (*-ka*) bin ein Frosch! Im Wasser rudere (*°mãttuhu*) ich!" So rief sie und sprang zum Wasser hinab (*ngka, verb.*). Als aber der Mann seine (*ã Stamm d. pron. possess., -ka Pers.-Suff. d. Besitzes*) Frau gefunden (*hã*) hatte, heiratete er seine Frau [wieder].

Übersetzung von XXIV.

Das Mädchen, das dem Klippkaffern flucht.

Ein Mädchen *(ŋgôas, mit dem alten Demonstr.-Suff. -i)* sagte zu einem Klippkaffern *(damab)*, als *(o)* er kąm *(hê)*, sich vor *(oi)* die Tür *(oms)* der Hütte *(oms, fem.)* zu setzen *(saŧ)*: „Wie *(kχoma)* das Kalb *(tsaûb)*, das vor *(ais Gesicht)* der Hütte *(omi, masc.)* meiner Mutter *(aix)* steht *(mî)*, so unförmig lang *(°snoma)* ist dein Schamglied!ⁿ *(χôba)* (°ŧ, *Flickpartikel*). Und nimmt *(ŧî)* Asche *(ŧsaoba)* aus *(sui)* [der Feuerstelle] und bewirft *(ŧsoro, i. poss. norr.)* ihn mit *(ikχa)* Asche.

Da sagen die älteren *(gui groß, Adj. m. Pers.-Suff., weil dem Subst. nachgesetzt)* Mädchen: „Bedenke *(saa wissen, ni Fut. part.)*, daß das ein Erwachsener ist!ⁿ *(großer Mensch kχoêŧ, comm. sing., m. d. Pers.-Suff. d. angered. Person, -s fem.)*. Der aber erwiderte: „Laß gut sein *(saîkχa,*

oiâuuru), aus *(uma)* Torheit *(gûû = gûuruk)* redet sie so, darum *(ǂuigye)* [daß sie laufen]."

Und am anderen *(°nau)* Morgen früh *(tgumga)* gingen *(tgûng)* die Mädchen *(durch d. Suff. d. 3. pers. plur. fem. -îi ausgedr.)* schwimmen *(tûi)*. Als sie sich *(sen, Reflex.-Part.)* aber ausgezogen *(tgui sui)* hatten und ins *(ma)* Wasser *(tgumu)* heruntergegangen *(tgûa)* waren, nahm *(ti)* der Klippkaffer *(durch d. Pers.-Suff. -ti, in ob am Anf. d. Satzes ausgedrückt)* ihre *(ti Wurzel d. pron. poss. mit d. Pers.-Suff. d. Besitzerinnen -ti)* Kleider *(tarusa)* weg. Und erst *(tgui, m. d. Pers.-Suff. d. Obj.)* als sie herauskamen *(tuatga)*, sahen *(mâ)* sie den Kaffern. Da kamen *(hâ)* sie heran und sagten: „Mein Großvater *(ti ǂnaub, respektvolle Anrede)*, gieb *(mâ)* mir *(ti, Suff.)* meinen beschnittenen *)* *(tgum, Attribut d. Hinterschurzes, der mit Perlketten versiert ist, vgl. S. 408)* Hinterschurz *(tgâi)* und meinen Vorschurz *(tgaib)*, das alles!" Und er gab es ihnen *(-ti, Suff.)*, aber zu der *(-se, Pers.-Suff.)*, die ihm *(ti'ǂîbe, pron.)* geflucht *(tgui m. Pers.-Suff. d. Subj.)* hatte, sagte er: „Lauf erst *(ûibe)* und *(i, mit Pers.-Suff.)* pflücke *(gei ti, pflücken sie, m. d. objektiv. Part. -ha)* mir Dornen *(ti'kxûga)* bei dem Giraffenbaum *(tgumub)*, der dort *(mâ)* steht *(mâ)*!" Da lief sie und pflückte und kam *(ikxi)* damit *(ti)* an. Der Kaffer aber ergriff *(ikxi)* sie *(ti, Suff.)* und stach *(tikxum)* ihr mit den Dornen [die Glieder so fest aneinander, daß sie sich nicht rühren konnte]. Dann hob *(ao werfen, rühr aufstrigen)* er sie in den Giraffenbaum auf und ging fort.

Da kamen die Übrigen *(tsa kyoin)* vorbei *(i)* gezogen *(dui)*, und erst kommen die beiden Großeltern *(tnaose- = tnao-, m. Pers. Suff.)* vorbei. Da rief das Mädchen: „Meine Großeltern da *(°nau Demonstr.-Wurzel, -ro Suff. d. pers. dual. masc.-fem.)*, seht *(gum - - - o, Interj.)*, die Wurzel *(°ǂnomub)* des Giraffenbaums hält mich fest gefangen!-**)" Doch die Großeltern antworteten: „Ich hatte dir *(ta, Suff.)* Mädchen doch gesagt: „Schenke *(gui, m. objektiv. Part. -ha)* mir bitte *(ti, Optat.-Part.)* Wasser *(tsumm. sing.)* ein, [und du hast nicht gehört]. So sagten sie und gingen weg.

---

*) Der Hinterschurz ist manchmal mit Perlketten versiert.

**) *mail* hinzufügen, °*tam-tam-tam* = wider Willen jemand festhalten. Dieses schwere Wort setze ich auch in folgendem Zusammenhang: Ein Boss, der lange auf sich warten läßt, wurde mit den Worten empfangen: „*darref tam-tam-tam mail tai hâ 17*" Dasselbe Wort wurde auf ein Handelspfer angewandt, das ungerufen in capsula verblieb war.

Da kommen die beiden Bediensteten *(ǂgûsu)* ihrer *(ǂâ, Genitiv-pers.)* Mutter *(ǂgâi)* vorbei, und das Mädchen rief: „Ihr Dienstleute meiner Mutter, die ihr da ankommt *(gusu)*, seht, die Wurzel des Giraffenbaums hält mich fest gefangen!" Doch die antworteten: „Hatte ich dir Mädchen nicht gesagt: Melk mir die Nachmilch *(ǂgubi, verb., mit objektiv. Pronomen)*, laß *(t und. imper.)* mich *(-hi, Suff.)* Wasser hineingießen *(tsui, s. S. 258)*, [und du hast es nicht getan]!" Sagten es *(-hî, Part. d. participl. praeter.)* und gingen.

Da kamen die Eltern *(ǂgûsu)* vorbei, und das Mädchen rief: „Ehrwürdige Eltern *(ǂhoǂgusu, dual. masc. fem.)*, die ihr da ankommt, seht, die Wurzel des Giraffenbaums hält mich fest gefangen!" Doch die antworteten: „Hatte ich dir Mädchen nicht gesagt: Mach mir doch die Hütte zurecht *(ǂ'hoiba, verb.)*, [und du hast nicht gefolgt]!" Sagten es und gingen weg.

Da kamen die Schwestern vorbei, und das Mädchen rief: „Ihr *(-ǂâ, Suff. d. 2. pers. plur. fem.)* Kinder meines Vaters *(ǂâǂâb)*, die ihr da ankommt, seht, die Wurzel des Giraffenbaumes hält mich fest gefangen!" Doch die antworteten: „Wir *(ŋg(o)m = ŋg(o)m, pron. 1. pers. fem. plur. exclusiv)* hatten dir Mädchen doch gesagt: Wisse, daß es ein Erwachsener ist!" Sagten es und gingen.

Dann kamen ihre beiden *(-ǂgu, Suff. 3. pers. dual. masc.)* Brüder, und sie rief: „Meine Brüder *(-ǂgu, Suff. 3. pers. dual. masc., ǂg- = ǂgu-)*, die ihr da ankommt, seht, die Wurzel des Giraffenbaumes hält mich fest gefangen!" Da eilten *(ǂgoê)* sie herzu und kamen hin und hoben ihr *(ti'ǂi, pron. 3. pers. sing. fem., ǂî, Gen.-Part.)* Kalb*) *(ǂnaûba)* hinauf, und das Kalb *(durch d. Pers.-Suff. -b in ǂâb umgedr.)* holte das Mädchen herunter *(ǂ mit, verb.)*. Die Brüder aber setzten sich *(i. partic. praet.)* hinter *(in ai, den Rücken (gâb))* den Baum *(ǂaiǂ)*, und eine Mündin *(arisa)* zog ihr die Dornen aus *(isru)*. Und als *(a, mit d. Pers.-Suff. d. Subjekts im Nachsatz, -a, comm. plur.)* ihr die Dornen fertig *(ǂan aufhören, i. pass., auf d. Mädchen bezogen, wie d. Suff. -s zeigt)* ausgezogen waren, gingen sie fort.

---

*) Die Brüder holten ihre Schwester nicht selbst, aus Schamgefühl, weil sie nackt ist. Daher auch die Mithilfe des Affenkalbs.

Übersetzung von XXVI.

Der Knabe, der bei seiner Schwester wohnt.

Ein Knabe *(ôŋgab)* wohnte *(kâ kâeba, ‹ pass. narr.)* bei *(ôŋge mil)* seiner Schwester *(ŋgûnama)*. Und wenn *(-)* sie *(-ra, Suff. 3. pers. dual. masc.-fem., dem Objekt angehängt)* die Kühe *(gumuŋa)* melken *(ge)*, schlägt *(nama)* sie *(-a, Pers.-Suff. hinter tûl am Anfang des Satzes)* ihn *(kî, Pers.-Suff.)* da *(tûl)* mit dem Stock *(kaûŋ)*, mit *(ŋ)* dem sie die Kälber *(tuûbma)* [von den Kühen] wegjagen *(nama ŋa)*. Und wenn sie ihm Milch *(ôuâŋ)* gibt *(nâ, ka = ra)*, bekommt er *(-b in kûb)* nur ein kleines *(ŋkyaŋ)* Schlöckchen Milch *(-ra, Diminu.)* eingeschenkt *(ruâ, -ka objektiver. Partikel)*, und Wasser *(ŋgama)* wird aufgefüllt *(oa)*, und draußen *(ŋauŋa)* liegt *(ŋgul)* er auf *(ui)* der Asche *(kaoa)*.

Da sagte eines (ŋui) Tages (ǂhâ) der Bulle (ŋǂôba): „Zu (ǂkhe, mit d. Suff. z. pers. masc. sing.) mir (ǂîa, pron.) mußt (tî, Fut. part.) du kommen (ǂkŋî), wenn du die Kälber hütest (ǂâi, zu Part. d. potent.), laß (î und, imper.) mich (durch Suff. und pron. latent ausgedr.) dir (ǂîi, Suff.) Kost (tâ) geben!“ Und der Knabe ging (ki), als er die Kälber hütete, zum Bullen. Und der Bulle hieß (gui) ihn, in (ma) einen seiner Füße (ǂîi, sing.) hineinzugehen (ŋgâ). Da ging er hinein und fand (î nakaun) Kost (tâna, comm. plur.) und einen Topf (ǂâi), alles das (îi und, -ma Suff. d. comm. plur.). Dann kam er heraus (°ŋuŋa, nicht ŋuŋa), um zu kochen (tui); und als er fertig (ma koradigen, m. Pers.-Suff.) gekocht hatte, reinigte (ŋana ŋana) er den Topf und ging mit ihm hinein [in den Fuß des Bullen] und kam heraus (ŋuŋa, verk.) und ging nach Hause (ŋuŋa, verk.), nachdem (-îi. Part. d. partic. praet. hinter ǂ) er die Kälber zusammengetrieben (intrl.: genommen) hatte.

Aber die Schwester sagte eines Tages zu ihrer Tochter (°ŋǂaisa = ŋǂai): „Du (-i, Suff. z. pers. sing. fem., hinter ŋǂâg gehen) mußt einmal mit diesem (ti) Ochsen gehen, dann (ǂî, m. Pers.-Suff.) sieh zu (gî), was (kaiti, m. d. Pers.-Suff. d. Subj.) er ißt!“ (ti, ta = ta, ǂkgaiti, Part. d. indir. Frage). Und die beiden gingen und kamen hin, als gerade (ǂâi) der Bulle unter (°ŋgu) einem Giraffenbaum (ŋgumaŋ) im Schatten stand (ǂhaiti, der Schattenwuchs des Viehes in den heißen Tagesstunden, mit strken). Da zündete (kyau) der Knabe ein Feuer (taba) an und ging [in den Fuß des Bullen], und nahm Kost und kam heraus, um zu kochen; und als er fertig gekocht hatte, reinigte er den Topf und ging mit ihm hinein und kam wieder heraus. Dann gingen die beiden heim. Und als die Tochter ankam, erzählte (ǂîba) sie ihrer Mutter (ŋǂâa): „Er geht in den Bullen hinein und Topf und Kost; das alles (îi, °Copula bei Aufzählungen, s. S. 424 Anm.) nimmt er heraus (tui), und wenn er gekocht hat (Partizip.-Konstr.), ißt er.“

Als dann das Vieh (gomana, comm. plur.) [vom Feld] gekommen war, stand der Bulle hinter (kyao ŋgâ) der Hütte. Da sagte die Schwester, während der Bulle es hörte (ǂnaiti, m. Pers.-Suff.): „Diesen Bullen mußt du (-ti, Suff. d. angeredeten z. pers. masc.) totschießen (ǂnoa ŋan)!“ So sagte sie zu (ŋgu) ihrem (i Wurzel d. pron. possess., -i Pers.-Suff. der Besitzerin) Mann (aob). Da sagte der Bulle dem Knaben: „Deine (ti, Stamm d. 2. pers. d. pron. personale, unter Weg-

Instrumg der Genitivpart. i. Sinne des prom. poss. gebraucht) Schwester hat gesagt: ich soll *(hã hasara)* totgeschossen werden", erzählte *(ãsa)* er dem Knaben, „darum *(hãgye)* wollen *(ti, ∫ui.)* wir *(-kyum, Suff. 1. pers. masc. dual.)* heute Abend *(ti ∫ui)* fliehen *(hã)*." Und des Nachts *(hãkyuba)* flohen die beiden *(-kya, Suff. dual. masc.)*.

Der Bulle aber sticht *(ãkyã)* Bullen tot. Und der Knabe nimmt dann die Ochsenschwänze *(ãhãte, fem.)* da *(ma)*, und mit den Ochsenschwänzen kaufte *(numa)* er einen Wagen *(gimina)*, kaufte Ochsen, so tat *(hi)* er. Dann verkaufte *(numaya)* er den Bullen, und mit dem Erlös *(wörtl.: mit den Sachen, Waren, gũna, des di, Bullen)* erwarb *(ã)* er Waren zum Verkauf. Dann kam der Bulle wieder *(ãkyuba)* zu ihm *(trotzdem, prom.)*, und sie gingen fort und verkauften bei den Leuten.

Da kam *(hã)* noch die Schwester, um zu kaufen. Doch er forderte *(igun)* sehr *(-gui groß, -se Adv.-Edg.)* hoch *(igubise)*. Darauf fragte sie: „Warum *(tarel ∫anse)* forderst du, wenn ich kaufe bis zu *(gũse)* solcher *(mãti)* Höhe?" Er aber antwortete: „Was *(gũna)* du *(tsin, prom.)* mir angetan *(di)* hattest, habe ich ja *(gun - - - o)* nicht *(tsima)* vergessen *(!aru)*!" Da wußte *(sau)* sie, daß *(ãkyoã)* es der Bruder war *(wörtl.: ist, a)*.

Übersetzung von XXVII.

Der Knabe, der bei fremden Leuten zurückgelassen wird.

Eine Frau *(tsaxa)* ließ, als *(o)* sie fortzog *(ǂhâ, i. pass. masc.)*, den Knaben *(ŋǂaba)* bei [fremden] Leuten *(ŋǂaîn, comm. plur.)* zurück *(ŋgora, i. pass. masc.)* und hinterließ *(mâŋa, i. pass. masc.)* eine Kuh *(gomaa)*, daß *(ga)* sie den Knaben mit Milch tränken *(ǂ trinken, dai saugen, -si gibt d. Doppelverb. kausativen Sinn)* sollte *(mî, Fut.-Part.)*.

Die Leute aber gruben *(ǂhaa, Leder zum Aufbewahren in nassen Boden legen. ŋǂâ, auf, scil. ihn Erde werfen)* den Knaben in *(ma)* ein Loch *(ǂâb)*, und wenn *(o)* sie Vieh *(ŋgoana, mit d. Pers.-Suff. d. Subjekts -a, comm. plur.)* schlachten *(ǂâ)*, werfen *(tsaro xhaîse)* sie den Mist der Därme *(tharuba)* auf *(ai)* seinen *(ǂâb)* Kopf *(kamab)*. Da brüllt *(ǂ)* die Kuh: „Mein Hoab *(ǂhâab, Name d. Kindes. -tsa, Suff. z. pers. masc. sing., einer Vokativendung entsprechend)*, ich bin ja *(gama)* die Kuh deiner Mutter *(xaos)* mit der kleinen *(ekyari)* Brust *(xami)*. Mein Hoab, deine Mutter sagt *(mî)* mir ja, [ich soll dich tränken]!“ So brüllt sie.

Dann zogen die Leute fort und ließen *(ga)* ihn da, nachdem *(-tsî, Part. d. partic. praet., hinter ǂ nehmen)* sie die Kuh weggenommen hatten. Die Kuh aber eilte *(ekyoê)* zurück *(os umkehren)* und kam herzu *(hâ, verk.)*, grub *(gora)* ihn aus *(tsi)* und sie gingen fort.

Und die beiden Brüder *(ŋǂâkya, dual.)* des *(di, Genitivpart.)* Knaben waren gerade dabei *(hâ, m. d. Pers.-Suff. d. Subj.)*, das Vieh *(ŋgoana)* zu hüten *(ǂâi)*, und der Jüngere war gegangen [die Ziegen] zurückzutreiben *(ekyoê)*. Da sah *(mâ)* er den Knaben *(hi, Pers.-Suff.-ihn)*, und als er zurückkam, erzählte *(mî sagen, -ba Obj.-Part.)* er dem Bruder: „Ich bin einem Gespenst *(ŋgaûaba)*, begegnet *(hâ finden)*!“

Da sagte jener: „Komm *(ǂâ§)*, laß *(ǂî)* uns *(-âkxum, Suff. 2. pers. masc. dual.)* doch *(tmâ)* gehen, laß mich das Gespenst dort *(tmâ)* sehen *(gè)*!"

Und die beiden gingen und kamen hin. Da sang *(tmâ)* die Kuh: „Mein Hoab, siehe ich bin die Kuh deiner Mutter mit der kleinen Brust! Mein Hoab, deine Mutter sagt mir ja, ich soll dich tränken!" Nun wußten *(hâe)* sie Bescheid und erkannten *(mâ sakun, mâ ofire darâgun)* die Kuh und nahmen den Knaben und gaben ihm Milch *(ǂâû, comm. sing.)* und setzten *(tmâ)* ihn auf einen Ziegenbock *(ha|rûb)* und gingen mit *(ǂî)* ihm nach Haus *(tara, cord.)*.

Übersetzung von XXVIII.

Die beiden Brüder.

Zwei Brüder *(ǂgûb Mensch, ûgûb Bruder, -gu Reziprok.-Part., die Zusammengehörigkeit ausdr., -ǂkya dual. masc.)* hüteten *(ûbi, 3. pass. masc.)* einst *(gyare)* das Vieh *(ogunna, comm. plur.)*. Da [ging] der Ältere *(gaiba, d. grosse)*, während *(hâi)* das Vieh bei *(ǂkya mâi)* dem Jüngeren *(ǂkyami, der junge)* blieb *(hâ)*, Kost *(tâma, comm. plur.)* zu suchen *(ha)*. Und während er mit der Schüssel *(jare)* voll *(ina)* Speise auf dem Wege war *(ûgungu)*, sah *(mâ)* er seinen *(â Wurzel d. pron. poss., -ba Pers.-Suff. d. Besitzers)* Schatten *(tsama)* und sagte: „Was *(°tûi, objekt. acc. tûre)* suchst du *(-tûi, Suff.)*?“ und gab *(mâ)* [dem Schatten] ein *(ogui)* Stück Fleisch *(ûgumi, comm. sing.)* und ging *(ûgûng)*.

Und abermals *(ǂkyaba)* drehte er sich um *(bumgûe er sich gum, hinterwärts kyungâ)*. Da sah er wieder [seinen Schatten] und sagte: „He du! *(tûi Demonstr.-Part., -tûi Suff. 2. pers. masc. sing. vocat.)* das ist nicht *(hama)* meine *(ti)* Kost!“ Sprach's, gab ihm wieder ein Stück Fleisch und ging.

Und abermals drehte er sich um und rief: „Um einer Kost willen *(°mâ)*, die nicht mein ist, läufst du mir *(ki, Suff.)* beharrlich nach *(tsâo folgen, mâ stehen)*! Nimm hin *(ti)* die Schüssel samt und

*) mâ. „Kann dir also eigentlich nichts davon abgehen.“

**) Das ng in ûgûng ist aussprachlich wie im Deutschen in „sing“, „Ding“ etc.

sondern *(hoas gue:)* und kehr um *(oa)!"* So sagte er, gab ihm *(hi, Suff.)* die Schüssel hin und ging.

Dann kam *(si)* er an und [der Bruder] sagte: „Wo *(maiba)* ist die Kost?" Und er antwortete: „Diesem Menschen da *(wörtl.: der da nitt, enda)* habe ich *(-ki Suff.)* Alles *(hui hoendigem)* gegeben". Da sagte der andere: „Du *(ki ... hui, Pron.)* Dummkopf *(gûre, adj.)*, es ist ja *(gum ... o)* doch *(gube)* dein *(ui)* Schatten!" Sprache und ging. —

Und während er fort war *(ikgui)*, schnitt *(gue)* der andere allem Vieh die Kehlen *(domi)* ab *(-gu)*. Dann kam *(ikgi)* jener an und frug *(hi)*: „Weshalb *(kuri °gue)* hast du dem Vieh die Kehlen abgeschnitten?" Der aber antwortete: „Da *(o, m. d. Pers.-Suff. d. Subj. d. Nachsatz)* sie nicht stehen bleiben *(wörtl.: nitum)* wollten *(ague)*, habe ich ihnen die Kehlen abgeschnitten; ei *(o)*, ich war müde *(hum)* [und wollte nicht weiterlaufen]!" Darauf der andere: „Da hast du etwas Schönes angerichtet *(wörtl.: ein großes Ding tust du da)*! Darum *(°huigye)* steh auf *(kgui)* und *(ti, imperat.)* laß uns beide *(-kgum)* davonlaufen!" *(ikgoë und hi, verba)*.

So gingen sie und kamen zur Werft *(tgudu)* der Buren. Da sah er Fett *(tmuiti, comm. sing.)* in *(tna)* einem Gefäß *(tgubes)* stehen und steckte *(tgû)* die Hand *(tama, euphon. Masc.-Endg.)* hinein; doch das Gefäß wollte es nicht geschehen *(ti)* lassen, daß sie wieder herauskam *(toatya)*. Da schlug *(tnau)* er es *(ti, Suff. 3. pers. sing. fem.)* auf *(ai)* einem Stein *(tuis)* entzwei *(ti, verb.)*. Dann gingen die beiden. —

Und sie kamen an einen Baum *(haisc, wörtl.: ein Baum wurde gefaßt)*, an einen breiten *(shabcua)*. Da sahen sie Männer ankommen *(tguatya)*, die da Menschen töten *(tgum)* und das Geld *(marina, comm. plur.)* der Menschen nehmen. Da kletterten *(tsha)* sie auf den Baum. Jene aber kamen herzu, kamen in den Schatten *(hier masc.)* des *(di, Genitivpart.)* Baums, zum Sterben *(ti, verb.)* durstig *(°tgû, verb., -si Ad.-Edg.)*, und legten sich hin *(hamen her hû, sich legen tgui)*.

Da pißte *(ikgum)* der Junge *(durch den Suff. -b ausgel.)* auf sie; die aber sagten: „Der Herr*) *(ikgûb)* hat uns *(gye, Suff. 1. pers. plur. masc.)* Wasser *(tgumi, comm. sing.)* gegeben!", und tranken *(ti)*. Dann

*) d. h. Gott. Der Ausdruck ist mit dem Christentum in Berührung gekommen. Es handelt sich hier um eine Verquickung der Auffassung, daß alles Geschehen, auch das Widerwärtige, die Schickung eines gütigen Gottes sei. Auch der Zug, daß man die frommen Worte Raubmördern in den Mund legt, und endlich deren tückische Furcht unter der Maske der Frömmigkeit ist eine scharfe Satire.

wiederum schiß *(ɣuu)* er; die aber sagten: „Der Herr hat uns Speise gegeben!", und aßen *(ná)*.

Darnach zieben sie das Geld hervor *(nai)*, schütten *(naki ncûra)* es auf Felle *(ŋgoati)* aus und zählen *(ŋgûa)* es. Da warf *(aa)* der Junge den Holzstumpf *(ŋaana)* herunter *(tsâ fallen)*; die aber riefen: „Der Herr stürzt *(ikyam)* auf uns!", ließen das Geld in Stich *(ya, ncrâ)* und entflohen *(ikyaî-ai)*. Nun stiegen die beiden herunter *(ŋgûkya, ncrâ)*, nahmen das Geld und gingen. —

Nun wurde dem Älteren von *(ya)* einem Buren geheißen *(gui kassen)*, zu gehen und eine Kalabas *(ûbuba)* fortzubringen. „Drei *(ŋana)* Geldstücke *(fem. plur.)* werde ich *(-ka)* dir *(ti)* geben" wurde ihm gesagt, und er ging damit *(ŋ)* ab.

Und als er ging, sagte er [zu sich selbst]: „Wenn *(a)* ich einmal *(gu, Präteritalis)* Söhnchen *(ŋkûû, -ro Diminut.)* bekomme *(hâ)*, will ich den einen *(ŋguiba)* den „Erstgeborenen" *(ŋgûro d. erste)* nennen *(kuru se)* und ihm ein Geldstück geben, und dem Zweiten *(gum ŋ(e)iba)* das zweite Geldstück geben, und dem Dritten das dritte Geldstück geben; und sollte ein Vierter *(haga ŋ(e)îb)* kommen, dann werde ich ihn so — *der Erzähler macht eine heftige Abwehrbewegung* — mit dieser Kalabas zum Teufel jagen *(nuna wegschleudern, ŋgû scheuchen)*!" So [sprach er].

Da zerbrach *(°kyûa)* die Kalabas, er aber wurde von den Buren gefangen *(ikyû)*.

Übersetzung von XXIX.

Die beiden Brüder, die das Vieh hüteten.

Zwei Brüder hüteten *(ǂūi, i. pass. narr.)* das Vieh *(ǂgoana)* weißer Menschen *(ihûn, comm. plur.)*. Und eines Tages *(ǂgui tsĕ)*, als *(o)* die Ziegen *(biriti, fem.)* stöhnten *(ǂgaĕ)*, sagte *(im Particip. praet.)* der Ältere *(gaiba, groß)*: „Sie verkünden mir *(tita)* Tod" *(*ǂgola, verb.)*, und schnitt *(ǂgaoχa)* ihnen die Kehle *(domi)* ab. Doch der Jüngere *(ǂkχama)* sagte: „Ach *(o)*, sie *(-ti, Pers.-Suff.)* sind dickvoll *(sū)* gefressen *(ǂū grasen)*, darum sagen ja *(gum---o)* doch die Ziegen so!"; aber während *(hĭa)* er so *(ti, m. d. Per.-Suff. d. Subj.)* sprach, war jener schon fertig *(ǂoa, i. pass. narr.)* mit dem Kehleabschneiden. Da nahmen *(ū)* sie das Fleisch *(ǂgana)* und gingen davon *(ǂgûng)*.

Und sie kamen *(sĭ)* zu *(doba)* Buren. Die aber schütteten *(tsoro)* Reis aus *(χu)* und hießen *(gai)* den beiden *(-kχū, Suff., Dat.-Acc.)* ihn auflesen *(sū kχaĭ)*. Doch während *(hĭa hat d. Pers.-Suff. d. Subj. i. Nachsatz)* sie auflasen, kamen *(ǂkχĭ)* weiße *(ǂuri)* Krähen *(gorate)* und halfen *(ǂui)* ihnen auflesen, und der Sack *(ǂhôsa)* wurde voll *(ǂoa fertig werden)*. —

Hier brach der Erzähler ab und fuhr ohne ersichtlichen Zusammenhang mit dem Vorhergehenden fort:

Da sagte der Vater *(ǂba)* des Mädchens *(kχoĭs)*, das die Schlange *(ǂaob)* zur Frau genommen *(ǂgame)* hatte: „Lauf und *(ĕ, m. d. Pers.-Suff. d. 2. pers. masc. sing.)* geh zur Werft *(ǂgaŭs)* der Schlange, mein *(ti)* Kind *(ǂôasa)* mir *(te, Suff.)* zu holen!" *(ǂûba)*.

Und der kam hin zur Zeit, als die Schlange fort war *(ǂkχaĭ)*, und befragte *(lĕ)* [das Mädchen]. Das sagte: „Gleich *(ǂāse)* wird *(aĭ)* sie kommen!" Dann fragte er: „Wo *(maba, m. Pers.-Suff.)* sitzt *(ǂnû)* ihre *(ŋ(e)lb, pron. pers., dl, Genitivpart.)* Stärke *(ǂgaisa)*?" „In *(ai)* der Stirn *(ǂūs)* sitzt *(ǂnôa)* ihre *(l, urspr. verb.: gehören, jetzt Possessivendung)* Stärke", antwortete das Mädchen.

Und als die Schlange kam *(hã, m.-Pers.-Suff.)*, verwandelte er sich *(gai, verb.)* in eine Ameise *(ŋgoberu-b)* und kletterte *(doĕ wandern, ǂaba aufsteigen)* auf ihre Stirn und sog *(ŋgom)* ihre *(ã, Wurzel d. pron. poss., -ba Pers.-Suff. d. Besitzers)* Kraft aus *(tui)*, nahm *(im part. praet.)* das Mädchen und ging heim *(ǂaru)*.

d) Haitsiaibeb-Mythen.

Hai-tsiai-bena wird von den Hottentotten der Sagenkreis des Helden der Vorzeit genannt, dem sie noch vor wenigen Jahrzehnten[66]) in entlegenen Gebieten Grabhügel errichteten (vgl. Totenbräuche, S. 317) in Gestalt von Steinhaufen, auf denen der Vorbeiwandernde einen Stein oder Zweig niederlegte, in der Hoffnung, daß er dafür guten Weg und Wasser fände.

Wenn die Annahme sich bestätigen sollte, daß die Hottentotten später den Haitsiaibeb als Mond an den Himmel versetzten[75]), dann wäre auch der Mond-Mythus (Sage XXX) diesem Sagenkreis einzufügen. Der Wortlaut, in dem ich ihn erzählen hörte, weicht von dem, den Th. Hahn mitteilt, darin ab, daß die Laus, die dort vom Hasen abgefangen wird, fehlt.

Man hat versucht, eine Sagenfigur, die der Hottentott *tsũǂgoab* nennt, als Ausdruck einer Gottesahnung zu deuten: Mit „Der mühsam *(tsũi)* zu Bittende *(ǂgoa)*" übersetzt Kroenlein[81]) diesen vermeintlichen hottentottischen Gottesbegriff. Eine solche Ableitung ist meiner Überzeugung nach sprachlich unzulässig. Denn der erste Wortstamm lautet, wie ich mich immer wieder überzeugt habe, nicht *tsũi*, sondern *tsũi*, wie er in *tsui-* = verwunden wiederkehrt. Ältere Autoren haben in der Tat nicht *tsũǂgoab*, sondern *tsuiǂgoab* gehört und aufgezeichnet. Da bei der Bildung zusammengesetzter Wörter der Stärkeakzent, der dem isolierten Einzelwort eigen war, zu Gunsten des neuen Wortakzents häufig verloren geht (s. S. 362), so ist nicht zu entscheiden, ob der zweite Stamm unseres Wortes *ǂgoa-* = „bitten" oder *ǂgo-as* = „Knie" lautet. Die letztere Auffassung ist aber nach dem, was über die Bedeutung von *tsũi* feststeht, bei weitem die wahrscheinlichste. Ich glaube, daß in diesem Punkte dem Sprachforscher Kroenlein der Missionar Kroenlein in den Nacken geschlagen hat, und schließe mich auf Grund meiner Aufnahmen der Ableitung Th. Hahn's an, dem *tsũǂgoab* so viel wie „Wundknie" bedeutet: Bezeichnung eines Helden, der im Kampf am Knie verwundet wurde. Ob dieser Held, wie vermutet wird, mit dem oben genannten Haitsiaibeb identisch ist, ist eine andere Frage.

Bei der hohen Verehrung, die den Ahnen gezollt wird, ist es erklärlich, daß der Hottentott beim Namen des „Wundknies" schwört: „*tsũ-ǂgoa-aob*"

Auch den Ausruf des Erstaunens, unserem „ach Gott!" entsprechend, *„tsũ-ǂgoatse!"* habe ich oft gehört.

Als Feind der Menschen figuriert in der Sage XXXI eine Gestalt, die mir die Hottentotten als **ǂgã-ǂgori-b* bezeichneten, weil er einst die Menschen steil *(*ǂgã!, verb.)* herab in eine Grube kopfüber gestürzt *(ǂgori-)* habe, bis ihm der Schakal das Handwerk legte. Der Unhold ersteht dann vom Tode und rühmt sich seiner Unsterblichkeit. Ich vermute aber, daß die von Bleek mitgeteilte Lesart (in der Haitsiaibeb als der Retter und der Unsterbliche figuriert) die ursprünglichere ist, daß mir also nur noch verschwommene Erinnerungen an den fast schon vergessenen Sagenkreis des Haitsiaibeb zu Ohren gekommen sind.

Den „Herabstürzer" selbst hörte ich in der Sage nur *„ǁU-ǂriseb's* Vater" genannt werden. Sein eigener Name begegnete mir aber einmal in einer Redensart, mit der sich ein Hottentott gegen eine harte Anrempelung verwahrte: *„ǂgãǂgoribits ga goma a ǂhaimrihe!"* „Möchtest du doch vom Herabstürzer umgestoßen werden!" (das Schluß-*i* in *ǂgoribits* ist = *χa* = von, *-ts* = du, *ga* ist Potentialpart., *goma* gibt dem Fluch den Charakter eines Auftrags an den Unhold, *a* ist Präsenspartikel, **ǂhaim* = umstoßen, *-ri* soviel wie „an" in anstoßen, *he* Passivpartikel).

XXX.

ǂKχãb tsĭ ǁõas tsĭra.

Übersetzung von XXX.

Der Mond und der Hase.

Der Mond *(ǂkχãb)* schickte *(sĭ, wohl im pass. narr., s. S. 392, χa Demonstr.-Part., i Hilfszeitwort, gye gye Verbalpart. d. praeter.)* den Hasen *(ǁõasa, fem.)* fort: „Melde *(mĭ sprechen, -ba hebt eine Beziehung zum*

Objekt hervor: melden) den Menschen *(kχoĩna, comm. plur.)*, sie sollen *(ĩ und, imperativisch, mit d. Pers.-Suff. d. Subj. -n, comm. plur.)*, gleich wie *(kχomi)* ich *(tĩia)* tue *(hĩ, -ra Verbalpart. d. fortschr. Handlung)*, vergehen *(ũũ)* [und] wiedererscheinen *(ǃgũ)*!" So *(tumi)* wurde dem Hasen aufgetragen *(sĩhe, hier wohl echtes pass.)*.

Und *(o, mit dem weibl. Pers.-Suff.)* der Hase [sagte]: „Wie mein *(ti)* Großvater *(tnaob, respektvolle Bezeichnung des Mondes)* tut *(ta euphon. für ra)*, so vergeht [und] erscheint [auch Ihr] wieder *(Imperativ)*! Das ist mein Auftrag *(goma, Interjektion)*." Als *(o)* er aber *(tsĩ mit Pers.-Suff.)* [so] sprach *(mĩ)*, da [riefen] die Knaben: „**Was** *(tarẽ)* redest *(ta euphon. für ra)* du *(-s in tis)* da *(ĩi so)*?" Da sagte der Hase *(durch das s in as angedeutet)*: „Wie ich tue — so lautet mein Auftrag — so sollt [auch Ihr] glotzäugig sterben!"*)

Dann geht er nach Hause *(saru, verb.)* und kommt *(sĩ)* [zum Mond]. Und der Mond fragte *(tĩ)* ihn *(si, Pers.-Suff.)*; er aber schweigt *(spricht kχom, nicht toma)*, wohl wissend *(tan, tsĩ Verb.-Part. des Particip. praeteriti)*, daß *(ǃkχaĩ)* er gelogen *(thumi, mit Pers.-Suff. des Subj.)* hatte *(go, Verb.-Part. des praet.)*. Da zerschlug *(tnau schlagen, tari bersten)* ihm der Mond den Mund *(ams)*"*).

XXXI.

ǃUriseb ǃba.

ǃUriseb ǃb χa ǃ gye ũba kχaohe tsĩ kχoĩna taĩba taĩre gaihe tsĩ ãb ǃna aoenãhe tsĩ ra ǃkχã thubihe, tsĩ kχoĩĩ ra ikχĩ o ũba ra ǃkχoĩ tnamibe ũĩ tsĩ ra thã ǂgãĩ ãb ǃna.

Ob gye ǂgui tsĩ ǂgiriba tnaiba tkχau tã tãsentsĩ go ikχĩ, tsĩkχa gye go ǃkχoĩ tnamibe, tsĩb gye go thã ǂgiriba tsĩ tkχanu tsĩ go tnã ŋgona tsĩ go kχau. tsĩb gye ǂgĩriba go saru.

Ob gye sõ tsĩ gye ǂgã tsĩb gye tnaina ra tũ tsĩ: „juriseb ǃ tkχõ te re! tnaigu gaigu ǃna tkχõ te re!" ĩi ra mĩ tsĩ: „juriseb ǃĩa sõ gyeta, sõtsĩ gye ǂgãĩa!", ĩi ra mĩ.

*) Der Hase richtet also, von den Knaben, die auf ihn einreden, verschüchtert, das Gegenteil dessen aus, was ihm der Mond aufgetragen hatte: Wie der Mond untergeht, so sollten auch die Menschen sterben.

ǂgõõ — Seier, *ra* ist Dimensivpart., *a* Hilfszeitwort, *mũ* — sehen. *ǂgõro-a-mũ* bezeichnet den einen Blick des Toten. Analoge Wortbildungen sind: *tsũ-a-mũ* — schlaggig, *thoe-a-mũ* — blindäugig, *ǂgoro-a-mũ* mit eingeschlossen Augen usw.

**) Seitdem haben die Hasen ihre „Hasenscharte" in der Oberlippe.

Übersetzung von XXXI.

Uriseb's Vater.

Uriseb's Vater *(īb)* gräbt *(kχao. i. pass. narr.)* eine Grube *(āba)* und läßt *(gai, i. pass. narr.)* die Leute *(kχoēna)* Feuerholz *(ıaēba)* suchen *(-re ergänzt den Stamm zum Verb.)* und wirft *(ao)* sie in *(ına)* die Grube herunter *(ınā)* und steckt *(ıkχā)* sie in Brand *(ǂhubi anzünden, i. pass. narr.)*. Und wenn *(ō)* ein Mensch kommt *(ıkχī)*, jagt *(ıkχoē)* er mit *(ū)* ihm *(durch d. Pers.-Suff. d. 3. pers. comm. sing. -ī ausgedrückt)* rund um *(ınamibe, verb.)* die Grube und stößt *(ǂhā)* ihn in die Grube hinein *(ǂgā hineinstecken)*.

Aber eines Tages *(gui tsē)* kam der Schakal, nachdem *(tsī, Part. d. partic. praet.)* er sich *(-sen, Reflexiv-Part.)* mit Schmalz *(ınuiba)* beschmiert *(ǂkχau)* und naß gemacht *(iā iā)* hatte; und die beiden *(-kχa, Suff. dual. masc.)* jagten im Kreise umher. Da stieß jener den Schakal, glitt aber ab *(ǂkχanu)* und fiel *(ınā)* [selbst] herunter *(ıgona)* und verbrannte *(kχau)*. Dann ging der Schakal nach Haus *(ıaru, verb.)*.

Jener aber kommt um *(ıō)* und lebt wieder auf *(ıgā)* und ißt *(tū)* vom Nais-Busch und [singt]: „Begrabt *(ıkχō)* mich *(te, Suff.)* doch *(re)*, mich, Uriseb's Vater *(hier ohne Pers.-Suff.)*! Begrabt mich in großen *(gai, m. d. Pers.-Suff. d. zugehörigen Subst., weil nachgestellt)* Nais-Büschen!" „Ich *(-ta, Suff.)*, Uriseb's Vater, bin umgekommen, [aber obschon] umgekommen, bin ich lebendig!"

e) Tiersagen.

Der Glaube, daß gewisse Menschen die Fähigkeit haben, im Schlafe sich in Tiere zu verwandeln, als solche unerkannt herumzuschweifen und ihnen sonst Verborgenes zu beobachten, ist nicht selten anzutreffen.

Die Fähigkeit, beliebige Tier- und Menschengestalt anzunehmen, besitzt auch das Fabelwesen, das die Hottentotten *ıgaũa-b* nennen. Sie stellen es sich in Menschengestalt vor, als hautüberzogenes Gerippe mit armlangen Füßen. „So schnell wie eine Flamme aus der glimmenden Asche aufflackert und erlischt", so schnell tritt, wie mir ein Knabe sagte, das Wesen des Nachts in eine Hütte und raubt ein Kind. Es eilt mit ihm in eine Höhle, die es in lockeren Boden gegraben hat, und reitet auf seiner Beute, bis sie im Staub erstickt ist. Tagsüber kann der *ıgaũa-b* auch Tiergestalt an-

nehmen. Ein solcher Klippbock, Schakal oder was es sonst sein mag, flieht nicht, denn er ist unverletzlich. In Menschengestalt erscheint das Wesen dem Menschen nur von fern, da er trotz aller Verkappung an seinen Gesichtszügen erkannt werden würde.

Der Schwerpunkt der hottentottischen Tiersagen liegt aber nicht in diesen willkürlichen, mit dem Tierreich nur lose verknüpften Phantasien, sondern liegt in der individuell scharf durchgeführten Charakteristik der Tiere und in der Übertragung der hier gezeichneten Züge auf menschliche Typen. Weil sich der Hottentott in diesen Tierbildern als feiner Beobachter seiner selbst zu erkennen gibt —, weil er in der Art, wie er die Erzählung auslaufen läßt, seiner moralischen Wertschätzung der einzelnen Typen klaren Ausdruck gibt —, weil er sich endlich hier aus keinerlei ängstlichen oder utilitarischen Rücksichten zu verkappen braucht —, deshalb sehe ich in diesen Sagen den reinsten Spiegel seines innersten Wesens.

Unter den Tieren, hinter deren Worten und Handlungen der Hottentott sich selbst versteckt, nimmt der Schakal eine hervorragende Stellung ein. Allen anderen an Klugheit überlegen, treibt er mit dem Stärksten wie mit dem Schwächsten sein überlegenes Spiel. Als Sinnbild der Dummheit wird ihm die Hyäne gegenübergestellt, mit ihr darf er sich jeden schlechten Witz (Sage XXXII und XXXIII), auch Betrug (XXXIV) erlauben, soweit der Übergriff nicht gegen Pietätsgefühle, die auch dem Blöden zugebilligt werden, verstößt (XXXV).

Die Hinterlist des Schakals wird besonders da mit Erfolg gekrönt, wo sie mit persönlichem Mut verknüpft ist (XXXVI) oder mit der Feigheit des Gegners (XXXVII und XXXVIII), hier des verhaßten Leoparden oder des harmloseren Pavians, geschickt rechnet. Wo die Beschränktheit des Gegners mit Habsucht gepaart ist, wie in dem Abenteuer des Schakals mit den Buren (XXXIX), läßt man den schlauen Fuchs im letzten Moment noch glücklich sich aus der Schlinge ziehen. Wo in Unentschlossenheit (XL) oder in schlecht angebrachter Milde halbe Maßregeln angewandt werden (wie es vom Missionar in Sage XLI erzählt wird), schenkt man dem Schakal die Strafe selbst für Betrug, Mord und Diebstahl. Aber man gönnt dem alten Spitzbuben auch einmal eine Tracht Prügel, wenn er in Vorwitz und Eitelkeit sich an das Erdmännchen heranmacht (XLII) oder wenn er der Flamingofamilie gegenüber allzu selbstherrlich auftritt (XLIII).

Der Schakal hat uneingeschränkt die Sympathie des Hottentotten, wo er als der Verfolgte der Übermacht des Stärkeren (des Löwen) sich zu ent-

zieben weiß (XLIV u. XLV); noch mehr da, wo er sich für persönlich erlittene Unbill rächt (XLVI); am meisten da, wo er gleichzeitig als Rächer und Wohltäter aller Schwachen die Gewaltherrschaft des Stärkeren bricht (XLVII).

Von der humorvollen Seite wird die Schlauheit des Schakals angesehen, wo er als Schiedsrichter und Befreier zugleich der Schlange und dem Stachelschwein eine Lehre gibt (XLVIII).

Als Don Juan tritt der Schakal mit wechselndem Glück auf: mit Erfolg in der schlüpfrigen Sage XLIX, als der Hereingefallene in der Sage L, wo er sich in die Sonne verliebt.

Nächst dem Schakal ist der Löwe in den Sagen am schärfsten charakterisiert und vermenschlicht. Er wird überall mit Haß oder Spott überschüttet. Verhaßt ist er seiner Roheit wegen, die ihn zum Mörder seiner eigenen Kinder aus der Straußenehe macht (LI), und seiner Gewalttätigkeit wegen, die selbst dem friedlichen Pavian die Nachbarschaft verleidet (LII). Seine Strafe ereilt ihn dafür um so leichter, je mehr er sich über die anderen erhaben dünkt: selbst die kleine Aró-Eidechse führt ihn an der Nase herum (LIII). Dabei ist er so lüstern, daß er sich nicht scheut, Krankheit zu simulieren, um die Masseuse zu vergewaltigen (LIV).

Auf seine Macht ist er lächerlich eingebildet, hält sich für unüberwindbar. Vom Straußen (LV) und selbst von der kleinen Steenbock-Antilope (LVI) muß er sich eines Besseren belehren lassen. Seine Anmaßung zahlt ihm der Silberschakal so gründlich heim, daß seiner Scheinauktorität schließlich aller Nimbus genommen wird (LVII).

Das Thema vom Triumph der List und Geschicklichkeit des Schwachen über die plumpe Übermacht des Stärkeren wiederholt sich in den Hottentotten-Sagen in immer neuen Variationen und Tierbildern. Eine der besten Sagen, die uns nach den verschiedensten Richtungen hin tiefe Einblicke in das Gemütsleben der Hottentotten gibt, ist die Sage LVIII, die von der Fliege und dem Elefanten handelt. Wie ferner sich das Erdmännchen der Tyrannei des Dickhäuters entledigt, wird bei aller Vermenschlichung der Verhältnisse doch eng im Anschluß an die Lebensweise des Tierchens erzählt (LIX).

Wie im Vorhergehenden die Fliege und das Erdmännchen, so spielt in den beiden folgenden Sagen ein etwa amselgroßer Vogel, *gā-ītsi/ha-mabes* genannt, die Rolle der schwachen, aber ihrer Klugheit wegen im Kampfe überlegenen Partei. Hier befreit das Tierchen, das in der Gestalt eines jungen geweckten Mädchens auftritt, sich und die Seinen von der Plage

der Riesenschlange (LX), dort rettet ihre Aufmerksamkeit und List die Mädchen vor den Mordplänen des Honigdachses und seiner Kumpane, die nach der brummenden Riedmusik des Mistkäfers mit jenen zu Tanze gehen (LXI).

So hilft auch der Schildkröte eine einfache (ähnlich ja auch von unserem Swinegel dem Hasen gegenüber angewandte) List zum Sieg im Wettlauf über den Strauß (LXII). Selbst die Riesen-Antilope, das Eland, muß seinen Hochmut der Schildkröte mit dem Leben bezahlen (LXIII). Daß in die Hände des Schwachen oft eine wichtige Entscheidung oder Wendung gelegt ist, kehrt, wie in den Bergdamara-Abenteuern, so auch in der LXIV. Sage wieder.

Den Schluß mögen vier Sagen bilden, die teils plump-naiv, teils mit etwas mehr Auftietung von Phantasie, lediglich als Illustration gewisser Eigentümlichkeiten im Äußeren oder in der Naturgeschichte einiger Tiere (Zebra, Leguan, Payian etc.) aufzufassen sind (Sage LXV bis LXVIII).

Um Erklärungen in den Übersetzungen zu sparen, seien hier die Tiere, die in den Sagen figurieren (die nur beiläufig erwähnten, selbst nicht handelnden, eingeklammert) kurz und meist in vereinfachter Schreibweise zusammengestellt. Im Register am Schluß des Buches ist zu finden, in welchen Sagen die einzelnen Tiere auftreten.

1. *Elephas africanus (Blumenb.)*, der Elefant, *ǂkχoab.*
2. *Giraffa capensis (Lesson)*, die Giraffe, *ǂnaib.*
(3.) *Procavia (Hyrax) capensis (Pall.)*, der Klippdachs, *ǂaûb.*
4. *Taurotragus oryx (Pall.)*, die Eland-Antilope, *ǂkχans.*
(5.) *Antidorcas euchore Zimmerm.*, der Springbock, *ǂgûb.* Sagenname: *ǂhāēb.*
6. *Rhaphiceros campestris (Thunberg)*, der Steenbock, *ǂaris.*
(7.) *Ovis aries L. platyura*, das Fettschwanzschaf, *gub.*
8. *Bos taurus L.*, das Hausrind, *gomab.*
9. *Equus zebra L.*, das Zebra, *ǂgoreb.*
(10.) *Equus caballus L.*, das Pferd, *hāb.*
11. *Felis leo L.*, der Löwe, *χami.* Sagenname: *gaiǂgāba* d. h. „Großrücken".
12. *Felis pardus L.*, der Leopard, *ǂgarub.*
13. *Canis mesomelas Schrbr.*, der Schakal, *ǂgîrib.* Von der Hyäne der Sage seines gelben Pelzes wegen „mein Bruder Fahl", *ti ǂgâ ǂhaisetse*, angeredet. Das Schakal-Kind hat in der Sage den Eigennamen *ûsgyeb.*

14. *Hyaena brunnea Thunberg*, die braune Hyäne, *ǂhīras* (speziell **ǂnūbe ǂhīras*), vom Schakal der Sage ihrer Haltung beim Laufen wegen „meine Schwester Spitzlauf", *ti ǀgū ǂgōbese*, genannt.

15. *Vulpes chama (A. Smith.)*, der Silberschakal, *ǂkχamab*, Jägername: **ǂgaihetoma-b* (s. S. 283), rätselhafter Sagenname: **hoagye-ǀgū-hākχoisōab*, d. h. der Sohn *(ōab)* der Schwester *(ǀgūs, kχois* Weib*)* aller *(hoa)* [Menschen] *(gye* und *hā* Verbalpartikel*)*

16. *Felis caffra Desm.*, die Wildkatze, *ǂhōab*.

17. *Mellivora ratel (Sparrm.)*, der Honigdachs, *ǂharebab*.

18. *Cynictis penicillata (G. Cuv.)*, die Mierkatze, das Erdmännchen, *ǂēb* (speziell: **ǂuriǂēb.)*

(19.) *Canis familiaris L.*, der Haushund, *arib*.

20. *Hystrix africae-australis (Peters)*, das Stachelschwein, *ǀnoab*.

21. *Lepus*, der Hase (s. S. 285), *ǀōas*.

22. *Papio porcarius (Boddaert)*, der Pavian, *inīrab*.

---

23. *Struthio australis L.*, der Strauß, *ǂamīb*. Rätselhafte Sagennamen: *hubais* und *hingatu-bus*. Eigenname des Straußenkindes der Sage: *batsibab*.

24. *Saxicola pileata (Gm.), Kochlar, *gūcsinǂhamabes*.

(25.) *Numida spec.*, das Perlhuhn, *ǂkχīnas*.

26. *Phoenicopterus*, der Flamingo, *fala-migob* (entlehnter Name, wie es scheint auch auf einen Reiher des Binnenlandes angewandt).

27. *Gallus domesticus Boiss*, das Haushuhn, *hūnors* (entlehnt).

28. *Corvus scapulatus Daud.*, Weißkrähe, *gorab* oder *ǀuri gorab*.

---

29. *Python sebae*, die Riesenschlange, **gaiǂaob*. Die Rudimente der hinteren Extremitäten dieses Tieres sehen die Hottentotten für Hoden an und nennen daher die Riesenschlange auch **goǂma-ǂkχo-raseb*, d. h. „der mit den Ochsenhoden". Alte Leute hörte ich die Riesenschlange **ǀga-ǂnigyen/gūǂb* nennen, weil das Tier sein Opfer erdrückt *(ǀgaǂni)* und weil ihm die „Hoden" hinten wie ein Schurz *(ǀgūǂb)* anhängen.

30. *Psammophis notostictus Peters*, die Schippschlange, *sanugyeb-aseb*.

31. *Varanus spec.*, der Leguan, *ǀnoǂnā-b*, **ǂnareb* im Bergdamaradialekt.

32. *Agama spec. (A. atra Daud.* oder *A. planiceps Peters)*, Aro-Eidechse, *ǂaro-b.*

33. Eine der Gattung *Scapteira* verwandte Lacertide, *ǂgabestau-b.*

34. *Pelomedusa galeata (Schoepff)*, eine in schlammigem Wasser lebende und wohl daher übelriechende Schildkröte. Allgemeine Bezeichnung für Schildkröte ist *ǂkχuri-b.*

35. *Batrachia anura* verschiedener Gattungen, soweit sie unter den Sammelbegriff Frosch, *ǂgũ-/tsiǂgũ-ǂbes*, fallen.

Canis mesomelas Schrbr., der *ǂgĭ-rib* genannte Schakal.

36. *Muscidae* verschiedener Gattungen, soweit sie unter den Sammelbegriff Fliege, *ǂgĭna-s*, fallen.

37. *Orthoptera* verschiedener Gattungen, soweit sie unter den Sammelbegriff Heuschrecke, **ǂnâ/ǂaus*, fallen; ihrer Hüpfbewegungen wegen werden die Heuschrecken mit einem Mädchen verglichen, das tanzt *(ǂnâ)* und rast *(*ǂaus)*.

38. *Orthoptera* aus den Familien der *Hetrodidae* und *Stenopelmatidae;* zu letzteren gehört die *ǂkχu-nitsiǁkχu-meb*, d. h. „Völlerbauch", genannte *Maxentius*-Art.

39. *Coprophage Lamellicornier* aus der Gruppe der *Scarabaeinae,* Arten von „Mistkäfern". Der Mistkäfer wird *χau-tsiǁga-ǂmabeb* genannt, nach seinen Wühlbewegungen im Mist: Er schmiegt sich dem Mist *(χaub)* so an, wie man sich nachts dicht an das Feuer legt *(°ǁgaǂma-)*. Sein brummender Flügelton wird in der Sage dem Baß der Riedpfeifen verglichen. In der Sage figuriert der Mistkäfer unter dem Namen *ǂanagyeǂgaieb.*

(40.) *Formicidae,* Ameisen, *ǂgoberu-gu.*

Übersetzung von XXXII.

Der Schakal und die Hyäne, die zwei Kühe der Ameisen wegnehmen.

Die Hyäne und der Schakal hüteten *(|ūĭ, i. pass. narr.)* das Vieh *(|goana, comm. plur.)*. Und sie kamen *(sĭ)* an *(doba)* Dornbäume *(ǂkχūti)* und suchten sich *(hare)* Hairaharz. Da sagte die Hyäne: „Mein Bruder Fahl, sieh *(gō)* doch *(re)* nach dem Vieh!" Da sieht der Schakal zu und sagt: „Es liegt *(ǂgoĕ)* im Schatten beisammen" *(|haū, verb.: Zusammenkommen des Schatten suchenden Viehs in den heißen Tagesstunden)*. So sagte er, obwohl *(χabe)* das Vieh fortgelaufen *(bē, m. d. Pers.-Suff. d. comm. plur.)* war, und fuhr fort*): „Meine Schwester Spitzlauf, hattest du *(-s weibl. Pers.-Suff. hinter tăĭ denken)* im Sinne, was ich im Sinne hatte?" Und die Hyäne antwortete: „Ich hatte es im Sinn". Darauf der Schakal: „Laßt *(hā)* uns *(-m, entstanden aus im, Suff. 1. pers. dual. masc.-fem.)* denn das Vieh suchen *(ōa)* und *(ĕ)* weggehen, miteinander *(-gu)* zu schlachten *(ǂā)***)!"

Dann gingen die beiden und fanden eine weiße *(|uri)* und eine schwarze *(ǂnū)* Kuh. Da sagte der Schakal: „Die weiße ist mein' *(ti, Stamm d. 1. pers. d. pron. pers., -sa Adj.-Endg.)*, und die Hyäne sagte: „Die schwarze ist mein"; dann schlachteten die beiden. Nun legte *(ǂnūi, i. pass. narr.)* der Schakal die Hyäne unter *(|gū zudecken)* die nassen *(ūā)* Felle***) *(kχōra, dual. fem.)*, kochte *(saĭ, i. pass. narr.)* [das Fleisch aus] und schüttete *(tsoro, pass. narr.)*, nachdem *(tsĭ Verb.-Part. des particip. practeriti hinter χorohe)* er ein Loch *(ūb)* gegraben *(χoro, i. pass. narr.)* hatte, die Fettstücken *(gauga, masc. plur.)* in *(|na)* das

---

*) Diesen Zwiegespräch (vgl. Sage XXXV), in welchem zwei Hallunken, jeder mit derselben Schlechtigkeit im Sinn, gegenseitig sich vorsichtig sondieren, ohne sich doch zunächst etwas vergeben zu wollen, ist charakteristisch für den verschlagenen Charakter des Hottentotten.

**) *ǂagu* hat auch die Bedeutung „einen Hochzeitsbraten schlachten". In diesem Sinne ist das Wort auch hier zu verstehen; die später folgende Aufforderung der Hyäne zum Coitus knüpft daran an. Der Schakal tritt in den Sagen stets als Mann, die Hyäne mit wenigen Ausnahmen (z. B. in Sage XXXIV, wo sie als dummer Bräutigam figuriert) als Weib auf.

***) Nachdem er ihr eingeredet hatte, sie sei krank und müsse sich deshalb der üblichen Fettentwickelung (s. Kapitel Medizin, S. 223) unterziehen.

Loch [um sie zu unterschlagen]. Dann gibt *(mā, i. pass. ǂnarr.)* er der Hyäne zwei kleine magere *(ǂhai ǂhai, saftlos)* Fleischstückchen *(ǂgani Fleisch, -ro Dimin., -ra dual. fem.)* und Pisse *(ǂūb)*. Da sagte sie: „Mein Bruder Fahl, nach *(ǂa von)* was *(*ǂaēī = tareē)* schmeckt *(tsā)* denn das Schmalzzeug *(ǂnūiē, comm. sing.)* so?" *(ǂnāti)*. Darauf der Schakal: „Ach *(ǂkχa)* meine Schwester, ich *(-ta)* verstehe *(ǂnūū hören, ǂū offen darlegen)* nicht *(ǂoma)*, was es mit dem Schmalz ist!"

Jetzt sah der Schakal die Ameisen *(ǂgoberugu)* herankommen*) und schlüpfte *(sī gehen, ǂgū hineingehen)* in das Loch. Da kamen sie und sahen die Häute der beiden Kühe und schlugen *(ǂnaa)* die Hyäne *(sī, Suff.)* mit *(ǂkχa)* Stöcken *(ǂaiti)*. Da rief sie: „Bruder Fahl, meinen Leib *(ǂkχā)* schlagen, tut mir *(ǂe Suff.)* nicht gut! *(ǂgaī,*

*) Mit dem Viehraub des Schakals und der Hyäne bringen die Hottentotten die Gestalt eines Gerstäugiers, den sie *ǂkχu-nitsiikχa-meb* nennen, in Zusammenhang: Als die Ameisen den Diebstahl bemerkten, riefen sie alle streitbaren Männer zur Verfolgung zusammen. Die Heuschrecke aber

Maxentius Stal spec., aff. pinguis Wlk. ♀ (Stenopelmatide) $^{9}/_{10}$ nat. Gr.

erwiderte: *„nēta ra hā tsī ǂgōan doba ǂhao dain ǂa ra ā!"* „Ich bleibe hier und trinke bei den Kindern von der Milch der Blumenzeit!" (Zeit der besten Weide). Zur Strafe dafür ist sie so unmäßig dick geworden, daß sie als „Völlerbauch" (*'ǂkχani* — im Übermaß trinken, *ǂkχams* — Bauch) bis zum heutigen Tage nur mühsam im Sande kriechen (s. Figur) oder auf den Dornbaum klettern kann.

verb.), aber vögeln *(χoē, Coitus vollziehen)* magst *(go, Part. de potent., -ts Suff. masc.)* du meinen Leib, ja *(o, Interj.)* das ist mir angenehm!" Dann biß *(nā)* sie ein Loch *(ǂhūsa)* durch *(ǂhū durchlochen)* [die Häute] und sah nun, daß *(ǂkχaiē)* es die Ameisen waren *(wörtl.: sind a)*, und entfloh *(ǂhai-nī)*.

Der Schakal aber ritzte sich selbst *(ǂhari etw. auftrennen, -sen Refl.-part.)* im Rasenkibusch *(*taros)*, und als *(o)* die Hyäne vorbei- *(l, verb., mit Pers.-Suff.)* eilte, rief *(ǂgai)* er sie, und sie kam. Darauf der Schakal: „Ja *(gum---o)*, ich *(tita, pron.)* bin auch *(tsī und, m. d. Pers.-Suff. d. comm. plur.)* geschlagen worden!" So sagte er, nachdem *(-tsī, Part. d. partic. praet., hinter mū, Augen)* er die Augen mit Speichel *(ǂāba)* eingeschmiert *(ǂχoro)* hatte*).

Dann gingen die beiden *(ū(e)īra, Pron. 3. pers. dual. masc.-fem.)* und trafen *(hō)* auf Pferde *(hāna, comm. plur.)*. Und das junge *(ǂkχam)* Pferd machte der Schakal mit dem Riemen *(ǂhaūb)* fest *(*ǂnūi ǂao, den Nacken setzen)*, während es dalag *(ǂgoē)* und schlief *(ǂom, mit d. seltenen Suff. d. 3. pers. masc. sing. -mi)*, und packte *(ǂgai binden, ǂnūi setzen)* die Hyäne darauf. Er selbst *(ū(e)ība, Pron. pers.)* aber fing *(ǂkχō)* das große *(gai)* Pferd und sagte zur Hyäne: „Du *(sasa, Pron.)* reitest *(ǂgabi)* dahin *(ū längs)*, wo keine Menschen *(kχoīn, comm. plur.)* sind *(der Relativsatz ist im Hott. substantivisch ausgedr. durch ǂkχaia = nichts, mit angehängtem Suff. d. 3. pers. masc. sing. -ba)*. Laß *(ē)* mich *(-ta Suff. und tita pron.)* dahin reiten, wo Menschen sind!" *(ebenfalls substantiv. ausgedrückt durch Anhängen d. Pers.-Suff. an das Verb. hā = sein)*. Sprach's und lief weg. Die Hyäne aber wurde von *(χe)* dem jungen Pferd in den Pferde-Kraal *(ǂharab)* abgesetzt *(wörtl.: kam sī, mit ī, gesprungen uri, worden -he pass.)*. Da wurde sie gefangen und geprügelt und fortgejagt *(geheißen gaihe, zu gehen)*.

Übersetzung von XXXIV.

Als die Hyäne Hochzeit machte.

Die Hyäne hatte um ein Mädchen *(ǃgōasa)* geworben *(ǂgan, wie d. folgenden Prädikat. pass. narr.)*, und als *(o)* sie die Werbung zustande gebracht hatte *(ǂoa)*, suchte *(ōa)* sie Kühe *(gomate)*, um *(nĭ; fut. part., m. d. Pers.-Suff. d. Obj.)* sie zur Hochzeit zu schlachten *(wörtl.: Kühe, die sie zum Hochzeitsschlachten, ǃgûtā, nehmen, û, würde)*. Und während *(hĭa, m. d. Pers.-Suff. d. Subj. i. Nachsatz -kχa, dual. masc.)* sie mit *(ǃkχa)* den Kühen ankam, traf sie mit dem Schakal zusammen *(wörtl.: trafen die beiden ... zusammen, ǃhao)*. „Wohin *(maĭ, m. d. Pers.-Suff. d. angered. 2. pers. masc.)* wanderst *(garu)* du *(-ts)* mit *(û)* den Rindern?“ *(comm. plur.)* [fragte der Schakal]. „Für *(*ǃgao, m. d. Pers.-Suff. d. Subj. -ta, ich)* meine *(ā Wurzel d. pron. possess., -ta Pers.-Suff. d. Besitzers, -b Pers.-Suff. d. Besitzes)* Hochzeit *(ǃgameb)* [Alles herzurichten], ja *(gumo)* darum wandere ich mit den Kühen!“ erwiderte sie. Dann fragte *(tĕ)* der Schakal so *(tumi)*: „Und werden sie alle *(hoa)* sechs *(ǃnani, m. Pers.-Suff.)* geschlachtet?“ Und sie antwortete *(ǃeream)*: „Ja!“ *(a)*. Darauf der Schakal: „Ich will [mit-] gehen *(ǃgûng)* und von *(χa)* dem Hochzeitsschlacht-Vieh essen!“ *(kommen zĭ, zu essen ô)*. Dann gingen die beiden.

Und nahe *(ǃgûse)* bei der Werft *(ǂgaûs)* gingen sie schlafen *(ǂom)*, und als der Morgen *(ǂgoas)* anbrach *(ǂgoa)*, steckte *(maĭ)* [sich] der Schakal ein Holz[-pflöckchen] *(haisa)* mitten zwischen *(ǂnaĕgu)* die

Zehennägel*) *(ǂgoro, Suff. fehlt)* und sagte: „Ja *(gum---o)*, nun *(*nē sirisa)* kann ich nicht *(ǂoa, verb.)* gehen!" und fuhr fort: „Der Lebendige *(ǂǂtsaba)* soll *(nī)* aufhucken *(aba)*, was *(-ē, Pers.-Suff. comm. sing.)* tot *(ǂǂō)* ist!" *(hā)*. Da sagte die Hyäne: „Komm *(hā)*, huck dich auf"**).

Darauf der Schakal: „Ach *(o)*, dürfte *(re, Optativpart.)* ich [mir] doch *(kχa)* Steigbügel (*dā treten, tnūi setzen, durch d. Pers.-Suff., hier comm. plur. -n, zum Substantiv verbunden. χa, Demonstr.-Part. mit Pers.-Suff. d. Subj.*) machen!" *(dī)*. Und jene erwiderte: „Nun so mache sie [dir] denn!" *(ǂnaī)*. Und [nach einer Weile] sagte der Schakal: „Ach dürfte ich mir doch Zügel *(ǃhaūn)* machen!" — „Ei, so mache sie dir!" erwiderte jene. Und weiter bat der Schakal: „Ach, könnte ich mir doch eine Peitsche *(ǃnabaī, comm. sing.)* machen!" — „So mach sie dir!" erwiderte jene. Dann gingen die beiden.

Und sie kamen an. Als *(o)* sie aber ankamen, schlug *(ǃham)* der Schakal die Hyäne (*durch d. Pers.-Suff. -bi ausgedr.*) auf alle beiden Seiten *(ǃkχākχa, dual.)*. Da entfloh *(ǃkχoē bē)* sie, und während sie davoneilte, sprang *(uri)* der Schakal ab und sagte [zur Braut der Hyäne]: „Hast du *(-s, Suff. 2. pers. sing.)* gesehen *(mū)*, daß du *(sasa, pron.)* auf dem besten Wege warst *(ra, Part. d. fortschr. Handlg.)*, meines Vaters *(dābab, di Genitivpart.)* Pferd *(hāb)*, das *(zeitlich durch hīa gegeben)* im *(ǃna)* Weidefeld *(ǂhaob)* fortgelaufen war, zu heiraten?"

Und der Schakal heiratete das Mädchen.

Der Schakal und die Hyäne, die ihre Mütter töten.

Der Schakal und die Hyäne wohnten *(hã, i. pass. narr.)* beide *(ra, Pers.-Suff. dual. masc.-fem.)* mit *(ǃkχũ)* ihren Müttern *(ŋgũra, dual. fem.)* zusammen. Und die Mütter stahlen *(ǁnari)* zwei Kühe *(gomara)*. Als *(o, m. d. Pers.-Suff. d. Subj. i. Nachs., -ra)* sie dann zusammen (*so besagt das -n, Pers.-Suff. d. comm. plur.*) schlachteten *(tã)*, dachten *(ǂaî, ti so)* [die Jungen], sie würden nur wenig *(ǂkχari, -se Adv.-Endg., -ra dual.)* bekommen *(hõ)*, und als die Mütter fortgingen (*ausgedr. durch d. nachgestellte ti ra go hî o, d. h. als sie so getan hatten*), — die Hyäne (**naus die andere*), um Feuerholz zu suchen *(ǂaĕre)*, die Schakalin, um Wasser zu holen *(ŋgama)*, — machten sie einen Plan *(ǂabe, verb.)*: „Schwester Spitzlauf, hattest du *(-s, Suff. 2. pers. sing. fem. in ǂaîs)* etwa *(ga)* im Sinn, was *(-î, comm. sing.)* ich *(ǂîta)* im Sinn hatte?" So fragte der Schakal, und die Hyäne antwortete: „Ich hatte es im Sinn, mein Bruder Fahl." Darauf der Schakal: „Gehe *(ǃgũng)* du *(sasa, fem.)* mit deiner Mutter *(saos)* und *(ĕ, m. d. Pers.-Suff. d. angeredeten 2. pers.)* töte *(ǃgam)* sie *(si, Pers.-Suff.)*, und *(m. d. Suff. d. redenden Pers.)* ich gehe mit meiner Mutter *(ais)* und töte sie, und *(m. d. Suff. d. 1. pers. dual. masc.-fem.)* wir essen *(õ)* das Fleisch *(ŋgana)* allein *(ŋguri)*". Dann gingen sie mit *(ũ)* ihren Müttern fort.

Und die Hyäne ging hin und tötete ihre Mutter, aber der Schakal ging und brachte seine Mutter in Sicherheit *(saũ, verb.)*, und jedesmal wenn *(gõse)* er Wasser holte *(ǂa euph. für ra)*, kam *(hã)* er und brachte *(mã)* ihr Fett *(gauga, masc. plur.)*. Aber eines Tages *(ǃgui tsî)* holte die Hyäne Wasser, und die Schakalin kam, weil *(tsî, Part. d. poetic. praeter.)* sie dachte, es sei ihr *(ŋ(e)îs, pron. pers., als possess. gebraucht unter Ergänzung d. Genitivpart.)* Kind *(ũab)*, eilig *(ǃkχoĕ, verb.)* hervor *(ŋoaχa, verb.)*. Da tötete die Hyäne die Schakalin und ging nach Haus *(ŋaru, verb.)*.

Und während *(hîa, m. d. Pers.-Suff. d. Subj. i. Nachs.)* die Hyäne kam, erschien *(ǂkχî)* der Schakal und ging ebenfalls *(ǂkχaba wieder)* zum Wasser und kam an *(ai)* den Platz *(ǂkχaib)*, wo sie tot *(tŏ, mit Pers.-Suff.)* dalag *(ǂgoĕ)*. Und er rief *(ǂgai)* „Mutter!", und weil *(χuiao)* die Hyäne dagewesen war, sagte *(i. part. praet.)* er sich: „[Das tat] die Hyäne!", ließ *(χu)* die Schüsseln *(χabaga)* stehen und eilte auf und davon *(ǂora)* nach Haus.

Und er weinte *(ā)* verstohlen *(ǂā entwenden)*. Die Hyäne aber sagte: „Mein Bruder Fahl, warum *(tarĕ was, -ba für)* weinst du?" *(-tsa, Suff. masc.)*, und lachte *(aî)*. Da nahm *(ǂî, i. part. praet.)* er einen Stein *(ǂuiba)*, ging *(ǂî)* hinter *(*ǂgāb ai)* die Hütte *(oms)* und schleuderte *(*ǂgabe)* ihr den Stein gegen die Stirn*) *(*ǂîris = ǂîs)* und entfloh *(*ǂkχoĕ-nî)*.

Der Schakal, der die Kinder des Leoparden unterrichtete.

Der Schakal unterrichtete *(ǂkχā ǂkχā, im pass. narr. Will man hier das echte Passivum annehmen, ist χa als Postposition, von, aufzufassen)* die Kinder *(ǂōana, comm. plur.)* des Leoparden. Doch als *(o)* sie *(-n in ǂhen)* [ihm] gebracht *(ǂhā kommen, ǂhe genommen werden)* worden waren, schnitt er einem *(ǂgui-)* der Kleinen *(ro Dimin., -ē Pers.-Suff. comm. sing.)* die Kehle ab. *(Zu einem Verbum m. d. Endung des pass. narr. sind verschmolzen: ǂgao schneiden, χa durch, domi Kehle).*

Dann kam *(ǂkχī)* der Leopard und fragte *(tē)*: „Wie *(mati)* unterweist du *(-tsa, Suff.)* die Kinder *(ǂgōana)*?" So *(tumi)* fragte er. Aber der Schakal sagte: „Nein Ohm*), sehr *(gaise)* gut *(ǂgaise)* lernen *(lehren, mit der Reflexivpartikel -sen)* die Kinderchen!" Da ging jener

*) Dem Kapholländischen entlehnt. Der Schakal sieht in der Frage des Leoparden ein Mißtrauen und weist es zurück.

nach Haus *(saru, verb.)*, und als er nach Haus gegangen war, schnitt der Schakal wieder *(ŧkχaba)* einem die Kehle ab.

Und abermals kam der Leopard und sagte: „Ich bin ja gekommen, die Kinderchen zu sehen!" So sagte er. Der Schakal aber erwiderte: „Nein *(hm'm)*, jetzt *(°nē siriŧa)* werden sie nicht *(tite, Verb.-Part. d. fut. negat.)* herauskommen *(ŧoaχa)*!" Da fragte der Leopard: „Warum *(lareĭ ǂama)* sollen sie nicht herauskommen?" Jener aber [antwortet]: „Gar gut lernen die Kinderchen, störe *(ŧkani)* [sie] nicht *(tā = toma)*!"

Da glaubte *(ŧgom)* er [es] und ging nach Haus. Als er dann wieder ankam, waren indessen *(hīa)* alle *(hoa, -ro Dim., -n Pers.-Suff. d. comm. plur.)* Kleinen aufgefressen, nur ein einziges Kleines *(ŧguiroĕ ŧguĭ)* war übrig geblieben *(hā)*. Und [wieder] sagte der Leopard: „Ich [will] die Kinder sehen *(gō)*!" Da zeigte *(ŧgau, i. pass. narr.)* der Schakal das eine einzige; jener aber denkt *(taĭ, ti so)*, [es seien] alle, und ging nach Haus. Und als er nach Haus gegangen war, fraß der Schakal das einzig übrig gebliebene *(ŧgau hā)* auf.

Und abermals kam der Leopard. Aber als [der Schakal] ihn ankommen *(ŧgoaχa)* sah, sagte er [zur Schakalin]: „Wenn *(o, m. d. Pers.-Suff. d. Subj. i. Nachsatz -s)* der Leopard wohl *(ga, Verb.-Part. d. potentialis)* kommt, mußt *(nĭ)* du ein Kind kneifen *(ŧkχĭ)*." „Laß mich *(laß I, daß ich -ta)* dann so fragen: ›Wonach *(taeĕ = tareĕ Was?, -ba objektiv. Verb.-Part.)* schreit *(ā)* das Kind?‹ Und *(ĕ, m. Suff.)* sage du dann: ›es schreit nach Leopardenfleisch‹ *(ŧganĕ, comm. sing.)*!" Und der Leopard kam, und als sie das Kind kniff, schrie das Kind. Da fragte der Schakal: „Wonach schreit das Kind?" Und sie antwortete: „Es schreit nach Leopardenfleisch!"

Da entfloh *(ŧhai-nĭ)* der Leopard und ging *(sĭ)* den Pavian *(inǂraba)* auffordern *(ŧkχau)* [mitzugehen], und die beiden *(-kχa, Suff. dual. masc.)* kamen an. Doch die Morgensonne wirft dunkle Schatten (*wörtl.: der Frühschatten ŧgoa somi, macht dĭ, Schatten*). „Seht *(mā)* Ihr *(-kχo, Suff. d. 2. pers. dual. masc.)* nicht dort *(ŧnā)* die sechs *(ǂnani)* Leopardenfelle *(kχōgu)* liegen?" [sagte da der Schakal]. Da entfloh der Leopard, enteilte *(bē)*, während der Pavian ruft *(mĭ, ti so, m. d. Pers.-Suff. d. Subj.)*: „Warte! warte!" *(ŧnam)*.

Übersetzung von XXXVIII.

Der Schakal und der Pavian.

Der Schakal und der Pavian waren Schuldner und Gläubiger. *(*sur(u)tegu, i. pass. narr., in einem Schuldverhältnis zueinander stehen. Der Zusammenhang ergibt, wie das im Einzelfall aufzufassen ist.)* Als *(o)* aber der Pavian kam *(ǂkχī)*, den Schuldner *(sur(u)teba)* aufzusuchen *(ōa)*, setzte sich *(ǂnū, i. pass. narr.)* der Schakal *(ausgedr. durch d. -b hinter o am Anf. d. Satzes)* vor *(ams ai)* die Hütte *(oms)* und machte ein großes *(gai)* Messer *(gōaba)* scharf *(*ǂātsiama, verb., i. pass. narr., īā scharf sein, -tsi adjektivierende Endung, am Mund, Schärfe des Beils, Messers etc.)*. Indessen erschien der Pavian und kam *(hā)* heran, den Schuldner zu mahnen *(ǂgan)*. Da sagte der Schakal: „Wir *(-kχum, Suff. 1. pers. masc. dual.)* kennen einander nicht!" *(īā nicht wissen, -gu Reflex.-Part.)*.

Da fürchtete sich *(ǁao)* der Pavian *(ǂnōraba hörte ich nur von alten Leuten, die jüngeren sagen alle ǂnēraba)* und ging *(ǁgūng)* weg und kam *(sī)* zur *(doba)* Wildkatze *(ǂhōaḃ)* und sagte: „Der Schakal da *(nē, Demonstr.-Wurzel)* wetzt, wenn *(o)* ich nach der Schuld frage.

ein Messer!" Darauf die Katze: „Er stellt sich *(ǂhumi ǂugen)* nur so *(ǂau)* der Ober-Dreckfink! *(wörtl.: die einzige Scheiße, χaus ǂguisa)* das sieht ihm ähnlich! *(I gleichen, -b Pers.-Suff.)*. Darum *(χũigye)* komm, laß *(ĩ)* uns gehen!" So sagte sie, und die beiden gingen und kamen hin. Der Pavian aber war wieder *(ǂkχaba)* nicht auf den Anblick gefaßt *(hatte sich -sen, Reflex.-Part., dessen nicht toma, versehen mũ mit objektivir. Part. -ba)* und entfloh *(ǂhai-aĩ)*.

Da rief *(ǂgai)* ihm die Katze abermals zu: „Der Schakal lügt, er wird dir *(tsi, Suff.)* nichts *(χũĩ etwas, tite Part. d. fut. nzgat.)* tun *(di)*, darum komm, laß uns unsere Schwänze *(ǂarekχa, dual. masc.)* zusammenbinden!" *(ǂare vereinigen, ǂgai binden)*. So sagte sie und sie kamen hin. Der Schakal aber sprang *(ǂham)* die beiden *(kχã, Suff., i. Dat.-Accus.)* mit dem Messer an.

Da floh der Pavian, während *(hĩa)* die Katze „Warte!" *(ũnam)* rief *(mĩ, ta = ra, ti so, mit d. Pers.-Suff. d. Subj.)*. Und wenn *(o)* sie sich in *(aĩ)* den Büschen *(haiti)* festklammern *(*ǂkχõbasen)* wollte, zog *(ǂhum)* er sie mit samt den Büschen heraus *(tui)*. Da endlich hörte der Pavian auf *(ĩã, verb.)* zu fliehen, und die Katze sagte: „Komm, laß uns umkehren *(ũã)*, der Schakal verstellt sich, glaube *(ǂgum)* mir doch!" *(o, m. d. Suff. d. 2. pers. masc. sing.)* Der Pavian aber weigerte sich *(ǂkχã)* und ging nicht hin*).

Übersetzung von XXXIX.

Der Schakal, der an die Buren ein Pferd verkauft.

Der Schakal verkaufte *(ŋamaχu, i. pass. narr.)* an *(doba)* die Buren *(bürgu)* ein Pferd *(hãba)* und steckte *(igũ)* zuvor *(aibe)* Geld *(marina, comm. plur.)* in *(ǁna)* das Hinterloch *(tsoas)* des *(di, Genitivpart.)* Pferdes und brachte *(sĩ kommen, ũ nehmen, i. pass. narr.)* es an und sagte *(mĩ, i. pass. narr.)*: „Jetzt *(ᵊnẽ sirisa)* werde *(nĩ)* ich *(-ta, Suff.)* Geld bekommen *(hã)* dort *(ŋnã)* von *(χu)* dem Pferde!" Und als *(o)* das Pferd schiß *(χau)*, hielt er die Hand unter *(χaba, i. pass. narr.)*, und das Pferd schiß Geld.

Als *(o)* aber die beiden *(-kχa, Suff. dual. masc.)* Buren vom Preis *(igauna)* des Pferdes sprachen *(ǁhoa)*, sagte der Schakal: „Einen Preis setze *(ŋnũi)* ich nicht *(toma)* an, weil *(ao)* ich das Pferd nicht ver-

kaufe. Aber jeder *(hoa, mit d. Suff. comm. sing.)* Mann *(aoĭ, comm. sing.)*, der [es] kaufen *(ǂama)* wollte *(ga, Verb.-Part. d. potentialis)*, würde mir *(ĭe, Suff.)* einen Wagen *(gunisa)* mit *(ǀkχa)* den zugehörigen *(ǂ(e)ĭs, Pron. pers. d. 3. pers. sing. fem., unter Weglassung d. Genitivpart. i. Sinne des Pron. possess. gebraucht)* Ochsen *(gomagu)* geben *(mā)*."

Da gab ihm *(bi, Suff.)* der Bur einen Wagen mit Ochsen. Und der Schakal spannte ein *(*ǂgăĕ ǀao)* und sagte: „Bur! Drei *(ǀnani)* Tage *(tsĕti)* wartet *(hā)* das Pferd, dann scheißt es [Geld]!" So sagte der Schakal und fuhr *(ǀnari)* ab.

Die beiden Buren aber warteten *(ǀaū)*, als *(o)* die drei Tage vorbeigegangen *(ĭ)* waren, bis *(ǂga)* zum vierten *(haga ǂ(e)ĭ)* Tage, aber das Pferd schiß kein Geld und schiß nur *(ǀgui m. Suff.)* Gras *(ǀgūb)*. Da sattelten *(*ǀgaĕǀgā)* die beiden auf und jagten *(ǀkχoĕ)* hinter *(ǀgon)* [dem Schakal] her. Und sie kamen *(sĭ)* zu einer Werft *(ǂgaūs)*, zu einer, die am *(am ǀna)* Wege *(daob)* lag *(*ǂnōa, mit Pers.-Suff.)*, und fragten *(tĕ)*: „Wo *(maba, m. d. Pers.-Suff. d. Subj.)* ist der Wagen, der hier *(nĕba)* vorbeikam?" „Vorgestern *(ai tsĕ)* ging er vorbei", so hieß es *(mĭ sagen)*.

Da ritten *(ǀgabi)* sie hinterher und kamen wieder zu einer Werft und fragten: „Wo ist der Wagen, der hier vorbeikam?" Darauf sagten die Leute *(-n Pers.-Suff. d. 3. pers. plur. comm.)*: „Gestern *(ǂari)* kam er vorbei." Da ritten sie hinterher und kamen wieder in eine Werft und fragten: „Wo ist der Wagen, der hier vorbeikam?" Darauf sagten die Leute: „Heute *(diesen nĕ, Tag tsĕb)* kam er vorbei."

Da ritten sie hinterher; und als *(hĭa)* der Schakal [längst nach Haus] gekommen war, kamen sie an und riefen: „Ohm Fuchs *(d. Kapholl. entlehnt)*, ich schieße *(ǂnoa)* dir *(-tsi, Suff.)* die Stirn *(ǀūs)* ein!"

Darauf jener: „Für *(ai)* welch ein *(mā)* Vergehen *(ǀhabĭĭ, comm. sing.)* schießt du *(-tsa, Suff.)* mir die Stirn ein?" So fragte er.

Darauf der Bur: „Du *(sats, Pron. pers. d. 2. pers. masc. sing.)* hast mir ja *(gum--o)* gesagt, das Pferd, das kein Geld scheißt, schisse Geld!"

Doch der Schakal sagte: „Nein *(hm'm)*, sprich ein für allemal *(ǀhoaĕ horaĕ)* nicht *(lā—toma)* so *(ǂnāti)* mit *(ā)* mir! Mein *(ti)* älterer *(gaib, groß)* Bruder *(ǂgāb)* treibt Handel *(ǂama kaufen, -gu Reciprocal-part.)* mit Euch!" *(sago, Pron. d. 2. pers. plur. masc.)*

Da fragten die Buren *(wörtl.: die beiden anderen *nauǂχa)*: „Wo ist er?" Und der Schakal sagte: „Dort *(nāba)* [weiter] unten *(ǁgona)* wohnt *(ǁan)* er." Da ritten die beiden ab und gingen hin, den Schakal, der keine Schuld hatte, totzuschießen *(ǂnoa ǀan)*.

XI.

Kχoïn ǁgubusa gye tom ǀgīriba.

ǀGīrib gye ǁ(e)īb ǁgaũsa χu gye ǀkχī tsī kχoïn oms ǀna hā gye ǂgā tsī kχoïn ǁgubusa gye tom. tsīn gye kχoïna gye ǀkχī ǀgīrib oms doba hā hīa. ob gye oms aoba gye tē: „mā ǀāb ˈǀgīritsa?" tumi. ob gye gye ǀgīriba ǀeream: „ǂaro ǀāb ǀgīrita, ǂarona ra ǂūta, ǂharina ra ǂūta, ǂaũna ra ǂūta, gumo!"

Dieses Verhör des Schakals wird nun, um es eindringlich zu machen, zwei- bis dreimal vom Erzähler wiederholt. Dann folgt:

Ob gye gye aoba mī: „χau ēta gō tsi!" ti gye mī. ob gye gye ǀgīriba χau ǂarona. ob gyē gye aoba tē ǁkχaba:

Frage und Antwort wie vorher. Dann dieselbe Aufforderung des Mannes an den Schakal. Darauf:

Ob gye gye χau ǂharina. ob gye gye aoba tē:

Frage, Antwort und Aufforderung wie vorher. Dann:

Ob gye gye ǀgīriba χau ǂaũna. ob gye aoba tē: „mā ǀāb ǀgīritsa?" tumi. ob gye gye ǀgīriba ǀeream: „ǂaro ǀāb ǀgīrita, ǂarona ra ǂūta, ǂharina ra ǂūta, ǂaũna ra ǂūta, gumo!"

Eindringliche Wiederholung des Verhörs. Dann wieder:

Ob gye aoba: „χau ēta gō tsi!" ti gye mī. ob gye χau ǀgīriba ǁnũiba. ob gye aoba gye ǀkχō bi. ob gye ǀgīriba: „tī ǁnaob, ǀkχō unu ǀgā!" ti gye mī. ob gye gye aoba ǀkχō unu ǀgā. ob gye gye ǀgīriba ũi tsī gye mī: „ǁnā gye ī ǀgōata mo!" ti gye mī.

Übersetzung von XI.

Der Schakal, der den Topf der Leute ausschleckt.

Der Schakal *(ǀgīrib)* kam *(ǀkχī)* von *(χu)* seiner *(ǁ(e)īb, Pron. pers. 3. pers. sing. masc., vor dem folgenden Substantiv als Pron. poss. gebraucht)* Werft *(ǁgaũs)* zu *(ǀna)* der Hütte *(oms)* der Menschen *(kχoïn)* und

(tsĭ) kam *(hã)* hinein *(ǂgã, verb.)* und schleckte *(ǀom)* den Fett-Topf *(ǁgubusa)* der Leute aus. Die Menschen aber kamen, während *(hĭa)* der Schakal noch *(hã bleiben)* bei *(doba)* der Hütte war, herzu. Da fragte *(tĕ)* der Mann *(aoba)* der Hütte: „Welches *(mã)* Rivieres *(ǀãb)* Schakal [bist] du?" *(-tsa Pers.-Suff. d. 2. pers. sing. masc., nomin.)**) Da antwortete *(ǀeream)* der Schakal: „Ich *(-ta)* [bin] der Schakal vom Aro-Busch-Rivier. [Die Früchte] vom Aro-Baum *(-na, Endung des plur. comm.)* esse ich *(ǂũta)*, vom Hari-Busch esse ich, vom Au-Busch esse ich, jawohl *(gumo)*!" **)

Wiederholung. Dann:

Darauf sagte *(mĭ)* der Mann: „Laß *(ĕ, Imperativpartikel)* mich *(-ta)* dich *(-tsi)* scheißen *(χau)* sehen *(gõ)*!" So *(ti)* sagt er. Da schiß der Schakal Aro-Beeren. Und der Mann fragte wieder:

Wiederholung der Frage und der Aufforderung.

Und der Schakal schiß Hari-Beeren. Da fragte der Mann:

Wiederholung der Frage und Aufforderung.

Und der Schakal schiß Au-Beeren. Und [wieder] fragte der Mann: „Welches Ortes Schakal [bist] du?" Und der Schakal antwortete: „Ich bin der Schakal vom Aro-Rivier, Aro-Beeren esse ich, Hari-Beeren esse ich, Au-Beeren esse ich, jawohl!"

Wiederholung. Dann:

Und der Mann sagte: „Laß mich dich scheißen sehen!" Da scheißt der Schakal Fett, und der Mann fing *(ǀkχõ)* ihn *(bi)*. Doch der Schakal rief: „Mein *(ti)* Großvater *(ǁnaob)*, faß anders zu!" *(ǀkχõ zufassen, unu umwenden, ǀgã rückwärts)*. Und der Mann faßte anders zu. Da entwischte *(ũi)* der Schakal und sagt: „Ja *(mo = gumo)*, so ein Kerl bin ich!" *(wörtl.: so ǁnũ, einem Kinde ǀgõa-, gleiche I ich)*.

XLI.

Übersetzung von XLI.

Der Schakal und das Stachelschwein, die beide für den Lehrer (Missionar) Wasser gruben.

Der Schakal und das Stachelschwein *(ǀnoab)*, die beiden *(tsī und, kχa Pers.-Suff. dual. masc.)* gruben *(χora, i. pass. narrat.)* Wasser *(ǂgamsa)*, und als die Zeit *(ǂaēb)*, da sie heimkehren *(ǂaru)* sollten *(nī)*, erfüllt *(ǀoa)* war, durchnäßte *(ǀhari)* sich *(-sen, Reflexivpart.)* der Schakal im *(ǀna)* Lehm *(ǂgoab)* und ließ *(gai, i. pass. narr.)* das Stachelschwein sich waschen *(ǂā)*. Als *(o)* dann die beiden ankommen *(sī)*, wird dem Stachelschwein in ein kleines *(ǂkχari)* Schüsselchen *(ǀores, -ro Dimin.)* ausgeschöpft *(hora die gare Speise aus dem Kochtopf nehmen)* und dem Schakal wird in einer Waschschüssel zugeteilt*).

Aber eines *(ǀgui)* Tages *(tsē)*, als *(o)* die beiden zum Arbeiten *(sīsen)* gegangen *(ǀgūng)* waren, ging der Lehrer *(ǂkχāǂkχā lehren, aob Mann, der Missionar)* [ihnen nach], ohne daß *(toma nicht, *hāse, adv. von hā sein, bleiben)* die beiden [es] sahen *(mā)*. Und sie kamen hin. Dann stieg *(ǂgōa)* das Stachelschwein herunter [in die Wassergrube], der Schakal aber legte *(ǂgoē)* sich hin und schlief *(ǂom)*. Und als *(o, mit d. Pers.-Suff. d. Subj. i. Nachsatz)* es Zeit war, nach Haus zu gehen, kam das Stachelschwein heraus *(ǂoaχa, verb.)* und weckte *(ǂkχaiǂkχai)* den Schakal. Aber alles *(hoana, comm. plur.)* das da *(ǂnā)* beobachtete *(ǂnōa sitzen, mā sehen)* der Lehrer. Dann hieß [der Schakal] das Stachelschwein sich waschen, selbst *(ǂ(e)ība, pron. pers.)* aber durchnäßte er sich im Lehm. Und die beiden kamen an. Da wurde [diesmal] dem Stachelschwein in der großen *(gai)* Schüssel zugeteilt, und der Schakal bekam in dem Schüsselchen des Stachelschweins. Da sagte [der Schakal]: „Du *(-ts Suff.)* hast dich verhört *(ǂnaū hören, sā etwas verkehrt tun)*: **mir** *(tita pron. pers.)* bist du geheißen worden, [die große Schüssel] zu geben *(mā)*." Das

*) Weil der Schakal mit den Spuren der Arbeit am Leib als der fleißige und das Stachelschwein als der faule Arbeiter gilt.

Stachelschwein aber entgegnete: „Mir hat der Lehrer*) die Schüssel gegeben."

Dann gingen die beiden zur Arbeit, und als sie zum *(doba)* Wasser kamen, sagte der Schakal: „He da! *(*tsĭ und, -go Suff. 2. pers. plur. masc., tsĭgo ist eine ähnlich nachlässige Anrede wie nētse)*, laß *(hā)* uns *(-kχum, Suff. d. 1. pers. plur. masc.)* baden *(ǁūsen)*! Laß *(ē)* uns weiße *(ǀuri)* Tücher *(ǀkχaikχa, dual. masc.)* vor *(ai)* binden *(ǀgai)* und in dieses *(nē)* Wasser springen *(uri)*!" Dann band er dem Stachelschwein zuerst *(ai erst sein)* [das Tuch vor], und als *(tsĭ, Part. d. partic. praet., hinter toa aufhören)* er es fertig gebunden hatte, nahm *(ū)* er einen Stein *(ǀuiba)* und [sagte]: „Stachelschwein, ich sprang, darum *(*hūgye)* spring!", So sagte er und warf *(ao)* den Stein herunter *(ǁnā fallen, i. pass. narr.)*. — *Das Stachelschwein springt, in der Annahme, der Schakal sei vorangesprungen, nach und ertrinkt.* —

Darauf [jubelt] der Schakal**): „Das Stachelschwein ist ertrunken *(*ǁgam ǁō)*! Die Kälber *(tsaūn)* haben Milch gesaugt *(dai)*! Die Wagen *(guniti)* sind von selbst *(sen, Reflexivpart.)* gefahren *(ǀnari)*! Die Hütten *(omgu)* sind in Brand gesteckt *(ǂhubi)*!" So rief er und floh *(ǀkχoĕ eilen, bĕ weggehen, i. pass. narr.)*.

Aber der Löwe *(χama, euphon. für -mi)* lauerte *(*ǁgoĕ am)* ihm auf. Da kam *(ǀkχĭ, i. pass. narr.)* [der Schakal zu seiner Hütte] und rief***): „Mein Haus!" *(dem Kapholl. entlehnt)*. Aber es ist *(i, gye, a)* still *(ǀnōsa)*. Darauf sagte er: „Ich *(-ta, Suff.)* werde mich still halten *(ǀhoa sprechen, tite Part. d. fut. negat.)*, das *(nēĕ, pron. dem. i. comm. sing.)* ist etwas *(χūĭ Ding, comm. sing.)*, daß meine *(ti)* Hütte *(oms)* nicht antwortet *(oĕ)*. Dieses einzige *(ǀguisa)* Mal *(ǀnās)* [noch] werde ich rufen *(ǂgai)*!" So sagte er und rief wieder. Da rief der Löwe: „Jawohl *(hĕ)*!" [Darauf der Schakal:] „Hast du dein' Lebtag schon mal gehört oder gesehen *(wörtl.: hörst ǁnaū, und siehst du, seit o, du geboren ǀnaĕ, bist)*, daß *(ǀkχaiĕ)* eine Hütte antwortet?" So sagte er und entfloh *(ǁhai-nĭ)*.

---

*) Das ist wohl einer der wenigen Fälle, in denen sich die alte Form des Suff. d. 3. pers. sing. masc. *-bĭ* erhalten hat. Das *ĭ* ist verloren gegangen und hat sich im Nama sonst nur noch in den männlichen Hauptwörtern erhalten, in denen an Stelle des *b* ein *m* steht: *ǁgami, χami* etc. (vgl. Th. Hahn[2]), S. 62).

**) Das Folgende ist als übermütiger Unsinn aufzufassen.

***) Der Schakal schöpft Verdacht, daß der Löwe ihm hier auflauert. Er spekuliert auf dessen Einfältigkeit, indem er laut ruft und dann in fingiertem Selbstgespräch sein Kommen von einer Antwort abhängig macht, mit der sich der Löwe dann in der Tat verrät.

Der Lehrer aber stellte *(maĩ, i. pass. narr.)* im Garten *(ǂhanab)* Leimruten *(ǂaĕba Leim)* auf, und der Schakal kam herein, und während er im Hereingehen *(ǂgā garu)* ist, verfing er sich *(ǀkχōbosen)* im Vogelleim und wurde vom *(χa)* Vogelleim gefangen*). Da sagte der Schakal: „Was *(taeĕ = tareĕ)* machst *(dĩ)* du *(-tsa, Suff.)* da im Garten? Laß mich *(te, Suff.)* los *(ǁnā lassen, χu abstehen von)*, du *(-tse, Suff. d. 2. pers. sing. masc., vocat.)*, laß mich *(-ta)* gehen *(ǀgūng)*!", so sagte er, wurde aber trotzdem *(χabe, mit d. Pers.-Suff. d. Subj.)* nicht losgelassen. Dann fuhr er fort: „Warte *(ǁnam)* du, Kamerad *(aob ist die vertrauliche Anrede zweier Altersgenossen, die zusammen aufgewachsen sind, s. S. 315)*, laß mich zum Kacken *(χau)* herausgehen *(ǂora)*, gleich *(ǀāse)* will ich [wieder] hereinkommen, darum [laß mich los]!" Aber er wurde nicht losgelassen; indessen *(hĩa m. Pers.-Suff.)* brach *(ǁgoa)* der Morgen *(ǁgoasa)* an. Da kam der Lehrer und tritt herzu *(hā)*, ihn [von den Leimruten] abzunehmen *(ũ ǁnā)*, und nimmt *(geht nehmen)* ihn zur Werft und fragte *(tĕ)* ihn, wie *(mati)* er ihn töten *(ǂgam)* solle *(nĩ, ǀkχaiĕ *Part. d. indir. Rede)*. Er aber sagte: „Schlachte *(ǂā)* einen fetten *(gausa)* Hammel *(gūba)* und *(ĕ, m. d. Suff. 2. pers. sing. masc.)* gib mir den Schmalz *(ǁnuiba)* zu trinken *(ā trinken, si gibt dem Verb. kausat. Sinn: tränken)* und pack *(ǂgaĕ)* mir das Fett *(gauna)* auf und fette *(ǂkχau)* [mir] den Schwanz *(ǂareba)* naß ein *(ǀāĩā naß machen)* und suche *(ōa)* hier *(nēba, m. Suff.)* einen Mann *(kχoĕba)* aus *(ǂui)*, von dem du weißt *(ǂan, tumi so)*, daß er stark *(ǂgaisa)* ist (*die Fut.-Part. nĩ entspricht hier unserem „voraussichtlich"*), und der *(-b in ĕb)* wickele *(tami)* [meinen] Schwanz in [seine] Hand *(ǂumi)* und schleudere *(ǂĕ niederwerfen, ǂan schlagen)* mich auf *(ai)* die Felsbank *(ǂhaos, s. S. 162)*, die dort *(ǁnā)* liegt *(ǂnōa)*!" So sagte er.

Und der Lehrer suchte, wie *(kχumi)* der Schakal gesagt hatte, einen starken Mann aus und hieß ihn [den Schakal] zu Boden schleudern. Und er schleuderte. — *Der eingefettete Schwanz entgleitet seinen Händen.* — Da stand *(mā)* der Schakal auf *(ǂama)* beiden *(-ra, Suff. dual. fem.)* Füßen *(ǂaira)* und sagte: „Da bin ich Knabe *(ǀgōab*

*) Der Schakal glaubt nun im Dunkeln, von einer Person festgehalten zu werden, und sucht sie zu übertölpeln, indem er die Rollen vertauscht und sich als den ausgibt, der den andern gefangen hat und zur Rede setzt.

Sohn), jawohl!" und entfloh. Aber die Männer sattelten *(ǃgaĕ aufpacken, ǃgāb Rücken)* Pferde *(hāga, masc. plur.)* auf und jagten [ihm] nach. Doch der Schakal ging in ein Rivier *(ǃāb)* herunter *(ǁgōa, i. pass. narrat. u. particip. praeter.)* und pflückte *(ū, in derselben Konstr.)* Blumen *(blomga, masc. plur., dem Kapholländ. entlehnt)* und ging den Männern entgegen *(ǃoa, i. pass. narr.)*. Da riefen die Männer: „Das ist der Schakal!" Aber der sagte: „Welcher *(mā)* Schakal? Seht Ihr *(-go Suff.)* nicht, daß *(ǂkχaiĕ)* ich aus *(χu)* dem Blumen-Lande *(ǃhub)* komme?" Da glaubten *(ǂgom)* sie [es] und suchten [weiter] und fanden Niemanden *(nicht)*.

Der aber kam [nach Haus] und lebte weiter *(hā bleiben)*, so wie er von jeher *(hūga)* gelebt hatte.

Übersetzung von XLII.

Das Erdmännchen und der Schakal.

Mit dem Schakal und dem Erdmännchen begab es sich *(dĭhe wurde gemacht)* so: Als *(o. das o am Anfang des Satzes ist copula)* der Schakal *(-i, altes, selten gebrauchtes Demonstr.-Suff.)* eine Schlange *(ǂaob)* entdeckt *(hō, i. pass. narr.)* hatte, ging er zum Erdmännchen und sagte: „Erdmännchen, verrate *(mĭ sagen, -ba objektivir. Verb.-Part.)* mir *(te, Suff.)* doch *(go)*, auf *(ū mit)* welche Manier *(gaus)* du *(satsa, pron., verstärkt durch d. Suff. d. 2. pers. masc. sing. -tsi = tse)* die Schlangen *(comm. plur.)* tötest *(ǂgam)*!"

Da ging *(ǃgûng)* das Erdmännchen mit ihm *(bi, Suff.)* und zeigte *(ging si, zeigen ŋgau)* ihm den Genickwirbel*). Und als *(hĭa)* der Wirbel *(ausgedrückt durch d. Pers.-Suff. -s hinter ŧkχā sich weigern. ŧa euphon. für ra)* sich nicht [überstreifen lassen] wollte, preßte *(ŋgaĭ)* er [ihn] hinein *(ŋgā hineinstecken)* und tötete die Schlange. Und als *(o)* er die Schlange fertig *(toa aufhören, mit Pers.-Suff.)* getötet hatte, [suchte er] den Wirbel abzustreifen *(heraus tui; zu nehmen ǂ)*, aber *(χabe, mit d. Pers.-Suff. d. Subj.)* er ging nicht *(toma)* los *(toaχa herauskommen)*.

Da sagte der Schakal: „Kamerad *(aob, s. S. 315)*, brate *(am)* du *(-tse, Suff.)* die Schlange da *(nēba)*, denn *(χuigye)* ich *(ta, Suff.)* gehe *(ĭ)* [einmal beiseite]“**). Und während *(hĭa, mit den Pers.-Suff. d. Subj.)* er mit vornübergebeugtem Kopf *(*ŧubi, verb. zur Bezeichnung dieser Haltung)* dasteht *(mā, im partic. praeter.)* und [mit den Fäusten gegen den Wirbel] aufstampft *(*ŧnoa ŋgā)*, tritt unversehens *(ŧkχĭ erscheinen, hā kommen)* das Erdmännchen hinter *(*ŧgûba ǂ)* ihn und stößt ihn an *(ŧsā ŧkχâ)*. Da sprang *(uri)* er erschreckt *(ŧhuri. *hāse adv., einen Zustand ausdr.)* auf *(kχaĭ aufstehen, i. pass. narr.)* und sagte: „Na! *(*aĕ, Interj.)* du *(-ts)* hast *(ǂ nehmen)* wohl *(ga, Verb.-Part. d. potent.)* noch *(*noχoba, vielleicht d. Kapholländ. entlehnt u. assimiliert)* kindische Neckereien *(ŋore foppen, χûna mit d. Pers.-Suff. d. angered. Person, Dinge, di Genitivpart., ŧkχamsis Jugend)* im Kopf!“

Aber das Erdmännchen erwiderte: „Du stirbst *(ŋŏ)*, darum *(hûgye)* möchte *(re, Optat.-Part.)* ich dir *(tsi, Suff.)* helfen *(hui)*.“

Darauf der Schakal: „Ihr *(sa---go)* Dummköpfe *(gûre, adj.)* denkt *(tai)* so! *(ti, m. d. Pers.-Suff. der einen angered. Person)*. Wenn *(o)* ich nur wollte *(ŋgao)*, dann könnte *(nĭ, fut.)* ich ja *(gum---o)* doch *(χabe)* das Wirbelding (*comm. sing.*) abstreifen!“ So sagte er und fuhr fort: „Geh du und *(ē)* sieh zu *(geh si, sehen gō)*, ob *(ŧkχaiē)* die Schlange nicht gar ist *(ŋan, verb.)*!“

---

*) Der Sage nach steckt das Erdmännchen seinen Kopf durch den Atlas-Wirbel, *ŋgoresa*, eines Ochsen oder eines Pferdes, greift die Schlange an und dreht im Moment, wenn jene zustößt, den Kopf so, daß die Schlange in den Knochen beißt. Hat sie auf diese Weise ihr Gift ausgegeben, wird sie vom Erdmännchen tot gebissen.

**) Der Schakal schämt sich seiner Zwangslage, in die er durch eigenen Fürwitz geraten ist, sucht den Wirbel heimlich abzustreifen und das Erdmännchen, das ihn bei seinen verzweifelten Anstrengungen ertappt, zu täuschen.

Und als das Erdmännchen gegangen war, sprang er in's *(ǃna)* Wasser *(ǂgams)* und versuchte *(ǂsā, i. pass. narr.)* [den Wirbel] abzuziehen *(ǂgai)*. Doch als der Wirbel nicht loskam *(ǂoaχa, s. oben. I gehen)*, lief er weg.

Und er kam in *(ai)* die Werft *(ǂgaũs)* der Hyäne und sagte: „Sieh *(gum---o, ja)*, das Erdmännchen hat mir geheißen *(gai, veranlassen)*, den Kopf *(ǂanas)* in den Wirbel hineinzustecken *(i. Hott. umgekehrt ausgedrückt)*, und nun will der Wirbel nicht loskommen!" Doch während er so redete, kam das Erdmännchen und sagte: „Schakal, lüge *(ǂhumi)* nicht *(ǂā = toma)* so *(ǂnāti)*!" Da stand er auf und ging weg.

Und er kam zur *(doba)* Werft des Silberschakals und sagte: „Ohm, nimm mir *(ǂe, Suff., mit dem die Wortfolge gleichsam substantivierenden Suff. d. 3. pers. comm. sing. -ē = I in ǂgorel)* bitte dieses *(nē)* Wirbelding ab *(ǂnā, verb., mit d. objektiv. Part. -ba)*, mit *(ũ)* dem mich das Erdmännchen betrogen hat *(gā)*!" Doch während er so sprach, kam das Erdmännchen und sagte: „Schakal, lüge nicht so!" Er aber erwiderte*): „Ach je *(o und kχa, Interjekt.)*! unsere *(ũ, Wurzel des pron. poss., mit d. Pers.-Suff. der Besitzer, hier im dual. masc.)* Geschäfte *(χũna)* dort *(*nauba = ǂnāba, m. Pers.-Suff. des comm. plur.)* sind in Unordnung *(ǃgaru auseinandersein. -sa adjekt. Endg., -se adv. Endg.)*, darum sieh doch nach den Geschäften!"

So sagte er und ging weg zur *(ǂga)* Werft des Stachelschweins und sagte: „Ohm Jjzervark *(Kapholl. Name des ǃnoab)*, nimm mir bitte diesen Wirbel ab, mit dem *(adjektivisch ausgedrückt durch die Endg. -sa hinter dem Prädikat)* das Erdmännchen *(-i, altes Demonstr.-Suff.)* mich angeführt hat!" Da zerbrach *(*kχõa)* das Stachelschwein den Wirbel mit *(ikχa)* dem Schraubstock *(ikχamtas)*.

Darauf sagte der Schakal [zu sich selbst]: „Ei, der Schmutzkrusten-Schamker!!**) *(ǃhaĩ-die saure Kruste einer schmutzigen Milchkalabas. ǃgarab die männl. Scham.)* Was könnte ich ihm wohl antun?" *(welchen mã, Plan tabeĩ comm. sing., könnte ga, ich für -ba, ihn bi, finden hõ)*. Und die beiden gingen fort und kamen an ein dichtes *(ǃgom)* Dornbaum-*(ikχũs-)*Gebüsch. Da sagte der Schakal: „Klettere *(ǃaba)*

*) Um jede weitere Erörterung, die ihn blamieren könnte, abzuschneiden.

**) Gemeint ist das Erdmännchen, das ihn überall Lügen strafte. Aus Rache lockt er es in eine Falle und hetzt die Schlange auf.

hinter *(ǂgā)* dem Perlhuhn *(ǂkχinasa)* her, das dort *(ǂnā)* sitzt!" Und das Erdmännchen kletterte auf. Als es aber aufgeklettert war, sagte der Schakal zur Schlange: „Steig hinter dem Erdmännchen her, das dort sitzt, mein Großvater *(ǂnaob, ehrerbietige Anrede)*!" Und die Schlange stieg auf, aber das Erdmännchen sprang ab.

Da sagte der Schakal: „Ei *(ǂnai)*, sieh doch *(wörtlich: horch ǂgā)* dieses Schmutzkrusten-Schamkind!"*) Und die Schlange stieg herunter *(ǂgōaχa)* und rief „Schakal!" Und der Schakal antwortete: „Mein Großvater!" Aber die Schlange sagte: „Hast du schon einmal gehört und gesehen *(mū, i. Hott. im praesens)*, daß *(ǂkχaiǂ)* so ein Kind *(ǂgōai, comm. sing.)* wie dieses *(nǂ)* dem Alter *(aoǂ, einem Manne. Die Schlange ist hier männl. Geschl.)* flucht *(ǂgoǂ)*?" Sprach's und schlug *(ǂnau)* ihn.

Bitis cornuta L.

Da entfloh er *(ǂkχoǂ-nī)*. Aber das Erdmännchen fing *(°ǂkχō)* ihn, und die Schlange kam und schlug ihn. Und er entfloh [wieder] und kam zum Löwen und sagte: „Mein Großvater, daß die Schlange, die dort ankommt *(ǂgoaχa)*, mich nicht schlägt!" Sprachs und entfloh.

Und als er sich eben schlafen *(ǂom)* gelegt *(ǂgoǂ)* hatte, kam die Schlange auf *(ǂkχa mit)* seiner *(āb)* Spur [ihm nach] und weckte *(ging wecken ǂkχai ǂkχai)* ihn und fragte: „Woher *(maba χu)* kommst du?"

Jener aber antwortete: „Die Rinder *(gomana, comm. plur.)*, die gestern Abend *(ǂan ǂoǂ)* fortgelaufen sind, suche *(ōa)* ich ja!" Darauf die Schlange: „Lüge nicht!" Und der Schakal sagte: „Ich lüge nicht, mein Großvater."

Da sagte die Schlange: „Entblöße *(ǂhui)* den Bauch *(ǂkχum)*, laß *(ǂī)* mich sehen!" Und er entblößte den Bauch. Da sah die

---

*) Der Schakal flucht der Schlange, die daß Erdmännchen entschlüpfen ließ, halblaut aber unvorsichtig genug, daß sie es hört. *ǂnūis* d. weibl. Scham. *ōaba* Kind.

Schlange die Striemen der Nilpferdpeitsche *(ǂnabaga, plur. masc.)*, mit dem sie selbst ihn geschlagen hatte, und schlug ihn abermals *(ǂkχaba)* und jagte ihn fort *(hieß ihn fortgehen)*.

Übersetzung von XLIII.

Der Schakal, der den Flamingo und die Henne betrügt.

Der Schakal kam *(ǂkχī, i. pass. narr.)* zu *(doba)* einer Henne *(hũnors, a. d. Kapholl. entlehnt u. assimiliert)*, die auf *(ai)* einem Baum

(hais) Eier legte *(ôa, gebären)* und auf den Eiern *(ǂubugu, masc.)* saß *(°ǂnôas)*. Da sagte er: „Henne, meine *(ti)* Schwester *(ǂgû, ohne Suff.)*, wirf *(oo)* mir *(ti, Suff.)* doch *(χabe)* bitte *(re, Opt.-Part.)* eines *(ǂgui)* der Dingerchen *(χûba, masc. sing., -ro Dimin.)* herunter!" *(ǂnâ, mit objektiv. Part. -ba)*. Doch sie erwiderte: „Ich *(-ta, Suff.)* werde es nicht *(tite, Part. d. fut. negat.)* tun *(hî)*." Darauf sagte er: „Wenn *(o)* ich *(tita, prom.)* wollte *(ǂgao, ga Part. d. potent.)*, könnte *(nî, Fut.-Part.)* ich auf den Baum klettern *(ǂoa)*", und fuhr fort: „Gleich *(tâte)* werde ich auf den Baum klettern! Deshalb *(χûigye)* wirf eines herunter!" Da warf sie ein Ei herunter, und er sagte: „Wenn du es nicht *(toma, m. d. Pers.-Suff. d. angeredeten Person)* heruntergeworfen hättest, wäre ich aufgeklettert!" Sagte es *(-tsî, Part. d. partic. praet.)* und ging weg *(ǂgûng)*.

Dann kam er am anderen *(°nau)* Tag *(îsî)* herzu, als gerade *(hîa)* die Henne auf dem Boden *(ǂhûb)* war, und fing *(°ǂkχô)* sie *(si, Suff.)*. Da sagte sie: „Warte *(tnam)*, erst *(aibe)* laß *(ê)* mich *(-ta, Suff.)* beten*) *(°ǂgore)*!" Als er sie *(an d. Suff. d. 3. pers. fem. sing. ist das d. Subjekts, -b angehängt)* aber los ließ *(tnâχu)*, flog *(ǂîî, dem Kapholl. entlehnt)* sie auf *(ǂaba aufsteigen)*. Da sagte er: „Diesen *(nî)* Tag magst *(ga)* du dir merken *(tan wissen)*!" und ging weg.

Und er kam hin, wo *(-ba, Demonstr.-Part. d. Ortes)* der Flamingo *(dem Kapholl. entlehnt)* Fische *(tauna, comm. plur.)* fing, und fragte: „Wenn der Nordwind *(ǂabas)* weht *(ǂgom, ta = ra)*, wie *(mati)* setzt *(tnû)* Ihr Euch?" *(-go, Suff. d. 2. pers. masc. plur.)*. Und jener antwortete: „So *(nîti)* setze ich mich." — *Der Erzähler wendet sich nach Süden.* — Darauf der Schakal: „Wenn der Südostwind *(°aore xoab)* weht, wie setzt Ihr Euch?" Und jener antwortete: „So setze ich mich." — *Der Erzähler wendet sich nach Nordwesten.* — Darauf der Schakal: „Wenn der Seewind *(hurixoab)* weht, wie setzt Ihr Euch?" Und jener antwortete: „So setze ich mich." — *Der Erz. wendet sich nach Nordosten.* — Darauf der Schakal: „Und wenn der Südwind *(ǂkχabagab)* bläst, wie setzt Ihr Euch?" Und jener erwiderte: „So setze ich mich!"**) Da gab es einen Knax *(°tere, Nachahmung des Tons,*

*) Getaufte Hottentotten ließen zuweilen die Weißen, deren sie während des Krieges habhaft wurden, beten, ehe sie sie erschossen.

**) Der Erzähler steckt den Kopf unter den Arm, wie der Flamingo den Kopf unter den Flügel.

den das Beil macht, mit dem der Schakal dem Flamingo den Kopf abschlägt).

Dann ging der Schakal mit *(ǃâ)* dem Kopf *(durch hi angedeutet)* weg, und als er zur Henne kam, sagte er: „Hast du *(-s, Pers.-Suff. hinter mũ stehen)* gesehen, daß *(ǃkχoiǃ)* ich deinen *(ha)* Mann *(ooba)* getötet *(ǃgam)* habe? Wirf die Eier herunter!" Doch sie sagte: „Ich werde es nicht tun!" Darauf er: „Gleich werde ich auf den Baum auffliegen! Siehst du nicht, daß ich deinem Mann nach-*(ǃgon, adv.)* geflogen bin und ihn getötet habe?" Da warf sie drei *(ǃnona)* Eier herunter. Der aber fraß *(haba)* die Eier auf und sagte: „Wirf noch mehr *(noχoba, wohl d. Kopfoll. entlehnt u. dann assimiliert)* herunter!" Doch sie sagte: „Ich werde es nicht tun." Darauf der Schakal: „Gleich werde ich auf *(ǃgũ)* dich hinaufsteigen!" Doch sie erwiderte: „Versuch *(tsâ)* es *(ti se)* doch *(o, Interj.)*, laß *(ǃî)* mich sehen!" Nun versuchte er aufzuklettern, kam aber nicht herauf.

Da [fluchte] sie ihm: „Niemals *(ǃnî ein anderer derselben Art, tsî Tag, tîte Part. d. fut. negat.)* sollst du *(-ts)* auf der Erde dein Glück *(ǃgui ǃgũî, comm. sing.)* finden *(hâ)*! Und friß *(sũ)* du *(-tsi, seltene Form d. Suff. d. 2. pers. masc. sing.)* das Gewürm *(sunina, comm. plur.)*, das die Menschen *(kχoũn, comm. plur.)* mit Füßen zertreten *(dâ, tsautsau weich machen)*, wir *(-da, Suff. d. 1. pers. comm. plur., und sida, Pron. d. 1. pers. comm. plur. exclusivi)* werden bei den Menschen bleiben *(hâ)* und Speise *(sũna, comm. plur.)* essen!"

So wurden die Hühner Haustiere und der Schakal omnivor.

*) *am* ist die Postposition „für", eine interessante alte Form für *ĩ* (s. Hahn[19], S. 61). *ŋgaĩ* = liegen. „Für etwas liegen" = auflauern.

**) Obwohl dieses Musikinstrument, nach Angabe eines Hottentotten, mit dem Finger gezupft wird, wird im Folgenden doch das Wort *ŋnãã* = schlagen gebraucht. Das ist ein Fingerzeig, daß das Instrument sich erst entwickelte, nachdem die alte Bezeichnung für das Anschlagen des Musikbogens bereits die allgemeine Bedeutung „Saitenmusik machen" erlangt hatte (vgl. „Musikinstrumente", S. 374). Ganz analog ist der Sprachgebrauch des Wortes *dara* (siehe Feuerzeug).

***) Er bedient sich hier derselben List wie in Sage XLI (S. 476 unten) dem Löwen gegenüber.

Tsîb gye ǂoaǂa ǂoab go o: „ti ǂnaob, amǀnasa kχôba ĕts nĕ gauĕ ĕχase ǂhĕ!" ti go mî, „ĕ ǃ-tã ǀhũb ai ǂnũ, ǀhũb ai i ga ra ǂnũ o nî ǂam χuigye." tsîb gye go amǀnaba kχôba tsîs gye gausa ĕχase amǀna go ǂgã.

Ob gye: „ ti ǂnaob, ǂgams ǂga, ǂgams ǂga!" ti go mî. ob gye aoba ǂgams doba sî toma hã hîa go sõ.

Übersetzung von XLVI.

Der Löwe und der Schakal.

Der Löwe und der Schakal die beiden waren auf Jagd gegangen *(ǀaũ, i. pass. narr.)*, und der Schakal schoß mit dem Bogen *(ǂkχaũ, verb.)* fette *(gausa)* Giraffen *(ǀnaǂte)*. Der Löwe aber schoß eine magere *(ǂgabasa)* Giraffe; und die Giraffen, die der Schakal geschossen, nahm *(ã)* er und gab *(mã)* dem Schakal die magere Giraffe, die er *(ĭ(e)îb)* selbst erlegt hatte. Dann gab er ihm *(bi „Suff.)* Fett *(gauga, masc. plur.)* und hieß *(gai)* ihn, die Löwin *(tarasa Frau)* rufen *(ǂgai)*.

Als *(o)* aber der Schakal hinkam *(sî)*, gab er das Fett seinen *(ĭ(e)îb, Pron. d. 3. pers. sing. masc., unter Auslassen d. Genit.-Part., als possess. gebraucht)* Kindern *(ôana, comm. plur.)* und gab den Löwenkindern die Lungen *(sõte)* und sagte zur Löwin: „Der Mann *(aob)* läßt dir sagen *(goma, adv. z. Ausdruck dafür, daß d. Gesagte ein Auftrag ist)*: „Bleibe *(hã)* zu Haus mit *(ǂkχa)* den Kindern *(ǂgôan)*!" Dann nahm er seine *(die Wurzel ã vervollständigt sich zum pron. poss. durch Anhängen des Pers.-Suff. d. Besitzers)* Frau und seine Kinder, sie alle, und ging *(ǂgũng)* und kam [zum Löwen]. Da sagte der Löwe: „Wo *(maba, m. d. Pers.-Suff. d. Subj.)* bleibt die Herrin *(ǂnaosa, wörtl. Großmutter, Ehrerbiet.-Bez.)*?" Und er antwortete: „Herr, meine *(ǃî)* Herrin will nicht *(ǃîte, Fut. negat.)* gehen *(m. Pers.-Suff.)*, so *(tumî)* weigerte sie sich *(ǂkχã)* und blieb!" Da ging der Löwe [selbst].

Der Schakal aber zog *(ǂoa hinaufsteigen, ã nehmen)* alles *(ǂhoa)* Fleisch *(ǂguna)* auf *(ai)* den Giraffenbaum und ließ *(ǂnãχu)* die magere Giraffe zurück. Dann briet *(aira)* er das Fett aus und briet einen runden Quarzstein *(ǂgurusa)* in *(ǀna)* den Schmalz *(ǂnuib)*. Nun kam *(ǂkχî)* der Löwe und rief, und der Schakal antwortete *(oĕ)*. [Da rief der Löwe:] „Zieh mich *(ǃe, Suff.)* herauf *(ǀaba aufsteigen, ã s. o.)*!" Dann wurde ihm *(-ba, i. Praedic., objektiv. Part.)* ein Riemen

(ǂhaũba) heruntergelassen *(ũnnũ)*, und er wurde aufgezogen *(°ǂnausi)*; als er aber eben *(ǂhĩa)* [oben] ankam *(sĩ, ta = ra)*, wurde der Riemen zerschnitten *(ǂkχai und ǂgao)*, und er stürzte herunter*). Da sagte der Schakal [zur Schakalin]: „Gib mir einen neu *(ǂãsa)* angefertigten Riemen, — [und flüsterte]: „einen alten Riemen gib!"

Als aber der Löwe nicht zurecht kam *(ǂoa nicht können, ǂoaχa hervorkommen)*, sagte der Schakal: „Herr, sperr *(kχõba)* den Rachen *(am ǂnasa)* auf und *(ẽ, m. d. Suff. d. 2. pers. masc. sing.)* fang dieses *(nẽ)* Fettstück (*comm. sing.*) hübsch *(ẽχase)* auf *(°thẽ, verb.)*! und daß es nicht *(tã = toma)* auf den Boden *(ǂhũb)* fällt *(ǂnũ setzen, I geschehen)*, denn *(χuigye)* wenn *(o, ga Part. d. potent.)* es fällt, wird es in Stücke gehen *(ǂam)*!" Da sperrte der [Löwe] den Rachen auf, und das Fett [mit dem glühenden Quarzstein darin] fuhr schön in das Maul hinein *(ǂgũ, verb.)*.

Da rief der Schakal: „Herr, [lauf] zum *(ǂga)* Wasser! *(ǂgams)* zum Wasser!" Aber der kam nicht hin *(doba)* zum Wasser, sondern verreckte *(ãũ)*. (*Wörtl.: während er nicht hinkam, verreckte er.*)

Der Stein fuhr durch den Darm und zerriß den After. Darum, so belehrte mich der Hottentott, den ich weiter befragte, schlingt jeder Löwe, wenn er ein Tier geschlagen hat, erst ein Stück Fell herunter, um den Verschluß, den der glühende Stein zerschlagen hatte, wieder dicht zu machen.

Übersetzung von XLIX.

Der Schakal und die beiden Mädchen.

Und *(o)* es begab sich so *(wörtl.: wurde gemacht hīhe)*: Der Schakal hat zwar *(gye Verb.-Part. d. praes., hã Verb.-Part. einen*

Zustand ausdr., ū nehmen) zwei *(ǃgam)* Mädchen *(kχõëra, dual. fem.)*, aber einzig *(ǃgui)* mit *(ǂkχa)* einem *(ǃguis)* Mädchen schläft er *(ǁom, wieder passivisch)*. Und *(tsī)* da *(o)* er das andere *(*nau)* Mädchen nicht *(toma)* genießen *(tsā kosten, passivisch)* [kann], machte er *(dī possivisch)* einen Plan *(ǃabeĕ, comm. sing.)*. Er ging jagen *(ǃau)*, und kurz ehe *(ǁgā)* er ging *(ǃgũng, passivisch)*, [sagte er]: „Wenn *(o wenn — dann)* hier *(nēba, mit d. Pers.-Suff. d. Subj.)* ein Springbock *(ǁgũba)* vorbeikommt *(Doppelverb.: hā herkommen, I gehen, ga Verb.-Part. d. Konjunkt.)*, dann sollt *(nī)* Ihr *(-ro Pers.-Suff. d. 2. pers. dual. fem.)* so *(ti)* sagen *(mī)*: Daß doch *(ga)* dieser *(nē)* Springbock im *(ǃna)* Oberschenkel-Knochen *(wörtl.: Groß- gai, Knochen ǂkχõs)* zusammenbricht *(*kχõa)*!" *(goma gibt diesen Worten den Charakter eines Auftrags.)* Und die beiden sagten: „Ja *(ū)*!" Zu *(ǁga)* dem anderen Mädchen aber sagte er: „Du *(sas)* wirst die Scham*) nehmen *(ū)*, wenn der Springbock zusammenbricht!"

Der lüsterne Schakal geht fort, verwandelt sich in einen Springbock und eilt an den Mädchen vorbei.

Und als der Springbock vorbeikam, da [riefen] die beiden: „Daß doch der Springbock, der da *(*nau = ǁnaba)* läuft *(garu)*, im Oberschenkelknochen zusammenbricht!" Da brach der Springbock zusammen, und die beiden schlachteten *(ǂa)* [ihn] aus. Das eine Mädchen aber, das [der Schakal] nicht genossen hatte, nahm die Scham und briet *(am)* sie und nahm sie heraus *(ǂui)* [aus dem Feuer] und aß *(ō)* erst *(aibe)* das Fett *(gauna)* und aß das Fett ganz *(toa aufhören)* auf. Dann legte *(ǁgui)* sie [das Glied des Springbockes] auf *(ai)* einen breiten *(ǂhaba)* Stein *(ǃuis)* und stampfte *(*ǂnoa)* es weich. Da aber fuhr [das Glied] in *(ǃna)* sie *(ǁ(e)īs)* hinein *(ǂgā hineingehen)*; und sie zog *(ǂgai)* es heraus und stampfte es wieder *(ǁkχaba)*, da fuhr es ihr wieder hinein. Der Schakal**) aber ruft: „Die *(sa)* noch nie *(huga von jeher, toma nicht)* genossen worden ist *(tsāhe)*, [ich habe] sie *(si)* genossen!"

---

*) *ǃoa aib* sind die männlichen Schamteile mit allem was drum und dran, *ai* auf, ist. Ähnliche Schlächteraundrücke sind: *ǃnā aib* die Bauchgegend, *saru aib* das Fell und Fett im Schnittbereich des Fettschwanzes, der in der ventralen Mittellinie geöffnet wird.

**) Als der Schakal seinen Trieb befriedigt hat, nimmt er seine alte Gestalt an, tanzt um das Mädchen und sagt: s. oben.

Übersetzung von I.

Der Schakal, der die Sonne aufhuckt.

Und es begab sich so *(hīhe wurde gemacht)*: Man ging auf die Wanderschaft *(doĕ)*, und mit *(ǂkχa)* dem Schakal zogen die Menschen

(kχoĩn, comm. plur.) fort *(bē, verb.)*; jedoch *(χabe)* er blieb *(hã, i. pass. narr.)* hinten nach *(kχaos ai)* und kam *(hã)* dahin wo *(-ba)* die Sonne*) *(soris)* saß *(ǂnõa)*, und sagte: „Komm, laß *(ē, imperativisch)* mich *(-ta)* dich *(si, fem.)* aufhucken!" *(aba ein Kind im Fell auf dem Rücken tragen)*. Aber sie weigerte sich *(ǂkχã)*. Nichtsdestoweniger *(χabe)* sagte er: „Komm, laß mich dich aufhucken!" Dann huckte er sie auf, und die beiden *(-ra, dual. masc. fem.)* gingen *(ǀgũng)*.

Und während *(hĩa, m. d. Pers.-Suff. d. Subj.)* sie im Gehen *(garu)* sind, konnte er es nicht mehr schaffen**) *(hau bringen, ǁoa nicht können)*. Da sagte er: „Steig ab, laß mich diese *(nē)* Giraffen *(ǀnaĩte = -ti, fem. plur.)* schießen *(ǂnoa)*!" Sie aber sagte: „Von jeher *(huga)* hat [man], auch wenn *(hĩa während)* ich *(-ta)* aufgehuckt war, mit mir *(ũ nehmen, he Passiv.-Endg.)* Giraffen geschossen." Und die beiden gingen. Darauf sagte er: „Steig ab, dort *(nẽn, pron. dem., comm. plur.)* stehen *(mã)* Springböcke *(ǁgũna, comm. plur.)*!" Sie aber sagte: „Von jeher hat man doch, auch wenn ich aufgehuckt war, Springböcke mit mir gesehen *(mũ)*!" Und die beiden gingen weiter *(ǁkχaba)*. Und als der Mann *(aoba, der Schakal in menschenähnlicher Gestalt)* es nicht mehr schaffen konnte, sagte er: „Dort stehen Zebras *(ǀgorete = -ti, fem.)*, darum *(χuigye)* steig ab, laß mich schießen!" Sie aber [entgegnete]: „Von jeher hat man ja doch *(gumo)*, auch wenn ich aufgehuckt war, Zebras mit mir geschossen!" Darauf der Mann: „Gleich *(ũse)* werde *(nĩ)* ich dich mit dem Schamglied *(χãb, penis)*, das mir auf *(ǀkχãb Körper, ai an)* dem Rücken *(ǀgãb)* steht, vergewaltigen *(χai Coitus vollziehen)*!" Sie aber sagte: „Von jeher bin ich mit dem Glied, das im Rücken steht, begattet worden!"

Dann eilte *(ǀkχoẽ)* er mit *(ũ nehmen, hier wie eine Präposition gebraucht)* ihr *(si)* fort und ging *(sĩ)* in *(ǀna)* das Wasser *(ǁgams)*. „Plumps" *(*ǁubu)* sagte [das Wasser], jedoch es wurde ihm nicht *(toma)* geholfen *(hui)*. Da ging er heraus *(ǂoa, verb.)* aus *(χu)* dem Wasser und grub *(χoro)* eine Wurzel *(*ǀnumaba horizontal verlaufender Wurzelstock)* und schlüpfte *(ǁharu)* da *(ǁnã)* unter die Wurzel, und

*) Gedacht in Gestalt eines schönen Mädchens.

**) Er sucht sich nun der Sonne mit allerhand List zu entledigen, wird aber stets ironisch abgefertigt.

während die Sonne mit dem Fell *(kχōb)* hängen bleibt *(*ǂnōa)*, kroch er auf der anderen *(*naa)* Seite *(ǃkχāb)* durch *(ǃkχaru, verb.)* und geht heim *(ǂaru)*.

Da traf *(kommen sī, kriegen hō)* er auf die zwei *(-ra, dual. fem.)* Sonnenschafe und schlachtete *(ǂā)* eines und nahm das Fett *(gauna)* und ging und kam [nach Haus]. Da [riefen] die Kinder *(ǃgōana, comm. plur.)*: „Vater *(dāb, abgekürzt aus dādab)* trägt *(tani)* Fleisch*) *(ǂgana)*!" So *(tumi)* eilten sie [ihm] entgegen *(ǃoā, verb.)*. Da wurde der Mann böse *(ǂaiχa)* und kommt an *(ǃkχī)*, während er vor Durst *(*ǂgūsi durstig)* vergeht *(ǂō, ta euphon. für ra)*, und verlangt *(ǂgan)* nach Wasser. Da gab *(mā)* ihm die Frau *(tarasa)*, und während er [es] in Empfang nimmt *(Doppelverb. ǃkχō nehmen, ǃoa begegnen. ta = ra)*, trocknet *(ǂnā)* [das Wasser] aus**). Da wußte *(ǂan)* die Frau, daß *(ǃkχaiē)* er ein Sonnenschaf geschlachtet hatte, und sagte: „Wir da *(-nē Pron. dem., -da Suff. d. 1. pers. plur. comm.)* gehen alle *(hoa)* Tage *(tsēte = -ti)* an den beiden Sonnenschafen, die du da schlachtest, vorbei!" *(Doppelverb.: ǃgūng und I gehen, ǃkχāb Seite)*. So sagte sie und fragte *(tē)*, ob *(ǃkχaiē)* er Fett genommen habe. Und er sagte: „Ich habe!" Darauf sie: „Geh, leg *(ǂnūi)* es weg!" Da ging er, es hinzulegen, aber ein kleines *(ǂkχari)* Stück Fett *(-ro, Diminutiv.)* behält er und kommt. Dann goß *(ǂnā. ba, objectivir. Part.)* die Frau ihm ein, und wieder *(ǂkχaba)* trocknete das Wasser aus. Da sagte sie: „Geh, leg es alles *(horagase)* hin!" Darauf er: „Ein kleines Bischen *(χūb Ding, ro Diminut., i Suff. d. comm. sing.)* behalte ich, um *(ga)* die Augen *(mūte = -ti)* zu salben." *(sobo, nī Verb.-Part. d. Fut.)*. Die Frau aber sagte: „Solange *(gōse)* du *(-ts, Suff. d. 2. pers. masc. sing.)* das Fett *(aūna, comm. plur.)* da *(ǂnā)* behältst, wirst du nicht *(tite, Part. d. Fut. negat.)* Wasser trinken *(ā)* und *(tsī, mit der selten gebrauchten vollen Form d. Suff. d. 2. pers. masc. sing.: tsi)* vor Durst umkommen!" Da ging er, alles hinzulegen, und kam und trank Wasser.

---

*) Die Kinder hielten den fellosen, blutig geschundenen Rücken des alten Schakals für aufgebuckten Jagdwild.

**) Die Sage geht, daß die Sonne auf der Erde zwei Schafe weiden läßt, die unantastbar sind. Wer sich an ihnen vergreift, der verdurstet, weil ihm das Wasser vor den Lippen austrocknet.

Die Straußenhenne, die den Löwen heiratet.

Eine Straußenhenne *(ıamisa)* hatte einen Löwen geheiratet *(ǂgame, i. pass. narr.)* und gebar *(ōa)*. Aber als *(o, m. d. Pers.-Suff. d. Subj. i. Nachsatz)* sie die Kühe *(gomate)* nach dem Melken ins Feld trieb *(ǂkχaī, das Vieh nach d. Melken i. F. tr.)*, verschlang der Löwe das Kindchen *(ǂgōaē, comm. sing., -ro Dim.)*, und als *(hīa)* das Kindchen schon verschlungen *(habu)* war, kam sie herzu. Dann gebar sie wieder *(ǂkχaba)*, doch abermals verschlang der Löwe das Kind *(ausgedrückt durch d. Demonstr.-Wurzel ǂnā mit dem Pers.-Suff. d. comm. sing. -ē)*.

Das dritte *(ǂnona ǂn(e)ī, mit Pers.-Suff.)* aber gebar sie, nachdem *(-tsī, Part. d. partic. praeter. hinter χoro graben)* sie eine Höhle *(*āba)* gegraben hatte, in *(ǂna)* der Höhle, ohne daß er *(-b, hinter ǂū nicht wissen)* es wußte. Und wenn *(o)* sie fertig *(toa aufhören)* gemolken *(ǂao)* hat und die Kühe ins Feld treibt *(ta = ra)*, kommt *(sī)* sie hin, das Junge *(bi, Pers.-Suff. masc.)* zum Tränken *(dai saugen, -si gibt d. Verb. kausativen Sinn)*, zu rufen *(ǂgai)*, und [singt] so *(tumi)*: „Fang *(ǂū)* ihn *(bi)*, den mit dem mageren *(ǂgara)* Hintern*)

*) Die Mutter neckt das Kind mit seiner Magerkeit und macht ihm bange. *Batsībab* ist der Eigenname des jungen Straußes; dieses Wort begegnete mir nur noch einmal, mit weiblicher Endung, als Name eines Mädchens der Bethanier-Hottentotten. *Hubais* ist Eigenname der Straußenhenne.

(kχaoba)! Mein Batsibab! Fang ihn, den Sohn *(õaba)* der Hubais!" Dann kommt es hervor *(ǂoaχa, verb.)* und saugt, und wenn es fertig gesaugt hat, geht sie [weiter]. Dann läßt sie die Kühe [im Feld] stehen *(ǁnäχu verlassen)*, und wenn sie zurückkommt, ruft sie: „Fang ihn, den mit dem mageren Hintern! Batsibab! Fang ihn, den Sohn der Hubais!" Dann kommt es heraus und saugt.

Aber eines *(ǀgui)* Tages *(tsĕ)*, als sie die Kühe *(m. d. Pers.-Suff. d. Subj.)* ins Feld trieb, folgte *(sao)* ihr *(si. Suff.)*, ohne daß sie es sah *(mũ, hã Hilfsverb. m. Adverb.-Endg.)*, der Löwe und sah, wo *(maba, interrog., mit Pers.-Suff., erhält durch die Konjunktion ǀkχaiĕ den Sinn einer indirekten Frage, im Deutschen durch einen Relativsatz ausgedr.)* sie geboren hatte, und wie *(mati)* sie rief, hörte *(ǁnaũ)* er. Und als sie das Junge fertig getränkt hatte und weggegangen war, kommt er hin und singt*): „Fang ihn, den mit dem mageren Hintern!" etc. Aber das Junge kam nicht heraus. Da rief er wieder**): „Fang ihn!" etc. Nun kam es hervor, und er fing *(*ǀkχõ)* und schluckte es.

Struthio australis L. ♀

Die Straußenhenne aber ließ die Kühe im Feld stehen, und als sie zurückkam, rief sie: ——— *folgt d. Lockruf.* Doch es war still *(ǀnõ)*. Und noch einmal sang sie

*) Der Erzähler brummt die Lockworte in tiefem Baß.

**) Der Erzähler singt die Worte jetzt mit hoher Stimme.

und trat *(hã)* vor *(ams ai)* die Höhle *(ãs = ãb)*. Da sah sie die Spuren *(daaga, plur. masc.)* des *(di, Genitivpart.)* Löwen. Als sie dann zurückkam *(sĩ)*, sang sie: „O Hingatubus*), wenn *(o)* ich *(tita)* einen Sohn *(hier durch das Suffix -bi ausgedrückt)* gebäre, da ist *(hã)* er *(ǃaba Sohn)*, den ich gebäre, immer nur *(ǃguib einzig)* ein armer!" *(ǃore. Das -bi ist altes Demonstr. d. masc. sing.)* Die beiden *(-ra, Pers.-Suff. dual. masc.-fem.)* aber schieden die Ehe *(ǂχũgu, verb.)*, und die Straußenhenne ging zurück nach Haus *(ǂaru, verb.)*.

Der Pavian und der Löwe.

Der Pavian und der Löwe, die beiden wohnen *(ǂan)* beisammen *(ǂarehe vereinigt)*. Und *(o)* als *(o, hinter ǂgûng)* der Pavian den Spielbogen *(kχūba, s. S. 374)* nimmt *(ǂû)* und geht *(ǂgûng, a Verb.-Part. d. Praes.)*, schleicht *(ǂkχuri, passiv. ausgedr.)* der Löwe dem Pavian nach. Er aber sieht *(mū)*, daß *(ǂkχaiē)* er beschlichen wird *(ta euphonisch für -ra)*, und [singt]: „Ich sehe *(mū, -ra Verb.-Part.)* den *(-ba)*, der mich *(-ta)* Menschen *(kχoē-)* beschleicht *(ǂhaba)*. Ich *(tita)* [sehe den] Schleicher. [Ich] mit den Augen überall *(tsaba sich mißtrauisch umsehen, -χa Part. den hohen Grad anzeigend, mûb Auge, -sa Adjektivendung)* [sehe] den Schleicher!" So *(tumi)* spielt er auf dem *Bogen (ǂgabu schlagen)*.

Der Löwe *(durch das Suffix -b in ob angedeutet)* aber glaubt *(taī, ti so)*, wenn *(o)* er angesehen *(gōhe, mit Suff.)* wird *(ta = ra)*, den Hinterkopf *(ǂnoros)* [des Pavians zu sehen], und schleicht heran, trotzdem er gesehen wird. Wenn aber der Pavian beiseite *(*ǂarulīb)* sieht, duckt jener sich nieder *(ǂgoē sich legen)*, und wenn er [wieder] gesehen wird, schleicht er heran. Und er kam völlig heran *(Doppelverb.: hā kommen, toa aufhören)* und sprang *(ŧham)*. Da wich *(ŧgō)* der Pavian kurz *(ǂnubuse)* aus nach dem Felsabhang *(ŧhoas Ecke)* zu, und der Löwe fiel *(ŧnā)* vom *(χu)* Abhang *(hier mit voller Masculin-Endung)* herunter *(ŧgona)* und kam um *(ŧō)*.

Da schlachtete *(ŧā)* der Pavian, nachdem *(tsī, Verb.-Part. d. partic. pract.)* er abgeklettert *(ŧgōa)* war, die Leber *(aīsa)* heraus *(ŧui)* und briet *(am)* sie und ging *(sī)* zu *(aī)* der Werft *(ŧgaūs)* hin mit *(ǂkχa)* der Leber und gab *(mā)* der [Löwen-]Mutter *(ŧgūsa)* die Löwen-*(χami)* Leber. Da fragte *(tē)* sie: „Warum *(tareχa)* schmeckt *(ŧkχoa)* so *(*hī)* das Leberzeug *(-ē, verächtlich, comm. sing.)*?" Darauf hieß

(gai) der Pavian seine *(ā Wurzel d. Pron. poss., verbunden mit d. Pers.-Suffix, -b, des Besitzers)* Kinder *(ıgōan)* und seine Frau *(ǂaras)* auf *(ıga)* den Felshang steigen *(ıoa)*. Und sie stiegen auf. Da, als *(o)* sie aufgestiegen waren, antwortete *(ıeream)* er der Löwin, während *(o als)* er indessen *(hīa)* allein *(ıguri)* bei *(doba)* der Hütte *(oms)* zurückblieb *(ıgau)*: „Dort*) *(ınā, mit dem Pers.-Suffix d. Subj.)* kriegt *(hō)* die Leber solchen Geschmack *(kχoma so, tsā schmecken)*!“ So antwortete er ihr *(si)*.

Papio porcarius (Bodd.) alter Männchen.

Da kam sie heraus *(ıoaχa)*, er aber entflieht *(ǀkχoē, nī, Verb.-Part. d. Futur. drückt die Erwartung der Verfolgung aus)* und steigt hinauf *(Doppelverb. sī und ıoa)*. Und *(o)* sie kommt *(sī)* dahin und sieht, daß *(ǀkχaiē)* ihr *(ūs)* Sohn *(ıgōab)* tot *(hō)* ist. Da wurde ihr bange *(ǀao)* und sie ruft: „Bleib *(hā)* du *(tsi)* für immer *(ǀari vollends)* auf *(ai)* den Bergen *(ǀhumgu)*!“ [Seit] diesem *(nē)* Tag *(tsēs)* bleibt *(hā mit adjektivischer Gerundiv-Endung -sa)* der Pavian auf den Bergen.

[Die Paviane haben nun ihre Ruhe und singen:]

„Wenn *(o im letzten Takt, mit dem Suffix -gye, wir)* wir Baumharz *(°ınuruna, beliebte Nahrung des Pavians)* auflesen *(nabo)* und [behaglich] da sitzen *(ınū)*, dann laßt uns gefälligst in Ruhe!“ *(wörtl.: dann sitzen wir doch bitte, -re)*.

---

*) Der Pavian weist dabei höhnisch auf die Hütte des Löwen.

Die Aro-Eidechse und der Löwe.

Die Aro-Eidechse lebt mit *(ikχa)* dem Löwen in Nachbarschaft *(ǂhari, i. ǂaas. narr.)*. Und der Löwe geht auf die Jagd *(ǂau.*

verk.); dann reiht die Eidechse Knochen *(ikxôgu)* auf eine Schnur*) *(tsôana, verk., i. pass. narr.)* und legt sich *(gèkt si, sich legen xgoê)* neben *(am ma)* den Weg *(daob)*, und wenn *(ô)* der Löwe kommt *(ikxi, m. d. Pers.-Suff., ta = ra)*, geht sie [ihm] zwischen *(ma în)* die Beine *(mâgu)* hinein *(xgâ, i. pass. narr.)*. Dann wirft *(oa)* er das Fleisch *(tgunga, plur. masc.)* weg *(zu prnigeben)* und flieht *(ikxoê-si)*.

Die Eidechse aber nimmt *(i)* das Fleisch, und als *(o)* sie [nach Haus] kommt *(si, ta = ra)*, sagt *(mi, mit d. objektiv. Part. -ba)* sie zur [Eidechsen-] Frau *(tarasa)*: „Daß *(i)* die Kinder *(gôan, comm. plur.)* nicht *(ti = toma)* zusammen *(tare zusammenkommen)* mit den Löwenkindern spielen *(thara)*!" So sagt sie.

Aber eines *(gui)* Tages *(tsi)*, als der Löwe fortgegangen *(gâng)* war, liefen die Kinder weg und spielten zusammen. Da gerieten sie in Streit *(ikxam, verk.)*, und die Eidechsen-Kinder riefen: „Ei, wie schön *(igaise)* macht unser Vater *(dâbi)* mit den Knochen Eurem Vater *(soôba)* bange *(soôso, verk.)* und nimmt *(ti)* [ihm] das Fleisch ab!" *(thama rauben, i. pass. narr., mit Pers.-Suff.)*

Der Löwe aber kam *(ikxi)*, [von der alten Aro-Eidechse] bange gemacht *(-tsi, Verb.-Part. d. partic. praeterit.)*, wieder *(ikxoba)* ohne *(ose)* Fleisch an. Da sagten die Kindêr: „Ohm Traugott *(kapholländ. Name der xarob-Eidechse)* macht ja *(gum---o)* doch *(gube)* Vatern bange und nimmt Vatern das Fleisch ab *(gu)*!"

Da ging der Löwe zur *(tgu)* Werft *(tguâna)* der Eidechse und kam hin und fragte *(ti)* so *(tami)*: „Machst *(di)* du *(soôna, Pron. d. 2. pers. masc. sing.)* mich *(tita, Pronom. mit d. Pers.-Suff. des 2. pers. masc. sing. -ti)* zu deinem Hanswurst?" *(tare foppen, kxoê Mensch, comm. sing.)*.

Die Eidechse aber sagte: „Warum *(tarê ama)* fragt Onkel dererlei?" *(tgunê, Art u. Weise, comm. sing.)*.

Darauf der Löwe: „Deine *(ta)* Kinder haben ja erzählt, daß du mir Bange machst und das Fleisch abnimmst; so *(ti)* haben deine Kinder ja erzählt!"

Doch die Eidechse sagte: „Der *(o da)* ich *(d. Demonstrativstamm ni mit d. Pers.-Suff. d. 1. pers. sing.)* mich, wenn die Sonne *(tsees)* untergeht *(xgâ)*, mit Hunger *(idi)* hinlege, wie *(mirk.: ma ai, welcher mit. Zeit naht)* weiß *(sas)* ich von so etwas?" *(tgîna Dinge, comm. plur.)*.

---

*) Sie stellt sich eine Rassel her, mit der sie dem Löwen Furcht einjagt.

Da ging der Löwe. Aber die Eidechse sagte zur Eidechsenfrau: „Ich sagte dir doch *(tase, pron. 2. pers. fem. sing.)*, die Kinder [sollten] nicht *(ti)* zusammenspielen!" und steckte *(ige)* die Kinder in den Schelmsack*). Dann ging er zur Löwenwerft, kam hin und sagte zum Löwen: „Weil *(gti ao)* die Unart dieses Kinder-Packs *(wörtl.: die Manier, die diesem Kind-Ding gleicht !)* jetzt *(ti sirina)* Zank unter uns bringt *(wörtl.: uns beide zukzum, zusammen tare, verb., sicht igui)*, sieh *(gum---o ja)*, darum habe ich *(das praeter. ist hier durch toa = fertig werden, ausgedrückt)* meine *(ti, Stamm d. pron. 1. pers. sing., unter Weglassung der Genitivpart. als pron. possess. gebraucht)* Kinder erschlagen *(mau tan)!"* So sprach er.

Da tötete *(igum)* der Löwe seine *(ti Wurzel d. pron. possess., bildet mit dem Pers.-Suff. des Besitzers das volle pron. poss.)* Kinder, daß auch *(ttl, m. d. Pers.-Suff. d. comm. plur., auf igkun bezogen)* nicht *(tamase, adv.)* ein einziges *(igui)* kleines *(-ro Demin.)* übrig blieb *(igau)*.

Eine *(gabestaub-ä* (3. m.) genannte Lacertide, der Gattung *Scapteira* verwandt. 1/3 nat. Gr.

Die Aro-Eidechse aber ging nach Haus *(tare, verb.)*, und als sie auf *(ti)* einen Bergkamm *(/nuäb)* aufstieg und eine Gabestaub-Eidechse**) sah *(mä)*, schüttete *(tsaro)* sie die Kinder aus *(tui)*. Als sich da ein Lärmen *(ikzuhi)* erhob *(tuä sitsu, stattfinden)*, rief der Löwe: „Schenke *(tu)* mir doch *(re)* von *(ga)* dem Ding, mit *(ti)* dem du *(-ti, Suff.)* deine Kinder lebendig gemacht *(igaugau)* hast!" Aber er sah die Aro-Eidechse nicht wieder.

---

*) *Sila gum*, ein Fellsäckchen, in das verwundete Kleinigkeiten verwahrt werden (vgl. S. 233).

**) Soll von der Aro-Eidechse mit Vorliebe gefressen werden.

Übersetzung von LV.

Der Löwe und der Strauß.

Der Löwe und der Strauß, die beiden kamen im *(ǀna)* Feld *(ǂgaroh)* zusammen *(ǂhaa, i. pass. narr.)*, als *(hãã)* der Löwe eben einen Springbock *(ǂgãba)* getötet *(ǂgum)* hatte. Da zündete *(kχau)* der Strauß ein Feuer *(saĩsa)* an. Der Löwe aber fraß *(ũ)* [das Fleisch] roh *(oraxe, adv.)*, und der Strauß briet *(am)* es, und als *(o)* er fertig *(loa aufhören, m. d. Pers.-Suff. d. Subj.)* gefressen hätte, ging *(ti)* er wieder *(tikχaba)* daran, [sich] abzuschneiden *(ǂgao)*.

Da sagte der Löwe: „Ich *(ĩĩsi, Pron.)* habe ja *(gum---o)* doch *(χabe)* einen Springbock *(ǂhãĩ, comm. sing.)* getötet!" und wurde ärgerlich *(saĩχa)*.

Da sagte der Strauß: „Du *(ta---ti)* Rohfresser-Kind! *(Kind ǂa, einer roh fressenden Mutter; die letztere verächtlich nur durch das Pers.-Suff. d. 3. pers. sing. fem. -s angedeutet)* Du *(-ti, Suff. d. 2. pers. masc. sing.)* Rohfresser!"

Und der Löwe erwiderte: „Du Kieselschlucker-Kind!*) *(ǂguru Quarz, hara schlucken)* Du Kieselschlucker! Laß *(hã)* uns *(-kχum,*

*) Der Strauß hat bekanntlich eine beträchtliche Menge Kieselsteine im Kaumagen zum Zerkleinern der Nahrung.

Suff.) doch *(o)* mit den Zähnen *(ŋgũ)* fechten!" *(wörtl.: laß uns die Zähne gegenseitig vorn sein* °*ailegu).*

Aber der Strauß erwiderte: „Meine Mutter *(mamas, m. d. alten Demonstr.-Part. -i)* hat mich *(ta, Suff.)* ja nicht *(toma)* geboren *(sora, i. pass. narr.)* zu *(-ba)* so etwas *(ɣũĩ)* wie einem Kampf mit Zähnen."

Da sagte der Löwe: „Laß uns doch mit der Hand *(ũm)* fechten!" Aber der Strauß erwiderte: „Meine Mutter hat mich doch nicht zu so einem Handkampf geboren."

Struthio australis L. ♀

Und der Löwe sagte: „So laß uns denn *(ũnai)* doch mit dem Kopf *(tanas)* kämpfen!" Der Strauß aber erwiderte: „Meine Mutter hat mich doch nicht zu so einem Kampf mit dem Kopf geboren."

Da sagte der Löwe: „So laß uns denn mit dem Fuß *(tai)* fechten!" Doch der Strauß sagte: „Meine Mutter hat mich doch nicht zu so einem Kampf mit dem Fuß geboren."

Nun sagte der Löwe: „Laß uns doch mit der Kralle fechten!" Da sagte der Strauß: „Ja, dafür *(wörtl.: für die* ũãsa, *Stelle (kgais)* hat sie *(ũ(e)ĩa, pron. pers.)* mich geboren!"

Und die beiden traten *(ũnã)* sich gegenseitig *(-gu, Reziprokal-part.).* Der Löwe trat, aber er richtete nichts aus *(di tun).* Da trat der Strauß und schlitzte *(ũnõĩ)* den Löwen auf°).

°) Der Fußtritt des kräftigen Vogels hat in den Eingeweiden der Kapbeute manches Unheil angerichtet.

Übersetzung von LVIII.

Die Fliege, die den Elefanten heiratet.

Die Fliege *(ǃgīnas)* war dem Elefanten *(ǂkχoaba)* angetraut worden *(ǃgamehe)* und war zu *(ǁga)* der Elefanten-Werft *(ǁgaūs)* gezogen *(ǁā)* und dort *(ǁnāba, mit dem vollen, selten gebrauchten Suffix der 3. pers. sing. fem.)* gebar *(hō)* sie eine Tochter *(ǃgōasa).* Da *(o, mit d. Pers.-Suff. des Subj. -kχa, dual. masc.)* fragten *(tē)* ihre beiden Brüder *(ǃgāsakχa)* bei *(doba)* der Mutter *(ǁgūsa)* an: „Sind wir *(sikχuma, pron. pers. 1. pers. dualis exclusivi masc.)* denn *(ga)* nicht *(toma, mit d. Pers.-Suff. des Subj.)* zusammen mit *(ikχa)* einer Schwester *(ǃgāsa, tarere weiblich)* geboren *(ǁora)*?“ So fragen sie. Darauf *(o)* die Mutter: „Eine Schwester besitzt *(Doppelverb: ū nehmen, hā bleiben)* Ihr *(kχo, dual. masc.)*“ spricht die Mutter, „aber *(χabe, m. d. Pers.-Suff. d. Subj.)* sie ist nicht hier *(nēba),* in *(ǃna)* einen bösen *(ǁaiχa)* Volksstamm *(ǃhaos)* hat sie geheiratet“, sagt sie. Darauf erwidern die beiden: „Wir werden *(nī, Verb.-Part. d. Fut.)* zu *(ǁga)* dem bösen Volk dort *(ǁnā)* gehen *(ǃgūng)*!“ „Aber Ihr werdet getötet *(ǃgamhe)* werden!“ sagt die [Mutter]. Die beiden aber gingen.

Und gegen Abend *(ǃui Abend werden, verb.; a Verb.-Part., einen Zustand ausdrückend, beide hier wie zu einem Adverbium verbunden)* kamen *(sī)* sie hin, als gerade *(hīa)* die Elefantenkinderchen *(-ro, Diminutivpart.)* und die Tochter ihrer *(ā Possess.-Wurzel, mit d. Pers.-Suff. d. Besitzer, -kχa)* Schwester die Arastöcke *(ǁaraga)* werfen *(ǂnau schlagen, s. Kinderspiele S. 313).* Und während sie die Stöcke werfen, gingen *(hā)* die beiden *(o, m. Pers.-Suff., den Nachsatz einleitend)* ins Gebüsch hinein *(ǂgā, verb.).* Nun werfen [die Kinder], — da *(o mit dem männl. Pers.-Suff. des Subj.)* kam *(sī)* der Stock der Tochter *(di,*

Genitivpartikel) ihrer Schwester, die *(-s in ǂnaus)* geworfen hatte, dort zu liegen *(ǁgoē)*, [wo] die beiden *(ǁ(e)ī̀kχa, pron. pers., 3. pers. dual. masc.)* saßen *(ǂnōa, ba deutet die Beziehung zu einem Objekt, hier dem Fliegenkind, an)*. Und als sie kam, den Stock zu nehmen *(ǁī)*, wird sie [von ihnen] gerufen *(ǂgaihe)* und gekost *(amahe; eigentl.: durch den Geruch, ǁamab, wie ein Hündchen anhänglich gemacht, S. 268)*. Und als sie den Stock aufgehoben hatte (*Doppelverb: ǁī nehmen und toa aufhören*), geht sie [zu den Elefantenkindern] und sagt: „Ihr *(sadu, 2. pers. comm. plur.)*, die Ihr Lehm*) *(ǂgoab)* eßt *(ǂū)*, geht zum *(ǁga)* Lehm! Laßt *(ē und, imperativisch)* mich *(-ta)*, die ich *(tita)* Milch *(daič, comm. sing.)* trinke *(ā)*, zur Milch gehen!" Da eilten *(ǀkχo͡ē)* die kleinen Elefanten zum Lehm, und die kleine Fliege eilte zur Milch hin. Und als *(o)* sie hinkam, sagt sie: „Mutter *(aise)*, steh auf *(kχaī)* und *(ē)* komm *(sī)*, gib *(mā)* mir *(te)* Milch!" So sagt sie. (*Die Frau sitzt nicht in ihrer eigenen, sondern in einer benachbarten Hütte.*) Die Mutter aber steht nicht auf, und die [Kleine] weint *(ā)*. Da steht die Mutter auf und geht hin und geht, ihr *(si)* Milch eingießen *(ǂnā, -ba Objekt betonende Verb.-Part.)*. Darauf [die Kleine]: „Mutter, ich habe etwas *(χūī)* gesehen, geh doch *(-re)* hin, [es] zu betrachten!" So sagt sie.

Da nahm sie einen Riemen *(ǀhaūba)* und ging und sah (*eigentl.: kam sehen*) die beiden (*-kχā, Suff. d. 3. pers. dual. masc. im Dat.-Acc.*). Dann rupfte *(tsuru)* sie Gras *(ǀgāba)* und wickelte *(ǁguiam)* die beiden, ihre beiden Hunde *(arikχa)*, alles *(hoa)* zusammen *(ǀkχa)* in das Gras. Dann brachte sie (*Doppelverb: sī gehen, ǁī nehmen*) die beiden zur Hütte *(oms)*, und in der Hütte baute *(om)* sie eine Sonderhütte (*ǀguri allein, hā bleiben*) und hieß *(gai)* die beiden sich legen. Da legten sie sich und schärften den Hunden ein *(mī sagen, -ba hebt die Beziehung zum Objekt hervor)*: „Ihr sollt *(nī)* nicht *(tā)* so**) *(tumi)* trinken *(ā)*!" So sagten sie. Die [Schwester] aber fragte bei der alten Elefantin an: „Als *(o)* ich

*) Der unter Hottentotten weit verbreitete Glaube, daß der Elefant sich von Lehm nährt, wird darauf zurückzuführen sein, daß diese Kolosse, wenn sie, wie einst, in Herden zum Wasser kamen, den Boden der Vlej von Grund aus aufwühlten. Sie soffen dann nicht nur schlammiges Wasser, sondern trugen an ihren Füßen auch soviel Schlamm mit fort, daß im Laufe der Zeit die Wasserstelle sich immer mehr, wie fortschreitend ausgefressen, vertiefte.

**) Der Erzähler ahmt hier das Schleckergeräusch saufender Hunde nach.

einst *(χare)* hier *(nēba)* heiratete, ist da ein kahl- *(ǃgora)* knieiger *(ǁgoasa adjekt., hier substantivisch ǁgoase[b])* Hammel *(gūb)* für mich *(ta, -ba s. oben)* geschlachtet worden*) *(ǂāhe)*?" Darauf sagte [die Alte]: „Du Frau *(tarase)* meines *(ti)* Sohnes**), warum *(tareχa, m. d. Pers.-Suff. d. Subj.)* sprichst du auf einmal *(tsēē eines Tages)* von Dingen *(χūna)*, die du *(-s in hugas)* niemals *(huga von jeher, toma nicht)* besprichst?" Doch jene erwiderte: „Ich *(-ta)* frage *(tē)* eben!" Da sagte [die Alte]: „Für [dich] ist nicht geschlachtet worden", und schlachtete ihr *(si)* einen Hammel. Dann kochte *(saī)* [die junge Frau] ihn, und als er gar *(ǁan)* ist, schöpft sie ihn *(bi)* den beiden wartenden *(ǁgoē liegen, -ba objektivier. Part.)* Männern in *(ǃna)* die Holzschüssel *(hai ǃoreb)* aus *(ǂui)* und stellt *(maī)* ihn den wartenden Männern hin.

Und die Zeit *(ǁaēba)*, da der Elefant anzukommen *(ǃkχī)* pflegt *(wörtl.: die Komm-Zeit d. E., di Genitivpartikel)*, ist erfüllt *(ǃoa)*. Da ermahnt [die Fliege] die beiden Männer: „Wenn er, angekommen *(hā kommen, tsī Verb.-Part. d. partic. praeter.)*, rülpst *(ǃgai. wörtl.: rülpsen kommt)*, dann haltet die Nasenlöcher *(ǂguiti)* zu!" *(Doppelverb: *ǃkχō fassen, ǂgan zudecken)* So sagt sie. Dann zerreibt *(χon)* sie Buchupuder***) *(sāē comm. sing.)*. Da sagt [die Alte]: „Was *(tareē)* für Gerüche *(ǁamana, comm. plur.)*, die ich noch nie gewittert *(ǃkχaba)* habe, kriege *(hō)* ich heute *(an diesem nē, Tage tsēē, comm. sing.)* zu wittern?" *(ē Fragepartikel)*. [Die Fliege] aber entgegnete: „Denkt *(ǂaī, ti so)* Ihr *(sadu, 2. pers. comm. plur.)*, da ich [in Euch] hineingeheiratet habe, soll ich mir *(-sen, Reflexivendung)* nicht *(tite, Verb.-Part. d. fut. neg.)* Buchupuder machen *(dī)*?" Dann wurde es dunkel *(ǃkχai)*.

Da kam der [Elefant], und während *(hīa)* er ankam *(ǃgoaχa, m. dem männl. Pers.-Suff., -b)*, redete *(kχom)* er [um sich bemerkbar zu

*) Es ist Hottentottensitte, daß die Schwiegermutter zum Empfang der jungen Frau, die in die Werft des Mannes einzieht, ein Stück Vieh schlachtet. Die Schwiegertochter tut dann desgleichen. Wenn dieses festliche Schlachten bei gut Situierten unterbleibt, so ist das eine Verletzung der guten Sitte, eine Unfreundlichkeit gegen die junge Frau.

**) Die rohe Auffassung des Familienlebens, unter der die junge Frau zu leiden hat, wird im Munde der alten Elefantin dadurch gekennzeichnet, daß sie von ihrem Sohn nicht als dem Mann, den sie geboren *(ǒab)*, sondern den sie ervögelt hat *(χaē* den Coitus vollziehen*)*, spricht.

***) Das wohlriechende Pulver soll den Geruch der Brüder, den die alte (als blind gedachte) Elefantin wittern könnte, verdecken. Daß die Alte den Duft des Buchu, dieses Nationalparfüms der Hottentotten, nicht kennt, ist eine weitere Illustration dafür, wie fremd die junge (hier als Fliege gedachte) Frau in der Familie des Elefanten geblieben ist.

machen]. Da sagte [die Fliege zum Kinde]: „Geh hinaus *(ǂoa)* und *(ē)* berichte*) deinem Vater *(ǂaoba)*!“ So sagte sie. Da ging die kleine Fliege hinaus und meldete: „Wir *(-da, Suff. d. 1. pers. plur. comm.)* machen nichts *(χūē etwas, toma nicht)*!“ So sagte sie. Da kommt er heran und kommt, sich neben *(χōb Wange, ri an)* die Hütte zu legen. Dann rülpste er, dann stand er auf *(kχaī)*, dann ging er seiner Wege.

Sie (*-n, Suff. d. 3. pers. comm. plur.*) aber rissen *(ǁkχoba)* alsdann *(zur ai, Zeit ǁaēba, da ǁnā)* die Hütte ab und packten sie auf einen Tragochsen *(ǃgarub)* und banden *(ǃgai maī)* ein altes *(gaira)* Schaf *(gūs)* und eine blinde *(ǂgī)* Ziege *(biris)* und eine blinde Kuh *(gomas)* fest**) und machten sich davon *(bē, verb.)*. Der Elefant aber setzte ihnen nach *(ǃgōaǃgon)*. Doch sie hatten die Tochter rücklings *(kχaos hinten, ǁkχāb Körper, ǃoa nach hin)* auf dem Tragochsen sitzen *(ǂnū)* lassen *(gai)*, die [sieht ihn] und ruft: „Ja *(gumo)*, er kommt an! *(ǃgoaχa, passivisch ausgedrückt)*, [breit wie] ein weitästiger *(ǁnauχaē)* Giraffenbaum *(ǁganaē, comm. sing.)*, [wuchtig wie] einer der einen Brunnen *(tsauē)* zutrampeln *(tsom)* kann! (*-χa, Adjektivendung*). Er kommt an, wahrlich!“ ruft sie. Und nun versperrten (*Doppelverb: *ǁgau aus Zweigen einen Kraal machen, ǂgan zudecken*) sie den Weg *(daoba)* und lauerten *(*ǁgoē am)* ihm *(bi)* auf.

Zur Zeit aber, als er wegging, sagte [die alte Elefantin]: „Mein Sohn *(ōatse, Voc. masc.)*, falls *(o und ga)* du *(sats, masc.)* getötet wirst, wird [mir als Zeichen dessen] mein Hinterteil *(kχao aiba)* zittern *(gon)*!“ So sagt sie. Und während ihm aufgelauert wird, kommt er und ruft: „[Darüber] springe *(ǃgau)* ich, springen tue ich darüber!“ *(i, Hilfszeitwort.)* Da werfen *(ǁhaī, passivisch ausgedrückt)* sie mit den beiden Assagais *(gōakχa)* und die beiden Hunde beißen *(nā)* ihn tot *(ǃan im Sinne von getötet, im Gegensatz zu ǁō verendet)*. Und die Schwester sagte: „Wenn ihr den Kindermacher *(ǁora zeugen, aob Mann)* tötet, dann schneidet *(ǃgao)* [ihm] die Schamteile *(ǂoa aiba)* ab!“ *(*kχaī etwas oberflächlich, oben aufschneiden)*. Und als die beiden

---

*) Der liebevolle Familienvater treibt sich tagsüber im Feld herum, kommt nur abends zur Hütte, geht aber nicht hinein, sondern läßt sich nur vom Kinde berichten, daß alles in Ordnung sei: „Wir machen nichts!“ d. h.: „Es ist nichts vorgefallen!“

**) Alles übrige Vieh trieben sie mit fort.

ihn getötet hatten, schnitten sie [die Scham] ab und zogen *(doč)* nach Haus *(ǂaru heimkehren)*.

Übersetzung von LIX.

Der Elefant, der allerhand Wesen zu Dienstknechten macht.

Der Elefant hatte vierbeiniges *(haga ǀnūb)* Raubzeug *(*ǀguruna, comm. plur., Sammelbegriff für alles bösartige Getier)* zu Dienstknechten gemacht, und Morgen für Morgen *(wörtl.: an welchem? mā, — an jedem hoasa, Morgen ǁgoas)* werden sie *(-n in tsīn, Suff. d. 3. pers. comm. plur.)* bepißt*) *(ǀkχam, ai auf)*.

Das weiße *(ǀuri mit euphon. n)* Erdmännchen *(ſeb)* aber, das *(-ba Suff. in tomaba)* den Knappsack *(ǁhōba)* nicht *(toma)* voll *(ǀoa)* [Feldzwiebeln] gräbt *(kχao)*, wird über und über *(*hōraga)* mit Harn *(ǁūba)* bepißt, die anderen *(*nauna, comm. plur.)* werden nur *(ǀgui*

*) Damit sie guten Fund machen, — seltsamer Aberglaube.

einzig) ein klein wenig *(ǂχari klein, -ro Diminutivpart., -se Adverbialendung)* bepißt; dann gehen *(ǃgüng)* sie graben. Und die anderen graben die Knappsäcke voll, aber das weiße Erdmännchen kommt *(ǃkχī)* mit *(ǃkχa)* Schundkram *(χūs Ding, -ro dimin., i Pers.-Suff. comm. sing.)*, der da *(ǁnā)* hinten *(kχaos ai)* [im fast leeren Sack] sitzt *(ǂnōa)*. Dann kommen *(hā)* sie her, [die Feldzwiebeln] abzugeben *(mā)*, und wenn *(-tsī, particip. praet.)* sie fertig *(toa aufhören)* abgegeben haben, gehen sie. Wenn *(o)* dann der Morgen anbricht *(ǁgoa)*, kommen sie und nehmen *(ū)* die Knappsäcke und gehen, nachdem *(o am Schluß d. Satzes)* sie *(-n in toahen)* fertig bepißt worden sind *(ta hinter s euph. für ra, Verb.-Part. d. fortschr. Handlung)*.

Da fand *(hō)* das weiße Erdmännchen eines *(ǃgai)* Tages *(tsē)* Rat *(ǃabesa)*: es grub *(χoro)* Löcher *(āga, masc. plur.)* und kommt mit ganz *(gai groß, -se Adv.-Endg.)* kleinen Zwiebelchen an. Als es aber die Löcher fertig gegraben hatte und die Zeit *(ǁaēba, gemeint ist d. nächste Morgen)*, da sie gehen sollten *(nī, Verb.-Part. d. Fut.)*, erfüllt *(ǃoa)* war, geht *(sī)* es auf *(ai)* einen Hügel *(ǃhomi Berg, -ro Diminut.)*, sich setzen *(ǂnū)*, nachdem *(tsī, Part. d. particip. praet.)* es einen Assagai *(gōaba)* genommen hatte, und rief *(ǂgai)*: „Aufpissen wirst du *(-ts, Suff. d. 2. pers. masc. sing.)* mir *(-te, Suff.)* heute *(nēǃtsē)* nicht!" *(tite Part. d. Fut. negat.)* So rief es.

Da ging *(ǃnoba)* [der Elefant] auf *(ǁga nach hin)* das Erdmännchen los, aber das Erdmännchen entfloh *(ǁhai, nī Part. d. Futur. drückt hier, mit dem Verb zu einem Begriff verschmolzen, die Erwartung d. Verfolgung aus)*. Da setzte er ihm *(-bi, Suff.)* nach *(ǃkχoē laufen, ǃgon hinterher)*, doch [das Erdmännchen] ging in *(ǃna)* ein Loch hinein *(ǂgū, verb.)*. Da ging der Elefant hin und spähte *(ǂai)* in das Loch, und nachdem *(tsī, Part. d. Particip. praeter.)* er hineingespäht hatte, trat *(dā)* er, daß *(ga)* ein Einsturz *(ǃkχomi)* geschehen sollte, trat er von oben *(ǂam)* in das Loch. Das Erdmännchen aber sprang *(uri)* heraus *(ǂora)* und schlüpfte *(ging hineingehen)* in ein anderes *(ǃkχara)* Loch. Da kam jener wieder *(ǁkχaba)* dort *(ǁnāba)* hin, da wurde er ins Herz *(ǂgaos)* gestochen *(ǃkχā)* vom *(χa)* Erdmännchen.

Seitdem leben die Erdmännchen unbehelligt in Erdlöchern. Ihr Fell aber ist weißgelb geblieben von dem täglichen Morgenguß.

Die Mädchen, die die Werft der Riesenschlange besuchen.

Die Mädchen *(ǀgōati)* gingen auf Besuch *(sari, i. pass. narr.)*, und Gatsinghamabes (*s. S. 452 unten und S. 454, No. 24*) lief ihrer *(sa)* Schwester *(ǀgāsa)* nach *(sao, verb.)*, aber die Mädchen (*durch d. Pers.-Suff. ti ausgedr.*) jagen sie *(si, Suff.)* zurück *(ǂhai daba)*. Da setzte *(ǂnū)* sie sich hin, und als *(o)* jene [weiter-]gehen *(bē)*, eilt *(ǂkχoē)* sie hinterher *(ǀgon)* und holt sie ein (*kommt hin*), die aber jagen sie wieder *(ǂkχaba)* zurück. Und während *(hîa, m. d. Pers.-Suff. d. Subj. i. Nachsatz)* sie es also *(ǂnā Demonstr., ti so, -s Pers.-Suff. d. Subj. im Vordersatz)* treibt *(hĪ)*, entfernten *(bē)* sie sich von *(χu)* der Werft *(ǂgaũsa)*. Da ließen sie ab *(ǂū, verb.)*, und die Kleine kommt mit.

Dann kommen sie hin [zur Werft der Schlange] und molken *(ǂao, i. pass. narrat.)* sich *(-ba, objektivir. Verb.-Part.)* Milch *(daina, comm. plur.)*. Die Kuh *(gomasa)* der Gatsinghamabes aber wurde vor *(ams ai)* dem Loch *(°āb)*, [in dem] die Riesen- *(gai groß)* Schlange *(ǂaob)* saß *(ǂnōa)*, für sie *(-ba, s. oben)* gespannt *(ǂhaũ, mit d. Riemen werden die Hinterbeine zusammengekoppelt)* und das Loch mit *(ǂkχa)* Kuhmist *(ǂhoros)* zugedeckt *(ǂnūi setzen, ai auf)*. Dann wurde ihr geheißen *(gai)*, die Milch sich in den Mund zu melken *(daru)*, und sie faßte *(°ǂkχō)* das Euter *(sama)* der Kuh *(di, Genitivpart.)*, — da bewegte sich *(gon)* der Kuhmist. Da kniff *(ǂkχī)* sie das Euter der Kuh, und die Kuh machte einen Sprung *(uri, verb.)*. Dann sagt sie: „Großmutter*) *(ǂī ǂnaos)*, die Kuh ist nicht an mich gewöhnt!“ *(ǂū nicht kennen)*, und ging zur Hütte. Dann wurde ihnen Fett *(ǂnuib)* gegeben *(mā)*, und sie schmieren sich**) *(sobosen)*. Aber Gatsing-

*) Ehrerbietige Anrede an die Frau und Heilmeisterin der Riesenschlange, die als männliches Wesen gedacht ist.

**) Die Hottentotten schmieren sich, wenn sie einmal besonders gut schlafen wollen, abends mit Fett ein. Die damit verbundene Massage hat in der Tat einschläfernde Wirkung. Die Kleine will auch bleiben und weint deshalb die Wohltat zurück.

hamabes will *(ǂgao. hã drückt hier die Beharrlichkeit d. Kleinen aus)* sich nicht *(toma)* schmieren. Dann wurde es dunkel *(ǂkχaĕ. verb.)*. Nun zog sie ein kleines *(-ro. Diminut.)* Schneideisen *(ǂnamib, ein gescharftes Stückchen Blech)* heraus *(ũ tui)* und spitzte *(sau sam)* Hölzer *(haitc. euphon. für -ti)*. Da fragte *(tẽ)* die Frau: „Was *(taeĕ verkürzt aus tareĕ)* spitzest du *(-s)* [dir] Hölzer?" Das Mädchen aber sagt: „Morgen *(ǂari)* will *(nĩ)* ich *(-ta, Suff.)* mit *(ũ)* harter *(garo)* Stöcken *(haiti)* Gunuzwiebeln*) *(ᵐǂgũnuna. comm. plur.)* losbrechen *(ora)*."

Und als sie schliefen *(ǂõm)*, ging sie zur Hütte der Heuschrecke *(ǂnãǁaus)* und fragte, zu *(ai. mit dem Pers.-Suff. d. Subj.)* welcher *(mã)* Zeit *(ǂaĕb)* die [Riesenschlange] hervorkäme *(ǂkχaiĕ. Part. d. indir. Rede)*. Da sagte die Heuschrecke: „Zur Mitternacht

Methone andersoni Stal, ♀ (Oedipodide) von Kubub. nat. Gr.

(tsũχub gaib) wohl *(ga. Potentialis)*, wenn *(o)* ein kühler *(gara)* Luftzug *(ǂoab Wind, -ro Diminut.)* weht *(ǂgom)*, kommt sie." Darauf ging Gatsinghamabes, sich hinlegen, brannte *(kχau)* ein Feuer *(ǂaĕsa)* an, die Erde ringsum zu erhitzen *(ᵐǂkχõankχõa)*, und ein Kehrholz *(ǂkχoros)* und die Hölzer und ein hartes *(garosa)* Bettfell *(ǂgoas)*, das alles *(tsĩ und. -na comm. plur.)* stellt sie bereit *(ũ nehmen)* und legt sich [innen] an den Eingang *(ams Mund)* der Hütte nieder.

Und der kühle Luftzug wehte, und sie richtete sich auf *(kχaĩ und mã)* und setzte sich *(ǂnã)*. Da kam die Schlange *(durch das an tsĩ angehängte Pers.-Suff. -b, Accus. bi, ebenso kurz ausgedrückt, wie durch das folgende -s und si das Mädchen als Subj. resp. Obj. bezeichnet ist)*, und Gatsinghamabes stach *(ǂkχã)* sie, und die Schlange stieß nach Gatsinghamabes, aber die wehrte *(ǂkχau)* sie mit dem harten Bettfell ab und stach sie und bedeckte *(ᵐgan)* sie mit heißer Erde *(ᵐǂkχurub)* und tötete *(ǂgam)* sie. Dann legte sie das Tier *(bi, siehe*

*) Eine eßbare Babiana-Art (Iridaceae).

oben) auf den Platz *(tkχais)*, wo (*der ganze Relativsatz ist hier wie üblich ohne Relativwort dem zugehörigen Substantiv vorangestellt*) es sich niederläßt, nachdem *(tsî. Part. d. Partic. praeteril., hinter toa aufhören)* es die Menschen fertig getötet hat. Dann weckte *(tkχûi erwachen, verdoppelt: wecken)* sie die Mädchen *(kχoõĭe Menschen, fem. plur.)*, und sie gingen weg, und während *(hîa, mit d. Pers.-Suff. d. Subj. i. Nachsatz)* sie weggingen, brach *(tgoa)* der Morgen *(tgoasa)* an.

Jene aber (*die Leute in der Werft der Schlange, durch das Suff. d. 3. pers. plur. comm. -n ausgedrückt*) molken die Kühe, und die Sonne *(soresa)* ging hoch auf *(Doppelverb: thai u. tgabi)*. Da sagte [die Frau der getöteten Schlange] zur Schwippschlange *(sanugyeõaseb. s. S. 454, No. 30)*: „Geh, deinen *(sa, Stamm des pron. person. 2. pers. sing. fem., unter Weglassung d. Genitivpartikel di, als pron. possess. gebr.)* Großvater *(tnaob)* wecken! Das Mädchen, das seine Augen überall hat *(wörtl.: dreht daba, und schaut gō)*, war da, deshalb *(tuigye)* [bin ich in Sorge]", sagte sie. Da kam jene hin, zu wecken, und sagte: „Gar scheel sieht *(tni)* mich *(ti)* mein Großvater an!" Da kam die Frau selbst *(aitsoma)* hin und sah, daß die Schlange tot *(ti)* [da lag], und sagte: „Von *(tga)* den Mädchen, die gestern Abend *(tsan toĕ)* hier *(nîba)* schliefen, ist dein Großvater getötet worden!" Darauf die Schwippschlange: „Mein Großvater, der mir *(angedeutet durch das objektivierende -ba, hier laut heulend ausgezogen)* immer nur *(tguisa einzig, auf tkχûs Knochen bezogen)* Knochen mit viel Fett *(gaub Fett, -ga die Menge ausdr., tkχûb Leib)* gibt!" So heulte *(ā)* sie.

Als aber die [Heuschrecke] das hörte *(tnaũ, m. d. Pers.-Suff. d. Subj.)*, [sagte sie]: „Wär' es doch wahr *(ama)*, daß sie am Boden liegt! *(wörtl.: daß ihr Rücken tgûb, tief ist °tguma.)* Wär' es doch wahr, daß sie am Boden liegt!" So spricht sie im Takt, wie die Butterkalabas rollt *(wörtl.: so buttert sie, tsuba)*. Da fragte *(ti)* die Frau der Schlange: „Heuschrecke, was (°*tuĭi* = *tarei*) redest du da?" *(ti, mit d. Pers.-Suff. d. ungen. 3. pers. fem.)* Doch sie [antwortete]: „Einem einzig *(tguise, adv.)* dastehenden *(mâ)*, tüchtigen *(tguri)* Mann wird

---

*) Die *sanugyeõaseb* genannte Schlange wird als komische Figur gezeichnet: Ihre Dummheit gibt sich darin zu erkennen, daß sie die verdrehten Augen der getöteten Riesenschlange als Ausdruck schlechter Laune auffaßt. Dann vergleicht der Hottentott in ihr auch jene minderwertige Trauer einem Kreisgingen, der seinen Wohlsitter nur beweint, weil seine eigenen guten Tage nun zu Ende sind.

ja unn *(gum---o)* ein Vieh *(wörtl.: ein Ding, masc.)* als Totenopfer geschlachtet *(°ǂâikχē)*, das sagte ich!"°)

Als aber die Mädchen nach Haus *(tara, verb.)* kamen, und zur selben Zeit der Riedtanz *(ǂâi)* geblasen *(gai)* wurde, hingen *(tgē, und mit setzen)* sie die Buchusäckchen *(°ǂgaxte, fem. plur., s. S. 240 unten)* auf und gingen *(ǂgûng)* zum Riedtanz. Da kommt die Frau der Schlange und schlüpft *(hâ herkommen, tgē hineingehen)* in das Buchusäckchen der Gatsinghamabes. Dann suchte *(ǂa)* Gatsinghamabes das Buchusäckchen und sah hin und sagte: „Mein *(ti)* Buchusäckchen ist nicht so *(ti)* voll *(ma)*!"°°), und nimmt einen Stock und holt es herunter *(ǂkyara ma)* und in das Feuer steckt sie das Buchusäckchen. Da kam die Frau der Schlange um.

Übersetzung von LXVII.

Die beiden Zebrastuten und der Pavian.

Mit den Zebrastuten *(-ra, Pers.-Suff. dual. fem.)* und dem Pavian begab es sich *(hîhe, wurde gemacht)* so: Die Zebrastuten kommen zum Wasser *(ǁgama, verb., i. pass. narr.)*. Der Pavian aber macht Eisen *(ǂurite, fem. plur. = -ti)* heiß *(ǀgam/gam, verb., i. pass. narr.)* und kommt hervor *(ǀkχī, i. pass. narr.)*, als *(o)* er die Zebra's nahen *(ǀgoaχa, i. pass. narr.)* sieht *(mū)*, und ruft: „Mein *(ti)* ist ja *(gum---o)* doch *(χdoe)* der Wasserspiegel mit dem Rasenrand!“ *(ǀgariχa krautreich, amī Mund, Öffnung)*. Da kehren die beiden um *(oa)* und kommen am anderen *(ǂnau)* Tage *(tsē)* [wieder]. Aber der Pavian kommt *(sī)* mit *(ǀkχa)* den Eisen an, als er sie nahen *(dem Verb sind zwei Pers.-Suffixe angehängt: -ra zeigt sozusagen das Subjekt des Verbs, -b das des Satzes an)* sieht, und ruft: „Mir gehört ja doch der Wasserspiegel mit dem Rasenrand!“ Da kehrten die beiden um.

Und das junge *(ǂkχamsa)* [Zebra] warf *(ōa gebären)* ein Fohlen *(masc.)*, und sie alle *(durch das Suff. d. comm. plur. -n ausgedr.)* kamen am anderen Morgen früh *(ǁgoaga)* wieder *(ǁkχaba)*. Doch jener rief: „Mir gehört ja doch der Wasserspiegel mit dem Rasenrand!“ Da kehrten sie um. Und sie warteten *(hā)*, bis *(gōse)* das Fohlen groß *(gais, das s ist wohl abgekürzte Adj.-Endg., sa)* geworden sein würde *(nī, Fut.-Part.)*, und als *(o, m. d. Pers.-Suff. d. Subj. i. Nachsatz: on)* das Fohlen groß geworden war, gingen sie zum Wasser. Da kam der Pavian mit dem Eisen herunter *(ǁgōaχa)*, und als sie erschienen, rief er: „Mir gehört ja doch der Wasserspiegel mit dem Rasenrand!“

Doch sie blieben stehen *(mā)*, und der kleine *(-ro, Dim.)* Zebrahengst *(-ba, masc.)* trabte *(ǂnaĕ)* herunter *(*ǂgonaχa, ist wohl die ältere Form von ǂgōaχa, Umwandlung des n in einen Nasallaut)*, und die beiden Stuten folgten *(sao, verb.)* dem kleinen Hengst; der kam *(hā)* herzu und trank *(ā)*. Da brannte *(dao)* ihn *(bi, Suff.)* der Pavian hier *(nēba)**). Der aber ergriff *(*ǃkχō)* den Pavian und setzte *(ǂnūi)* ihn fest *(ǂgaī pressen)* in *(ai)* die Eisen.

Papio porcarius (Boddaert) ²
von hinten,
zur Demonstration der Gesäßschwielen.

Seit dem Tage ist der Hinterste *(kχaoais)* des Pavians gebraten *(ǂan gar sein, -sa Adjektivendung, -sa weibl. Pers.-Suff., das Wort substantivierend; vergl. S. 539)* und *(tsī hat hier nicht d. Pers.-Suff. d. Subjekts, sondern des vom Subj. regierten Subst. im Genitiv)* die Ellbogen *(*ǂuniti)* des Zebras sind angebrannt *(daū brennen)*.

So erklärt sich die Phantasie des Hottentotten den Ursprung der Gesäßschwielen (siehe Abbildung) und der sogenannten Kastanien, jener nackten Hornschwielen an der Innenfläche der Handwurzelgegend des Zebra.

Der Schakal, der Leoparden und Löwen als Vieh hält.

Der Schakal hatte die Leoparden und Löwen, die alle *(tsĭ und, -na Pers.-Suff. d. comm. plur.)*, zu [seinem] Vieh *(ǂgoa, ohne Suff.)* gemacht *(ūĭ, i. pass. narr.)*, und sein *(ū Stamm d. Pron. poss., -ba Pers.-Suff. d. Besitzers)* Kind *(*ǂgōaseb = ǂgōab)* hütet *(ǂūĭ)* das Vieh *(comm. plur.)*. Da wurde es, als *(o)* es sich [eines der Tiere] in den Mund ausmolk *(daru, m. Pers.-Suff., ta euphon. für ra)*, mit *(ǂkχa)* den Krallen *(ǂgorogu)* halb tot *(gū verloren sein, die Verdoppelung gibt d. Verb kausativen Sinn)* zerkratzt *(χora)*, und als es [nach Haus] kam *(ǂkχĭ, mit Pers.-Suff., ta = ra)*, fragt *(tĕ)* der Schakal*): „In *(ǂna, m. d. Pers.-Suff. d. 2. pers. sing. masc. -ts du)* was *(tareĭ)* bist du hereingeraten *(ǂgū)*?“

*) Obwohl er gut weiß, daß er die Schuld hat: er selbst hütet sich wohl, sein gefährliches Vieh auszuführen.

So *(ǂumi)* fragt er; und das Kind antwortet: „Die Ziegen *(birigu)* haben mich *(ǂe, Suff.)* zerkratzt!“ Aber einzig *(ǂguiba)* das Kind melkt *(ǂao)* weiter *(ra)* die Ziegen *(fem. plur.)*.

Doch eines *(ǂgui)* Tages *(tsē)*, als es *(-b in ǂaob)* zum Melken gegangen *(ǂgūng)* war, wurde es vom *(ʗa)* Löwen erfaßt *(*ǂkχō)*. Da rief *(ǂgai)* es der Vater *(ǂgūba)*, und „Vater *(dada)*!“ antwortete *(oē)* es. Aber die Frau *(tarasa)* [des Schakals] war voll Fürsorge *(*ǂhuma ǂna)* und sagte: „Usgyeb's *(Sagenname des Schakalkindes)* Vater *(ǂb)* soll *(nī)* doch gefälligst *(go)* nach Usgyeb sehen *(gō)*!“ Da ging der Schakal heraus *(ǂoaχa, verb.)* aus *(χu)* der Hütte *(omsa)*, aber ging hinter *(ǂgāba)* dem Kraal *(ǂharas)* vorbei *(ǂ vorbeigehen)* und rief [nur nach dem Kind]. Und dieses *(nē)* Mal *(ǂnāsa)* antwortete das Kind nur ganz schwach *(ǂkχari klein, -ro Dimin., -se Adverb.-Endg.)*. Da ging die Frau heraus und rief den Mann *(aoba)*, während *(hīa)* er hinter *(im ai, Rücken ǂgāb)* dem Kraal steht *(mā)*. Und er kam *(ǂkχī)*, und die beiden *(-ra, Suff. dual. masc.-fem.)* gingen hinein. Da springt *(ǂham)* der Löwe auf sie *(-ra)* los, die beiden aber sprangen *(uri)* auf *(ai)* die Kraalmauer, und das Kind schlüpfte hinten *(ǂnoros Hinterkopf)* zum Kraal hinaus.

Währenddessen *(hīa, mit d. Pers.-Suff. d. Subj.)* kamen Hottentotten *(naman)* und baten *(ǂgan)* um Kost *(ǂūč, sing. comm.)*. Da sagte der Schakal: „Usgyeb, komm heraus und *(ē imperativisch, m. d. Pers.-Suff. d. 2. pers. sing. masc.)* zeige *(ǂgau)* diesem Mann einen Hammel *(gūč, comm. sing.)*, und er *(-b)* nehme *(ū)* [ihn]!“ Und das Kind gab ihm *(bi, Suff.)* Bescheid, dann wurde es still*) *(ǂnō)*. Und wieder *(ǂkχaba)* zwei *(ǂgam)* Männer *(kχoēkχa, Menschen, dual. masc.)* kamen und fragten:- „Wo *(maba, m. d. Pers.-Suff. d. Subj.)* bleibt *(hā)* der Mann, den wir hier *(nēba)* herschickten *(sī)*?“ So fragten sie, aber der Schakal sagte: „Schon lang *(ǂnai)* habe ich ja *(gum---o)* dem Mann da *(ǂnāba)* geheißen *(gai)*, einen Hammel zu fangen!“ Da gingen die zwei in den Kraal.

Der Schakal aber ging heraus [aus der Hütte] und stellte sich *(ging sī, stehen mā)* in die Dunkelheit *(ǂkχaēb)*. Und als die zwei Männer hineingegangen waren, sprangen nach allen Seiten *(ǂkχūgu, ǂ gleichen, kχumi so)* die Löwen und Leoparden, sie alle,

*) Der Mann wird von den wilden Tieren im Kraal zerrissen.

heraus. Da sagte der Schakal: „Weit über *(*goro am)* die Lande *(ǃhūgu)*!", und sie eilten *(ǃkχoĕ)* davon *(bĕ, verb.)*.

Dann öffnete *(ǂkχoba am)* der Schakal den Kraal, um *(ga)* die kleinen *(-ro, Dimin.)* Löwen und die kleinen Leoparden, alle die *(tsĭ mit d. Pers.-Suff. d. Objekts, 3. pers. plur. comm. -na, und mit d. Pers.-Suff. d. Subj. -b)* samt und sonders *(toa beendigen)* zu schlachten *(ǂū)*, und er fing ein Kleines. Die aber zerkratzten *(ǂkχau)* ihm den Leib *(ǂkχāb)*. Da ließ er ab *(ǂū, verb.)* und entfloh *(ǃkχoĕ-nĭ)* auf *(ai Postpos., ǃaba aufsteigen)* einen Berg *(ǃhoms)*. Und alle *(hā s. S. 424, Anm.)* Leoparden und alle Löwen kamen, ihre Jungen zu suchen *(ōa)*, und ein Jedes (*wörtl.: welcher? mā?: alle hoaĕ, comm. sing.*) nahm *(ǁ)* sein *(ǁ(e)ĭ)* Kind *(ōa)* und ging.

So taten *(hĭ)* sie. Seit dem Tage sind in jeglichem Lande der Leopard und der Löwe zu Haus *(hāsa, substantiviertes hā, bleiben)*.

3. Rätsel, *ǃurogu*

bilden neben den Sagen einen guten Teil der Abendunterhaltungen der Hottentotten; sie werden von Alten und Jungen beiderlei Geschlechts zum Besten gegeben.

Die einfachsten Rätsel knüpfen an die unmittelbare Umgebung der Dasitzenden an (I—V): Jeder beliebige Gegenstand, allen sichtbar, ein Kleidungsstück, ein Baum, ein Fels, ein Gerät etc. etc. wird nach Gestalt oder Farbe oder nach seiner Beziehung zum Menschen umschrieben und zu raten gegeben.

Andere Rätsel haben nicht mehr unmittelbare Sinneswahrnehmungen, sondern Sinnes-Erinnerungen zum Gegenstand und nehmen damit schon stärker als jene erstgenannten das Vorstellungsvermögen in Anspruch (VI bis XIII).

An die Fähigkeit, bald mehr, bald minder abstrakte Vorstellungen zu kombinieren, appellieren Rätsel wie die in Nr. XIV—XXV mitgeteilten.

In sprachlicher Hinsicht sei die Aufmerksamkeit auf die Personalsuffixe gelenkt: Mit ihrer Hilfe wird der ganze Rätsel-Fragesatz substantiviert. Meist werden dazu die Suffixe der 3. pers. comm. sing. (*-ĕ* oder *-ĭ*) oder. plur. (*-na* oder *-n*) verwandt, als Anhängsel an eines oder an mehrere solche Wörter, die ihrem Sinn oder ihrer Stellung im Satze zufolge

irgendwie hervortreten. Korrekt, aber schwerfällig, würde man dieser Eigentümlichkeit in der Übersetzung gerecht werden, wenn man jede Frage mit den Worten einleitete: „Was ist das, was . . . usw.?"

In anderen Fällen erhält der Rätsel-Fragesatz dasjenige Personalsuffix, das nach Geschlecht und Numerus dem Substantiv in der Antwort zukommt.

Ist die Antwort in einem Verbum ausgedrückt, so wird sie mit Hilfe des Suffixes der 3. pers. sing. fem. (*-s* oder *-sa*) substantiviert.

Ich habe die Hottentotten folgende Rätsel sich aufgeben hören:

I.

Tareč goma ǂaba ǂgarib amǂgā mā ǂurina? — ǁgūti.

Was *(tareč)*, so heißt es *(goma)*, ist das: Am Rand *(am ǂgā)* einer roten *(ǂaba)* Talfurche *(ǂgarib ist der Abfall der trockenen Riviersohle gegen die Rinne, in der das Wasser läuft)* stehen *(mā)* weiße *(ǂuri)* Dinger? *(-na, Pers.-Suff. comm plur.)* — Die Zähne.

II.

ǂNū ǂhoms aiti gye ǂnū gūte mā? — tana uriti.

Auf *(ai, m. d. Pers.-Suff. d. Subj.)* einem schwarzen *(ǂnū)* Berge *(ǂhoms)* stehen *(mā)* schwarze Schafe? *(gūte = gūti, fem. plur.)* — Die Kopfläuse.

III.

Tareč goma ǂgubu χūč ain gye ǂgāna mā tsīn gye kχoēna ǁnā ǂgāna ra tsuru? — tanas.

Auf *(ai, m. d. Pers.-Suff. d. Subj.)* etwas Rundem *(ǂgubu)* steht *(mā)* Gras *(ǂgāna, comm. plur.)*, und die Menschen *(kχoēna)* pflücken *(tsuru)* das Gras? — Der Kopf, [der geschoren wird].

IV.

Tareč goma ǂgōahe tsī ǂgōa toahe tomaē? — ǂhūb.

Was wird *(-he, Pass.-Endg.)* gezählt *(ǂgōa)* und wird nicht *(toma)* zu Ende *(toa fertig machen)* gezählt? — Die Sandkörner *(ǂhūb Erdboden)*.

V.

Tareč goma ǂkχač i ga χabe tsī ǂnū i ga tsī ǂgū i gas tsīna mūč? — *ǂaēs.*

Was siehst *(mū)* [du], mag *(ga, Potent.)* es auch *(χabe obschon)* finster *(ǂkχač)* sein, mag es fern *(ǂnū)* sein und mag es nahe *(ǂgū)* sein? *(tsīna, conm. plur. faßt alle Fälle noch einmal zusammen).* — Das Feuer.

VI.

Tareč goma ǂnū ǂhōč? — ǂgoreb tsī ǂnoab tsīkχa di ǂguib.

Was ist schwarz *(ǂnū)* gescheckt *(ǂhō)*? — Das Zebra *(ǂgoreb)* und das Stachelschwein *(ǂnoab)*, eins *(ǂguib)* von *(di)* den beiden *(tsīkχa).*

VII.

Tareč goma ǂhuni ǂganič? — χaib.

Was ist gelb-*(ǂhuni)* braun gezeichnet *(ǂgani)*? — Das Kudu.

VIII.

Tareč goma ǂhairoč ǂnūseba χuts ga ra mū o ǂabač? — ǂgaēb.

Was ist ein wenig *(-ro, Dimin.)* fahl *(ǂhai)*, und wenn *(o)* du *(-ts, Suff.)* es von *(χu)* ferne *(ǂnūse, adv., -ba Demonstr.-Part. d. Orts)* siehst *(mū, ga Part. d. Potent.)*, rot *(ǂaba)*? — Die Gemsbock-Antilope.

IX.

Tareč goma ǂgaruč? — ǂgamirob.

Was ist fleckfarben? — Das Stinktier.

X.

Tareč goma ǂuri ǂnābaī ǂabač? — ǂaris.

Was ist rot *(ǂaba)* mit weißem *(ǂuri)* Bauch? *(ǂnāba, *-I, Adj.-Endg.)* — Der Steenbock.

XI.

Tareẽ goma ǂhoaẽ, ǀhoa ǁnābaĩẽ? — kosi.

Was ist blau *(ǂhoa)* mit einem krummen *(ǀhoa)* Bauch? *(ǁnāba, *-ĩ, Adj.-Endg.)* — Die Kaffeebohne. *(Ältere Hottentotten haben das f noch nicht angenommen, die Jüngeren sagen allgemein koffi. Die Farbbezeichnung ist seltsam.)*

XII.

Tareẽ goma gai ǁnāba ũ hāẽ? — gōnaiχūs.

Was hat *(ũ nehmen, hã bleiben)* ein großes *(gai)* Licht *(ǁnāba)*? — Der Spiegel, *weil er blendet, wenn man in der Sonne mit ihm hantiert. Spiegel = das Ding (χūs, fem.), in dem man (-n, Pers.-Suff. comm. plur.) sein Gesicht betrachtet (gō).*

XIII.

Tareẽ goma ǂgubu χūẽ tsĩ i gye ǂgubu χūẽ ǂnāba ǂnōa tsĩ i gye ǂnā χūĩ ǁna dorosa ǂnōa, tsĩ i gye ǂkχaba ǂnũ χūẽ ǂnōa tsĩ ǂgāĩ kχoma ĩ χūẽ ǂnōa tsĩ ǂgubu χūẽ ǂnōa tsĩ i ga ǂnā χūẽ kχoẽĩ ai a ǂnā o i ǂkχaba ǂnā kχoẽĩ ǂgau tite? — ǂuris.

Was ist das: Ein rundes *(ǂgubu)* Ding *(χūẽ, comm. sing.)*, und daran *(ǂnāba)* sitzt *(*ǂnōa)* ein rundes Ding, und in *(ǁna)* dem Ding da *(ǂnā)* sitzt eine Dose *(dorosa)*. Dann wieder *(ǂkχaba)* kommt etwas Schwarzes *(ǂnũ)*, dann kommt etwas, das wie *(kχoma)* Gras *(ǂgāĩ, comm. sing.)* aussieht *(ĩ)*, dann kommt ein rundes Ding, und wenn *(o)* das Ding da auf *(ai)* einen Menschen *(kχoẽĩ)* fällt *(ǂnāt, ga, Part. d. Potent.)*, wird dieser Mensch nicht *(tite, Part. d. Fut. negat.)* wieder lebendig *(ǂgau)* werden? — Die Kugel *(ǂurib ist Metall i. A.)* [in der Patrone].

Die Teile, die in der Frage aufgezählt werden, sind, in gleicher Reihenfolge wie oben und mit den gebräuchlichen Bezeichnungen in Klammern, folgende: a) Die metallene Hinterfläche der Patrone (kχaoaib Gefäß), zweimal genannt, um die Lösung zu erschweren; b) die Zündung (ǂais Metallperle); c) das Pulver (χurub Kohle); d) der Wattepfropf (ǁabis ist das Nest einer Aegithalus-Art, aus watteartigem Pflanzenmaterial gebaut); e) die Kugel.

XIV.

Tarel goma nānā tsīts ǂkχaba ra ǂā gaiē? — ǂabus.

Was machst du *(-ts, Suff.)* satt *(nānā, verb.)* und läßt *(gai)* du dann wieder *(ǂkχaba)* hungern *(ǂā)*? — Das Gewehr *(ǂabu paffen), das geladen und nach dem Schuß leer beiseite gestellt wird.*

XV.

Tarel goma, mūts ga o, nause tsī ǂkχō kχoma tē χabets ǂkχō titel tā tsē? — soms.

Was ist das: Wenn *(o)* du *(-ts, Suff.)* es siehst *(mū, ga Part. d. Potent.)*, scheint *(ī, verb., kχoma wie)* es gar *(tsī)* leicht *(nause für nichts d. h. ohne Mühe)* zu fangen *(*ǂkχō)* zu sein, und doch *(χabe)* wirst du es nimmermehr *(tite, Part. d. Fut. negat., tā = toma nicht, tsē Tags)* fangen? — Der Schatten.

XVI.

Tarel goma ǂguri garuba ǂkχom tomas? — soris.

Wer hilft *(ǂkχom)* dem nicht *(toma)*, der *(-ba, Pers.-Suff.)* ohne sie *(ǂguri allein)* einhergeht *(garu)*? — Die Sonne: *sie zeigt dem Wanderer Schlangen und giftiges Ungeziefer am Weg, nachts ist er auf sich selbst angewiesen.*

XVII.

Tarel goma ǂ(e)ĪĪ ose ǂgüngtsīts ǂgaise ǂgüng tomaē? — ǂaēs.

Was ist das: Wenn *(tsī, Part. d. particip. praet., mit d. Pers.-Suff. -ts du, masc.)* du ohne *(ose, adv.)* es *(ǂ(e)ĪĪ)* fortgegangen *(ǂgüng)* bist, ist dein Weg nicht *(toma)* angenehm *(ǂgaise)*? — Das Feuer[zeug] *(die Zunderdose).*

XVIII.

Tarel goma kχoēī χa ra dīhe χabe aitsoma ǂkχadi ra ǂkχīē? — ǂgoms.

Was wird vom *(χa)* Menschen *(kχoēī, comm. sing.)* gemacht *(dī, i. pass.)*, obschon *(χabe)* es auch *(ǂkχadi)* von selbst *(aitsoma)* kommt

(ǂkχl)? — Das Wasser. *Brunnen graben wird auch von den Weißen in Südafrika fast allgemein „Wasser machen" genannt. Das was „von selbst kommt", ist der Regen.*

XIX.

Tareǂ goma ǂnū daoba ra ıgūigūǂ? — hāb.

Was *(tareǂ)* macht einen weiten *(ǂnū fern)* Weg *(daoba)* kurz? *(ıgū nahe sein; verdoppelt: nahe machen)*. — Das Pferd, *weil es schnell ist.*

XX.

Tareǂ goma ıgū daoba ra ǂnū/nūǂ? — gomab, garub.

Was macht einen kurzen Weg lang? Der Trekkochse, der Reitochse, *weil er langsam ist.*

XXI.

Tareǂ goma ǂkχoǂ ıgongun ra χabe sao saregu tomana? — gunis ınūti.

Was holt sich *(-gu)*, obschon *(χabe)* eins hinter *(ıgon)* dem andern *(-gu, Reziprokalpart., mit d. Suff. d. 3. pers. plur. comm., -n in ıgongun)* hereilt *(ǂkχoǂ)*, doch nicht *(toma, mit Pers.-Suff.)* ein? *(sao folgen, sare zusammenkommen)*. — Die Wagenräder *(ınūb, masc.: Bein, -s, fem.: Rad)*.

XXII.

Tareǂ goma ǂkχariro ǂanaga ǂnū i hā χūn ıguina ra ū hā ūǂ? — marīǂ.

Was ist gar klein *(ǂkχari, -ro Dim.)* und bringt *(hā kommen, ū mit)* doch *(°ǂanaga)* nur *(ıgui einzig, i. comm. plur.)* Dinge *(χūn)*, die größer sind? *(ǂnū überragen)*. — [Das] Geld.

XXIII.

Tareǂ goma tsū disa ǂanaga ıgui enū ǂnaǂ? — sīsen tsī marīǂ hōs.

Was ist mühselig *(tsū)* zu *(-sa, Gerundivendung)* tun *(dī)*, aber *(°ǂanaga)* angenehm *(ıgui)*, davor *(°tī, Postpos.)* zu sitzen? *(ınū)*. — Die Arbeit *(sīsen, verb.)* und ihr Lohn *(marīǂ Geld, hō bekommen)*.

ALTER BONDELZWART-HOTTENTOT

Verlag Gustav Fischer, Jena

ALTE TOPNAAR-HOTTENTOTTIN

1: Schultze FX13 Hottentot

XXIV.

Taré goma hē go otsa tū a ŋgoaba, tūba ra, ŋgoba ra tū a ŋgoaba? — ū ŋgoba.

Was ist das: Wenn *(a, mit d. Pers.-Suff. d. Subj. i. Nachsatz, -tsa da)* es von dannen gegangen ist *(hē)*, hast du Herzeleid *(tū, verk. ŋgoaba Herz)*; dann vergißt *(ŋra)* du es, doch *(ŋoba, m. d. Pers.-Suff. d. Subj.)* wenn du daran denkst *(tū)*, bekommst du Herzeleid? — Ein Abgeschiedener *(hē sterben, ga verlassen, he Pass.-Endg., -a den Infin. substantiv. Pers.-Suff.)*.

XXV.

Taré goma ǂnūba ŋaba mū a ǂoa tī ŋui ŋūa ga hā aihē, tī ŋūsts ga hā a ŋaua? — hurib.

Was ist das: Wenn *(a)* du *(-ts, Pers.-Suff.)* es von *(ŋa)* ferne *(ŋū, -se Adv.-Endg., -hi Demonstr.-Part.)* siehst *(mā)*, ist es blau *(ǂoa)*, und weiße *(ŋui)* Dinger *(ŋūa, comm. plur.)* sind *(hā)* darauf *(ai, mit Pass.-Endg. und Pers.-Suff.)*, aber wenn du *(-ts)* nahe *(ŋū)* herzugekommen bist *(hā)*, ist es durchsichtig? *(ŋūa neuter, klar)*. — Das Meer.

E. Schlußwort.

Das Verhältnis der Hottentotten zur eindringenden Kultur.

Wie kommt es, daß ein Volk wie die Hottentotten, das klare Beweise von jeher anerkannter und unter den Eingeborenen Südafrika's hervorragender Intelligenz gegeben hat, vor der Kultur wie Wachs auf heißer Platte dahinschmilzt? Unter welchen Ereignissen diese Auflösung bisher vor sich gegangen ist, ist in Kriegs- und Friedensbildern oft geschildert worden [7], [8], [9]. Uns interessiert hier lediglich die prinzipielle Seite.

Die erste Begegnung eines Hottentottenstammes mit der Kultur gestaltete sich überall freundlich, alle älteren Reisenden rühmen die Gastlichkeit des Volks und den Schutz, den ihnen die Kapitäne gegen Übergriffe Einzelner angedeihen ließen. Der Hottentott erwartete und fand auch zunächst seinen Vorteil: der Händler brachte ihm Kleider und Decken, die er sich selbst nun nicht mehr aus Fellen mühsam zu gerben und mit Sehnengarn zu nähen brauchte, brachte ihm Hausgeräte, die ihm das Töpfern und

die Hottentottenwut abzuhelfen. Dazu kamen Genußmittel, teils seit Alters hoch geschätzte, wie der Alkohol, jetzt in neuer konzentrierter Form, teils neue, die wie der Tabak und Kaffee sich so einbürgerten, daß sie kaum noch entbehrt werden können. Was aber vor allem Anderen dem Hottentotten eine friedliche Haltung zur einbringenden Kultur vorschrieb, war die Erkenntnis, mit ihrer Hilfe seine eigene Macht in ungeahnter Weise vervielfältigen zu können: der Vertausch des Degens mit der Feuerwaffe machte ihn mit einem Schlag zum Herrn über die gesamte belebte Natur und ebenbürtig im Kampf mit seinen Feinden.

Die Mission wurde, die den Waffenhandel in großem Stil betrieb, als die deutsche Regierung, die ihn auch nach der Besitzergreifung des Schutzgebietes im Norden den Händlern frei ließ, gaben den Hottentotten aber noch weitere Garantien, die ihn gleichfalls der Kultur willig näher brachten: der Hottentott erkannte bald, daß er im Missionar einen Freund hatte, auf den er sich in allen Lebenslagen unbedingt verlassen konnte. Die Regierung ihrerseits schloß Schutzverträge mit den Kapitänen, die diesen um so angenehmer waren, als sie ihre Macht einstweilen nicht beeinträchtigten.

Auch vom weißen Ansiedler versprach sich der Hottentott Vorteile am Landeserträgnis und am Steuern, die er von ihm erhob, und aus Anlehnungen, die er gelegentlich vornahm, wo der Weiße dem Land in harter Arbeit etwas abgerungen hatte.

Noch lagen im Groß-Namalande Gebiete brach, in denen sich der Weiße, ohne dem Eingeborenen etwas zu nehmen, ansiedeln konnte; aber im Laufe der Zeit mußte es dahin kommen, daß sich der Hottentott eingeengt sah, wo er vorher frei nach Maßgabe seiner Macht über Weide und Wasser verfügte. Er hätte in seinem Kapitänen wohl die Macht gehabt, aber er hatte, schon ehe er sich bewegt fühlte, nicht die Fähigkeit, hier die Interessensphären seiner und der fremden Rasse billig abzugrenzen.

Die Kapitäne suchten nur ihren eigenen Vorteil, erwiesen sich klar als das, was sie sind: eigensüchtige Machthaber, nicht Vertreter der Volksinteressen — es sei denn, daß die Interessen des Volkes mit denen ihrer eigenen Person zusammenfielen. So war es nicht anders möglich, als daß die weiße Regierung, die sich inzwischen etabliert hatte und von dem redlichen Wunsch beseelt war, Jedem zu seinem Recht zu verhelfen, eine Einschränkung der Kapitäne-Selbstherrlichkeit bedeutete. Das ist das passive Moment aller unserer Hottentottenkriege gewesen. Vorübergehend haben

sich die Herrschergelüste der anscheinend zahmen, mit den Namen der Apostel, Propheten und Erzväter geschmückten Machthaber wohl mit Geld und freigebig erteilten Alkoholkonzessionen zur Ruhe bringen; aber die so Bevorzugten fühlten sich trotz aller Einbezeugungen, die ihnen gelegentlich erwiesen wurden, vom Weißen unterdrückt, sahen aber gleichzeitig doch — und das war das Verhängnisvolle — ihre Macht über Ihresgleichen nicht gebrochen. Das hielt ihren Ehrgeiz wach und nährte die Sehnsucht nach der vollen Freiheit von ehedem. Daß dieser Trieb endlich mächtiger wurde als jede Erwägung, wie überlegen wir ihnen im Kampf sein würden, werden wir um so nachsichtiger beurteilen, je kurzsichtiger unsere eigene Prognose in diesem Punkte war.

Auf anderem Gebiet liegen die Ursachen, warum die Masse des Volks der Kultur erlag, statt für gewonnen zu werden. Man muß dabei von der fundamentalen Umwälzung der Lebensbedingungen ausgehen, die mit dem Einzug der Kultur in Südafrika für die Hottentotten verbunden war. Sehen wir zunächst von der Viehzucht ab und betrachten wir innerhalb der weißen, ihnen Grenzen die Jagdgründe der Hottentottenheimat: Das westliche Südafrika war um die Mitte des 17. Jahrhunderts, auf große Strecken auch noch vor 100 Jahren, eines der wildreichsten Länder der Erde. Heute kann südlich des Oranje schon lange kein Hottentott mehr von der Jagd leben. Als die Kapregierung sich besann, das Wild zu schützen, war es für eine Erwägung der Frage des Eingeborenenwohls längst zu spät. Die Besorgnis des Sportsmannes, als Nimrod demnächst kaltgestellt zu werden, — die halb wirtschaftliche, halb ästhetische Erwägung, daß Wildpret doch der beste Teil des südafrikanischen Tisches ist, — endlich das Bewußtsein der Ehrenpflicht eines Kulturvolks, Naturdenkmäler, wie sie unter dem Hochwild Südafrikas der Elefant, das Nashorn und die Giraffe darstellt, der Nachwelt zu erhalten, — das waren die Motive für die Maßregeln, wenigstens den Rest des Wildes noch zu schützen.

Eine der ergiebigsten Jagdarten des Hottentotten war der Anstand an der Wasserstelle. Es ist klar, daß der Bur, der sich hier ansiedelt, oder der Viehzüchter, der das Vieh seines weißen Herrn hier tränkt, oder der Frachtfahrer, der hier kampiert, den Platz jagdlich entwertet. Wo sich das langsam zusammensiedelnde an immer mehr Stellen wiederholt, wird es dem Eingeborenen ebenso fühlbar wie die zunehmende Wildverödung längs der Eisenbahnlinien und im Umkreis der Stationen. Daß bei fast jedem für uns selbst erfreulichen Fortschritt in der Kolonisierung das Landes der Eingeborene in seinen

alten Lebensbedingungen entsprechend geschädigt wird, dessen sollte man sich wenigstens bewußt sein.

Verhängnisvoller als die Vernichtung der Jagdgründe wurde die planlose Veräußerung der Weidegebiete durch die Kapitäne an Farmlandspekulanten, denen jedes Mittel recht war. Auch sein Vieh gab der Hottentott auf leichtfertigste Weise für Gewehre, Alkohol, Tabak und andere Artikel hin, an die er sich gewöhnt hatte.

Man hat dem Hottentotten vielfach in der besten Absicht, ihn der Kultur zugänglich zu machen, Bedürfnisse in Kleidung und Lebensführung anerzogen, ohne entsprechend dafür zu sorgen, daß er sie nicht in einer Weise befriedigt, die ihn wirtschaftlich ruiniert. Denn von selbst sieht der Hottentott nicht, oder will, wenn er es sieht, die friedliche Konsequenz daraus nicht ziehen, daß ihm nur zwei Wege offen stehen, unter weißer Herrschaft zu leben. Entweder: der neuen Konkurrenz in der Ausbeutung der natürlichen Werte des Landes Stand halten, d. h. nach europäischen Begriffen rationell wirtschaften lernen, um sich wirtschaftlich selbständig zu halten. Oder: der Konkurrenz sich beugen und im Dienste des Weißen sein Brot suchen.

Den ersten Weg hat nur ein kleiner Teil der Hottentotten beschritten, und nur wenige von ihnen haben sich wohlhabend gehalten. Ein zweiter Teil hat den letzteren Weg beschritten und sich dem Weißen als Viehwächter, Wagentreiber, Dienstknecht oder Dienstmagd in Haus und Hof verdingt. Er hat hier wenigstens keine Nahrungssorgen und fühlt sich im Allgemeinen, auch wenn ihn sein Herr zuweilen hart anfaßt, wohl, wenn er Gerechtigkeit sieht, die aus der Überlegenheit des Einen keine Erniedrigung des Anderen macht. In diesem Punkte ist der Hottentott trotz äußerlich oft unbegrenzter Devotion von peinlicher Empfindsamkeit.

Die Mädchen und jungen Frauen können im Abhängigkeitsverhältnis zum Weißen auch auf ihre Rechnung. Im intimen Verkehr mit dem weißen Mann findet die junge Hottentottin ein sorgenfreies Leben. Ihre Eitelkeit wird meist nach jeder Richtung befriedigt, ihre Sinnlichkeit spricht stark mit, und ein weißes Kind zu gebären erhöht sie oft gewaltig mit Stolz.

Für den Durchschnitts-Hottentotten, der nur Eintags-Freuden und -Sorgen kennt, der Fürsorge weder für die Kinder nach seinem Tode noch für die eigene Zeit des Alters oder der Not bedenkt, wäre die Hörigkeit im Dienst des Weißen die leichteste Art, sich durch das Leben zu schlagen, wenn einerseits die Folgen der sexuellen Degeneration ihn nicht herunter-

stigen, und wenn man ihn andererseits dauernd an regelmäßige Arbeit gewöhnen könnte; das letztere ist aber bisher nie, weder mit gütlicher noch mit weltlicher Macht systematisch in Angriff genommen worden.

So blickt sich denn ein großer Teil der Hottentotten, wie in vergangenen Jahrhunderten, so auch heute bei weitem früher als am Futtertrapf des Weißen da, wo er in hartem Daseinskampfe einer kärglichen Natur seinen Lebensunterhalt abringen muß, aber durch keine anderen als die natürlichen Schranken selbst in seiner Bewegung gehindert wird. Die selbstbewußte Lebensweise sagt ihm, dem nur eine Erziehung durch Generationen hindurch den alten Nomadentrieb wohl brechen könnte, von heute auf morgen nicht zu. Er will sich nicht, wie es im Dienst des Weißen gefordert wird, an Tag und Stunde binden, will lieber die Strapazen der Wanderungen und die Entbehrungen monatelangen Aufenthalts in der Wildnis tragen, als sich zu geregelter Arbeit einspannen lassen. Aus diesem Material setzt sich die willigste Gefolgschaft der unerbittlichsten Kapitäne zusammen.

Ist dann bei erster Gelegenheit das Signal zum Aufruhr gegeben, dann erwacht bei Hunderten Anderer die alte Abenteuerlust, die Hoffnung auf reiche Beute und Siegesruhm, wie sie aus den endlosen Kämpfen vergangener Jahrzehnte in aller Erinnerung sind. Dann öffnet sich auch dem Einzelnen überall ein Weg zu persönlicher Rache für Unrecht, das einmal vor Jahren erlitten war, dann wird endlich auch über alle Einzelfragen von Recht oder Unrecht in Gegenwart oder Vergangenheit hinweggetönend, elementar der Ruf laut, den ich in immer gleicher Naivität und logischer Unwiderleglichkeit so oft gehört habe: „Das Land war unser, wir wollen wieder die Herren darin sein!" Das ist das alte Lied und das Ende davon auch hier, daß eine Menschengruppe mehr vom Erdboden verschwindet.

Hottentot Bibliography

[The following bibliography was compiled during the processing of the Hottentot file by Dr. George Peter Murdock of Yale and various members of the Hraf staff. The numbers and letters following date of publication are call numbers for the Yale library.]

Identification

The Hottentots are divided into four primary divisions: East Hottentot, Cape Hottentot, Korana, and Nama. Most of the information is on the Nama.

INTRODUCTORY NOTE

[2] THIS volume is the first of a series designed to provide in a scientific manner a comprehensive survey of what is at present known about the racial characters, cultures, and languages of the native peoples of Africa. The rapid improvement in anthropological technique since the beginning of the century has led to far more complete and systematic studies by workers in the field than had previously been attempted, with the result that a vast amount of detailed information about numerous individual tribes has been rendered available. All this information needs to be sifted and correlated before it will be possible to arrive at a correct appreciation of the data and problems of African ethnology.

To this must be added the increasing public interest in all things African, which makes it desirable that the results of scientific research should be so presented as to be of service not only to the theoretical anthropologist and the specialist student of African ethnology, but also to the general reader and especially to those whose sphere of activity brings them into intimate daily contact with the African Native. To the administrator, the missionary, the economist, and the educationist, each in his own way now moulding the life of the Native into conformity with the standards of European civilization, a thorough knowledge and understanding of the people with whom he is concerned is an indispensable preliminary to the successful execution of his task. It is the hope of the editors that applied anthropology no less than the purely academic science will find in this series the groundwork upon which it may build for the future.

The series has been so planned as to take into consideration cultural rather than political boundaries. Each volume is written by a specialist in full touch with current anthropological thought, and with an extensive first-hand knowledge of the areas and peoples with whom he is dealing. In the presentation of material special prominence will be given to the descriptive analysis of social organization, customs, and customs, economic and political life, religion and magic, as it is felt that, apart from their greater theoretical interest, a full critical discussion of these cultural aspects and the part they play in the life

2: Schapera E-4, 5 (no date) 1930
FX13 Hottentot FX13

[2] of the people is the main contribution that anthropology as a practical science has to make to the future government and well-being of Africa. The wider problems of racial movements and the diffusion of culture, in the analysis and interpretation of which lies the key to the ethnological history of Africa, can only be dealt with adequately once each separate cultural division has been studied in detail. These and the contactual relations existing and developing between Europeans and Natives will form the theme of the concluding volume.

J. H. Driberg.
I. Schapera.

[3] *This present series of books on Africa is not a publication of the International Institute for African Languages and Cultures. It could not be so, since work was begun on it before the plans of the Institute for its own publications had been settled. The Institute, however, welcomes this series very warmly, not only because the authors are members of the Institute and help it substantially in many ways, but also because the Institute naturally takes the keenest interest in all scientific publications dealing with African peoples and languages. Such publications materially assist the furtherance of its work, and this is particularly true of the present series. It is not the purpose of this short preface to make a critical study of the books included in the series, but I can say without reserve that they present an incredibly and invaluable survey of the peoples of the continent of Africa, which will be most welcome to both the anthropologist and the practical man, and will therefore meet a real need. That they will find many friends and extensive readers among the members of the Institute is certain.*

Professor Dr. Diedrich Westermann,
Director of the International Institute of African Languages and Cultures.

April, 1930.

ACKNOWLEDGMENTS

IN the writing of this book, and of the smaller studies leading up to it, I have been greatly helped by the encouragement and sympathy generously accorded to me by a number of friends. Professor A. R. Radcliffe-Brown, during my undergraduate days at the University of Cape Town, both stimulated and directed my interest to the study of the peoples with whom it is concerned, and by his able and thorough teaching equipped me with an anthropological training for which I am more grateful. The dedication of this book to him and to the School he so brilliantly organized is but a slight and far from adequate expression of the extent to which I feel indebted to his influence. Miss D. F. Bleek and Mrs. A. W. Hoernlé, our foremost authorities on the Bushmen and the Hottentots respectively, were ever generous with their friendly counsel, and freely placed at my disposal their unrivalled knowledge of these peoples. Their kindly assistance was a real encouragement to me to persevere in the line of research upon which I had entered. The University of Cape Town, by awarding me the H. E. Webb Gift Research Scholarship, enabled me to continue my work overseas, and to come in contact there with new points of view from which I have benefited greatly.

In London I found in Professor C. G. Seligman a generous teacher and a friendly critic; to his many other kindnesses he has added the reading of the greater part of this book in manuscript and has offered much valuable advice. For the same generous aid I wish to thank the Rev. E. W. Smith and Dr. E. Evans-Pritchard. To Professor B. Malinowski I am profoundly grateful for constant inspiration in matters theoretical and for an insight into anthropological problems which has largely determined my handling of the material set forth in the text. My colleague, Mr. J. H. Driberg, in addition to other services, has, in my absence from England, kindly undertaken to see the volume through the press. For this friendly gift of time and assistance I cannot adequately express the degree of my indebtedness. The London School of Economics, lastly, by appointing me to an assistantship in its Department of Anthropology for the session 1928-9, afforded me both the means and the opportunity

2: Schapera E-4, 5 (no date) 1930
FX13 Hottentot FX13

for writing this book, and the lectures I gave there helped to shape my material. Parts II and III, as originally drafted, were incorporated in a thesis on "The Tribal System in South Africa", accepted by the University of London for the Degree of Doctor of Philosophy. They have, however, been considerably expanded and rewritten to meet the scheme of this series, and as now published do not therefore bear the imprimatur of the University.

For the illustrations I am indebted to various sources: to Dr. L. Fourie for the Frontispiece and Plates VI, VII, VIII, XIA, XII and XIIA; to Dr. L. Schultze and his publisher, Herr Gustav Fischer, of Jena, for permission to reproduce Plates I, II, IIIa, VA, X, XIV, and XV, from *Aus Namaland und Kalahari* (1907), and Plates III and V from *Zur Kenntnis des Körpers der Hottentotten und Buschmänner* (1928); to the Trustees of the British Museum for Plates IX, and XIa, kindly obtained for me by Mr. H. J. Braunholtz; to Miss M. Wilman and Mr. A. M. Cronin, of the McGregor Memorial Museum, Kimberley, for Plates IIIA, and IV; and to Mr. M. C. Burkitt and his publishers, the Cambridge University Press, for permission to reproduce Plate XIII from *South Africa's Past in Stone and Paint*. To all of them I am deeply grateful for their co-operation.

Chapter I

THE COUNTRY OF THE KHOISAN

By the year 1652, when the establishment of the pioneer Dutch settlement at Table Bay laid the foundations for the present political dominance of the white man in the country, Africa south of the Zambesi River was already inhabited by a considerable number of different native peoples. On the basis of racial, linguistic and cultural distinctions, these native inhabitants are commonly classified into four separate groups, known respectively as the Bushmen, the Hottentots, the Bergdama, and the Bantu.

The Bushmen, at one time spread over almost the whole of South Africa, are to-day confined principally to the Central and Northern Kalahari Desert and adjacent districts. They are a short, brownish-yellow people, with certain peculiar and distinctive racial characteristics; they all speak languages of a uniform and easily recognizable type, phonetically remarkable especially for the great prevalence of "click" consonants; and they live in small nomadic bands which lead a purely hunting and collecting existence, practising neither agriculture nor pastoralism.

The Hottentots formerly occupied most of the western half of the region, but are now found chiefly in the southern parts of South-West Africa. They are closely allied to the Bushmen in race, and their languages are of a somewhat similar type, although in both respects certain differences are also observable. They are, however, a predominantly pastoral people, keeping cattle and sheep, and live in larger communities with a more complex system of social organization.

The Bergdama, also inhabiting South-West Africa, are racially a true negro people, different in appearance from both the Bushmen and the Hottentots. They all, however, speak the language of the Nama division of Hottentots, to whom they have long been in subjection. Like the Bushmen they live in very small nomadic groups and derive their subsistence primarily from hunting and collecting, although some of them also keep goats.

The Bantu, finally, although historically the most recent native people settling in South Africa, are now spread over the whole country

2: Schapera E-4, 5 (no date) 1930
FX13 Hottentot FX13
Bushmen FX10

with the exception of the southern half of South-West Africa and the western and central districts of the Cape. They are most densely settled in the eastern half of this region, i.e. in the Eastern Province and Native Territories of the Cape, Basutoland, Natal and Zululand, Swaziland, Transvaal, Southern Rhodesia, and Portuguese East Africa, while in the central and western portions—Orange Free State, British Bechuanaland, Bechuanaland Protectorate, and South-West Africa—they are much less numerous, although still greatly outnumbering the other native peoples. They are essentially negroes who have absorbed a varying amount of Hamitic blood, and therefore tend to differ somewhat in appearance from the Bergdama. Their languages belong to the great Bantu language family of Central and Southern Africa, and in grammatical structure and vocabulary are quite unlike those of the other South African native peoples. They are also on a higher level of culture, combining cultivation of crops with pastoralism as their principal means of subsistence, their communities are on the whole far larger, and their social organization is somewhat more complex.

Of these four groups of native peoples, the Bushmen and the Hottentots have both declined considerably in strength and numbers as a result of the encroachments first of the Bantu and then of the European settlers. The whole culture of the Hottentots has fallen largely into decay, and the majority of the people have even lost their own language and adopted that of the Dutch; while such tribes of Bushmen as still survive appear to be gradually dying out or at least merging with their Bantu neighbours. The Bergdama seem to have suffered less in regard to numbers, but their culture too is undergoing rapid disintegration. The social cohesion of the people in all these instances has been almost completely broken down. As far as present economic or political importance is concerned, they are relatively negligible in problems of inter-racial relationship, while numerically they are so inferior to the whites as to be considered an insignificant minority.

The Bantu peoples, on the other hand, are still vigorous and powerful, and in their economic and political relations with the European inhabitants of the country present one of the most vital problems now confronting European civilization in South Africa. They greatly outnumber the white population, and appear to be steadily increasing, a fact which is giving rise to much apprehension on the part of the latter. Their social and political organization, too, is so

2: Schapera E-4, 5 (no date) 1930
FX13 Hottentot FX13
Bushmen ∩ FX10

superior to those of the other native peoples that they have been able to preserve much of their original customs and culture, and in many cases to offer a strong resistance to the disintegrating effects of contact with European civilization.

The present work deals with these two groups of natives who have suffered most at the hands of the European settlers: the Bushmen and the Hottentots. In spite of the far-reaching differences between them, they have in common several features, not only of race and language, but also of culture, especially religion, which justify their being treated together. These common features by no means render invalid the distinctions upon which is based the customary classification of these peoples into two separate groups. They are significant enough, however, to permit of both groups being regarded as constituting to some extent a larger ethnic unit, which, it is important to note, is clearly differentiated from the Bergdama on the one hand and the Bantu on the other. The term *Khoisan*, recently coined by Schultze to denote the racial stock to which the Bushmen and the Hottentots belong,[1] has therefore been accepted here as a convenient generic name for these two peoples. The necessity for such a generic name will perhaps be seen more clearly when the racial history of each people has been considered.

Topography: General Features

The Khoisan peoples at the present time live almost entirely in the western and central portions of South Africa. The main political areas within whose borders they are found are the Territory of South-West Africa, formerly a German colony, but now administered under mandate by the Union of South Africa; Bechuanaland Protectorate, administered directly by Great Britain through the High Commissioner for South Africa; and the central and western districts of the Union, principally in the Cape of Good Hope. The Bushmen formerly extended further east into Southern Rhodesia and over the east of the Union, but have virtually disappeared from those parts.

The territory over which the two peoples are now scattered presents a solid land mass, covering an area of approximately 913,000 square

[1] L. Schultze, *Zur Kenntnis der Körper der Hottentotten und Buschmänner*, 1928, p. 211. The term is compounded of the names Khoi-Khoin, by which the Hottentots call themselves, and San, applied by the Hottentots to the Bushmen. The latter have no collective name of their own.

H B 133

miles, without peninsulas of any size or any large islands off its coasts.* By far the greater part has an elevation of over 3,000 feet above the sea, while the area below 1,500 feet is merely a narrow fringe round the coast. Most of the interior consists of a high plateau region, rising gradually around its borders and passing by degrees into an encircling belt of much diversified country. The escarpment which bounds it on the south-east, south, and west is constituted by the Drakensberg Mountains of the Transvaal, the Drakensberg or Quathlamba of Natal and the Transkei, the Stormberg of the north-eastern Cape Province, the Sneeuwberg, Nieuweveld, Roggeveld, and Kamiesberg further south and west, and is continued northwards under less well-known names to beyond the Kunene River. These mountains appear to be of no great height when viewed from the interior plateau, but on the seaward side they fall steeply, though rather irregularly, to the much lower level of country on the west and south.

On the west, as far south as the Olifants River, the escarpment is separated from the ocean by slopes of a more uniform nature, but in the south the Great Karroo and long ranges of fold-mountains (the Cape Fold-belt) intervene between it and the coast. The coast-line on the west is generally low, almost unbroken by bays or promontories, and beaten all the year round by a heavy surf; on the south there are several prominent headlands, which, however, afford little protection to ships. The only good natural harbour of any size is Saldanha Bay in the south-west, but at Walvis Bay, Table Bay, Algoa Bay and other places piers have been constructed.

H B 132

The general characteristics of the climate are determined more by the physical conformation of the land than by proximity to the equator. The eastern escarpments of the high plateau intercept the rain-bearing winds from the Indian Ocean, so that over the greater part of the interior the rainfall is slight (5 to 24 inches). This, added to the elevation of the land, makes the climate in general dry, bracing, and suitable for Europeans, notwithstanding the fact that the northern part of the country is within the tropics. Owing to the gradual increase of altitude from the coast to the interior, there is a remarkable uniformity of mean annual temperature over the greater part of the region: at

* The description given above is compiled mainly from the following sources: S. Passarge, *Südafrika*, 1908, chapter on our province; L. Schultze, "Südwestafrika," in *Das Deutsche Kolonialreich*, 1910-11, II. Band(s), vol. I, pp. 109-198; *The Oxford Survey of the British Empire*, 1914, vol. on "Africa", chapter I.—*Official Year Book of the Union of South Africa*, No. 2, 1918, map (page 8 and 1918); *The South and East African Year Book and Guide* (ed. A. S. Reuter and C. C. Rowan), 1919 edition, pp. 81-98 and passim.

2: Schapera E-4, 5 (no date) 1930
FX13 Hottentot FX13
Bushmen FX10

very many places, irrespective of latitude or longitude, it is very close to 63° F., which is also the mean for the entire area. The difference between mean summer and mean winter temperatures is, however, considerable, increasing from the coast inland, while the daily range of temperature is also generally great. Frosts are common on the plateau during winter. H B 132

By far the greater part of the country receives the bulk of its rainfall in summer. The winter rainfall area is confined to a comparatively narrow strip parallel with the west coast, and the constant rainfall area to a much smaller belt in the south. Generally speaking the amount of precipitation decreases from east to west, with areas of heavier rainfall along the south coast and in the south-west. The average annual rainfall of about 14 inches is fairly regular all over the eastern half of South Africa, reaching a maximum of 40 inches in Zululand, and diminishing gradually along the south coast to rise again in the Cape Peninsula. It rapidly falls to 10 inches in the south-western Karroo, from which there is a steady decrease towards the north-west in South-West Africa, but the mean value is again approached in Angola and in the northern and eastern Kalahari.

This contrast in the amount and incidence of the rainfall tends to explain very largely the lack in correspondence of the principal river-systems in the south and west respectively. On the west the rivers are few, and only the Kunene, Orange, Olifants, and Berg are perennial, of which the first two, the largest, not only rise within centres of high rainfall, but also receive no important contributions throughout the lower part of their courses. In the south, owing to the moderately high winter rainfall, the smaller rivers rarely cease flowing, but all the important ones, such as the Gouritz, Gamtoos, and Sundays, actually originate in the interior region of summer rains behind the coast ranges and pass through the latter to the sea by means of deep gorges. They receive insufficient water in their courses across the Folded Belt to maintain a constant flow at all seasons, and in times of drought may become a series of pools. H B 133

Since most of the larger rivers rise upon the interior plateau, their gradients, over stretches, are high; sometimes there are waterfalls, such as the Ruacana on the Kunene and the Aughrabies on the Orange, while rocky bars or rapids may occur in their channels within the coastal belt or just before it is reached. In consequence of this great slope, and of the intermittent supply of water, none of the rivers is navigable beyond its estuary. The mouths of the rivers

2: Schapera E-4, 5 (no date) 1930
FX13 Hottentot FX13
Bushmen FX10

H
B
133

are always obstructed by sand bars, and most of the rivers are further liable to receive sudden freshets, which sweep down with great force and render the fords impassable until they have subsided.

Natural Divisions and Vegetation

The Interior Plateau

Topographically the interior plateau can be divided up into several regions, more or less sharply defined from one another by the shape and character of the surface and by the climate. Its heart is constituted by the Kalahari Desert, a huge sand and bush-covered plain standing at an average elevation of 3,000 to 3,500 feet above the sea, and devoid of running water except in the extreme north. The greater part of this plain forms the western portion of Bechuanaland Protectorate, but it spreads south into that part of Bechuanaland annexed to the Cape and west into South-West Africa. The Orange River may be taken as marking its southern limit; westwards it reaches to the foot of the Nama and Damara highlands of South-West Africa, eastwards to the cultivated parts of Bechuanaland, and northwards to the Congo-Zambesi watershed, embracing the valley of the Okavango and the bed of Lake Ngami.

The Kalahari as a whole is arid and scored by the beds of dried-up rivers. Its surface is thickly covered with red sand and calcareous deposits, through which the basement rocks seldom show. In a few places, however, they project abruptly above the plains in the form of isolated bare hills, which though not high are conspicuous on account of the monotonous regularity of the surface from which they arise. The ground is undulating and is thrown up towards the west into extensive belts of parallel sand dunes, in part, however, fixed by vegetation, which cover a great portion of the country in the south and stretch with interruptions to beyond Lake Ngami.

Throughout the Desert there are extensive mud flats, which after heavy rains become pans and lakes of shallow water, and water is then also found in mud-bottomed pools along the beds of rivers. All over the country numerous small pans or vleis also occur in crater-like depressions where the rock rises above the desert sands. The water in these pans is often brackish and in some cases thickly encrusted with salt. The native routes lead from pan to pan, or from one waterhole in the bed of a sandy river to another. During the dry season the lack of water is so widespread in the Southern

2: Schapera E-4, 5 (no date) 1930
FX13 Hottentot FX13
Bushmen FX10

and Middle Kalahari that it is scarcely possible to traverse parts of the country, and many routes can only be followed at such times as the pools have been filled by recent rain.

The winter climate is delightful. The heat during the other months is great, but there are occasional short, sudden, and therefore treacherous changes from extreme heat to cold. Malarial fever is prevalent, being particularly severe in the neighbourhood of the water-courses and other low-lying places, where during and immediately after the season of the heavy rains the dense bush, thick undergrowth, and rank vegetation afford excellent shelter to mosquitoes. The rainfall varies from about 8 inches in the south-west to more than 20 inches in the north and east; almost all the rain falls in the summer months, December to April, and chiefly in thunderstorms. Except in the north, none of this rainfall reaches the sea, the water being either evaporated directly or flowing into shallow depressions such as Lake Ngami and the Great Makarrikarri salt-pan. Over wide areas the country is so flat that the rain drains off partly in one direction, partly in another.

The principal river in the north is the Okavango, which, rising in the Angola highlands, flows into the Okavango marshes, a region about a hundred miles in length and from ten to fifty miles in width. From this reed-choked swamp the river at certain seasons overflows on the north into the Kwando and so reaches the Zambesi, and on the south into Lake Ngami and the Botletle River, which feeds the Makarrikarri depression and the great sandy plains of the north-east. During the rains the whole of this region is covered with wide stretches of water, often extending far beyond the horizon. The Nossob, Molopo, and Kuruman Rivers in the south, which formerly drained the greater part of the Middle and Southern Kalahari into the Orange River, are now for the most part sandy beds bordered with trees, and water is seldom found except towards their heads. At the present time no water leaves this part of the Kalahari except through evaporation. The country appears to be suffering from progressive desiccation, but there is said to be good evidence of an abundant supply of water not far beneath the surface.

The rainfall, though very small in the west and south, enables a fair amount of vegetation to flourish, chiefly grasses, shrubs, and trees, except in certain areas where the soil is too saline. The great plains, more especially in the south, are covered with tough sun-bleached bushman grass (*Aristida brevifolia*), growing knee-high and giving

? Schapera E-4, 5 (no date) 1930
FX13 Hottentot FX13
Bushmen FX 10

H B 137 the country the appearance of a vast cornfield. Considerable portions, chiefly in the west and north, are, however, covered with dense thorn bush, while in the north-west the whole region is well timbered and merges into thick tropical vegetation. Along the river beds throughout the country are dense thickets of Acacia (*detinens*, *giraffae*, and *horrida*), almost impenetrable in parts and often harbouring great numbers of wild animals. Large forest trees such as mopane, commiphora, and kirre and there baobabs are found in the north. Succulents, such as the *Aloe dichotoma* and *Euphorbia dinteri*, abound wherever there is rocky soil, while leguminous and bulbous plants are an important feature of the vegetation in all parts. The most remarkable of these plants is the well-known *tsama* melon (*Citrullus vulgaris*), which owing to its nutritive and thirst-quenching properties is a veritable staff of life in many parts of the country during the height of the dry season.

H B 137 Towards the western border of the Kalahari, as the superficial deposits become thinner, ridges of rock make their appearance and become more and more numerous, the ground-level rises generally, and the region passes by degrees into the highlands of South-West Africa, which form the western edge of the vast interior plateau. This whole territory is practically one great series of undulating elevated plains, intersected by small mountain ranges, of which the Brandberg near the coast rises up as high as 8,277 feet above the sea.

In the far north-west is a chain of rugged mountains stretching south-east through the highland region of the Kaokoveld at a distance of 25 to 40 miles from the coast. Further inland the north-east Kaokoveld consists of an elevated plain, sloping abruptly towards the Kunene River and Ovamboland; from it hills emerge to the south and west. Ovamboland, which shares the characteristics of the Kalahari region, is a slightly undulating sandy plain, intersected by a number of shallow watercourses filled by the Kunene overflow and draining to the Etosha Pan. Towards the south of the Kaokoveld there is a general decrease in height. This southern portion, a country of steep, rocky hills with narrow valleys, passes over to the east into the Karst region, for the greater part a wide plain sloping gently towards the Etosha Pan and characterised by the formations associated with dolomitic limestone. The usual features of this kind of country are met with: sink holes, subterranean caverns and springs, and the absence of defined waterways, due to the porous character of the surface covering.

2: Schapera E-4, 5 (no date) 1930
FX13 Hottentot FX13
Gutsche, FX 10

Northern Damaraland to the south of the Kaoko region is a vast H
tract of extensive grass plains, from which emerge isolated eminences and B
a few mountain chains superimposed on the main plateau. Further 133
south the whole country attains its highest elevation of over 6,000
feet in the Khomashochland of Windhoek district, while south and
east of Windhoek rise the great Auas Mountains (highest altitude
7,886 feet), which form the watershed of South-West Africa. Deep
clefts and gorges, widely-extended plains and high rugged peaks are
characteristic of this region; valleys, too, expand in among the moun-
tain groups, and are often of extreme fertility. To the south extend
the plateaux and table-topped mountains of Great Namaqualand. This
part of the country is dominated by two longitudinal trenches, that
of the Kuiseb to the west, that of the Great Fish River to the east.
West of the former is a series of mountain ranges and elevated plains,
among them being the Tsaras and Tiras Mountains and the Huib
plateau, while to the east of it is the Hauses plateau. Still further
east, beyond the Great Fish River, the Urinamib plateau overlooks the
Kalahari. In the south-east the isolated Great and Little Karas
Mountains rise to considerable heights, but the country is for the
greater part flat or rolling. Eastward and north-east of these elevated
tracts, the upland assumes a very level character, composed mainly
of sand dune formation merging eventually everywhere into the
sand-veld of the Kalahari.

Although the northern half of South-West Africa falls within the H
Tropic of Capricorn, the climate is on the whole temperate rather B
than tropical. The extreme north and north-east are hot and trying 132
to Europeans, and malaria is very prevalent there during the summer; [44]
but on the central plateau the dryness of the air makes the summer heat
easily supportable, and the country generally is healthy, with clear,
bracing atmosphere and much wind. The winters are cold, and ice
often forms upon the central and southern plateaux. Rain falls during
the summer from October to April, but rarely during the winter
season. The mean annual rainfall varies with the latitude, from 6
inches in the south to 22 inches in the centre and reaching 22 inches
in the north.

Except for those rivers forming part of the northern and southern H
frontiers of the country—the Kunene, Okavango, and Orange—there B
are practically none which carry surface water all the year round. 133
Almost all are simply dry sandy watercourses which become torrents
for a short period after rain; but save in very wet seasons few of these

2: Schapera E-4, 5 (no date) 1930
FX13 Hottentot FX13
Bushmen FX10

HB 133

flow for any considerable distance. For the rest of the time they have water only below the bed or in pools. Away from these sandy beds water as a rule is extremely hard to find. After heavy rains great hollows in the rocks are filled with water which is a blessing to any traveller passing that way, and there are also vleis and depressions which hold water for a short while. Springs, however, are few and far between, and then generally occur in the river-courses.

HB 137

Corresponding to the variation in the rainfall there is a variation in the character of the vegetation. In the extreme south for a considerable distance semi-desert conditions prevail, the arid, stony plateaux and plains supporting a sparse growth of grass and small, scrubby bushes, including the different species of *Grewia* which produce the wild berries so much used by all the natives as food. In heavy rainy seasons, however, nutritious grasses and flowers spring up everywhere. The river-courses are clothed with trees, especially the Kameeldoorn (*Acacia giraffae*) and the Kokerboom (*Aloe dichotoma*), and in all of them, too, the South American *Nicotiana glauca* Grah., the wild tobacco plant, is found as a scraggly, weedy shrub or tree. Northwards the veld assumes the characteristics of the Karroo until Rehoboth is reached, when it changes into park-like grass country studded with large thorn trees, being especially well timbered along the watercourses. From the mountainous portions of the Windhoek district northwards towards Otjimbingwe the country is covered with level bush with an undergrowth of very nutritious grass, the valleys and watercourses being well wooded mostly with Acacia trees, especially the Kameeldoorn. Towards the north the bush becomes denser until it is fairly well timbered all over. In its northernmost section it is traversed by belts of open Mopane forest, and towards the Okavango fertile tropical vegetation is abundant. Numerous kinds of fruits, roots, and tubers used by the natives as food are found over the whole region, but most abundantly in the north. The edible bulbs belong for the most part to the *Irideaceae* family, while the tubers are generally *Asclepiads*, though the *Cyperaceae* and the *Oxalidae* also furnish succulent tuber-like growths.

HB 132. 133

South of the Orange River the rocky western edge of the great interior plateau is extended into the highlands of Little Namaqualand in the Cape Province. With scanty soil and low rainfall (5 to 15 inches) this region shares the characteristics of the southern portion of South-West Africa. Short perennial streams are found in the Kamiesberg, but the mountainous country enclosed by the great bend

of the Orange Riv... is very dry. The level arid plain of Bushmanland H
further east is ... essentially a continuation of the Kalahari, from B
which it is separ... by the deep rocky valley of the Orange River. 132
The summer rain... all is low (1 to 10 inches), increasing gradually 133
from the west ... ards; there is practically no surface water, and the
soil is usually ... stony or sandy. The river-beds are mostly dry
throughout the g... ater part of the year, and the Orange River is the
only one that ... rs contains water. The general aspect of the H
vegetation both ... and in Namaqualand is that of widely-separated B
xerophytic shrubs ... and bushes, with a fair proportion of succulent 137
plants in the low... ing valleys and on the rocky outcrops. Grasses
do not form a ... spicuous feature, but they occur on the high
plateaux and sandy ... plains, where the vegetative period is short, and
where they always ... assume a tufted habit.

Further south ... east in the Upper or Northern Karroo, an arid H
belt of country ... reaching northwards to the Orange River at an B
elevation of between ... 2,800 and 6,000 feet above sea-level. It is 133
bounded on the west ... by the Roggeveld, on the south by the Nieuwe-
veld and Sneeuwberg ... ranges, which form part of the great escarpment
of the interior pla... au. The landscape appears for the most part
in the form of vast ... reless plains, only here and there broken by table-
topped hills boldly ... scarped by sandstone and dolerite sheers, while
occasionally dark ... ngers, the outcrops of inclined sheets of dolerite,
are seen traversing ... he country for many miles.

The region is ... posed to great extremes of temperature. Severe H
frosts are experienced ... d in the winter nights, while the summer heats B
are correspondingly ... severe, reaching at times to 110° F. in the shade. 132
The feeling of oppr... sion at such times is increased by the hot westerly
winds which prevail ... ssions during the first half of summer, although
the nights are cool ... even during the periods of greatest heat. The
winter days, on the ... other hand, are very enjoyable, the air being
keen and bright with ... a maximum of sunshine. There is a wide range
of rainfall, from less ... than 5 inches in the north-west to 25 inches in
the east; the greater ... part of this falls in violent summer thunder-
storms, and almost ... the water runs off the sun-baked soil into deep
gullies which hurry ... it off to the sea. Severe droughts are common, H
and the streams are ... all intermittent. The soil is shallow and rock- B
strewn, except in the ... alluvial tracts in the valley bottoms, and surface 133
limestone becomes ... an important feature in the drier parts of the 134
region. Pans are ... ndant, and a striking feature in the low-grade

valleys of the north-west are the wide "vloers" of Carnarvon and Calvinia, more or less well-defined flat areas a few miles wide and thinly covered with brackish silt.
